THE Belgian, following the example of the French magistrates, are condemning some of the unfortunate automobilists brought before them for excess of speed to imprisonment, and quite recently a well-known motor-cyclist was sentenced to no less than eight days confinement for exceeding the limit of speed prescribed by the law. This seems absurdly severe, and such treatment is hardly likely to be accepted tamely by Belgian *chauffeurs*. It will be remembered that in France the legality of imprisonment for scorching was very seriously at doubt, and that no less a personage than Monsieur Monis, the Minister of Justice, circularised the police authorities, expressing his opinion that offending automobilists are only liable to be fined. The contention of this high authority was based upon the ruling of Clause 475 of the French Penal Code, whereas the Paris police had been in the habit of prosecuting offenders under Clause 476. I am not aware whether this all-important question was ever definitely decided, but it was only by the continued agitation of the various interested clubs and journals that Monsieur Monis's attention was drawn to the point, and that the inclination of magistrates to sentence one and all to terms of imprisonment was restrained. To-day one practically never hears of such a sentence unless the offender has fallen foul of other police regulations in addition to those relating to furious driving. If, then, there exists the slightest doubt as to the legality of the Belgian authorities' action, automobilists should leave no stone unturned to put the matter on a proper footing, and that they will do so cannot be doubted for a moment by anyone with a knowledge of the Belgian temperament.

Motor-Cycles and French Customs.

SOME time ago Monsieur Ballif, the energetic president of the Touring Club of France, addressed a petition to the Government praying that motor-cyclists entering the country from the Swiss and Belgian frontiers might be accorded the same privileges as those enjoyed by ordinary cyclists; that is to say, upon presentation of the card of membership of a recognised club the rider would be permitted to introduce his machine into France without paying any deposit to the Customs. Such a privilege would have been invaluable, and motor-cyclists would have welcomed it with enthusiasm. But it is not to be, at any rate for the present, for the Government decision transmitted to Monsieur Ballif is that such a concession would prove detri-

mental to the industry in France, and that therefore it cannot be granted. This is the more peculiar inasmuch that recently the Italian authorities have decided to include motor machines in the same category as cycles, and French riders are therefore accorded a privilege which their own Government declines to grant to foreigners. It is a pity.

Fresh Records by Demester.

LAST week, when quoting the new records set up by Demester, I enquired, "Who will be the next candidate for record honours?" and in doing so had in mind more particularly Rigal. But it is not Rigal, but Demester himself, who has proved to be, not merely the candidate, but the successful candidate, and of whose performance I am now about to relate the history. It took place on the morning of Thursday, the 25th ultimo, on the famous track at the Parc des Princes, in the presence of Monsieur Tampier, the official timekeeper, and a mere handful of spectators. From the start Demester travelled not only at a great, but also at a wonderfully even pace, and upon reaching the thirtieth kilomètre he got inside record figures. From that point onwards he gradually augmented his advance on Béconnais' records, and then, when within appreciable distance of the hour, his tire burst. But Demester was not done with, and continuing to ride during the last two and a-half minutes without pneumatic, he managed to crowd no less than 71 kilomètres 265 mètres within the sixty minutes. This represents about forty-four and a-half miles, and is 1 kilomètre 896 mètres better than the previous record made by Béconnais on February 8th last. Ten minutes' halt to replace the tire and Demester was off again in his wild chase, but it was not until the ninetieth kilomètre that he again got inside the previous best. Once there, however, he stayed there, and finished by knocking over three minutes off Béconnais' figures for one hundred kilomètres. Demester was riding a Gladiator tricycle fitted with an Aster motor. His times *en route* were:—

Distance in kilomètres.	Record.	Former record.	Former holder.
	h. m. s.	h. m. s.	
30	0 24 54 ³ / ₅	0 24 59	Demester
35	0 29 7	0 30 26 ⁴ / ₅	Béconnais
40	0 33 20	0 34 45 ³ / ₅	"
45	0 37 33 ² / ₅	0 39 3	"
50	0 41 43 ¹ / ₅	0 43 22	"
55	0 45 55 ² / ₅	0 47 42 ³ / ₅	"
60	0 50 7 ⁴ / ₅	0 51 51 ³ / ₅	"
65	0 54 22 ² / ₅	0 56 15	"
70	0 58 44 ¹ / ₅	1 0 32	"
90	1 19 10 ³ / ₅	1 20 51 ³ / ₅	"
95	1 23 24	1 25 54	"
100	1 27 44 ² / ₅	1 30 49 ¹ / ₅	"

Undoubtedly this is far from the limit of speed at which his machine can travel, but very slight improvement can be made upon his figures at the Parc des Princes, for the track is not sufficiently large and the banking is not steep enough to allow of much faster times being made. But there is sure to be a candidate soon all the same—who will it be? Next, please.

A Fatal Accident in the Ardennes.

A SAD motor-car accident has occurred in the French Ardennes, resulting in the death of Comte Raphael Cahen d'Anvers. The accident took place at Lepron les Vallées, sixteen miles from Rocroy. They were going down hill, at the bottom of which there was a sharp turn of the road. It would seem that the brake gave way, for the driver lost control over the car, and, when going at full speed, it ran against a cliff facing the downward road. The driver jumped out, and was scarcely hurt, but the Comte was killed on the spot. Since the above was written additional details of the accident have come to hand. The deceased, who joined the Automobile Club of France four years ago, took great interest in the new mode of locomotion, but he was by no

means an expert driver. To this want of experience his death is attributed, for he insisted on engineering his car over bad ground, although he had a skilful conductor with him. Only a week since the Count bought a splendid motor-car from M. Girardot at a cost of £2,000. Accompanied by his *mécanicien*, he left his residence in the Champs Elysées last week for his château in the Seine-et-Oise. He was so delighted with his new purchase that he resolved to take a trip in it to Belgium, and started on Saturday last with the fatal result above chronicled. The deceased, who was 56 years of age, was a Commander of the Legion of Honour, and belonged to the Union Artistique, the Société Hippique, the Cercle Athlétique, the Acacias, and the French Automobile Club.

CELERIOR.

The shades of night were falling fast,
As through a country village passed
A youth who drove through mist and storm
A motor-car of Daimler form.
Celerior.*

His brow was scored, his eye was bright.
His lamps shone forth their dazzling light.
While like a syren in a storm,
Blared out the well-known motor horn.
Celerior.

By happy homes both warm and snug,
He wildly plied his sparking plug.
When right in front a helmet shone,
And from his lips escaped a groan.
Celerior.

Too fast! Too fast! the bobby cried,
And at the car his truncheon shied;
But speeding on like startled bird,
A loud and clarion voice was heard,
Celerior.

"O stay," the hostess said, and rest,
Of all the Inns this is the best.
He brushed a tear from off his eye,
And answered straight without a sigh.
Celerior.

Beware the newly metalled road,
Beware the drunken carter's load,
This was the hostess's last "adieu,"
As car and driver fled from view.
Celerior.

Some labourers at break of day,
To work proceeding on their way.
Of something strange became aware,
Such scent of petrol filled the air.
Celerior.

'Midst fragments scattered all around,
A motor man lay on the ground,
Still grasping in his hand of ice
The lever marked with plain device,
Celerior.

There in the twilight cold and grey
Lifeless, and scotched at last he lay,
While from the crowd which gathered round,
A voice fell solemnly profound,
Celerime.

T. FRED. HUNT.

* Celerior = Faster.
Celerime = Too fast.

THE proposal to institute a municipal motor 'bus service at Southampton has been adjourned for six months.

"MORE LIGHT" is referred to the article on "Tube v. Electric Ignition," in our issue of August 11th last, and one on "Electric Ignition Troubles," which appeared in the number for September 8.

THE Remington Automobile and Motor Co., Ilion, N.Y., have purchased the business of the Quick Manufacturing Co., Newark, N.J. Operations at Newark will be continued until orders in hand are completed, when the entire plant will be transferred to Ilion. The "Quick" motor will be improved and marketed under the Remington name in the following sizes: Three, four, six and eight horse power.

THE AUTOMOBILE CLUB'S TRIALS OF ELECTRICAL VEHICLES.

WE have already published the conditions in regard to the trials of electrical vehicles organised by the Automobile Club, and which are to be commenced on Monday next, the 5th inst. The following twelve vehicles have been entered.

The Leecoll Electric Battery Company, Ltd., seven cars, Nos. 1 to 7.

The National Motor-Carriage Syndicate, Ltd., one car, No. 8.

Carl Oppermann, one car, No. 9.

The Electric Motive Power Company, Ltd., two cars, Nos. 10 and 11.

Shippey Bros., Ltd. (Still Motor Company), one car, No. 12.

As stated in a previous issue, the trials comprise (a) a run over a given course for an unlimited distance on one charge. The driver to declare to the observer when the run is to be considered finished; (b) a course of 30 miles, to include considerable gradients; (c) a course of 30 miles of average road; and (d) a course of 30 miles of flat, or nearly flat, road.

Trial *a* will be carried out on Monday, the 5th inst., starting from the Chislehurst electric light station at 7.30 a.m., the route to be followed being Foots Cray, Farningham, Wrotham, Ightham, Seal, Pott Hill Summit, Orpington, Chislehurst.

Trial *b* will be made on Tuesday, the 6th inst., the route being Chislehurst, Orpington, Cudham, Scott's Lodge, Knockholt, Stonehouse, Green Street Green, Orpington, Chislehurst. The road between Green Street Green and Cudham rises from 300 to 680 feet above the sea, and at Knockholt it is 735 feet above the sea.

Trial *c*, for Wednesday, the 7th inst., will be carried out over the following route: Chislehurst, Foots Cray, Farningham, Eynsford, Shoreham, Otford, Bat and Ball Station, Orpington, Chislehurst.

The route for trial *d*, for Thursday, the 8th inst., is: Chislehurst, Sidcup, Eltham, Blendon, Sidcup, Eltham, Blendon, Sidcup, Eltham, Blendon, Sidcup, Chislehurst.

On Friday, the 9th inst., there is to be an optional trial, consisting of a run over a given course for an unlimited distance on one charge; the driver to declare to the observer when the run is to be considered as finished. The route is the same as that for trial *a*.

Trial vehicles must be at the Chislehurst Electric Light Station for charging not later than on Sunday, the 4th inst., at 6 p.m., and drivers or other representatives of owners must be prepared to superintend the charging of the vehicles at any time of the night which may best suit the convenience of the engineer. The owners' representative shall decide when the batteries are fully charged. On Monday, and following nights during the trial, the same arrangements will obtain for the charging of vehicles. No change or alteration may be made in the batteries, motors, or parts of them, or in the connections or other parts of a vehicle from 6 p.m. on Sunday, the 4th inst., until the judges' committee have notified at the conclusion of the trials that they no further require the vehicle, unless previous written permission be obtained from one of the judges or the secretary to the judges' committee.

M. BOURGEOIS, chief of police of Brussels, has lately been initiated in the management of motor cars. It was at Ostend where he made his debut. M.M. Goethais and Riviere piloted him in a 7-h.p. vehicle, and one of them, engaging successively the three speeds, and turning corners with much skill, executed a number of driving tricks, and then departed at the third speed, and, by applying the brake, brought the vehicle to a stop within 7 feet; the other gentleman meanwhile expounded the advantages of the new locomotion. M. Bourgeois was seemingly much impressed.

CORRESPONDENCE.

THE WERNER MOTOR-BICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In March last I became the owner of a Werner motor-bicycle, and since then have been much exercised to induce the motor to work. Sometimes it will travel for a few miles; perhaps it may have done about 100 miles altogether. Experts and amateurs have come to my assistance, but so far no satisfactory result has been achieved. At present the motor will explode lustily through the compression tap when open, or in any direction where an escape can be effected, but it will not force down the piston. Every effort seems to have been resorted to in order to get the electricity into good order, and the engine seems in proper working condition, so why the machine refuses to do its duty is a puzzle to everyone who has devoted attention to it. I gather from the correspondence in your paper, that some writers at least have had success with their motor-bicycles, but no one has explained how other bicycles may be made to travel, even when they have announced their own good fortune.

I think there must be many amateurs possessed of the information which would overcome the troubles I have referred to, who would be pleased to impart the knowledge they enjoy for the benefit of those whose experience has not been so fortunate, and I should be obliged if such automobilists would favour me and others in my predicament with such advice as we appear to stand in need of.

Yours truly,
J. A.

Altrincham, October 27th, 1900.

MOTOR DRIVING AND INSTRUCTION SCHOOLS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was glad to see the suggestion made by your Continental correspondent last week, that there is room not only for a school for the teaching of motor-car driving, but also that provision should be made for giving technical instruction to enable novices such as myself to become versed in the mechanism of motor-cycles and cars. I for one would be only too glad to avail myself of such opportunities were they available, for while much interested in automobiles, my want of knowledge of motors and motor mechanism has hitherto made me refrain from investing in a car.

Kensington, W., October 30th, 1900.

Yours truly,
NOVICE.

NINETEEN entries have so far been received for the Chanteloup competition, which is to take place on Sunday next, under the auspices of the Motor-Club de France.

FOR the petrol consumption competition which is being organised by the *Auto-velo* for the 8th inst., thirteen entries have already been received.

IN its recent annual statement the American Bicycle Co. lays stress upon the automobile branch of its business, and announces that four or five of its factories will be wholly occupied in producing them henceforth.

MR. JAS. E. TUKE, who has been appointed sole representative of the Yorkshire Motor-Car Manufacturing Company, of Hipperholme, Bradford, hopes to have a car on show in London at an early date. The company are, we hear, arranging for an increased output next year.

AN economiser for Locomobile and other light steam cars has been brought out by Mr. Hy. Brough, of Cornbrook Road, Manchester. It consists of a device for utilising the exhaust steam in heating the boiler feed water up to 202 deg. Fahr. In this way it is claimed that not only is a more uniform steam pressure maintained, but that the consumption of petrol is reduced.

MOTORISTS in the East End of London will be glad to learn that Messrs. Short and Co., of 363, Mile End Road, E., are keeping a stock of petrol, which they will supply any day of the week, including Sundays. They are laid out to undertake repairs, and also keep a supply of spare parts for Daimler, Benz, and De Dion motors.

The Event of the Year.

THE END OF THE 1,000-MILES TRIAL.

ALTHOUGH we have by no means heard the last of the great 1,000-miles Trial, organised and successfully carried out by the Automobile Club of Great Britain and Ireland, we have seen the last incident of the many events which have been called forth by that great tour. The initial stages were dull and common-place; the routine work of arrangement necessitated close application to matters of detail. Then came the Trial—full of incident, devoid of accident, and crowded with excitement, both pleasurable and worrying. That event over, there was the reunion dinner, when participants confessed their sins of omission and commission and told how rigorously they had adhered to the rules of the club. That was followed by the deliberations and the calculations of the judges. Interest was whetted again by the publication of the awards, and then there was another lull. And lastly, on Wednesday, a pleasant dinner at the Trocadero, Piccadilly, proved a fitting *finale* to the whole series of events comprised under the title of the 1,000-miles Trial.

The company present numbered over one hundred and twenty, and was widely representative of the automobile world. Owners of vehicles, representatives of manufacturers, and the drivers of cars sat down to a capital repast, and then a few minutes' interval enabled one to realise the comprehensive character of the gathering. Among those who had accepted invitations were Mr. Roger Wallace, Q.C. (chairman), Mr. F. R. Simms (vice-chairman), Mr. Frank H. Butler (hon. treasurer), the Hon. C. S. Rolls, Messrs. R. E. Phillips, H. Edmunds, W. W. Beaumont, J. Lyons Sampson, Staplee Firth, Mark Mayhew, C. Cordingley, S. Spooner, J. A. Holder, C. Vernon Boys, E. H. Bayley, J.P., T. Bayley, M.P., A. Bird, E. Kennard, J.P., R. H. Fuller, S. F. Edge, C. Jarrott, C. K. Gregson, T. B. Browne, C. Freeston, G. S. Critchley, G. F. Pedley, A. J. Drake, Percy Richardson, J. H. Gretton, Hewetson, R. Moffatt Ford, C. Grimshawe, C. Letts, J. J. Mann, A. Burgess, E. Pitman, W. E. Hart, H. B. Graham, F. F. Wellington, Van Toll, R. R. Banks, E. Dangerfield, E. M. Iliffe, T. G. Chambers, B. C. Joy, W. H. Kitto, F. O. Seyd, G. H. Thrupp, Sidney Straker, and C. Johnson (sec.). Most of these gentlemen were present, and among those who sent letters of regret was the Hon. J. Scott Montagu.

The toast of the Queen having been honoured, Mr. Roger W. Wallace made a short speech before proceeding to the business, or pleasure, of the evening, viz., the distribution of prizes and diplomas. He said that there was, unfortunately, one who had participated in the 1,000-miles Trial who was unable to be there. He referred to Lord Kingsburgh, who, since the Trial, had been honoured by the Crown in being made a K.C.B. Thus he had been recompensed for his helpfulness to automobilism and for his distinguished services to the country. On behalf of those assembled he (the chairman) proposed to send a telegram of congratulation to the Lord Justice-Clerk of Scotland. (Cheers.) He then proceeded to distribute the prizes and diplomas with a graciousness of phrase that gratified the recipients and delighted the observers of the ceremony. In our issue of July 7th we gave a full list of the awards—occupying more than five columns of the *Journal*—so that the publication of the list would be but a repetition. In the manufacturers' section the winner of the first prize in the class for vehicles selling at £200 or less—viz., the Benz car—occasioned the remark that many of the present owners of 12 h.p. Panhards had commenced their automobile careers with Benz cars. In the class for cars of a selling price between £200 and £300 the first distinction was obtained by the Wolseley voiturette, which was entirely an English car, and therefore its success gave great satisfaction to those who were anticipating a good future for the British motor-car industry. In Class C, the Daimler Company had taken the first prize with its triple entry of Nos. 35, 36, and 37—a fact which gave evidence of

the great improvements now being made by constructors in this country. In the class for motor-cycles carrying two persons the manufacture of the Ariel quadricycle in this country was favourably commented upon. Equally felicitous was Mr. Wallace in distributing the second class awards, occasioning much amusement by his lamentations over the prize money which had had to go to America, to the credit of the Locomobile Company, with whose cars many of his friends had expressed themselves well pleased. Diplomas (in all cases cheques had been previously sent) were also handed to the representatives of the New Orleans voiturette, the Motor-Car Company's Triumph, the Motor Manufacturing Company's car, the De Dion voiturette, and the Century tandem.

In Section II.—that for privately owned vehicles—the success of the Hon. C. S. Rolls overshadowed the distinctions of other entrants. He secured the gold medal for the most meritorious vehicle in the Trial, the silver cup presented by Mr. Owers, and a prize of £5, which had gone to the part purchase of a stop watch. On coming forward to receive his trophies, he was greeted with well-sustained applause, which, in the words of the chairman, showed how high he was held in the estimation of automobilists. He was a thorough sportsman, and had adhered most strictly to the rules of the Club within controls—(laughter and hear, hear)—and had gained ninety-three marks out of a possible 100. In presenting a silver medal to Mr. Phillips, high tribute was paid to his work as a member of the Club Committee, and Mr. E. Kennard was congratulated on the splendid success of his Napier car. Other recipients of prizes were:—Mr. F. H. Butler, Mr. T. B. Browne, Mr. E. Pitman, Mr. C. K. Gregson, and Mr. J. D. Siddeley, whose coming forward elicited an encouraging word to British manufacturers who were putting down works to go more completely into the manufacture of automobiles. Mr. J. A. Holder was welcomed as an early martyr to the cause—one who “has passed through the fire.” Mrs. Bazalgette received a silver medal amid loud applause, and was heralded by the chairman as one who had the united good wishes of the members of the club for her keen interest in automobilism. The mystery of the famous “Mr. Wm. Exe” was solved, as Mr. C. Johnson responded to the call for that gentleman, whose identity is now officially established. In the absence of Mr. H. R. Langrishe, Mr. Staplee Firth, who has represented that gallant motorist on more than one occasion, was called, but he had by that time disappeared, and many wondered if his departure had anything to do with further defence of automobilism and its votaries. Mr. S. F. Edge was heartily greeted as the driver of the Napier car, and Mr. E. M. Iliffe and Mr. Herbert Ashby were also among those who had the pleasure of becoming receivers.

A warm tribute to the skill of the drivers prefaced the distribution of driving certificates. 60,000 miles had been covered without accident, and the drivers deserved credit for their steady work. Then followed the presentation of the cups given by the motor-car journals in connection with the Automobile Club's motor-cycle meet at the Crystal Palace on June 30th last.

The next presentation was one in which the company joined with universal approval. Mr. Wallace referred to the early days of the Club. When Mr. C. Johnson joined—although there was a certain nucleus through the agency of Mr. Simms and Mr. Harrington Moore—he had a very difficult task before him. How he had surmounted that task all the members recognised. He (the chairman) hoped they would have an increased membership in the future, and be able then to adequately reward the work done by the secretary. The idea had occurred to Mr. Rolls to make an effort to show the appreciation in which Mr. Johnson was held by those who took part in the 1,000-mile Trial. That alone was a work which demanded very great ability

and constant and assiduous attention. He had accomplished that without any burden upon the finances of the club. The successful issue of the 1,000 miles Trial was due to Mr. Johnson almost entirely. He believed Mr. Johnson had organised the Trial better than any other man in the country could have done it. (Cheers.) The illuminated address which he presented to Mr. Claude Johnson asked that gentleman's acceptance of a purse of one hundred pounds in recognition of the valuable services which he had rendered to the interests of automobilism in this country. Through his able organisation and direction, the Club had carried to a successful issue the 1,000-miles Trial, which marked a distinct era in the history of locomotion. The address was signed by about eighty gentlemen.

Mr. C. Johnson, on rising to respond, was hailed with cheers. He said he was overwhelmed with the kindness of those who had given him that testimonial. When he first heard of it he wrote to Mr. Rolls pointing out that what he had done in connection with the Trial he had done as secretary of the club, and that he felt the pleasure it had given him was sufficient recompense. He thoroughly appreciated the kind expression of feeling, and the address was a possession of which any man might be proud. The organisation of the Trial was not altogether easy, and he had discovered that a man when he was driving a motor-car was not the same man as when not driving. He had realised the difficulties of adhering to rules, and he recognised how all had helped to make the event a success. The success was due largely to the way in which drivers had adhered to the rules. In conclusion he again said how grateful he was for the kindly appreciation that had prompted the presentation, and asked to be excused saying more (cheers).

Mr. Wallace then announced that Mr. Edmunds and himself had guaranteed £10 for a testimonial to Mr. Burrows, who was not only steward of the club, but also chief clerk, banker, and possessor of engineering information, always available for the members of the club. He had done much gratuitous work, and every member of the club would have pleasure in contributing to the testimonial, to which Mr. Edmunds and himself (the chairman) would each give a guinea. It would probably exceed the £10, it should not be less, and Mr. Edmunds would be glad to receive subscriptions. The incident was quite unexpected by Mr. Burrows, who was evidently too much taken by surprise to make a speech in reply. He modestly thanked the gentlemen present.

Then followed a series of resolutions, which, owing to the lateness of the hour, were more or less formally moved, but all of which were heartily endorsed. Thanks to the local committees were proposed by Mr. Wallace, seconded by Mr. F. R. Simms, and acknowledged by Messrs. Bird and Graham. Messrs. J. H. Gretton and S. F. Edge proposed the recognition of the judges, on whose behalf Professor Vernon Boys replied. To Mr. A. Harmsworth appreciation was rendered on the proposition of Mr. H. Austin, seconded by Mr. Hewetson; and the donors of the prize fund received the thanks of the meeting, voiced by Messrs. Pedley and Mann. Mr. Mann also proposed the acknowledgment of the services of the Press, which was seconded by Mr. Lanchester, and responded to by Mr. C. Cordingley. Messrs. Browne and Ford took charge of a resolution of thanks to the committee of organisation, and then, on the motion of Mr. H. Edmunds, the proceedings terminated with musical honours, rendered to the chairman.

THE Cycle and Motor Company, Ltd., Oriel House, Westland Row, Dublin, inform us that they are not only in a position to execute all repairs to motors, but also carry a large stock of petrol and motor lubricating oil.

In the report of the Caledonian Motor-Car and Cycle Company, Ltd., of Aberdeen, it is stated that the sales in the motor department show an increase of over £4,000 on last year's motor sales. The company's trade suffered very much through the disastrous fire at their premises on the 5th June last. The premises have been entirely reconstructed, and are now fire-proof and well equipped for motor business.

THE ALCOHOL MOTOR COMPETITION IN FRANCE.

(From Our Own Correspondent.)

ON Sunday last the *Vélo's* competition for automobiles employing alcohol as fuel took place over the trying route which unites Rouen to the capital. The second event of its kind, this contest had during the previous few weeks excited the greatest interest in automobile circles, and the number of entries had steadily increased until, on the evening previous to the start, no fewer than sixty-five vehicles had been booked to compete. The organisers had drawn up a very complete set of rules and regulations, from which it was made particularly manifest that no racing would be recognised, and that competitors would be required to keep strictly within the legal limit of speed, viz., thirty kilomètres (nineteen miles) per hour. Each vehicle was compelled to carry a commissioner, whose duty it was to keep careful watch over the conduct, both of car and driver. He was provided with four small bottles for the purpose of taking samples of the alcohol procured *en route*, and his route book contained a specification of the car under his charge. Each competitor was required to completely fill his tank at the moment of starting, and again at the moment of arrival, by which means the exact quantity of fuel used was ascertained. Naturally, should the operation be rendered necessary during the journey, the tank was also required to be completely filled. The start was ordered for half-past eight at the Porte Maillot, and long before that time a great crowd had assembled to see the preparations of the vehicles preparatory to getting under way. Monsieur Jean Dupuy, the Minister of Agriculture, was present, and many of the leading men in the automobile world, among whom I may cite: MM. René de Knyff, Paul Meyan, Serpollet, Charron, Gobron, Huillier, Michelin, Girardot, Richard, de Rothschild, Ballif, Cuénod, Scotte, and Ravenez. As they were ready so were the competitors despatched by M. Riguelle, and down that terrible *paré* of the Avenue de Neuilly they bumped. By the time Rueil was reached many cars were already *en panne*, for the jolting over the *paré* seriously affected the carburation, the intricacies of which all the drivers had not found sufficient time to master. By 9.13 a.m. the last car had got under way and then followed a great number of every type and class of automobile that can be found in Paris. No untoward incident occurred throughout the journey, and travelling by way of Nanterre, Chaton, Le Vésinet, Le Pecq, Saint Germain, Chambourey, Flins, Mantes, Bonnières, Vernon, Gaillon, Notre-Dame-du-Vaudreuil, Pont de l'Arche and Amfreville, the leading cars had covered the 127½ kilomètres of route by half-past eleven. Needless to say that some of them, as in the case of Giraud, for example, had travelled exceedingly fast in spite of the non-racing character of the competition. Giraud left the Porte Maillot at 9.3 a.m., and reached Rouen at 11.18 a.m., thus covering the distance in 2½ hours, or at the average speed of sixty kilomètres per hour. The other arrivals were:—

No.	h. m. s.	No.	h. m. s.
36. Charron and Girardot	11 34 30	56. Panhard	1 17 0
3. Gobron-Brillié	11 37 0	32. Clément	1 20 0
43. Degrais	11 55 0	28. Martha	1 21 30
8. Baras	12 8 30	53. Fernandez	1 42 0
61. Lefebvre	12 12 0	58. Peugeot	1 43 0

It is interesting to note that the No. 3 Gobron-Brillié car was driven throughout by Madame Gobron, and ran on pure alcohol. A banquet in the evening at Rouen brought to a most successful conclusion a truly memorable day. The official results will be published in due course.

HERE AND THERE.

MR. ROGER WALLACE, the president of the Automobile Club, will welcome the time when British manufacturers are able to meet the demands of British patrons of the automobile industry, and at the Trocadero dinner he very clearly showed a prejudice, which all must feel, in favour of the further development of English enterprise in this direction.

SHARING in this enthusiasm, I gladly chronicle an event of some importance which took place at Luton on Wednesday afternoon. It was nothing less than the laying of the foundation-stones of a new motor-car works, which Mr. E. W. Hart intends to erect to manufacture electrical vehicles. I should mention that the British and Foreign Electric Vehicle Company is being formed to develop general electric traction work, and that arrangements have been made with Mr. Hart to supply carriages to the company. Those who attended the recent meeting of the English Motor Club will be familiar with the location of the new works, which stand upon a site of about four acres. The foundation-stones were laid by the Mayor and Mayoress of Luton and by Mr. and Mrs. T. G. Chambers, the latter gentleman being actively concerned in the new company. Luton is very favourably situated for the enterprise, being only thirty miles from London, and the train journey being slightly less than forty minutes. Both Mr. Hart and Mr. Chambers have great faith in the future of electricity in connection with automobilism, and have substantial visions of a car that will not only run more than 100 miles on a single charge, but which can be recharged in considerably less time than has hitherto been possible.

THE testimony of Mr. Neville Grenville, the High Sheriff of Somerset, with regard to the automobile is interesting, for he travelled 248 miles in 14 hrs. 10 min., saving 26 hrs. 29 min. as compared with the time it would have taken him had he trusted himself to the railway companies. Among his fellow councillors who were present at the meeting at which he gave that information were the Earl of Cork, the Marquis of Bath, and Earl Temple. Probably this trio will shortly be in the ranks of the automobilists.

AT Lidgate, near Haverhill, there is a clergyman who adds to the ability to preach the gift of being able to entertain lads with broken arms and compressed chests. The *South-West Suffolk Echo* thus announces the fact:—"Mr. S. Rolfe, of Cheveley, sent a motor-car to Lidgate to fetch Mr. T. Mould, groom at the Rectory, to record his vote at Brinkley. On leaving Lidgate something went wrong with the steering gear, and the car ran up a bank and overturned, injuring two of Mr. Rolfe's sons, who were in the car. The boys were promptly taken to Dr. Wilkin's surgery, when it was found that one boy had broken his arm and the other was slightly hurt on the chest. After the arm had been set the Rev. E. A. Gray entertained the boys at the Rectory till the evening."

MR. SIDNEY MATTHEWS, of Holly Lodge, Crawley, has been writing to the *Standard* suggesting that "the time has come when cyclists and motor-car drivers should be compelled to carry a number conspicuously placed." It will be interesting to see what happens.

GREAT waves of feeling sometimes rush over the country, immersing the common sense of ordinary people, and resulting in strange antics and sayings. Such an ebullition seems to be going on just now among the various county and other authorities. From almost every district I have received news of councils recommending the Local Government Board to reduce the speed of motor-vehicles, and the outburst is not only general but is pretty strong. In view of this sudden outbreak of the anti-automobile disease among the local authorities of Great Britain, I intend to publish a list of counties where motorists had better be careful. In all the places thus pilloried there is evidence of the existence of the disease in a more or less virulent form. I shall be glad to have the experience of readers in any of these counties. Motorists

can render a public service by informing me of other districts in which the outbreaks have occurred. So far I have heard of the following:—

Essex.
Lincolnshire.
Hampshire.
Norfolk.
Middlesex.
Surrey.
Somerset.

Among the towns deserving of publicity in this category, I mention—

Huntingdon.
Bournemouth.
Swansea.
Altrincham.

SEVERAL high personages are almost as bad as local authorities, and I would suggest that they should be given rides in motor-cars so as to ease their minds on the subject of automobilism. Additions to this list will be made from week to week. I begin with—

The Earl of Kimberley.
Lord Cranworth.
Lord Walsingham.
The Recorder of Bournemouth
(Mr. R. A. Kinglake).
Mr. J. Spear, M.P.

Particular attention should be paid to the latter gentleman, who is said to have views on the special taxation of cars.

THE other morning an impromptu motor-car run from the City Square, at Leeds, to the White Horse Hotel, York, was made by Dr. Orford, Pontefract, Messrs. S. Leuchter and Palmer, Leeds, and Mr. W. Burrows, York,—all members of the Yorkshire Automobile Club.

REALLY the ordinary newspaper man is incorrigible, and will have to be given periodical rides on automobiles to keep him informed of the fact that the motor-car is not the only element of danger in the streets of London. The other day a gentleman was knocked down by a horse and wagonette at the junction of Beaumont Street with that badly-kept piece of roadway called Portland Place. The driver of the wagonette said the horse was frightened by a motor-car; and, in reply to the coroner, said that when the vehicle passed it was not making much noise, but that it caused the horse to take fright there was no doubt, for there was nothing else near to do so. He confessed, however, that the horse had previously gone past motor-cars in a quiet, respectful manner. And even after such an acknowledgment the report of the inquest has appeared in the daily papers with the heading, "The Dangers of Motors."

AFTER such a gathering of automobilists as was seen at the Trocadero on Wednesday, it was rather disheartening to find so many antiquated horse-drawn cabs prowling about. In fact, the only practical evidence I saw of the industry about which so many kind things were said over the dinner table was a steam water-cart in the Strand. The flush of water was broad and expansive, and the vehicle was pursuing its way very stolidly and quietly. But the theatre and the fashionable world require something more at midnight than a motor water-cart.

LOLLIUS.

AMONG the disgraceful bits of road which motorists have had to endure for long is that between New Mills and Furness Vale, on the Buxton highway. The attention of the local authorities should be called to the matter.

MEDICAL men are recognising the value of the motor-car to them in their professional work. Now the dentists are adopting it; or, at least, one of that profession has become a pioneer, viz., Mr. James Gibson, of Oxford House, Hebden Bridge, whose new De Dion voiturette is interesting the people of the locality.

THE PRINETTI-STUCCHI MOTOR-TRICYCLE AND VOITURETTE.

IN the Italian section at Vincennes may be seen a tricycle with two motors and a voiturette similarly powered, both manufactured by Messrs. Prinetti and Stucchi, of Milan, Italy. The two engines are in each case placed side by side, and have the centre lines of their crank shafts in line. The two crank shafts are coupled together mechanically, and the action is, therefore, claimed to be that of a double-cylinder engine; facility for heat radiation is increased, on account of the distance apart of the two cylinders, which, as

FIG. 1.—THE PRINETTI-STUCCHI VOITURETTE.

the motors are air-cooled, is of prime importance. In the motor-tricycle (Fig. 3) a pinion on the engine shaft, between the two motors, engages directly a gear on the differential, the latter being placed on the axle. The Prinetti-Stucchi machines have carried off many prizes in contests on the track and on the road in Italy, the latest occasion on which they covered themselves with glory having been the races at Padua in June last, at which voiturettes and quadricycles of this firm obtained first prizes, while the tricycle secured both the second and the third place in its category.

In the voiturette (Figs. 1 and 2) the two motors are placed in front, and are supported on a spring-suspended

FIG. 2.—PLAN OF PRINETTI-STUCCHI VOITURETTE.

tubular frame. On the shaft, between the two motors, are fastened a pulley and a sprocket wheel, the latter being employed in connection with the starting of the engines. The rear axle is provided with a differential gear, a little to the right of the centre. With the differential gear meshes a pinion on an intermediary shaft, the centre line of which is in front of, and somewhat higher than, the axle. A second intermediate shaft is located below the first one, and connects with it through spur gearing. This last-named shaft is supported

by bearings on arms swivelling around the axis of the first intermediary shaft. The second intermediate shaft carries a pulley, a belt connecting it with the pulley on the engine shaft. By means of the swivelling bearing arms, and a coil spring, uniting their extremities, and a fixed point on the casing over the differential, the tension of the belt can be regulated at will. When it is desired to disengage the motors from the gearing, a foot lever is depressed, which counteracts the force of the coiled spring, and thus releases the tension of the belt. To prevent the belt from leaving the pulleys when the tension has been released, the latter are constructed with flanges on both sides. There are two sets of spur gears connecting the two intermediate shafts, the two gears, on what has been referred to as the first intermediate shaft, running loose upon it. A ratchet clutch will engage one or the other of these two gears, and thus two mechanical speeds are obtained. The petrol tank is placed under the seat of the vehicle. The petrol flows by gravity to the carburettor in front near the engine. Steering is effected by a cranked steering lever, the shaft of which passes up through a tubular column, fastened to the vehicle body. Around this column are grouped the levers for changing the gear, for regulating the carburation, and for

FIG. 3.—THE PRINETTI-STUCCHI MOTOR-TRICYCLE.

advancing the electric ignition. A foot pedal similar to the one by means of which the tension of the belt is released, operates a brake, and another brake is operated by a hand lever. The frame is of steel tubing, spring suspended in front, but fastened directly to the bearings in the rear. The body is, however, suspended by C springs.

THE captain of the guard of Fairmount Park, Philadelphia, reports that 674 automobiles entered the park in September last.

M. SERPOLLET appears to be making a speciality of taking important personages trips on his steam-cars, the latest addition to his list being M. Jean Dupuy, the French Minister of Agriculture.

THE Kingsburgh Motor Construction Company, Limited, has been formed to acquire by purchase the property known as the Madelvic Motor Carriage Works, situated at Granton, near Edinburgh. The capital is £50,000 in £5 shares. The first subscribers are:—Charles Allan, merchant, Edinburgh; Thomas Devlin, jun., shipowner, Newhaven; Mr. P. Galloway, shipowner, Leith; J. Macdonald, accountant, Edinburgh; T. Rowland Outhwaite, engineer, Elie; John Scott, shipbuilder, Edinburgh; and Lieutenant-Colonel T. T. Turnbull, London. The registered office is at 28, Queen Street, Edinburgh.

SOCIAL ASPECTS OF THE MOTOR-CAR.

THE automobile has a unique social record among improved transit instrumentalities. At the very outset it quickly leaped into high social regard. The horse, the source of chivalry and inseparable from the idea of knighthood, was at once supplanted in the favour of aristocracy by his mechanical rival. In France the Automobile Club straightway vied with the Jockey Club as a great social organisation and as the gathering-place for *la haute société*. It seems very strange, remarks a writer in the *Automobile Magazine*, that one of the most important instruments of modern progress should start out with such associations. But "motor sport" is the rage of the day in France, and as the golden youth of centuries past used to put on their coats of mail, mount their steeds, and go forth to the tournament, so their successors of to-day don garments that give them the aspect of mechanics, with overalls and oil-cloth jackets, and race over the highways on their motor-cycles, voituresses, or automobiles at reckless speeds that rival the railway express. Like the sports of chivalry, the new pastime requires courageousness and coolness; but, more than those, it demands a mental equipment and physical training in accord with the spirit of the age—an adequate knowledge of mechanical science, together with a technical experience in which the oil can and the monkey-wrench have taken the place of the sword and the lance. It is, therefore, significant that in its pre-eminently aristocratic phase the automobile should exhibit a socially levelling trait, making the very attributes of the trained mechanic those which are most necessary to proficiency in its use.

Other instrumentalities of progress in transportation have both their aristocratic and their plebeian phases. The railway, for instance, has its private cars and first-class coaches, and its third-class accommodations. The bicycle had a gradual development; at first an athletic device and an instrument of popular sport, it suddenly sprang into the highest fashionable favour, and is now a universal convenience, its use an accomplishment almost as indispensable as a knowledge of how to walk. The automobile will inevitably have its broad, utilitarian phases; the high social favour in which it now stands in the days of its beginning will undoubtedly continue, but it will be insignificant in comparison with its manifold services in many other ways. The reason for this remarkable social regard may easily be seen. It lies very largely in the great cost of motor-vehicles in their present stage of development. There is a large demand for them, and the supply is exceedingly limited. So only those who can afford to pay high prices can obtain them. Their cleanliness, their ease, comfort, and rapidity of motion make them particularly desirable, and at present their possession and use is a mark of social distinction.

In time, however, the social monopoly of the automobile must give way to the demand for its universal use. This demand will be met by the increasing facilities of production which will suit all tastes. As with the horse and carriage, the most luxurious forms will supply the requirements of the wealthy, while good vehicles will come within the means of the moderately circumstanced, including a large constituency for whom the keeping of a horse and carriage is too expensive a luxury. Therefore, notwithstanding its distinctively aristocratic advent, the automobile will become one of the most powerful of social levellers. But its effect will not be that of levelling down; it will level up, by building a strong course in the structure of modern civilisation, with its diffusion of comfort, its abatement of the nuisances that proceed from animal traction, and the development of better and more convenient ways of life and superior means of intercourse in both city and country.

THE Joseph Dixon Crucible Co., of Jersey City, N.J., have issued a little pamphlet, entitled "Graphite for Automobiles." It contains a description of the physical qualities of graphite, and particularly its lubricating qualities. The Dixon Company manufactures a special motor-chain lubricant called graphitoleo. The firm also manufactures a graphite pipe-joint compound, a graphite axle grease, graphite wood grease, etc.

FURIOUS DRIVING CASES.

AT Brigg, last week, Richard H. Griffin was summoned for driving a motor-cycle through Brigg Market-place at a furious rate on Thursday, October 4. Sergt. Cook said the motor-cycle was being driven at the rate of 15 miles per hour, and people had to rush out of the way to avoid being run over. Corroborative evidence was given by Geo. Richardson, who stated that a man pulled him out of the way or he should have been run over. The motor cycle was going quite 15 miles per hour. The Chairman said he could not help thinking that the witnesses had exaggerated. He should be very much surprised if ever anyone saw anything going through Brigg market at the rate stated. The defendant, however, was going much faster than he ought to do in Brigg Market-place, and he had written admitting the offence. A fine of 20s. and 10s. costs was imposed.

AT Lutterworth Petty Sessions, last week, Mr. Edward Kennard, J.P., of Market Harborough, was charged with driving his car on the road near Welford Station at more than twelve miles an hour, on October 13th. The speed at which he drove over the railway crossing was estimated by a police-superintendent at eighteen miles an hour. It was also stated that on passing a trap he failed to slow down, although the driver held up his hand as a warning. Defendant declared he was only going seven or eight miles an hour. The Bench imposed a fine of £2 and 12s. costs.

AT Barry, on Monday, Thomas Williams, the driver of a local motor-car, admitted that the evidence of Inspector Morris and Acting-sergeant Gill was correct that he drove the carriage along the highway at Barry Dock at the rate of about twelve miles an hour. The Bench, therefore, fined Williams 20s. for furious driving, as well as 2s. 6d. for driving without lights.

AT Chelmsford County Sessions, last week, Edward Harry Lancaster, 1, Masons' Gardens, Berkeley Square, London, W., was summoned for driving a motor-car at a pace in excess of the rate prescribed by law, on Sunday, September 2nd. Defendant pleaded guilty. Mr. C. E. Jones, who appeared for the prosecution, observed that motor-car drivers in this district were taking a very great risk upon themselves in travelling at the rate they did. The defendant and three or four other gentlemen were riding from London to Chelmsford on Sunday, September 2nd. They were seen by Sergeant W. Cowell, at Ingatestone, travelling at a great speed, and he put himself in telephonic communication with the police at Chelmsford. Inspector Peters, at Chelmsford, telephoned to Sergeant Peters at Widford, and the latter stopped the car on its arrival at Widford. The distance from where Sergeant Cowell saw the car to where it was stopped at Widford was found to be 4 miles 5 furlongs 220 yards, and on comparing watches the police found it had been covered in twelve minutes, or at the rate of nearly twenty-three miles an hour. Defendant said he held a French licence for motor driving, and the road was clear. The Chairman imposed a fine of £5, with £2 8s. 3d. costs.

AT the South-Western Police Court Mr. Percy Twigg, of West Norwood, has been summoned for driving his motor-car furiously, contrary to the statutes, on the Norwood road. The officer stated that while he was on duty in the Approach Road, Norwood Road, on Sunday evening, October 7, the defendant came driving furiously under the railway arch down the Norwood Road and was travelling at the rate of fifteen miles an hour. The constable held up his hand and shouted to Mr. Twigg to stop, but he continued along the road. Subsequently, about half an hour afterwards, Mr. Twigg returned up the road, and the policeman then took his name and address and summoned him. Mr. Staplee Firth called evidence for the defendant, and criticised the speed sworn to by the officer as wholly erroneous and mere guesswork. Ultimately the magistrate dismissed the case.

LI HUNG CHANG GOES A-MOTORING.

[L'Automobile Illustrée.

OBSTRUCTION BY A MOTOR-CAR.

At the Leicester Borough Police Court, last week, John Weedon, motor-car driver, was summoned for causing an obstruction in the London-road, on October 10.—P.C. Warner said defendant left his motor car unattended near the Hind Hotel for 20 minutes. Witness then went into the hotel, and told the defendant he should report him, and he then drove it into Regent-street, where he left the car in the cab-stand for another 25 minutes.—Defendant said he was chartered to convey three constables of the county force to different places, and was waiting at the Hind for one of them to get orders as to where he was to go, this being his instructions.—He was fined 10s.

DRIVING WITHOUT A LIGHT.

At the Slough Petty Sessions, last week, Thomas Hesketh, a student of the Royal Military College, Sandhurst, who did not appear, was summoned for driving a motor car in High-street, Eton, after sunset on September 14th, without a light.—P.C. Blencowe stated he saw defendant driving a motor car through High-street, Eton, at 9 p.m. on the evening of Sunday, September 14th, without a light. Witness stopped the motor car, which was going at ten or twelve miles an hour, and on being questioned defendant said the lamps had gone out and that he was going to get some candles at Windsor. He examined the lamps, which were both cold, and found a small piece of candle in one, but the other was broken. Defendant rode on without any lights and witness told defendant he should report him.—The Bench inflicted a fine of £1 and 9s. 6d. cost, or seven days in default of payment.

THE LONDON ELECTRICAL CAB COMPANY.

THE petition of C. E. Foster and others for the compulsory winding up of the London Electrical Cab Company, Limited, was before Mr. Justice Wright in the Companies Winding-up Court on the 25th ult. Mr. Counsel, who appeared in support of the petition, read a lengthy affidavit, which stated that the company was formed in November, 1896, with a capital of £150,000, of which £100,000 was to be paid up. Its business was to acquire licences from other companies for the sole use of electrically-propelled cabs in the metropolitan area. Only 63,614 shares were taken up on the strength of the prospectus and allotted. Certain cabs were placed on the streets, but no dividends had yet been paid by the company. Afterwards the public was invited, in another prospectus, to subscribe the balance of the £150,000, but only about £12,900 was applied for and allotted. The petitioners complained that the directors were not justified in going to allotment on the shares applied for, and that the allotment was not made properly and in the interests of the company, and did not leave sufficient money for working expenses. It was also alleged that by the payment of £21,000 to the vendors the directors had been guilty of misfeasance. Mr. Stewart Smith, for the company, said the only effect of the petition would be to put an end to all the assets which the company possessed. His Lordship said it was clear the company could not go on. Mr. Smith said it was not carrying on business. The undertaking had been sold in so far as it could be sold, and had realised £3,362 gross, which, of course, was divisible among the debenture-holders of over £15,000, amongst whom were his friend's clients. The company's assets were two licences from the British Motor-Car Company and the Electrical Power Syndicate. These were exclusive licences, and had a surrender value. Some of the petitioners were shareholders and debenture-holders as well. As to the alleged misfeasance, he argued that the onus was on his friend to show specific acts. The winding up of the company, he argued, would put an end to the licences, which were its only assets. His Lordship asked what evidence there was of any value in these assets. Mr. Smith said they were exclusive licences for the use of certain patents in the metropolitan area. Mr. Reed, Q.C., said he appeared, with Mr. Dunham, for two contributories whose conduct had been called in question, and they had filed affidavits dealing categorically with the charges made. He submitted that no useful purpose could be served by making an order to wind up, because there could be no assets available for distribution amongst the shareholders. He argued that it was for the petitioners to show that some benefit would accrue to the general body of creditors on a winding-up order, which had not been done.

Mr. Bramwell Davies, Q.C., appeared for Mr. Evelyn Ellis (a director of the company), who, he said, held debentures to the extent of £7,000 and shares for £4,000 odd. He had put into the company £11,000, as compared with about £1,200, which represented the petitioners' interest. He contended that no possible good could accrue to the creditors from winding up unless misfeasance proceedings against the directors were successful. He submitted that his lordship had no evidence of misfeasance before him, and that he should have something of a more tangible nature before him before he made an order. Mr. Ellis had filed an affidavit absolutely denying the statements made by the petitioners, and saying that he had acted bona fide throughout. The only thing was whether the directors were justified in paying over one-third of the amount subscribed to the vendors, who sold them the licences under which the cabs were made. In reply to his lordship, counsel said the company had paid royalties of about £4 per annum on the cabs whilst they were in use. The whole of the plant has now been sold. He did not think the petitioners had shown any real, substantial prospect of getting any assets by using the machinery of the court and winding up

the company, and urged that the allegations made against the director were too vague for the court to go upon. Mr. Counsel, in replying, said there were many matters which required investigation, and there had been irregularities and concealments from the shareholders on the part of the directors which amounted to misfeasance. The whole of the cabs, for which the company paid some £60,000, had been broken up and sold for some £3,000, on the ground that the licences could not be used. The licences were therefore valueless. His Lordship said he would read the affidavits, and give his decision later.

Mr. Justice Wright delivered judgment on Wednesday last. His Lordship said the petitioners were secured shareholders and debenture-holders, and they were entitled to an order if an order would do them any good. The only possible benefit he could suggest was that there might be results arising from certain proceedings. If there were any such results, they would to the extent of £15,000 go to the debenture-holders and not to the shareholders. If more than that were recovered it would go to the benefit of the shareholders. The petition was opposed by some large shareholders, some of whom were threatened with misfeasance proceedings, on several grounds; but he did not think the objections were substantial enough to prevent his making an order. The petition, however, made a number of serious allegations; but it was supported by nothing in the way of evidence, other than the statutory affidavit. He was clearly satisfied, on the evidence before him, that the main ground on which the petition rested was a misconception founded on no basis of fact. In short, he did not think that the suggested misfeasance proceedings would produce any result whatever. The petitioners might be quite right in saying that the company was crippled from the first by having to pay two-thirds in cash for the licences to the vendors; but there were not sufficient grounds for making the order asked for. In the meantime nothing could be done for the benefit of the shareholders or debenture-holders, and it would be wrong to terminate the existence of the company on the ground that it had ceased to carry on business. Making an order, too, would destroy the value of one, at least, of the licences. The best course he thought, therefore, would be to let the petition stand over generally, and, if the parties desired it, he might appoint an official independent liquidator to act in conjunction with the receiver in relation to the licences and other matters, and whose sole function would be to protect the interests of the licensees and shareholders. The receiver for the debenture-holders was only concerned to get the debenture-holders satisfied, and he would accept any sum that would satisfy them, and it might be that the real value of the licences would be sufficiently large to leave a considerable sum over for the shareholders. As to the order made by Mr. Justice Byrne, that might probably be rescinded. The matter of costs could be mentioned again on Wednesday next.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editor's hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

Vol. II.]

LONDON, SATURDAY, NOVEMBER 10, 1900.

[No. 88.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

AUTOMOBILISTS have a busy time before them, and as the wet days of the early part of the week gave way to brighter conditions on Thursday, the Southsea run should be a great success. Elsewhere we give a complete list of entries, including many which did not appear in last week's issue, and we are also publishing some useful information with regard to the condition of the roads *en route*. At Portsmouth, the Mayor (Alderman A. L. Emanuel, J.P.), will receive the automobilists at the steps of the Town Hall, past which the vehicles will defile in single file procession at slow speed. We are glad to hear that the roads in the naval town are being put into proper condition, so that there should be no danger to pneumatic tires. The Borough Engineer will also endeavour to see that no glass or other matter likely to injure tires is on the roads in Portsmouth. It is to be hoped that all drivers will obey the club injunction to moderate speed to eight miles per hour in passing through towns and villages, and that all caution will be exercised in turning corners, etc. As already announced, non-stop diplomas will be given by the Automobile Club in respect of vehicles completing the journey from London to Godalming and from Godalming to Portsmouth without a stop, and at a speed not greater than twelve miles an hour.

Annual Dinner.

become automobilists.

The Duchess of York on a Motor-Car.

LAST week we chronicled the Duke of York's motor-car rides round Monmouth. While staying with Lord and Lady Llangattock the Duchess of York also went for drives on the Hon. C. S. Rolls's motor-car. On Thursday she renewed an old acquaintance with the venerable pile of Raglan, and again on Friday took a trip by motor-car, going to Tintern Abbey. She was accompanied by Lady Llangattock and Lady Eva Dugdale. The Hon. C. S. Rolls drove his party from Tintern to Chepstow, and returned to The Hendre by Wyndcliffe, the Moss Cottage, and Monmouth. More than seventy miles were covered by the motor-car on that day, thus giving Her Royal Highness a very fair idea of its powers.

Motor-Cars for Fire Brigades.

This has already been done in many Continental cities, and in

New York the automobile is employed by the chief of the Fire Brigade with every success. This week among our visitors has been Mr. J. Havemeyer, who is starting for Paris, from whence he will go to all the principal European towns in the interest of the Locomobile Company whose car is favoured by the fire authorities of New York, as well as by many police authorities and postal services in the United States. He cannot understand the backwardness of officials in this country so far as the automobile is concerned. We are glad that there is a prospect of the London Fire Brigade considering the subject, and also to hear that the Corporation of the Lancashire borough of Eccles has decided to invest in a motor-vehicle. Manufacturers should keep their eye on both London and Eccles.

An American Visitor.

CHATTING with Mr. Havemeyer, it was satisfactory to learn that many of the company concerns that have been interested in the financial rather than the manufacturing aspect of automobiles in the United States are going under. In fact, some have, in their extremity, suggested the formation of a trust in which they should combine to bolster up each other. But the American public are beginning to realise that, while a score of such companies have endeavoured to make a vehicle, three or four other organisations have succeeded in getting their cars on the streets. The Locomobile Company, for instance, have sold 2,500 cars, most of which are now in use in the United States. Their works have a capacity of 125 vehicles per week, and they are now turning out seventy-five per week. At their London depôt it is proposed to store 200 cars, and a shipment of sixty is now on its way, including four-seated cars as well as two-seated vehicles and a racing car similar to that on which Mr. Griffin recently made a pace of a mile in 1'6 minute. Mr. Havemeyer showed us a copy of a splendid catalogue shortly to be issued, in which we noticed the Locomobile in several situations, including a view in the Yosemite Valley, California. Overhanging a precipice 3,200 ft. deep was one of the cars—a risky location, indeed. Curiously enough, the next day we noticed in the *Traveller* for this week an enlarged view of the same scene, supplied by Mr. Arthur Inkersley, of San Francisco.

A Clubhouse for Automobilists.

THE committee of the Automobile Club is now considering the question of the provision of a suitable clubhouse in which the usual club accommodation should be supplemented by a *garage* in which members' motor-vehicles could be stored. There they would be repaired if necessary, cleaned, and prepared for running by trained mechanics employed by the club. Of the advantages of such provision there is no need to dwell at length. At the present time an opportunity is offered of securing a central site of 3,400 square feet area, with a frontage of 44 feet and a back entrance 19 feet wide. Upon this a handsome building of six floors could be erected for about £12,000. To enable the committee to undertake such a work £15,000 will have to be raised, and an annual sum of nearly £6,000 will have to be assured to meet the ordinary expenses and interest.

The 1901 Gordon-Bennett Cup Race.

As entries of vehicles to represent the United Kingdom must be made by the Automobile Club before the end of this year, those motorist gentlemen who desire to compete on behalf of Great Britain are requested to communicate without delay to the secretary of the Club. At a recent meeting of the Club committee, letters were submitted from Count Zborowski, the Hon. C. R. Rolls, and Mr. Mark Mayhew, in connection with the cup race of 1901. It was decided that in the event of there being more than three entries, there should be an eliminating race, at the conclusion of which the delegates of the Club committee will select the three vehicles which in their opinion are most likely to win the cup. The competing members will be called upon to pay their proportions of the entrance fee, *i.e.*, £120 in all, which has to be transmitted by the club to France.

The Accident to Mr. Sturmev.

MR. HENRY STURMEY is still in hospital at Canterbury, but the latest reports bring cheerful news, and he will probably be returning to Coventry towards the end of next week. The unfortunate accident occurred owing to the tire of one of the steering wheels coming off. The flanged edge of the steel wheel struck out a radius of motion for itself, and the steering gear was not able to counteract it before the car was up a raised footpath on the other side of the road. The tired wheel surmounted this, but that which had shed its tire did not. So the car got up behind and swivelled round on the stationary wheel parallel with the road. The 4-in. ash beam forming the front axle gave way with the strain, and the car stopped suddenly and went completely over. She landed on her back on the path with the engines going about 2,000 revolutions to the minute. Mr. Sturmev and Mr. Dawson were on the front seat, and they were sent forward, happily a good distance from the car. The steering post was carried away, the springs were bent or broken, and the steering connections bent. Regrettable were the damages sustained by the passengers, and all automobilists will be glad to welcome both gentlemen back again to the motor-car.

In Defence of Motorists.

A MEETING of the Committee of the Motor Vehicle Users' Defence Association was held on the 1st inst., at the Automobile Club. Amongst those present were:—Mr. Roger Wallace, Q.C. (in the chair), Major Holden, R.A., and Messrs. C. Cordingley, F. F. Wellington, and J. J. Mann. A variety of claims were considered, and in several of those cases which involved a question of principle affecting the interests of automobilists generally, substantial sums aggregating over £100 (including twenty guineas to the defence of Mr. C. A. Smith, of Cobham), were contributed by the Committee towards the expenses incurred or to be incurred by members in resisting claims and unjust demands, and in several other cases smaller sums were contributed by the Committee towards the expenses arising out of police and county court proceedings. Mr. G. R. Helmore, the treasurer and secretary, mentioned several cases that he had satisfactorily dealt with since the previous meeting, and reported that many new members had recently joined the Association, including Earl Russell, Baron Barreto and Mr. R. J. Mecredy. A vote of thanks to the chairman concluded the meeting.

Necessity of Unity.

WHILE recording the foregoing meeting, we would urge the claims of the Association to the support of motorists, for it is becoming possessed of much information which must be extremely helpful to owners. Nowadays none are secure against the attention of the police and the difficulty of successfully defending cases has been considerably minimised on several occasions by the efforts of this Association.

The Tare Limit.

THE draft report of the Liverpool Self-Propelled Traffic Association on Tare Limit has been considered by most of the makers of heavy vehicles, and they are in favour of raising the limit. The Thornycroft Steam Wagon Company, Ltd., say they are building vehicles in the United States carrying seven tons of load, designed to meet an acknowledged want. The vehicles have a tare of about five tons and a gross of 13½ tons. The Lancashire Steam Motor Company are sure the tare limit must be raised to four tons before a satisfactory vehicle can be made to carry loads over four tons, and Messrs. Coulthard and Company, Ltd., think that the matter would be met by an increase of 5 or 10 cwt. upon the present allowance. The only disapproving voice is that of Mann's Patent Steam Cart and Wagon Company, Ltd., who remark that for every customer wanting a heavier vehicle they have half-a-dozen asking for lighter ones to carry two tons. Speaking generally, there is a notable indication of what English builders of motor-wagons for heavy traffic will ultimately be able to do, in the fact that the tare weight of a vehicle to carry less than three tons, by the most eminent French builder, is five tons.

Berkshire Becomes Antagonistic.

SIR WARWICK MORSHEAD is a member of the Berkshire County Council, and regards motor-cars as dangerous things. Convinced of the folly of dealing with such rapid vehicles in small areas he wants national regulations, and at the last meeting of the body of which he is a member he proposed: "That the Clerk to the Council be requested to communicate with the Clerks of the different County Councils in England to co-operate with this Council in drawing the attention of the Home Secretary to the way in which motor-cars now traverse the roads, and to suggest that every car should carry a number in a conspicuous place, to be registered, and to be obliged to stop if signalled to do so." This motion was seconded by Major Thoyts, who naively remarked that "it was useless to turn and gallop after them (the motor-cars) because they vanished out of sight." After a long discussion the resolution was adopted.

Wisdom in Warwick.

THE Roads and Bridges Committee of the Warwickshire County Council has reported against reducing the speed of motor-cars from twelve to ten miles per hour, also against reducing the speed in turning corners to six miles an hour, but has recommended that Bye-law No. IV. (2) should be rescinded, and that a bye-law should be made requiring a registered number to be so placed on the light locomotives, and kept exposed as at all times to be easily legible. During the discussion at the Council meeting the Rev. C. Elsee asked for some justification of the action of the committee in the face of the recommendations of the County Councils Association. Lord Hertford said that they did not think that twelve miles an hour was an unreasonable speed, and they did not wish to hamper a new industry. The numbering of motor-cars would act as a check on dangerous driving. The Chairman remarked that, although the maximum speed was fixed at twelve miles an hour, the drivers were obliged to take all reasonable care, like the owners of ordinary carriages, or take the consequences. It did not mean that they could always drive at this rate. Lord Norton thought the regulations were now based on common sense, but a good deal of further caution was needed in driving through towns. Alderman W. Evans said there was no limit of speed mentioned in regard to other vehicles, but there must be no furious driving, and they ought to be content with this condition in the case of motor-cars. The public safety would be better safeguarded with this general condition than by any special regulation as to speed. The recommendation of the committee was adopted, and the credit of the Warwickshire Council for common sense maintained.

The Education of Councillors.

A SUGGESTION has been made that the Automobile Club should invite deputations from the county councils to attend a conference to be held near London in May next, when they would have an opportunity of thoroughly examining various kinds of motor-vehicles and also of riding thereon. In view of this the action which many county councils have proposed to take with regard to the restriction of the speed of motor-cars might well be postponed, so that there should be ample information obtained before legislation is proposed. County councillors throughout the country will have a chance of realising the reliability of the automobile and also its speed—two circumstances which seem essential to any well-directed proposal to the Local Government Board. Automobilists are well aware of the serious loss which may accrue to the engineering industry should the suggested arbitrary action of many councils secure the ear of the Local Government Board, and they know, from unpleasant experience, that there is no difficulty in securing prosecutions under the existing bye-laws. Why then should undue haste be shown by the county councils in ignoring the means provided for their education, and in desiring restrictive regulations which can only retard an industry in which other countries have long been ahead of us.

The Prejudice Against Motor-Cars.

THIS opposition to motor-cars is simply following the line of resistance offered to the tram and the bicycle. People regard the horse as the natural means of locomotion and decline, at first, to accept any innovation. But we are now nearing the Twentieth Century, and old-time prejudices should surely soon die out. An automobile has brakes and can be stopped within its own length with ease; it is not subject to fright as horses are; nor does the appearance of an unusual object or the hearing of a novel noise alarm its nerves. The present limit of speed is less than that of the stage coaches as far back as 1830, and is considerably below the Canadian tram line contract requiring a speed of twenty miles an hour. All these things, and many more, should be urged on county and other councillors by automobilists throughout the country, and the Club will be glad to have suggestions and facts suitable for inclusion in a memorial on the subject which, it has been suggested, should be sent to county and local councils as well as to the Press.

At Kingston.

HIS solicitor made a very persistent defence of Mr. C. A. Smith, of Cobham, whose case is reported in another column. But it was apparently of no avail, for the chairman of the Kingston County Bench is no friend of motorists—as was clear from his attitude in the court. The offence was alleged to have been committed at noon, whereas defendant declared that he was in his hotel up to three o'clock in the afternoon of the day in question. Evidently there is need for further investigation in this particular case.

How to Irritate a Groom.

MR. STAPLEE FIRTH has been enjoying himself of late, and although his three tussles with the magisterial bench, reported in another column, have not left him the victor, they have enabled him to do some good educational work on behalf of automobilism. Previously we have pointed out the peculiar antipathy which Norfolk County Councillors have to motor-cars, and this found partial vent in the prosecution of Mr. J. R. Hargreaves, J.P. Two offences were alleged against him by the police at the instigation of the members of the County Council recently reported. Both suggested delinquencies occurred on the same day, but being in two different parishes the sapient police authorities thought that two summonses would, perhaps, give them a chance of at least one verdict. Shibley, the groom who gave evidence, is evidently an old-fashioned type of fellow who cannot stand the smiles of fair ladies. He confessed he should have taken little notice of the motor-car but for the fact that "the

ladies who were sitting at the back (of the car) laughed at him when his pony jumped about." With two or three other witnesses of similar calibre and a cottager who acknowledged she ran a hundred yards to fetch her children off the road, beating the motor-car in the attempt, Mr. Firth had a splendid defence.

Against Automobilists.

AT Swansea a motorist was recently fined without a chance of defending himself; in Norfolk they manage things on somewhat similar lines. Mr. J. R. Hargreaves, J.P., was ably defended by Mr. Staplee Firth, who was, however, refused information as to the exact time and exact place the alleged offence took place. If justice is to be respected it will be necessary that every detail of the offence shall be given to the solicitor for the defence; otherwise how can anything like proper replies to allegations be given? This is a point upon which Mr. Firth insists with characteristic tenacity, and, although he has failed in the Norfolk case, he is not likely to be discouraged in his laudable attempts to secure fair play for automobilists.

Councillors and Magistrates.

IN the second case against Mr. Hargreaves, Mr. Firth elicited that the County council and a so-called joint committee of Magistrates and County Councillors had decided to instigate prosecutions against the owners of motor-cars. He pointed out that the first witness in the case had stated that he should never have complained, but that his inspector told him to report all cases. The secret of the affair leaked out when the Chairman of the Bench admitted that the County Council were at the back of the prosecution, and the Chief Constable had apparently been anxious to carry out their wishes in the matter. We are glad to notice that Mr. Firth emphasised the position of the Chairman of the Bench, who, as a County Councillor, was a member of the body that had incited the prosecution. It certainly is not conducive to the dignity of the bench or the due administration of justice when the magistrates allow themselves to be the stalking horses for Councillors—whether county or rural. If they are to be the servants of the County Councils, to carry out their behests, the original idea of their appointment is being entirely ignored.

A J.P. "to the Rescue" of the Police.

SEVERAL incidents of the trial were very amusing, notably Mrs. Palmer's 100 yards' race against the motor-car, in which she won, and the groom's annoyance at the smiles of the ladies, who, according to another witness, "were hanging on the seat at the back of the car." But there was one little circumstance during the cross-examination of a policeman that should be more severely regarded. The constable said he had seen Mr. Hargreaves driving daily for some months past, but had never reported him until he had orders from his inspector to report all motor-cars. Mr. Firth commenced to write down the identical words used, and before he had time to resume the cross-examination Mr. Stracey (the chairman) asked the policeman if he did not mean to say all motor-cars driven furiously. The constable replied that that was what he meant to say, whereupon Mr. Firth protested that the magistrate should not put words into the mouth of a witness. He again asked the constable as to the exact order, eliciting the reply that he had to stop all cars going between twelve and fourteen miles an hour. Then the chairman said he would come "to the rescue of the witness," and stated that the County Council, etc., etc. But surely the County Council that was really instigating the prosecution should not have a voice on the bench.

Another Fuel Competition in France.

THE technical committee of the Automobile Club of France is now organising a competition for the purpose of determining the best fuel, having alcohol as base, for explosion engines; and this contest should bring to light many interesting details in connection with this all-important subject. The recent competition for alcohol motors has drawn a great deal of attention to the possibilities of driving motors by a more efficient and economical agent than petrol, and the coming tests should stimulate the energies of students of the question. Evidently we cannot depend upon an unlimited supply of petrol, and with the increased demand prices will augment until automobilism, so far as petrol engines are concerned, will become the sport for the few, and will, from a purely industrial point of view, cease to exist. Something must be formed to supersede the light oil, and the sooner that the question is solved the better for the future of the industry. It is due to the initiative of the Count de Dion that this new competition is being organised. We shall give as early an indication as possible of the lines upon which it will be held.

The Automobile Club of America.

It was a case of new blood to the fore in the annual election of officers of the Automobile Club of America, at the annual meeting of the club, held a few days ago in New York. The officers chosen were:—President, Mr. Albert R. Shattuck; first vice-president, Mr. Albert C. Bostwick; second vice-president, Mr. J. Dunbar Wright; third vice-president, Mr. David Wolfe Bishop; treasurer, Jefferson Seligman; secretary, Mr. Malcolm W. Ford; governors (class of 1903), Messrs. Sydney Dillon Ripley, J. M. Ceballos, and Dave H. Morris. Mr. George F. Chamberlain, who has been acting-president of the club for nearly a year, presided, and over one hundred of the 262 members were present. The election's result showed the sentiment of the club toward racing and automobile competitions, as Mr. Bostwick has been a pronounced supporter of these tests since the organisation of the club. That sentiment received further recognition in the new president's speech of acceptance, for he strongly advocated more competitions, more tests, and more activity all along the contest line. The question of a new clubhouse was left for consideration to the new Board of Governors. Mr. Shattuck, the new president, after his election said that in all probability a petition would be laid before the next Congress asking for a modification of the present rule in the United States Revised Statutes, which prohibits the carrying of gasoline or any volatile oil on passenger boats, the Automobile Club particularly seeking a modification of this prohibitive clause in regard to ferry boats.

THE BIG EVENT OF 1901.

MEETING OF MANUFACTURERS AND AGENTS.

A MEETING of manufacturers and agents was held at the Automobile Club on Friday, November 2nd, at 5 p.m., to consider what, if any, should be the big event of 1901, corresponding with the 1,000-Miles Trial of 1900.

Mr. Roger W. Wallace, Q.C., the chairman of the club, was in the chair, and among members of the Club Committee present were Mr. Richard Muirhead, Mr. Hancock, Mr. Spooner, Mr. Cordingley, Mr. Shrapnell Smith, Mr. Butler, etc. The representatives of manufacturers and agents included Mr. Thomas Clarkson, Mr. Siddeley, Mr. Edge, Mr. Jarrott, Mr. Wellington, Mr. Ritchie, Mr. Buckea, Mr. Gretton, Mr. Critchley, Mr. Hewetson, Mr. Astell, Mr. Cappellen, Mr. Chambers, Mr. Hart, Mr. H. Mulliner, Mr. Foster Pedley, Mr. Beasley, etc.

The chairman explained the purpose of the meeting and asked for the opinions of manufacturers and agents.

Mr. Edge said that he thought a trial of some sort in 1901 was very desirable, in order to demonstrate new vehicles.

Mr. Gretton thought that a trial was desirable, but that it should not be so long or so intricate as that of 1900. He thought there should be some scheme to keep the capabilities of motor-vehicles before the public. He thought there might be periodical runs to big centres where vehicles might be exhibited in suitable buildings. He hoped the fastest car would not obtain most kudos.

Mr. Critchley said he thought manufacturers would support a 1,000-miles Trial, but that the Trial should consist of ten days of 100 miles a day and returning to the same place every night, with a non-stop run for the eleventh day and speed contest for the twelfth day. He also suggested that two hours or two and a-half hours a day should be the most for cleaning and repairs, and that on one day there should be a test of consumption. The cars should then be exhibited at the Club Exhibition.

Mr. Shrapnell Smith suggested that the Glasgow Exhibition might be visited.

Mr. Buckea suggested a series of runs under observation ending with an exhibition in London.

Mr. Cordingley said if Trials were held in connection with the Exhibition, they would help the Exhibition, but the display of trial cars would probably be confined to manufacturers' cars.

Mr. Mann pointed out that the consumption of vehicles was tested at periodical 100-mile Trials. He suggested a run to the Glasgow Exhibition.

Mr. Moffat Ford suggested "non-stop absolute" runs should form a strong feature in a Trial.

Mr. Butler suggested a run from London to Paris.

Mr. Clarkson agreed with the Glasgow Exhibition proposal.

Mr. Siddeley suggested that the Trial should take place in August, and that it should be a tour through the country in preference to tours round London.

Mr. Pedley said he thought the 1,000-miles Trial failed in that the public saw the cars and owners at a disadvantage, and suggested that, instead of exhibitions, owners should give rides to the public in the various districts.

The Secretary spoke on the points which had to be considered—as to the time of year. He suggested August or September, as it would then be easier to procure observers.

The duration must depend on the time of year and the convenience of manufacturers, and the duration would to some extent decide the total distance to be covered. He hoped that the total would not be less than that covered in 1900, as the inclination in France was to increase the distances from year to year, and he would be sorry to see this country going backwards.

He submitted that observers should be placed on every car, and should be on a different car every day in rotation. The reports by observers as to exactly what happened to each car would enable the judges to form a more accurate judgment of the excellence respectively of the various cars than was possible under the 1900 system. He believed that there were many

independent gentlemen in the club who would be willing to act as observers if the Trial were held in August or September.

The Glasgow Exhibition of 1901 promised to be the biggest exhibition which has taken place in the United Kingdom since the Colonial and Indian Exhibition of 1886, and if manufacturers thought that the display of their cars before thousands of spectators was of value to their businesses they could be certain of obtaining this end by visiting the Glasgow Exhibition during the Trial.

The daily time of starting had been discussed at the club. The difficulty was that if there were not to be daily exhibitions, but only evening exhibitions of the vehicles, it was important that vehicles should arrive at their destination early in the evening. If the starting time were made 9.30, and there were compulsory stops for meals of a total duration of an hour, then a journey of 100 miles would not terminate until 6.50 p.m., or 120 miles until 8.30 p.m. at a twelve miles per hour average.

The Chairman upheld the suggestion of a visit to the Glasgow Exhibition.

Mr. Edge proposed that the Trial should be not less than 1,000 miles; not longer than two weeks; that there should be observers; that large cars should travel not less than 150 miles per day, and smaller cars not less than 100 miles per day, and that a Committee be formed to go into details, and report to another meeting. Further that the Trial should take place during the last two weeks in August.

Mr. Mann proposed a week's automobile exhibition at Glasgow.

Mr. Shrapnell Smith suggested that no car should be allowed into the Glasgow Exhibition which had not covered a certain distance.

After discussion the following resolutions were passed:—

- (a) That there shall be a Trial in 1901 having a total mileage of not less than 1,000 miles. Carried unanimously.
- (b) That Glasgow shall be the principal destination of the tour. Carried unanimously.
- (c) That the Trial vehicles shall start from one locality, and follow one route. Carried unanimously.
- (d) That a Committee be appointed to consider details, and report to a further meeting. Carried unanimously.
- (e) That the Trial take place in August or September, 1901.

Mr. Moffat Ford did not agree to August.

Mr. Cappellen suggested early in the year, March or April.

Mr. Edge suggested second week in August, because he felt that by next spring the benefits of the last Trial would not be worn off, and because observers could be better obtained in the holiday season.

The proposal for August or September was carried by fourteen votes to five votes.

(f) That there shall be a week's motor exhibition in Glasgow. Carried by fifteen votes to two votes.

(g) That the following shall compose the committee to consider details and report to a further meeting:—Messrs. Wallace, Gretton, Edge, Critchley, Pedley, Jarrott, E. W. Hart, Moffat Ford, Siddeley, Beasley, Cordingley, Clarkson, Mann, Butler, Shrapnell Smith, Astell, Scott Montagu, M.P., Rolls, Phillips, Sturme, Hewetson, and the Secretary (*ex officio*). Carried unanimously.

The committee then appointed the following sub-committee to prepare a preliminary scheme for consideration by the committee above referred to:—Messrs. Edge, Pedley, Siddeley, Cordingley, Gretton, and the Secretary.

The meeting then concluded.

MR. H. M. FLETCHER, of Oxford, has made a suggestion that public motor-cars should be run in the streets of the University city.

MR. ERNEST HUTTON, J.P., has been elected to the committee of the Automobile Club, in the place of Mr. Hugh Campbell, who has resigned owing to pressure of engagements.

THE FINAL AUTOMOBILE FETE AT VINCENNES.

(From Our Own Correspondent.)

TO mark the closing days of the Exhibition, an automobile fête took place at Vincennes on Saturday last, and, in spite of adverse circumstances, scored a fair success. Poor annex, how unfortunate have you been in your efforts to attract the public within your gates, and secure a share of the wealth this year brought to Paris. Fêtes galore have you organised, but fruitlessly so far as securing the presence of the moneyed class. Parisians residing in the West End have, equally with the great majority of visitors to the gay city, abstained from "doing" the annex, because the journey is long and the means of communication inconvenient. On the other hand, Parisians living in the eastern quarters are not of the leisurely class who can patronise exhibitions and fêtes during the week, so the Thursday festivities received no support from them. No, the efforts of the organisers of the Vincennes fêtes have not reaped the reward so justly due, and one can heartily sympathise with M. Jeantaud and others who have done so much for the Exhibition and with

MESSRS. DE DION, BOUTON AND CO.'S EXHIBIT AT THE VINCENNES ANNEX OF THE PARIS EXHIBITION.

such meagre results. Often, too, has the weather proved inclement, a veritable death-blow to the success of any open-air festivity. Saturday last was in this respect no exception to the rule, for, without actually raining, the weather was threatening, and a downpour was momentarily expected. Little wonder, then, that, in spite of the strenuous efforts made to secure a large attendance for this closing fête but comparatively few people put in an appearance, while competitors also were not strikingly numerous. Timed to commence at one o'clock, that hour found certain officials, competitors, and other interested persons still at lunch at the Restaurant de l'Automobile et des Sports, and it was not until two o'clock that a move was made for the scene of operations. The public, too, versed doubtless in the punctuality of automobile fêtes, had only just begun to assemble, while, as for the majority of the competitors, they were still conspicuous by their absence. But at last the jury succeeded in finding nine of those entered for the event known as the *Jeux pour Voiturette*, and after a somewhat lengthy preparation succeeded in despatching them on their journey. An out and home run of some four hundred yards, a cutting of suspended ribbons, a second clear run, and then a drive among obstacles, was the task set the conductors of the miniature cars, and out of the ordeal Mercier, Ygrec, and Ricard emerged successful, in the order named. Then came a race of 7,200 mètres for the same class of vehicle, an event rendered noteworthy by the wonderful performance furnished by George Prades, mounted on a car the construction of which was as strange to him as was its management. Small wonder, then, that at the precise moment when Mercier was finishing Prades was but about to battle with the trials and tribulations of the third lap, that his place upon the official return qualified him for the historic wooden spoon. And then came the motor-cyclists, only, to the universal regret, Béconnais was not

among them, and many were the conjectures as to the why and wherefore of his absence. Is he waiting for something with which to wipe out Demester and Rigal? More than probable, I think, for he is not a man to lose his records without a struggle, and I fancy that ere long we shall see him regaining his own. The absence of Béconnais naturally robbed the event of some of its interest, but with Demester, Rigal, and Fossier competing, excellent sport was assured. The first-named rode his Gladiator tricycle, carrying a couple of Aster motors, while both Rigal and Fossier mounted machines fitted with two-cylinder engines. The other riders were Denesle, Ricard, Reculez, and Vasseur, the latter competing on a forty-four-pound motor-bicycle. Upon the signal to start being given Demester got quickest away, and speedily secured a fifty-yard lead. At eighty kilometres an hour did he and Rigal pass the grand stands upon completion of the first lap, and this pace they maintained to the finish. The official return was:—1, Demester, 6min. 8sec.; 2, Rigal, 6min. 31½sec.; 3, Fossier, 6min. 39½sec.; and the fastest lap was made by the winner, his time for the 2,400 yards being 1min. 59sec., or 15sec. slower than Béconnais' record. The road, however, was on Saturday dangerously wet and slippery in places, so the two performances can hardly be compared. Finished with their *course*, the cracks proceeded to furnish sport in a gymkhana event in which each competitor had to secure a ring by means of the wooden sword with which he was provided. Rigal's attempt to do so while travelling at forty miles an hour was not happy, and Denesle's method of stopping, securing the ring and restarting, although less sensational, was more practical and gave him the prize. Then out came the cars, and the mount of Caillois and Renault immediately attracted attention. Low and very light, this little car is torpedo-like in appearance and carries a four cylinder air-cooled motor developing some 24 h.p. Degrais was there on his 12 h.p., and Schneider and Prades completed the list, both driving 8 h.p. vehicles. The *Auto Vélo's* representative had no better luck than in the voiturette event, for after struggling in the rear for a lap his carburettor float began to leak and brought "G. P." up, helplessly *en panne*. Caillois, on the contrary, travelled superbly, and had he dared let the car go, a very fast performance would have been made. But the muddy state of the road forbade it, and 8min. 43½sec. was his time for the three laps (7,200 mètres) round the lake. Degrais finished second some four hundred yards behind the winner. A *défilé* then gave us an opportunity of seeing the easy manipulation of a variety of automobile vehicles, and after the commemorative banners, etc., had been presented to the drivers of the various cars, a general move was made to the borders of the lake, upon whose dead-leaf covered bosom the motor-boats were to contest a race of 1,650 mètres. Honestly, this event was not wildly exciting, for so hampered was the progress of the competitors by reason of the fallen leaves that we really began to wonder whether they would ever finish, and, when at last the struggling boats came wearily round the corner of the island, a sigh of relief went up from the impatient officials, who had begun to fear a forced attendance until a late hour. M. Pérignon's boat "Cosaque" won, followed home by "Joujou," "Nautilus," and "Loufoe" in the order named. And then we paid our adieus to the lake, the track, the Exhibition, and Vincennes, and set out upon the long journey to Paris content to think that for this year, at any rate, all automobile fêtes in that part of the capital are finished.

LOOSE stones are reported to be plentiful on the Portsmouth road between Milford and Thursley.

A SALE by auction of the stock and plant of the Automatic Conveyance Co., Limited, Torquay, is to be held on the 14th inst. Included in the sale are three or four light cars.

ABOUT eighteen motor-cars are at present in use in Stuttgart for street passenger traffic, competing with the electric trams. The hilly configuration of the ground is, however, rather against them. A few are also used for the conveyance of goods.

MR. ROWLAND HILL, of the Albion Foundry, Coventry, is making a speciality of high class motor castings, in both cast iron and gunmetal. He is prepared to supply all kinds of castings, such as cylinders, cylinder tops, combustion and crank chambers, etc., etc.; also valves of all kinds.

CORRESPONDENCE.

AN UNATTENDED HORSE AND ITS RESULTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A rather severe injury to my right arm has prevented my sending you an account of my recent accident. You have, no doubt, gleaned the particulars you publish from the local papers, but it is somewhat singular that these make no mention of the real cause of my trouble. This was a baker's horse and cart, left unattended outside a public-house. I sounded my horn repeatedly, and nearly pulled up, but no driver appearing, I ran slowly by, when the horse bolted in my direction. In front of me was a sharp turning forming a complete semicircle, the view in this direction being completely obstructed by a hill and builders' sheds. Here I found myself confronted by two heavy wagons abreast, both advancing towards me at a good speed down the incline. There was no escape but by turning sharply round, and the car was in contact with the nose of one of the horses in doing so; but the sharpness of the curve described and the slope of the road caused the car to turn completely over. I was firmly fixed beneath it, whilst my wife was thrown almost under the feet of one of the horses and severely bruised and shaken. With the runaway horse on one side and two wagons on the other, I was caught in a complete trap.

Yours truly,

G. W. GRABHAM, M.D.

Mathyus, Witham, Essex, November 3rd, 1900.

THE SPEED OF MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In view of the excessive speed of motor-cars, and the heavy fines which have recently been imposed in consequence, would it not be well if all motorists would keep to the regulation speed? For most persons and for most purposes (except in the case of a motor fire-engine) twelve miles an hour should be sufficient. For those persons who may wish to travel at the rate of twenty to thirty miles an hour, a properly prepared racing track would be the best place for their purpose. If motor pacing upon the highways is not restrained, I feel certain it will lead to further restrictions being placed upon light locomotives. Let those motorists who value their present freedom keep their motors within bounds.

Yours truly,

G. D. J.

London, November 3rd, 1900.

A WARNING FROM LINCOLN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your contributor "Lollius" was good enough to mention certain counties in which motorists must be particularly careful, in last week's issue of the *Motor-Car Journal*. Lincolnshire being so painfully and purely agricultural no doubt is the cause of the present unreasonable prejudice to the automobile. I was last Thursday fined the exorbitant sum of twenty-six shillings for riding my motor-tricycle through the streets of Louth, Lincs., the policeman telling me that my pace was "a deal over fast." The constable informed the magistrates I was travelling from sixteen to seventeen miles an hour. How I got round a somewhat sharp curve on the greasy road simply must have been a marvel, had his remark been near the truth! On my questioning him in court as to what pace motor-vehicles were allowed to proceed in a town he confessed he did not know. When asked if he used a stop watch, his reply was again "no." My advance ignition was right back, and my impetus kept up by momentarily switching on my current about every ten yards. If that is furious driving, I am very sorry for the police of that sleepy and out-of-date town, as it is evident they have never seen a motor-vehicle before, and I also feel sure there is a little for some of these small borough magistrates yet to learn as regards automobilism.

Yours truly,

PARSONS WRIGHT.

Wold Newton Manor, North Lincs., November 5th, 1900.

THE WERNER MOTOR-BICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read your correspondent's letter of the troubles with his Werner bicycle, and happen to know this particular machine, having seen it running about in my district. His real trouble lies in the timing gear, which has probably been taken to pieces by novices to see why it won't go. Many similar troubles would be avoided if such vital parts were left alone.

Yours truly,

Altrincham, Nov. 6th, 1900.

PEEL CAUSEWAY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to "J. A.'s" letter in your last issue complaining of his difficulties in getting his Werner motor to work, might I venture to point out to him that it is neither more nor less difficult to drive than the ordinary motor of De Dion and Bouton, which is at work in thousands, probably, all over the world. In fact, in the '99 model of the Werner machine there is one distinct gain, for the inlet valve is visible, which is not true of De Dion's engine, and any stoppage of its action through gumming of oil is at once seen. "J. A." may rest assured that there is no mystery whatever about the motor, which is really remarkably simple in its action. There is but a constant result to be had from constant conditions, and he has but to ensure these conditions of working and his motor will continue to give him a constant result. If it has carried him two miles it can carry him two thousand, for over heating is quite out of the question if he uses the proper lubricant, "D" oil for instance. It is impossible to detail here all the little points to which attention has to be paid, but Messrs. Werner give a very comprehensive little guide with each machine. If really "J. A." can only get his explosions with the compression tap open, it points to two defects. Either his carburettor is giving too much gas, and he must decrease it, or give more air, which comes to the same thing, or, which is probably the case, the sparking gap of his plug is too great, for the spark will pass at the ordinary pressure when it will quite fail to do so at the increased pressure due to the compression. So he must either decrease the space between the sparking points or increase his battery power. Perhaps his accumulator is exhausted. I would like to say here that I have found no plug, not even De Dion's, equal to that of Messrs. Bassé and Michel's. Its insulation resistance is so much greater that one can use it in heavy rain, which is not the case with several plugs I know of, where the spark leaps the wet porcelain. Its one fault is fragility, for it cannot stand a blow so well as others, but one can easily insert a new porcelain. I don't know anything of the makers, and I merely give the results of my personal experience. I believe it is quite an old-fashioned plug, but that doesn't matter. "J. A." should take courage from my own experience, for my Werner has carried me 2,000 miles without a single breakdown, and the accumulator was not charged once during that period.

Yours truly,

London, W., Nov. 6th, 1900.

A. L. B.

THE TAXATION OF MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Regarding your note re Mr. Spear, M.P., and his declaring in favour of taxation of motor-cars, what is meant by this? I have seen several times comments on the same subject, but as far as I can make out cars are taxed, and doubly so. A motor-trike has to pay 15s. as an ordinary carriage tax, but a car, I take it, has to pay the ordinary carriage tax, £1, and also the further tax same as for a traction engine, and according to its weight, which I think is most unfair. Surely one tax should be sufficient.

I suppose I am right in what I say; if not, will you please explain? For myself, I don't see why cycles should not be taxed as much as a motor or carriage, for hundreds of them cost quite as much as a small pony and trap turn-out, and the latter circulates far more money in up-keep, and therefore must do far more good to the public at large.

Yours truly,

Scarborough, Nov. 5th, 1900.

AMATEUR MOTORIST.

THE AUTOMOBILE CLUB'S QUARTERLY 100-MILE TRIAL.

THE quarterly 100-miles trial of the Automobile Club was held on Thursday, the 1st inst. The usual route was followed, viz., from the second milestone from the Marble Arch, via Ealing, Uxbridge, Beaconsfield, High Wycombe, and Stokenchurch to the fifty-second milestone (outskirts of Oxford) and back. Total: 100 miles. The road was very heavy throughout, the greater portion being thick in mud. In fact, the conditions generally were very bad indeed. Heavy showers and fresh wind, slightly ahead on the outward journey, were encountered. The hills on which hill-climbing trials took place were:—

(a) Dashwood Hill, commencing at the thirty-third milestone, and terminating at the thirty-fourth milestone, having a total rise of 241 feet in one mile, including 275 yards of a gradient of 1 in 21.7, and 600 yards of a gradient of 1 in 11.

(b) Aston Hill on the return journey. Distance 1 mile 1,100 yards, having a total rise of 316 feet, and including 1,910 yards of a gradient of 1 in 21.

Six vehicles altogether took part in the trial as follows:—

A Darracq car entered by the Automobile Manufacturing Company. The new vehicle which, with its attractive *tourneau*

THE SIRENE VOITURETTE.

Photo by]

[Curzon, Robey & Co.

body, is fitted with a vertical water-cooled engine having cylinder 100 mm. diameter by 102 mm. stroke. It is water-cooled and provided with electrical ignition. The carburettor is of the Phénix type, with automatic admission. The transmission gear, which is on the lines of the Panhard, except that the power is transmitted direct to the rear axle by bevel gear in place of sprocket wheels and chains, is adapted to give three speeds forward and a reverse motion. The car, which is fitted with wheel-steering and pneumatic-tyred wheels, weighs 9cwt. The following are the tabulated results as given by the observers:—

Quantity of petroleum spirit used on the journey.—3½ gallons.

Quantity of water used on journey.—3½ gallons (pump leaking).

Average cost of fuel, at 1s. 3d. per gallon.—562d. per mile.

Speed, including time occupied by all stoppages.—Up to the legal limit of 12 miles per hour.

Number and cause of stoppages.—(1) 5mins. to fill water tank owing to leak in pump. (2) 30 sec. to light carriage lamps.

Hill-climbing speeds.—(a) Dashwood Hill: Took four passengers all the way up, except for 40 yards, when only two were in the car. To danger board 5mins. 8sec. For the mile

6min. 30sec. = 9.2 miles per hour. (b) Aston Hill: Took four passengers up. Time 10min. 15sec. = 9.5 miles per hour.

General remarks.—Water leaked from the pump on to the commutator of electric ignition, and this, probably, caused misfiring, which was frequent throughout journey. Otherwise the alighting of two passengers, even for a short distance on Dashwood Hill, would have been unnecessary. In other respects, the carriage ran steadily throughout.

A Daimler light car by the Daimler Motor Company, Limited. This is an example of the latest production of the Daimler works—a two-seated car fitted with a two-cylinder motor, having cylinders $2\frac{1}{8}$ in. diameter by $4\frac{1}{2}$ in. stroke. Belt and gear transmission is adopted, the weight of the car being 12cwt. The results obtained with the car in the trial were:—

Quantity of petroleum spirit used on the journey.—4 gallons.

Average cost of fuel per mile, at 1s. 3d. per gallon.—6 of a penny per mile.

Quantity of water used on the journey.—1 gallon three quarts 1 pint.

Speed on outward journey.—Up to the legal limit of 12 miles per hour.

Speed on return journey including stops.—9.6 miles per hour.

Number and cause of stoppages.—Outward journey: None. Homeward journey: (1) After 3 miles, driver missed in changing gears. Carriage stationary 30sec. Engine did not stop. (2) After 13 miles, 10min. stop for lubrication and put preparation on belt. (3) Later, a further stop for belts. (4) After 33 miles engine was not running well and car was stopped for examination. Eventually found induction valves stuck and changed them. This stop was of 55min. duration. (5) Later, driver missed gears in changing and engine was stopped. Belt slipping, 8min. delay. (6) 6 miles from home, 3min. delay owing to slipping belt.

Hill-climbing speeds.—(a) Dashwood Hill: Both passengers alighted for 2min. during ascent. To danger board, 6min. 30sec. For the mile, 8min. 30sec. = 7.05 miles per hour. (b) Aston Hill: 15min. 27sec. = 6.3 miles per hour.

General remarks.—The principal cause of trouble was road-water on belts.

A Pieper voiturette entered by the British and Colonial Motor-Car Company, Limited.—Four miles after completion of first half of journey this vehicle was withdrawn owing to heating of engine.

A $3\frac{1}{2}$ h.p. De Dion-Cudell voiturette, by the British and Colonial Motor Company, Limited.

Speed on outward journey, including time occupied by all stoppages.—Up to the legal limit of 12 miles per hour.

Number and cause of stoppages on outward journey only.—(1) For 30sec. for lubrication. (2) At end of 50 miles owing to puncture when vehicle was withdrawn.

Hill-climbing speeds.—(a) Dashwood Hill: To danger board 6min. For the mile 7min. 35sec. = 7.9 miles per hour. One passenger alighted during ascent of steep portion of hill.

Two Sirene voiturettes, entered by Mr. E. W. Hart, of Luton.—This type of car was fully described in our issue of July 28 last. It is therefore only necessary to mention that it is fitted with an inclined two-cylinder motor; it is of the air-cooled type, of $3\frac{1}{2}$ h.p. Three speeds forward and a reverse motion are available, any intermediary speed being obtained by the variation of the electrical ignition. The motor is located in the fore part of the frame, where air has free access to the radial fins of the cylinders. The variable speed gear is very much on the lines of the Panhard, the box gear containing three pairs of spur wheels, any one pair of which can be brought into mesh at a time. The reverse motion is obtained by the interposition of a small pinion between the gear wheels giving the slow speed. From the gear box the power is transmitted direct to the rear axle through a universally-jointed transverse shaft and bevel gear. The car complete weighs 7cwt. 2qrs. The results are tabulated below:—

No. 1 car: Quantity of petroleum spirit used on the journey.— $2\frac{1}{2}$ gallons.

Average cost of fuel per mile, at 1s. 3d. per gallon.—35 of a penny per mile.

Speed, including time occupied by all stoppages.—Up to the legal limit of 12 miles per hour.

Number and cause of stoppages.—(1) At end of 50 miles, stopped $2\frac{1}{2}$ min. to fill lubricators and fasten mudguard.

Hill-climbing speeds.—(a) Dashwood Hill: To danger board, 4min. For the mile, 5min. 25sec. = 11.07 miles per hour. (b) Aston Hill: 10min. 8sec. = 9.6 miles per hour.

General remarks.—The car ran very consistently throughout. Gave no trouble. Motor cool at finish.

No. 2 car.—Quantity of petroleum-spirit used on the journey.—2.5 gallons.

Average cost of fuel per mile at 1s. 3d. per gallon.—37d. per mile.

Speed, including time occupied by all stoppages.—Up to the legal limit of twelve miles per hour.

Number and cause of stoppages. (i) Engine stopped in ascent of Dashwood Hill. This stop was of 5min. duration. (2) Stopped in ascent of Aston Hill for 7min.

Hill-climbing speeds.—(a) Dashwood Hill: Passenger alighted for 50 yards. Total time (including stop) to danger board 11min. For the mile 12min. 45sec. = 4.7 miles per hour. (b) Aston Hill: Passenger alighted for 100 yards. Total time (including stop) 24min. = 4.06 miles per hour.

MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

At Chanteloup.

IN spite of all forebodings the rain kept off on Sunday last long enough to permit the Parisian visitors to Chanteloup to reach home in comfort, after having witnessed an interesting, if not wildly exciting, race up the famous hill. The sensational element was lacking by reason of the exclusion of the motor-cycles and racing cars from the event, a step rendered necessary by the impossibility of securing permission from the authorities to hold the race exactly on the lines of former years. The course was therefore reserved for the slower classes of automobiles, and as the fastest performance up the grade of ten per cent. represented the insignificant speed of twenty miles per hour, the authorities were afforded an opportunity of seeing how sedate is the march of the present day touring vehicle. The exact length of the hill is 1,800 metres, and to facilitate comparisons I may here quote the bests on record, viz.:—Cars: Jenatzy (electric), 3 mins. 2 secs.; cycles: Béconnais, 2 mins. $34\frac{1}{2}$ secs. It must, however, be borne in mind that the racers cannot do themselves full justice over this course, for the presence of several extremely awkward turnings renders very high speeds an impossibility. On Sunday last the exclusion of the big Panhard and Mors cars gave others an opportunity of distinction, and the 26 h.p. German Daimler of Baron Henri de Rothschild came out of the ordeal with flying colours, for it proved itself to be the speediest of all the competitors. With four up this car made 3 mins. $45\frac{1}{2}$ secs., while at the conclusion of the race it mounted with a couple of passengers in 3 mins. $26\frac{2}{3}$ secs. Among the smaller cars the representatives of the Gladiator-Aster firm secured a couple of first prizes, and the car mounted by Mercier in particular proved itself to be a regular flyer. After the termination of the official tests, Marcellin drove a voiturette up the grade in 3 mins. $4\frac{1}{2}$ secs., a truly wonderful performance. The official returns are as follows:—

1. Four-seated cars.—1, H. de Rothschild, 3 mins. $45\frac{1}{2}$ secs. 2, Gobron-Brillié, 4 mins. $11\frac{3}{4}$ secs.; 3, Serpollet, 4 mins. $32\frac{1}{2}$ secs.; 4, Serpollet, 5 mins. 4 secs.; 5, Bardon, 6 mins. $19\frac{5}{8}$ secs.; 6, Gobron-Brillié, 6 mins. $33\frac{1}{2}$ secs.; 7, Bardon, 6 mins. 51 secs.; 8, Chameroy, 7 mins. 10 secs.; 9, Bardon, 7 mins. 22 secs.; 10, Rochet Schneider, 7 mins. $30\frac{3}{4}$ secs.; 11, Vinot and Deguingand, 9 mins. $35\frac{1}{4}$ secs.; 12, Maison Parisienne (Benz), 9 mins. 37 secs.; 13, Audibert-Lavirotte, 9 mins. 57 secs.; 14, Poittevin, 10 mins. 28 secs.; 15, Delantre, 11 mins. 49 secs.; 16, Gassier, 13 mins. 25 secs.

2. Six-seated cars.—1, Lefebvre, 5 mins. 10 secs.; 2, Delahaye, 5 mins. $20\frac{3}{4}$ secs.; 3, Serpollet, 6 mins. 14 secs.; 4,

Champrobert, 6 mins. 27½ secs.; 5, Du Boys-Parisienne, 7 mins. 4½ secs.; 6, Delahaye, 7 mins. 16 secs.; 7, Delahaye, 8 mins. 8 secs.

3. Two-seated voiturettes.—1, Mercier-Gladiator, 4 mins. 8½ secs.; 2, Théry-Decauville, 4 mins. 40 secs.; 3, Brierre-Cottureau, 4 mins. 47 secs.; 4, Théodore-Perfecta, 5 mins. 23 secs.; 5, Ravenez-Decauville, 5 mins. 48½ secs.; 6, Filtz-Turgan, 5 mins. 55 secs.; 7, Bied-Charreton, 5 mins. 58 secs.; 8, Van Berendonck, 6 mins. 9 secs.; 9, Ader, 6 mins. 28 secs.; 10, Quérey, 6 mins. 58 secs.; 11, d'Arnaud, 7 mins. 32½ secs.; 12, Vinet, 8 mins. 26 secs.; 13, Itasse, 9 mins. 8 secs.

4. Four-seated voiturettes.—1, Darracq, 5 mins. 57½ secs.; 2, Darracq, 6 mins. 11 secs.; 3, Richard, 8 mins. 31½ secs.; 4, Robert, 10 mins. 53½ secs.

5. Small voiturettes.—1, Gladiator, 5 mins. 56½ secs.; 2, Marot-Gardon, 7 mins. 34 secs.; 3, Campagne, 13 mins. 3 secs.

And to-morrow we have another hill-climbing contest, that of Gaillon, which will bring this year's racing events to a close.

A Prosperous German Concern.

THE report of Messrs. Benz and Company, of Mannheim, for the financial year ending April 30th last, shows the strikingly prosperous position of the company. During the year named, no less than 650 motor-cars and 500 motors were manufactured and sold, the turnover aggregating £136,710. The net profit amounted to £33,377, out of which £13,670 has been placed to reserve, and a dividend of ten per cent. declared. During the current financial year, the company hopes to turn out 850 cars, or at the rate of about sixteen per week.

THE WOLSELEY VOITURETTE.

THE accompanying illustration shows the latest type of voiturette: turned out by the Wolseley S.S. Machine Company, of Sydney Works, Alma Street, Birmingham. The car has seating accommodation for three persons. The engine is of the single-cylinder horizontal type, giving 4½ b.h.p. at a speed of 750 revolutions per minute. The ignition is electrical, and by means of the advance sparking apparatus the speed of the engine can be increased to about 900 revolutions. The valves and breech end can be removed in position, and all joints are ground fits—no packing being used. The water-circulating pump is geared to the side shaft and only runs at 200 revolutions, the gland consequently not wearing out so quickly as in a high speed pump. The water-cooling apparatus is all fixed above the engine, so that no difficulty is experienced with the circulation. Only 1½ gallons of water are carried, and this is sufficient for any journey, the water never boiling. Furthermore, the condensing tubes being placed higher up than usual do not get full of mud. An extra large silencer is fitted, and all back pressure on the engine is obviated.

Coming now to the transmission mechanism, the variable-speed gear case is connected to the engine by a Renold silent chain, and the change speed is effected by sliding gears. Three speeds forward of 7, 13, and 25 miles an hour and a reverse motion of four miles per hour are provided as the standard gearing, but this can be varied by the change of sprockets. Roller chains connect the balance gear shaft to the road wheels. All bearings on engine, including the piston, are lubricated from a sight-feed lubricator on the dashboard.

Wheel steering is fitted and is locked on the axle so that the hand wheel cannot be deflected by meeting any obstruction on the road. In locking the steering on the axle the least number of parts of the gear are, it is stated, subjected to the strains from rough roads, and perfect steadiness of steering is assured. All the bearings are intermediate, and the balance gear shaft and the road wheels run on ball bearings of a special type. The clutch on the engine shaft is operated by a foot lever, and is adjusted from the outside. Another foot pedal operates two hand brakes fitted to the rear-road driving wheels, and a side lever operates two rim brakes for emergencies and descending long slopes.

The petrol tank holds three and a-half gallons and is fixed to the dashboard inside the bonnet. A gauge glass on the dash shows the height of petrol in the tank, and can be seen from the driver's seat. A jet vaporizer is used. The mudguards are of leather, mounted in iron frames. The front seat is covered with leather without buttons. The rear seat is detachable, and a

THE WOLSELEY VOITURETTE.

large basket can be fixed in its place in a few minutes. The road wheels are fitted with pneumatic tires, 2½ inches by 30 inches. Altogether the Wolseley voiturette has an attractive appearance, and its design and construction throughout is of such a high order that it ought to quickly meet with a large sale, especially among expert motorists.

The Wolseley Co. have under consideration the building of a 20 B.H.P. racing car weighing 21 cwt. for next year's French races, and hope to receive an order for a similar car from some motorist who wishes to take up racing.

MR. ERNEST OWERS, of West Hampstead, will hold another sale by auction of motor-cars on Friday, the 23rd inst.

MR. MARK MAYHEW has joined the English Motor Club. By the way, this organisation is supporting the Automobile Club's run to Southsea.

MR. THOMAS CLARKSON, who has been developing a delivery wagon for the Locomobile Company of America, at Bridgeport, Conn., has finished his labours and returned to England.

MR. FRANK JACKSON, of Ashley Road, Peel Causeway, Altrincham, Chester, is now stocking petrol, and also keeps a supply on hand of spare parts for De Dion and Century Motors.

MR. DEACON, of Llandudno, has run two public service motor-cars in the Conway Valley during the season. One vehicle alone has travelled 6,000 miles in the neighbourhood.

MESSRS. HARRIS AND HILL, of High Street, Barnstaple, are as ready to undertake repairs as to supply petroleum spirit to motorists going that way.

AN American contemporary states that the Riker Electric Vehicle Co., of Elizabethport, N.J., has in course of construction two electric emergency wagons to be used by a London tramway company.

MESSRS. MARSTON (Limited), of the Sunbeam Cycle Works, Wolverhampton, have purchased a large area of land in Upper Villiers Street for the erection of works for the manufacture of motor-cars.

THE Mid-European Motor-Car Club, of Berlin, has established an insurance department for its members in which they may insure themselves against damage claims and accidents in respect of their motor-cars.

A SILLY horse, belonging to a builder in the Isle of Thanet, saw a motor-car at Ramsgate the other day. Instead of proceeding on his way quietly he made for the Royal Hotel, smashed its windows, and hurt himself. When will horses become sensible?

HERE AND THERE.

IN connection with the Automobile Trial of 1901 three main ideas are to be worked out. One is that suggested by Mr. Edge, as to the division of the entries into classes for large and small cars; another, that proposed by Mr. Shrapnell Smith, to have an observer on each car; and the third, which Mr. Mann tenaciously urged, to hold a great demonstration, extending over a week, at the Glasgow Exhibition. Evidently the Trial will cover more ground than that of this year, and will be quickened by the omission of the daily exhibitions of the last event. Probably it will be found advisable, when at Glasgow, to make a further subdivision, so that the cars belonging to manufacturers may be kept on show in the exhibition, and those privately owned be sent on daily trips to places of interest, thus combining publicity for the automobile with pleasure for the owners. The attention of likely purchasers would thus be called to the motor-car, while the manufacturers would be ready in the exhibition to answer inquiries and explain the working of vehicles. Of course, such an arrangement would not prohibit makers going on the pleasure trips if so inclined.

PASSING through the following counties motorists should be careful—

Essex.	Norfolk.
Lincolnshire.	Middlesex.
Hampshire.	Surrey.

This week's additions to the list of counties where discussions have recently taken place with a view to limiting the speed of motor-vehicles are—

Oxfordshire.
Berkshire.

Among the towns deserving of publicity in this category, I have already mentioned—

Huntingdon.	Swansea.
Bournemouth.	Altrincham.

And now add—

Kingston.
Louth.

To the list of persons high in authority and influence who have declared for the restriction, numbering, or increased taxation of motor-cars, I now add—

Mr. W. Y. Cockburn
(Chairman of the Kingston County Bench).
Sir Warwick Morshead
(Member of the Berkshire County Council).
Sir George Gunning
(Member of the Northamptonshire County Council).

In previous issues the following names have appeared—

The Earl of Kimberley.	The Recorder of Bourne-
Lord Cranworth.	mouth (Mr. R. A. King-
Lord Walsingham.	lake).

Mr. J. Spear, M.P.

AUTOMOBILISM has made progress in the Fens since the people of some of the villages around Cambridge sat up all night to see the Hon. C. S. Rolls whiz by on his car in the days when the man with the red flag was a power in the land. And it is likely to go ahead with even greater speed now that Mr. Morriss, of King's Lynn, has commenced business at Cambridge.

MR. W. L. DUCK, an old Sussex cycling champion, who has recently been developing the popularity of the motor-car in Cambridge, has left that classic town for breezier and busier Brighton. There, with Mr. H. C. Harris, he is starting the Sussex Automobile Company, at 33, East Street. In addition to the sale and hire of motor-vehicles, repairs will also be undertaken—a fact that makes this announcement of more than county interest.

MOTORISTS travelling in the Malvern district will find Mr. A. Burgess, of the Lightning Cycle and Motor Works, Barnard's

Green, Malvern, a useful man. He has plenty of room for the storage of cars, and always keeps a good stock of petroleum spirit. Just now he is engaged in making a new steam car of large size, and is also experimenting with a new gear. Mr. Burgess is a practical motorist, and has given much study to the development of the automobile.

Two grumbles at the apparent indifference of manufacturers to answer questions when addressed to them by likely purchasers come this week. Some of the questions sent to motor-car firms may appear rather elementary, and others may touch weak spots. But all should be answered if the general welfare of the industry is to be considered. To merely send a printed circular in reply will often irritate instead of satisfy an interested querist. Profit from advertising motor-vehicles depends not so much upon the number of inquiries received as upon the way in which they are handled. A hundred inquiries about a vehicle properly followed up are often of more value than a thousand replies which receive no more attention than the perfunctory posting of a printed pamphlet.

THE automobilists' party in the House of Commons is growing, and to Messrs. Balfour, Montagu, Carlile, Dalziel, and the others must now be added Mr. Eric Hambro, the new M.P. for the Wimbledon division. These are practical people whose presence in the House may be needed to instruct legislators afflicted with the reiterated ravings of county councillors, rural councillors, and other people who would like motor-cars on country roads to rival the speed of the Metropolitan growler. Mr. G. B. S. Sackville, M.P., is another sympathetic legislator, and has been telling his colleagues on the Northamptonshire County Council how far we are behind the Continent in motor-vehicles.

SOME time ago a London gentleman advertised a diamond ring in exchange for an automobile. Now a correspondent sends me the following advertisement culled from a contemporary:—

ANCIENT ARMOUR.—Two Breastplates, worn by Pizarro's soldiers at conquest of Peru; over 500 years old; very valuable; will sell cheap or exchange for good automobile.—Address D. B.

If you can get anything more incongruous than Pizarro and pneumatics, ancient armour and automobiles, I don't know what it is. Apparently we never appreciate how closely the most distant past can be brought to the present. LOLLIVS.

A CRUISE ON LAND—OR THE LOG OF A MOTOR-CAR.

BY MISS DOROTHY EDMUNDS.

(Continued from page 584.)

WE left Preston at 3.10, and soon passed through Garstang, on to Lancaster. We were now carrying two extra passengers, (making six in all) on the new car, but that did not seem to interfere with the speed. A hat was blown off by the wind, but we did not stop to pick it up, providing another out of reserves. Our passengers left us at Carnforth at 5 o'clock. We proceeded directly to Kendal, greatly

enjoying the scenery, and had tea at 6.10. Leaving there at 6.35 we made for Windermere, and arrived at the charming Belsfield Hotel, Bowness, where we very much enjoyed our dinner at 7.30.

It has been truly said that happy is that nation which has no history, but if there were nothing to record on this journey that was uneventful I fear it would be uninteresting. Next morning we arranged to leave for Keswick, going over Dunmail Raise. A young boy who had taken considerable interest in the cleaning of the motor-cars in the stable yard was greatly delighted when my father asked him if he would like to pilot us to Ambleside and show us the best road. We started off about noon, taking the low road, which, however, proved to be very hilly and not in very good condition owing to recent repairs. On climbing a hill the engine did not appear to be pulling very well, and as the hill grew rapidly steeper it was deemed best we should all get out and walk, in order to lighten the car, except my younger brother, who thought he would take it up at its lowest speed with the sprag down. We had not gone far when it seemed as though the engine would stop, upon which he put on the hand-brake, which, releasing the clutch, allowed the engine to get up its speed again, but in consequence of too rapidly releasing the brake and the clutch engaging, the car suddenly jumped forward, but for some unaccountable reason suddenly halted, and then began to run back, leaping the sprag, and the car, quickly gaining momentum, began rapidly to descend the hill backwards. My father called out to turn the car into the wall; this was done, and striking a small tree it came to an abrupt stand, the engine, however, still running. On examination we found the concussion had bent one of the radial bolts and thrown off the near chain. It was at once apparent that the car could not proceed until the bolt and bent sprag had been straightened. Luckily we were near a blacksmith's, and the necessary repairs were soon effected, and the car, fortunately not much damaged, was enabled to proceed to Keswick. Dunmail Raise was successfully mounted, and the rest of the charming run being rapidly made without further incident. After stopping at a friend's for several days at Keswick, during which time we had various samples of the English lakes' weather, but with several opportunities for some lovely runs round Bassenthwaite and other rides in this beautiful district, we left Keswick on August 23rd for Carlisle *via* Bothel and Kirkland Green, where we encountered a terrific hailstorm accompanied by thunder and lightning, the road in many places being white with hail, and in some places flooded so that the cars literally had to forge their way through several inches of water, which made a very curious spectacle as they splashed like some amphibious creatures in a perfect shower of spray.

At Carlisle we were comfortably housed at the County Hotel, and as we were intending to take some very hilly country in Scotland the sprocket wheels of both cars were changed for smaller ones, so that they could better climb the steeper grades. After this we had no further trouble with regard to climbing any hills we came to. On August 25th we proceeded to Dumfries. The road *via* Gretna Green and Annan being of excellent quality we made very good running. We stayed at Dumfries over Sunday at the comfortable Station Hotel and took

the opportunity of seeing much that would have interested lovers of Burns. The cars were housed at the King's Arms stable yards, where the proprietor, Mr. Irving, took much interest in them, and asked many questions as to the relative merits of motor-cars versus horses for excursion purposes. In that district it would not be surprising to learn that a practical demonstration may soon be made in regard to this question. On Monday, 27th, we left at noon, and soon encountered a long, stiff rise of nearly seventeen miles, much of which had to be done on the first and second speed. This tested very practically the relative merits of the Estcourt cooler attached to the new car, with the pump and ordinary radiator of the old car for circulating and cooling the water of the two engines. It was interesting to note that though it was a hot day the Estcourt cooler appeared to do all that was requisite, and although some steam was produced yet the engine ran well and continuously without any signs of overheating or trouble from this cause in any way. We ran on to Dalry, where we had lunch. The country in this district was unsurpassed by anything we had yet seen in regard to beauty and variety. We overtook one of Her Majesty's postmen, who seemed greatly pleased at being given his first ride on a motor-car, and who thought this would be an excellent method of carrying the mail.

After leaving Dalry we had another long, tedious ascent *via* Carsphairn to Dalmellington. As there had been a little diffi-

LEAVING DERWENT BANK FOR A RUN ROUND BASSENTHWAITE.

culty with the electric ignition on the new car the burners were lighted and the platinum tubes brought into use. We had not gone far before we slowed down. Evidently something had happened, and we found that one of the platinum tubes had been perforated. It took some little time to replace this, but the time waiting was not lost, as it enabled us to take several photographs and to admire the grandeur of the scenery.

After proceeding we arrived at the summit, the road becoming very narrow and with a curious series of ups and downs which reminded one of the Earl's Court switchback railway, the short, stiff hills being negotiated by taking the down grades at top-speed and going for all we were worth. On the down road as far as Patna, owing to the absence of traffic or other interruption, we were enabled to make some of the best speed on the whole of the journey, averaging a good ten miles an hour, which I believe is the Scotch legal limit. Though we had several delays we were enabled to reach our destination at Cassillis, Ayr, in time for dinner. If I were writing other than a strict account of a motor-car run I should be tempted to digress from my narrative and try and describe one of the most interesting houses in Scotland, situate on the bank of the bonny Doon, built in the thirteenth century, with its old walls, many over twelve feet thick, its dungeons, secret passages, and many stories associated with its varied history. We stayed here for several days, and our host and hostess and their friends much enjoyed the opportunity of making local excursions on the two cars to Ayr,

Maybole, Girvan, and other places in this picturesque and romantic district.

On one of these runs we had the misfortune to slip a tire. It happened just after leaving Maybole, and this accident, though trivial in itself, became the source of considerable annoyance later on in the journey. It is difficult to say what caused it, probably the breaking of some of the bolts that held the flanges which secured the compound pneumatic tire in its place; however, the tire was replaced, and in lieu of an air tube a filling of solid rubber obtained from Glasgow was substituted and an apparently good job was made, but curiously enough the working of the wheel after some two hundred miles of running appeared to powder the solid rubber insertion and the tire again came off; but more of this anon.

On September 2nd we left Cassillis with the intention of proceeding to Peebles, but several delays prevented our getting off before the afternoon. We went *via* Ochiltree and Cumnock, where the country became very mountainous and the roads steep and rough, which necessitated a good deal of careful driving and very frequent changes of speed-gear. We then got on to Muirkirk, and the next ten miles to Douglas was one of the pleasantest we had experienced as yet on the entire run. The car made magnificent running, and we arrived at Douglas a little after six o'clock, where we had tea at the King's Arms Hotel; everything here, however, was so inviting and comfortable that we

STOPPING FOR LUNCH AT DALRY.

determined to stay the night. We took the opportunity of visiting the Douglas Mausoleum, where the Douglas family were buried.

(To be continued.)

ONE of the chief features of the recent carnival at Indianapolis was a race between two horses and two racing automobiles. The race was over a one mile course and the horses were given a fair start. They won in both races, but by little more than a neck.

LIEUTENANT ENGLER, of Frankfort, has just accomplished the feat of crossing the Alps by way of the Stillfser-Joch in a 5 h.p. motor-car, accompanied by his wife and an attendant. The route was by way of Frankfort, Munich, the Brenner, and Ulm, and the whole excursion extended over 1,250 miles.

THE case of the Société Panhard and Levassor v. the Panhard and Levassor Motor Company came before the Chancery Division of the High Court of Justice last week, and Mr. Justice Cozens-Hardy ordered the motion to stand over for a fortnight. The plaintiffs, a French company, ask for an interim injunction until the trial of the action, or further order to restrain the defendants, their servants and agents, from manufacturing or selling motor-cars under the names of Panhard and Levassor.

THE AUTOMOBILE CLUB'S TRIALS OF ELECTRICAL VEHICLES.

IN our last issue we called attention to the series of trials of electrical vehicles to be held, under the auspices of the Automobile Club, in the neighbourhood of Chislehurst, and we have now to chronicle such particulars of the trials as we have been able to glean up to the time of going to press. To reach Chislehurst by train would have meant risking the uncertainty of a journey on the South Eastern Railway, and rather than this we perforce had to fall back on our trusty M. M. Company's Panhard. The weather was not such as made us yearn for motoring, and remembering the miles of tram-lines along Blackfriars Road, Old Kent Road, and Lewisham, the prospect did not strike us as being particularly alluring. However, on Monday afternoon—the first of the trials having been postponed till Tuesday—we made a start from Shoe Lane, and progressed satisfactorily through seas of mud to Bromley. The mud was too thick to permit of side-slipping, but we were caught in a heavy storm which lasted nearly half an hour. About three miles beyond Bromley a steep hill was encountered, and the surface being thick and heavy, it was as much as the car could surmount. The top was safely reached and our journey continued, a sign-post pointing in the one direction to Chislehurst West, and in the other to Chislehurst. Now, from the railway, the place where Napoleon III. died looks a fair sized town, and therefore no difficulty was anticipated in locating it. We took the right-hand road and travelled some distance, until in the middle of a common—which we afterwards discovered was named Paul Cray—was a sign-post pointing in the direction from whence we had come. Not a soul was in sight, and there was nothing for it but to turn the car round again. A solitary wayfarer was shortly afterwards met, and he in response to our enquiry vouchsafed the information that we were in Chislehurst. Considering there was not a house in sight we were somewhat sceptical, and accosted another stranger. This time asking for the "Bull's Head," we were rightly directed, and recognised, in the headquarters of the Club for the electrical trials, an inn we had passed half an hour earlier. Mr. Johnson, on a 6-h.p. Daimler, arrived about seven o'clock, having assisted the Electric Motive Company's vehicles up the hills by towing. There were then seven electric vehicles in the charging station, including the "Powerful" (Krieger), "La Toujours Contentée," one of the Electrical Undertaking Company's cars, two cars of the Electric Motive Power Company's, the Canadian Company's (Still's), and a Joel carriage—the latter having been brought down by train.

Before proceeding with an account of the trials some particulars of the competing vehicles may be given. Thirteen were altogether entered, but only nine put in an appearance on Tuesday.

No. 1, a Krieger long-distance car named the "Powerful," entered by the British and Foreign Electrical Vehicle Company, is, as will be seen from the accompanying illustration (Fig. 1.), of an entirely new design. It is equipped with two electro-motors of 3 n.h.p. each, geared on the Krieger system to the front wheels. The necessary power is furnished by a battery of sixty Leecoll accumulators, type 30EE. The battery, which weighs 3,360 lbs., has a capacity of 250 ampère-hours, the vehicle being intended for travelling long distances on a single charge. The controller is adapted to give six forward speeds, three reverse motions, two electric brakes, and is also provided with a recuperation switch, by means of which the motor can, in descending hills, be made to act as a generator in the recuperation of the battery. The car, complete, weighs about 2½ tons.

No. 3, a Columbia Stanhope phaeton entered by the British and Foreign Electrical Vehicle Company, Ltd., is now a familiar vehicle. It is equipped with a 2 n.h.p. electro-motor, geared direct to the rear axle. The battery consists of forty-two Leecoll accumulators, type 10EE., the weight being 798 lbs., and the capacity 90 ampère-hours. The controller is adapted to give three speeds forward and two reverse. The car, which weighs complete about 1,400 lbs., is fitted with tiller-steering and cycle-type wheels shod with pneumatic tires.

No. 4, entered by the British and Foreign Electric Vehicle Company, Ltd., is a delivery van, capable of carrying a load of one ton. It is equipped with two 2 h.p. electro-motors geared direct to the rear wheels. The battery consists of forty-two accumulators of the Leecoll type; it has a capacity of 135 ampère-hours and weighs 1,176 lbs. The controller is adapted to give four speeds forward, two reverse motions, and three electrical brakes; a foot pedal operating brakes on the rear wheels is also provided. Steering is controlled by a horizontal hand-wheel. The complete weighs about 3,000 lbs.

No. 5 is an exceedingly novel racing vehicle quite new to this country. It is entered by Mr. E. W. Hart, of Luton, who has secured the agency for the type in this country. An illustration of the car, which is made by Messrs. Jacob Lohner

FIG. 1.—THE "POWERFUL" CAR.

Photo by]

[Curzon, Robey & Co.

and Co., of Vienna, is given in Fig. 2. The peculiarity of the vehicle resides in the motors, which are placed in the hubs of the road wheels, and are of an extraordinary slow speed. The armature of the motors is fastened to the hub of the wheel, and the stationary field is fastened to the axle. The speed of rotation of the wheels is, therefore, the same as the speed of the motor. In order to keep down the width of the motor, the commutator is placed inside the armature, so that the width of the armature winding constitutes the whole width of the motor. The motors, of which there are four, have each $2\frac{1}{2}$ h.p. normal capacity, but it is claimed that they will work up to 7 h.p. for short periods. The battery comprises no less than seventy cells of the Leecoll 30EE type, the weight being 3,920 lbs., and the capacity 270 ampère-hours. The controller is arranged to give four speeds ahead, three reverse, electrical brakes, and is also provided with a switch by means of which the motor can be made to act as a generator in running down hill, so recuperating the battery. The car, which has accommodation for four persons, is fitted with inclined-wheel steering, and weighs complete about three tons.

No. 8, a Joel voiturette entered by the National Motor-Carriage Syndicate, Limited, calls for no lengthy description at this time, as an illustration together with the leading features were given in our issue of August 11th last. The car is equipped with two 2 h.p. Joel electro-motors, fixed on a detachable spring frame, driving the two back wheels of the carriage separately by chain gear. The current is supplied by thirty-six Rosenthal storage batteries, with an output of 140 ampère-hours. The total weight of the carriage is about 12 cwt.; 8 cwt. of this being battery. The controller is very simple in construction and action, and is adapted to give seven speeds forward and one reverse. The system of electrical changes is such that when the voiturette is ascending hills the motors work at their highest efficiency and at normal speed; they are geared down to run the car up hill at six miles an hour, whilst on the level the speed ranges from eight to twelve miles, or faster if desired.

No. 9, an Oppermann car to carry two persons; with

Flambeau battery and Oppermann motor. At the last moment this car was withdrawn owing to a fatal accident on Saturday last to Mr. Oppermann's son. Those who know Mr. Oppermann well, we feel sure, join with us in expressing our sympathy for him and his family in the loss they have sustained.

Nos. 10 and 11, two four-seated cars entered by the Electric Motive Power Company, Ltd., of Balham, S.W. The first car is fitted with one two-pole series electro-motor of 3 h.p.; the second has a four-pole enclosed series type motor of 4 h.p. The latter is connected to the rear axle by single reduction spur gearing. The battery in each car consists of sixty cells of the company's own type, weighing 12 cwt. and having a capacity of 19-h.p. hours. The controller is adapted for four speeds forward, and the same reverse, and also for the recuperation of the battery.

No. 12, an Oxford phaeton, having seating capacity for four persons, and entered by the Canadian Electric Motor Company, of Long Acre, W.C. This is fitted with a 4 h.p. special differential electro motor driving each of the rear wheels separately by chain gear. The car is furnished with a battery of forty-two New Ideal cells weighing $18\frac{1}{2}$ lbs. each, and having a capacity of 100 ampère-hours. The controller, which is located at the right-hand side of the car, is adapted for four speeds forward and the same reverse. This car, which weighs about $16\frac{1}{2}$ cwt., has now been running over eighteen months, and in that time has, we are informed by Messrs. Shippey Bros., the agents, travelled about 4,000 miles in Canada and in this country.

No. 13, a four-seated car by the Electric Undertakings, Limited, of Camden Town, N.W. This vehicle is equipped with two Lundell motors of 2 kilowatt capacity each, and connected to the rear axle by internal spur gearing. The battery comprises forty cells of the Leitner type, having a capacity of 160 ampère-hours and weighing $9\frac{1}{2}$ cwt. The controller is arranged to give six speeds forward and two reverse. Complete, the car weighs about 1 ton 6 cwt.

Altogether a party of about twenty had assembled overnight, including Prof. C. A. Carus Wilson, Messrs. Kennaway, Llewellyn, Preece, Fergusson, Johnson, Doubleday, Cordingley, Hart, Chambers, Lohner, Joel, Northey, O'Gorman, etc. On Tuesday morning all were up and in the yard before eight o'clock, and a busy sight presented itself at the charging stations. Some of the vehicles, notably those provided with the Leecoll batteries, only took about an hour to charge, while others took as much as ten hours.

FIG. 2. "LA TOUJOURS CONTENTÉ" CAR.

Photo by]

[Curzon, Robey, & Co.

After breakfast preparations were made for a start of Trial No. 1—an unlimited distance on one charge, the driver to declare to the observer when the run is to be considered as finished. The first two cars away were the "Powerful," No. 1, and "La Toujours Contenté," No. 5. This latter had all its batteries exposed, the covering and rear seats of the carriage body having been removed. A protest being made at the car thus travelling over the public roads, the batteries were afterwards covered—the upper tier with a rug and the lower tier with boards. The two cars then started at 9.45; the Still, No. 12 (with four up), at

10.5; the Electrical Undertakings, No. 13, at 10.15; the two Electric Motive Power Company's vehicles, Nos. 10 and 11, at 10.20, and the Joel at 10.28. In the meantime Major Holden arrived, as also had Mr. Critchley, Professor Vernon Boys, and others. Mr. Campbell, on a Columbia car, with Mr. Harper as passenger, also reached the starting point to see the cars depart.

The "Bull's Head" at Chislehurst is supposed to be on a level with the top of St. Paul's; at all events, it lies very high. Rain had been pouring most of the night, and it was drizzling at the time the cars started. The route was known to be a hilly one, and the roads were heavy and soft, so it was anticipated that the test would be a severe one—too severe, many thought—for the vehicles which had started. After giving the last car a few minutes' start we went after the competitors on our M.M. Co.'s Panhard. The route was a circular one, making 35 miles in all, through pretty country and over very hilly roads. Within three miles we passed the Joel car going well over the sticky roads, while in front could be seen, on the top of a hill, the Electrical Undertakings' car. This was quickly passed, and two other cars were then seen in front; they were driven by Mr. New and by Mr. Northey. These were duly passed, the latter on a somewhat stiff rise, about seven miles from the start. The surface of the road had slightly improved, but there had been a gradual rise for some distance, with occasional short declines. Into Farningham, eight miles from the start, is down hill, but leaving the town the gradient is once more long and steep, then rising and falling, with roads of good surface, over Kingsdown. A chalky road is then "struck," sticky and greasy, and signs on a steep hill with a danger board at the top, were visible of one or two bad side slips. The tracks of the Lohner car, with its big tires, were plainly visible, while another vehicle had charged the bank, making a deep indentation. Near the foot of the hill the road was under repair, and only a narrow passage was left for the cars to go through. Another hill a mile long took us to Wrotham; then down hill and up again through Igtham, this latter being worse than anything encountered so far. The surface of the road varied a good deal, some parts hard and dry, and others, through the woods, being heavy; but the trend of the ground was always in an upward direction, and this continued more or less till Poll Hill summit was reached, 25 miles from the start. In Riverhead, 22½ miles, we came across the Still car with two of the passengers pushing the car uphill. Mr. Critchley, the observer, had some time since declared the "run" at an end, and joined us on our car. The road was a pleasant one, without any difficulties, until Orpington, 3 miles from the finish, was reached. A sharp turn brought us to the foot of a steep hill, greasy and thick with mud, on which could be seen the Lohner being pushed by pedestrians and towed by a butcher's cart. Our wheels slipped a good deal, but we reached the top safely and landed at the charging station at 1.30, immediately after the Krieger car. The Electrical Undertakings' car arrived back at 3.15 p.m., with just sufficient current left to bring it safely home; Mr. New arrived at 3.20; Mr. Still, with two passengers walking, at 3.40; Mr. Joel at 3.40, with sufficient current in his battery for about another five miles, and his motor scarcely warm; and Mr. Northey at 4.20, having only travelled 17½ miles. The Krieger car, after having done the long course, started on a shorter one, and ultimately did 59 miles, the last few miles of which had to be done at a crawl, the batteries having just sufficient strength left to reach home.

The following is the official report issued by the Automobile Club as the result of the day's trial:—

The Powerful, entered by the British and Foreign Electrical Vehicles Company, carrying two passengers, covered 59 miles; the same company's Columbia Stanhope traversed 7½ miles; their delivery van chose an easier route, going 7 miles, but failed to carry the three passengers all the way; Mr. Hart's Toujours Contente travelled 34 miles with two passengers, and the National Motor-Carriage Syndicate's Joel car carried two persons 37 miles; the Electric Motive Power Company's two cars ran 17½ and 35 miles respectively, each carrying two passengers; the Canadian Electric Motor Company's Still carriage carried four persons 18 miles and the Electrical Undertakings' car conveyed two persons 35 miles.

The second trial took place on Wednesday over thirty miles of hilly road between Chislehurst and Knockholt, the result being as follows:—The B. and F. Electrical Vehicle Co.'s "Powerful" completed 28 out of the 30 miles and then withdrew, owing to an accident caused by a shying horse. The National Motor Syndicate's "Joel" car covered 26½ miles, but was delayed by chain coming off. The Electric Motive Power Co.'s car, the Canadian Electric Motor Co.'s car, and the Electrical Undertakings' car each completed 22 miles—the Canadian car had four passengers and the other cars two passengers, including driver. The "Columbia Stanhope," No. 3, the Delivery car, No. 4, "La Toujours Contente," No. 5, have been withdrawn from the trials.

Thursday's trial consisted of a course of about 30 miles over average roads. Just as we go to press we learn that at 3.30 p.m. the "Powerful" car No. 1, the Electric Motive Power Company's No. 11 car, the Canadian car No. 12, and the Electrical Undertakings' car No. 13 had arrived back at Chislehurst after covering the route. The Joel car, which during the morning had been under repair, necessitated by the chain accident on Wednesday, was just about to start on its day's journey.

FURIOUS DRIVING CASES.

AT Long Melford Petty Sessions on Friday last week, Arthur R. Vickers, engineer, Brent Eleigh, was charged with driving a light locomotive so as to endanger the life of Erle William Roper, at Lavenham, on October 13th. Defendant did not appear. Walter Diaper, Lavenham, stated that he saw defendant driving a motor-car down the Market Lane, about six o'clock in the evening. Defendant drove past his office at from twelve to fourteen miles an hour. The street was very narrow, and at one point two carts could not pass. Defendant was fined £2 and costs about a month ago for a similar offence, and a penalty of £8 and £1 costs was now imposed.

BEFORE Sheriff Scott Moncreiff, at the Lanark Sheriff Court last week, John Stirling, managing director of Stirling's Motor Carriages, Limited, Fairholm House; Mr. James Andrew, engineer; and Mr. William Dodds, all of Hamilton, were charged with having, on September 3rd, on the public highway leading from Glasgow to Carlisle, and at the part thereof between the village of Blackwood and the house, Mansefield, Lesmahagow, occupied by the Rev. William Lyall, minister of the Gospel, while riding on or in charge of a light locomotive or motor, caused or allowed said light locomotive to travel along said public highway at a greater speed than ten miles an hour, contrary to sections 4 and 10 of the Locomotives on Highways Act, 1896, and of article iv. of the Light Locomotives on Highways (Scotland) Regulations, 1896, whereby each was liable to pay a penalty of £10 for such contravention. Mr. A. M. Mitchell, of Glasgow, appeared along with the accused, and took objections to the complaint as stated, the principal of which were that only one person—the one driving or in charge of the locomotive—could be guilty of this crime, whereas the complaint bore that the three accused were each liable to pay £10. The complaint also bore that the three accused were riding on the locomotive. This in itself was not a contravention of the regulations. The Act provided only for the prosecution of the person in charge of the locomotive, and the complaint should have stated only the party who was driving. Sheriff Scott Moncreiff repelled the objections, and proof was led. James Macrae, Knowenap, near Blackwood, said he was looking out of his kitchen window which faced the public road on the morning in question, about half-past five, when at a distance he saw nothing but "stoors fleeing." (Laughter.) He went to the other window and saw that it was a motor-car. It was a peculiar car, and he had never seen the like of it before. He couldn't say who were on the car, whether it was the men in the box or not. The car was going at a "fearfu" rate, and it would be more than twenty miles an hour. He never saw anything going as fast—not even a railway train. Mr. Mitchell, in addressing the Sheriff, said there was no evidence in this case for a conviction. Before going into the evidence, however, he wished to explain that this was a car specially made for military purposes, and as it was about to be submitted to the War Office experiments were being made upon it. Special privileges had been granted for the running of this machine through Richmond Park, in regard to speed, and considering the circumstances he would place his defence on technical grounds. This machine was of such mechanism that it could go over ploughed fields and all sorts of country, which would render it invaluable for war purposes. Such a machine would be a great benefit to the Empire, and these experiments were being made to bring it to the greatest perfection, but should a conviction follow in this case the experimenters might possibly be compelled to abandon the project. The trials had taken place at a very early hour in the morning. The car had come from Hamilton and had reached this place by half-past five, and must have necessitated it leaving Hamilton somewhere about four o'clock—an hour when there would be nobody about. Again, there was no evidence whatever that this was a light locomotive. The evidence did not state whether this car was three tons or twenty tons, and by this the case for the prosecution entirely fell, because, under the Act, it stated that these regulations only dealt with light locomotives. It had also been admitted by the witnesses that the bright shield in front of the car, which was there as a protection for the soldiers

inside the car, might have startled the horse. There was no evidence whatever that the horse had been startled by the car being previously driven. Sheriff Scott Moncrieff said he was prepared to find the charge proved against Messrs. Stirling and Dodds. He had not sufficient evidence to say that Andrews was there at all. The car had been taken out at a very early hour in the morning for the purpose of experimenting, and in respect that no damage had been charged as having resulted from the accident, and in the whole circumstances he was prepared to modify the fine to £2 on both parties—the charge against Andrews being found not proven. Mr. Mitchell appealed against the decision and a case was granted.

Mr. C. A. SMITH, of the "White Lion," Cobham, was summoned at Kingston last week before Mr. Cockburn and a full bench of magistrates, for that he "did drive a light locomotive at Cobham at a speed greater than was reasonable and proper, having regard to the traffic on the highway." Mr. Staplee Firth appeared for the defence. P.C. Pearce stated that he saw defendant driving his motor-tricycle at a great speed. Measuring off half a mile he found that Smith had only occupied a minute in covering the distance. Two other witnesses were called, and during their evidence some breezy remarks passed between Mr. Firth and the chairman on the matter of evidence. For the defence Mr. Firth argued that by the section under which the summons was issued no case had been made out, as there had been no obstruction. This point was overruled, and the next step was the attempt to prove an alibi. Mr. C. A. Smith, and six others, testified that he (Smith) was at the "White Lion" at noon, the time when the alleged furious driving took place, and that he did not turn out until three o'clock, when he drove slowly over to the station. But P.C. Kirk supported his fellow-constable and said that he had seen Smith at 12.10, on October 15th, driving at twenty to twenty-five miles an hour. The magistrates imposed a fine of £5.

LAST week Mr. William Prince, cycle manufacturer, of Stretford Road, Manchester, was summoned at Sale for driving a motor-tricycle on the highway so as to endanger the lives and limbs of passengers. Prince on oath said he was not exceeding the lawful twelve miles per hour, whilst the police swore he was progressing at forty miles. Considering he had ridden a motor-tricycle for several years and this was his first offence, the Bench thought a fine of ten shillings would meet the case.

At Barry, on Monday, Harry Stafford, the driver of a local motor-car, appeared to answer a summons charging him with furious driving. The evidence of Acting-sergeant Abrahams was to the effect that he saw Stafford driving his car at the rate of about ten miles an hour along Broad Street, Barry, on the 22nd ult., and there were several vehicles and persons about in danger of being run over. The officer also stated that the car passed them on the wrong side.—For the defence, John Thomas, clerk at the district council offices, stated that the car was not being driven furiously—not more than eight or nine miles an hour. At the conclusion of the hearing the Bench dismissed the case.

At the Norwich Shire Hall, on Saturday, before Mr. Stracey (chairman) and a bench of magistrates, John Reginald Hargreaves, of Great Witchingham, was summoned on the information of Inspector Flint for driving a motor-car at a greater speed than twelve miles an hour at Horsford on October 22nd. There was another summons for a similar offence at Felthorpe on the same day. Mr. Firth appeared for the defence. George Shibley, a groom, stated that on the afternoon in question between four and five o'clock he was sitting in a trap near the schools at Felthorpe. Witness heard a horn blown and as he had a spirited pony he gathered up the reins and should not have taken much notice had not the ladies who were sitting at the back laughed at him when his pony jumped about. That made him annoyed. The speed was twenty to twenty-five miles an hour. It might have been more as it went past like a train. If he said thirty miles he should not exaggerate. Cross-examined: He had not had the pony long enough to train it to motor-cars. He would swear the car was going more than twenty miles an hour. He did not know that Mr. Hargreaves had driven many thousands of miles and had never had an accident, and was considered one of the best drivers in Europe. Arthur Clark, of Felthorpe, said that about 4.30 he was near Felthorpe Lodge, and saw the motor-car coming at a fast rate, dangerous to the public. Cross-examined: Witness was not in danger, but a woman pulled two children out of the road. Witness did not make any complaint, and nobody was injured. Mary Ann Palmer said she heard the motor-car coming, and ran to fetch her children off the road. The vehicle passed like a train. Cross-examined: If a horse and cart had come along she should not have gone after the children, as they were used to carts. The leaves were flying up, and the ladies were hanging on the seat at the back. Mr. Firth said two summonses had been taken out, and he suggested the second one should be struck out, as it was a continuous offence. He objected to two summonses for one offence, as it was un-English. The Bench were of opinion that the case should be heard. Mr. Firth further said the Act said the information should state the name and occupation of the person charged and the offence, together with the time and place. No place was mentioned except a certain highway situate in a certain parish. There were a great many highways in the parish. The Bench considered the information was laid in the usual way. Mr. Firth contended the summons must fail through insufficient information. It was only right and fair that a man should know where the alleged offence was committed. The Bench decided to hear the defence in the Felthorpe case. Mr. H. L. Clark, of the Maid's Head Hotel, Norwich, said he had been used to travelling over the district in all kinds of vehicles. He thought there was no reliance to be placed on the estimates of persons as to speed. Mr. Firth said he should not put his

client into the witness box, as he was a magistrate, and it might be suggested that his brother magistrates leaned towards him. No gentleman on the Bench would venture to estimate the speed of a moving object, but when there was a motor-car in the case people went into the box and coolly estimated the speed at twenty to twenty-five miles an hour. The evidence of Mrs. Palmer was rather remarkable. She heard the horn blown, but she had to run one hundred yards to get to the children. At whatever speed the car was going she beat it, and pulled the children out of the road and the vehicle went by. The Bench fined the defendant £5 with costs, amounting to 14s. 6d.

Then the case against Mr. Hargreaves for driving at a greater speed than 12 miles an hour was taken. Police-constable Arthur Allen, of Horsford, said on Monday afternoon, October 22, at about twenty minutes to five, he was on duty on the Norwich Road, near the school, when his attention was called to the sounding of a horn. A second or two after he saw Mr. Hargreaves driving towards the village. The motor was running from 18 to 20 miles an hour. He had received orders from his inspector to report all cases of driving beyond fourteen miles an hour. If there had been anyone else driving he would have reported it. After other evidence Mr. Firth briefly addressed the Bench, and severely criticised the joint committee and the County Council in respect to dealing with the pace of motor-cars. He contended that Mr. Hargreaves ought to have received a warning, and he was positive that he would only have been too pleased to meet their views. The vindictive prosecution, instead of taking out one summons against the defendant, took out a second one; and yet the evidence showed that this offence took place twenty minutes after the first offence. The chairman said being chairman of that Bench he happened to be the only representative of the County Council present. They had done everything in their power to make the roads good for the benefit of horses, drivers of motor cars, and also cyclists, and they had received communications from all parts of the United Kingdom, from drivers of vehicles, motor cars, and bicycles, stating the good condition of the Norfolk roads. He was sure the County Council would be delighted to see as many motor cars as desired to come on their roads, so long as they kept to the rate as provided in the Locomotive Act and the bye-laws of the county. He hoped this would be the last case that would be brought before them. The magistrates were unanimous as to convicting, and the Chairman said he was sure the Joint Committee would be satisfied with the fine inflicted in the first case. They would inflict the nominal fine of 1s. and the costs, which amounted to 10s. 6d., making 11s. 6d. in all.

ON Tuesday Mr. E. Estcourt, of Lowestoft, answered to three summonses at the Rollesby Petty Sessions. The first was for driving at too great a speed, having regard to traffic on the highway, at 12 o'clock on the 19th ult.; the second was for a similar offence at 4.30 p.m. on the same day, and the third was for driving at a speed exceeding twelve miles an hour on the 25th ult. Mr. Staplee Firth defended. There was the usual array of witnesses to confirm the evidence of the policeman that the defendant was driving at the rate of eighteen miles an hour. All admitted, however, in cross-examination, that their estimate was but an estimate and not based on any tangible evidence. Mr. Firth pointed out to the Bench that no person could be charged with two offences arising out of one and the same occasion, and urged that the summonses were bad and ought to be amended or dismissed. But the Court declined to interfere, and after a lengthy hearing the second summons was dismissed. But for the first and third summonses Mr. Estcourt was fined £2 and costs in each case. In default of payment he was ordered to be imprisoned for one month in each case, the sentences to run concurrently.

REFUSING TO STOP.

At the Lichfield city police-court last week, Richard A. Hinckley, of Bird Street, Lichfield, was summoned for that he being the driver of a motor-tricycle on the 12th ult., failed to comply with the regulation of the bye-laws in that he did not cause it to stop and remain stationary when Robert Bullock, having charge of a restive horse, gave the signal for him to do so. Robert Bullock stated that on October 12th he was in charge of a horse and conveyance in Wade Street. He was by the police station and the horse's head was turned towards St. John Street. He knew Mr. Hinckley, but didn't see him until he was close to him. Mr. Hinckley was on a motor-tricycle and was going at about the rate of seven miles an hour. When Mr. Hinckley approached him he put up his hand as a signal to him to stop the motor-tricycle, as he had had two or three smashes. The animal in his conveyance did not like motor-cars. As Mr. Hinckley drew near his (witness's) horse took fright and bolted, and the defendant followed him up the street. His conveyance struck against the causeway and witness had great difficulty in managing the horse. The defendant, who was sworn, said that he was the proprietor of the motor-tricycle. On the 12th he saw the horse and trap standing outside the police station. He did not see the driver of the horse and trap put up his hand or make any sign. He thought it was the stupid way in which the horse was turned that caused it to run away. He did not see Bullock and he didn't think he gave him a fair chance of seeing him. He had no witness, but he should like to say that he went on and stopped at Mr. Lester's big gate. He stopped in full view of the driver and of the police station, and he did not think that was the act of a man conscious of having just broken the law. The Mayor said the Bench had carefully considered the case and they did not think it a serious one. The case would be dismissed on the payment of the costs, 9s. 6d.

THE ANNIVERSARY RUN TO SOUTH-SEA.

THE following is a list of entries for the Automobile Run to Southsea to-day (Saturday), so far as they have been received at the Automobile Club up to Wednesday night, the 7th inst. Automobilists are reminded that the run is open to all motor-car owners, whether they be members of the club or not.

VEHICLES ENTERED FOR THE RUN.

Official Number.	Name of Owner.	Name of Makers, &c.	Horse power of motor.	Motive Power.	Number of seats, including driver.
1	Messrs. Frank Butler ...	Messrs. Panhard & Levassor ...	6	Petroleum spirit.	4
2	W. M. Hodges ...	London Motor Co., Ltd.	6	ditto	—
3	W. T. Pretty ...	Mors Voiturette ...	4	ditto	3
4	G. St. M. Willoughby ...	New Orleans Voiturette ...	3	ditto	2
5	H. Austin ...	Wolseley Voiturette ...	3	ditto	2
6	T. B. Browne ...	Panhard & Levassor ...	6	ditto	4
7	Roger H. Fuller ...	De Dion Bouton Voiturette ...	3½	ditto	3
8	G. D. Barnes ...	Benz & Co. ...	9	ditto	4
9	S. R. Roget ...	Locomobile Co. of America	2	Steam ...	2
10	Earl Russell ...	The Haynes Apperson Co. ...	8	Petroleum spirit.	4
11	Noel B. Kenealy ...	Benz & Co. ...	5	ditto	4
12	H. R. Beckett ...	Benz & Co. ...	3	ditto	3
13	Motor Power Co., Ltd.	Gladiator Co. ...	3½	ditto	2
14	Motor Power Co., Ltd.	Clement-Panhard ...	4	ditto	2
15	Motor Power Co., Ltd.	Gladiator Co. ...	8	ditto	4
16	S. F. Edge ...	D. Napier & Sons ...	16	ditto	3
17	Chas. Jarrott ...	De Dion et Bouton ...	8	ditto	1
18	Robt. E. Phillips ...	Mors Voiturette ...	4	ditto	2
19	J. Ernest Hutton, J.P.	Ernest Hutton & Co., Ltd.	4½	ditto	2

81	Henry W. Short ...	Motor Mfg. Co., Ltd.	5½	ditto	9
82	C. K. Gregson ...	De Dion et Bouton ...	3½	ditto	3
83	E. de Wilton ...	Ariel Motor Co., Ltd.	2½	ditto	1
84	E. Manville ...	Daimler Motor Co., Ltd.	6	ditto	4
85	H. Bevan Swift ...	De Dion et Bouton (Tricycle)	2½	ditto	1
86	Edmund Dangerfield	Peugeot ...	3½	ditto	2
87	W. J. Peall ...	Daimler Motor Co., Ltd.	6	ditto	4
88	Fredk. S. Peall ...	Hewetson's, Ltd. ...	3	ditto	2
89	A. A. L. Hickman	Motor Mfg. Co., Ltd.	6	ditto	4

At the moment of going to press we received the following additional entries:—

90 N. E. Aldridge.	105 Locomobile Co.
91 J. Burns.	106 Lyon Sampson.
92 Roadway Autocar Co.	107 C. W. Brown.
93 J. W. Amps.	108 Daimler Co.
94 C. Cordingley.	109 T. E. Lawson.
95 W. O. Dewey.	110 T. B. Percy.
96 C. Whitehall Cooke, M.D.	111 J. W. Stocks.
97 C. G. Davis.	112 Alfred M. Grose.
98 T. Leslie Spencer.	113 H. S. A. Smith.
99 W. Bransdon.	114 Herbert Davy.
100 Mrs. H. G. Allen.	115 Harry Livesey.
101 F. H. Barker.	116 J. J. Mann.
102 W. M. Hodges.	117 H. Hicklin.
103	118 G. Standling.
104 Locomobile Co.	119 R. W. Mills.

THE Electric Vehicle Company of Great Britain, Ltd., has been registered, with a capital of £1,000, to manufacture, sell, let on hire, or otherwise deal with electric motors, cycles, and vehicles of all kinds.

THE directors of the Speedwell Motor-Car and Cycle Company, Ltd., of Aberdeen, and other gentlemen interested in the development of economical road haulage, met at Persley Quarries on Thursday last week to witness the practical working of the company's new motor lorry. The motive power is steam, the vehicle being equipped with a compound engine of 25 a.h.p. The engine is attached to a lorry of the ordinary kind, the gross weight of the vehicle being 2 tons 18 cwt. In the trials a second lorry was attached to the first, and both were loaded with granite setts, the first carrying a weight of 3 tons 16 cwt. and the second 2 tons 14 cwt., or 6 tons 10 cwt. in all. The car started at a good speed, and took the steep incline between the bridge and Woodside with great ease. The speed attained in the trial was between five and six miles an hour. Coke is employed as fuel.

COMMENTS.

—8—

THE fourth anniversary trip in celebration of the passing of the Light Locomotive Act of 1896, was a really triumphal procession from London to Southsea. The inhabitants of Portsmouth and the popular seaside town certainly gave it a Royal welcome, and the official reception on the Town Hall steps will long be remembered by those who were early enough to participate therein. Contrasted with the entry into Brighton last year, the affair was magnificent. Instead of the newly-laid stones which were placed near the spot at which London-by-the-Sea was entered, we had a crowd of enthusiastic sightseers, and the efforts of the police to direct drivers and generally make the way pleasant deserve recognition. Altogether, the anniversary run of 1900 must be regarded as the best of the series that has hitherto taken place.]

The Annual Dinner.

ON Wednesday, the annual dinner of the Automobile Club was held at the Hotel Métropole, London. Mr. Roger Wallace presided, and after the loyal toasts had been honoured, proposed the toast of "The Navy, the Army, and the Reserve Forces," to which Sir Richard Harrison, Inspector-General of Fortifications, responded. Professor Boverton Redwood gave the toast of "The Houses of Parliament," and Mr. J. Cumming Macdonald, M.P. responded. The Rt. Hon. C. Stuart-Wortley, M.P., proposed "Success to Automobilm," and in replying Mr. J. Scott Montagu, M.P., gave some interesting figures with regard to the export of automobiles from France. In 1898 this was valued at £36,600; in 1899 at £99,720, and in the first nine months of 1900 at £249,000. Colonel R. E. Crompton had a good reception on rising to propose the health of "The Visitors," and gave some interesting particulars of his work in South Africa. A response by General Sir Thomas Gordon, and the toast of "The Chairman," proposed by the Hon. Cecil Duncombe, brought the proceedings to a close.

Heavy Motor Traffic in France.

As already mentioned in these columns, M. G. Forestier is to deliver an address on "Heavy Motor Traffic in France," before the members and friends of the Liverpool Self-Propelled Traffic Association on the 3rd prox. M. Forestier, in addition to his office as Engineer-in-Chief to the Department of Roads and Bridges under the French Government, is president of the Technical Commission which conducted the heavy motor trials at the recent International Exhibition, and of the Commission of Organisation for various trials arranged by the Automobile Club of France. He was also president of the International Congress on Automobilm held in Paris last July. The visit to Liverpool of one of the scientific heads of the French Automobile Club, the name of which has become famous

throughout the world, is a distinct compliment to and recognition of the position which Liverpool occupies in regard to heavy motor traffic in this country. M. Forestier has been at great pains to secure interesting lantern slides and special cinematograph films, in order to convey a true impression of what has been accomplished in France, and his address should prove particularly interesting.

The Electrical Trials.

WE understand that the driver of Mr. Hart's La Toujour Contente in the electrical trials caught such a chill on the first day that he was unable to be on the car at the appointed time on the second day of the trial. By dint of much doctoring he subsequently recovered and would have driven the vehicle, but the judges adhered rigidly to the rules, and could not allow the two trips on the same day which Mr. Hart suggested at a later hour. This unfortunate circumstance must have been very disappointing to Mr. Hart, whose enthusiasm for electrical vehicles is well known. Anyhow, he had the satisfaction of knowing that the "Powerful" distinguished itself on Saturday.

A Motor-Vehicle Racing Track.

THE question of a motor-vehicle racing track, brought forward in this journal some months ago, is still attracting attention. Mr. Roger H. Fuller remarks that the necessary capital would no doubt be forthcoming if the necessary park or enclosure could be found within twenty miles of London, on a dry soil where road-making would not be too costly. If any body of men would care to take up this sporting venture, become the founders of the Automobile Derby, and support the enterprise with about £10,000, he feels sure they would soon recoup the money necessary for the outlay. There is such a park for sale or lease within a few miles of Leatherhead, with an area of about 300 acres; but Mr. Fuller doubts if that is large enough, as the track or road should not be less than two miles round. This park is on dry soil, undulating, and free from any restrictions.

The Nottingham and District Automobile Club.

THE first general meeting of this club took place on Tuesday last week, at the Black Boy Hotel, Nottingham. Mr. E. W. Wells was in the chair. The hon. secretary, Mr. A. R. Atkey, read a letter from Mr. R. M. Knowles, J.P., of Colston Bassett Hall, accepting office as first president of the club. The suggested code of rules drafted by a sub-committee were considered, amended, and adopted. A committee of management was then elected by ballot, the following gentlemen being selected:—Messrs. W. D. Wells, H. Rimington, G. Rimington, S. Harvey, M. Ross Browne, R. Cripps, R. Harbidge, and P. Huskinson. The hon. secretary reported that eleven additional names had been added to the list of members since the preliminary meeting in October, bringing the total membership up to twenty-seven, all actual owners and users of private motor-vehicles. It was resolved to commemorate the formation of the

club by a run to the Red Lodge, on Thursday, the 15th inst. It was also decided to take steps in order to obtain a reduction of the excessive toll levied on motor-cars crossing Gunthorpe Bridge. A vote of thanks to the chairman concluded the meeting.

Automobile Fete in Paris.

A GREAT fete, organised by the Automobile Club of France, took place in the exhibition grounds on the afternoon and evening of Thursday, last week. Over three hundred carriages, profusely decorated with flowers and banners, participated in the parade, and the scene quite resembled the battles of flowers in the Bois de Boulogne, since the occupants, consisting mostly of well-known sportsmen and their families, pelted each other enthusiastically. In the evening the fete was resumed, all the palaces being illuminated. A procession of electric carriages, decorated with chrysanthemums, produced a splendid effect on the Champ de Mars, while torchlight processions circulated in other parts of the grounds. Over 300 vehicles took part, and all the leading automobilists of Paris were present.

A Strange Case in West London.

At the West London Police-court, on Tuesday, Mr. G. Sparks, of Strone Villa, Bedford, was summoned for travelling from Gunnersbury to Hammersmith Broadway at a greater speed than was reasonable and proper, having regard to the traffic on the highway, on Sunday, October 28th. In giving evidence Police-constable Holker said he followed the defendant on a bicycle, and that he was going at sixteen miles an hour. In cross-examination the constable admitted there was no interference with the traffic, and no complaint had been made. The magistrate, Mr. Lane, Q.C., referred to the Act, and stated that under the summons the case had broken down, but that he proposed to inflict a fine under another clause of the rules, which said that the car should not travel more than twelve miles an hour. The magistrate said that he had power to do this, although defendant was not summoned under that clause. A long argument took place between Mr. Staplee Firth, who was defending, and the magistrate, and the latter was ultimately convinced he could not convict. He then asked Mr. Firth to consent to amend the summons by adding a fresh charge. Mr. Firth pointed out that this was contrary to English justice and law, and that he should not consent. The magistrate thereupon said he should be bound to dismiss the present case, but he should tell the police to take out another summons. Mr. Firth observed that he considered that was a question for the prosecution and not for the Court. The magistrate seemed to appreciate the position, and calling up the Inspector of the Police asked him whether he desired to proceed as suggested. The Inspector said he certainly should so proceed. And thus the game goes on.

Held Over.

IN consequence of the very full reports we are giving of the Automobile Club's run to Southsea, several of the usual features of the *Journal* have had to be held over. These include our Continental Notes, some special correspondence and articles on new cars. In addition, we have been compelled to leave till next week a report of the Automobile Club's dinner on Wednesday. This we particularly regret, owing to the excellent advice tendered to motorists by the Rt. Hon. C. Stuart-Wortley, M.P., and the most important speech of Colonel Crompton. Still this week's issue will be found full of interest to all who follow the doings of the automobile world.

It is reported on good authority, states the *Horseless Age*, that Mr. F. W. Tousey, an American, who has been living abroad for some time, and who was one of the founder members of the Automobile Club of Great Britain, is to take up his residence in New York again, and become the active secretary of the Automobile Club of America.

CORRESPONDENCE.

TARE LIMIT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With respect to the arguments advanced by The Mann Steam Cart and Wagon Company, Limited, Leeds, in opposition to an increase in tare over and above that sanctioned by the Locomotive on Highways Act, 1896, it would be interesting if Messrs. Mann would state whether they have yet built a vehicle weighing less than three tons.

Yours truly,

E. SHRAPNEL SMITH,

Liverpool, Nov. 14th, 1900.

Hon. Sec., L.S.P.T.A.

A 1,000-MILE NON-STOP ABSOLUTE TRIAL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have pleasure in informing you that the Société Décauville, of Paris, has accepted a challenge I issued to them to run a Décauville car for 1,000 miles without stopping for any purpose whatever. Early this year I advocated the inauguration of a series of records of "runs of non-stop absolute," but deprecated the fact that owing to my business affairs keeping me so much in town, I was unable to record any initial non-stop run of any importance. At that period the non-stop record was about twenty miles, since when, of course, this distance has been very largely exceeded in a good many cases.

Now, however, although I shall be unable to drive a car myself for such a long distance as 1,000 miles, I think there is every prospect of an important non-stop record being made. In a letter to me, dated the 5th inst., accepting my challenge, the Société Décauville engage to run one of their 5-h.p. voituresses and also one of their larger 8-h.p. cars for 1,000 miles without the cars stopping for any purpose whatever, pneumatic tire punctures and bursts excepted; and in the improbable event of tire accidents, even if a car be forced to stop for a minute or two, the motor will be continually at work, which is sufficient proof that were it not for the pneumatic tires the car need never have stopped at all. The Société Décauville, however, stipulate that the cars are to run at any speed at the option of the *mécaniciens* who are driving them, and they agree that any stoppage for any other reason than that of tire accidents will constitute their defeat. They inform me that M. Michelin has agreed to furnish them with two very special sets of tires, so that even tire troubles are highly improbable, and that they hope, therefore, to complete the 1,000 miles on both cars without any stoppage at all. They reserve the right to change drivers at any time whilst the cars are running, also to fill up with petrol or water as they think fit under the same conditions.

It is with pleasure, therefore, that I am able to inform you and your readers that everything has now been arranged, and that the cars will commence their 1,000-mile journey at 6 o'clock in the morning on Wednesday next, the 21st inst., on the Crystal Palace track, and will run day and night until 1,000 miles have been covered.

Yours truly,

R. MOFFAT FORD.

London, W.C., November 14th, 1900.

WHY NOT AUGUST 14TH?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Why should we choose the middle of the worst month of the year to celebrate the emancipation of the motor-car? True, last Saturday was a glorious day for the time of year, but darkness comes on early in November, and the weather is certain to be cold.

The "Light Locomotives Act," which gave us our freedom, passed its final stages on August 14th, 1896, but came into active operation on November 14th. Surely it would be a far more acceptable date—August 14th—for celebration, the best month of summer, long days, warm weather, etc. Whatever club organises the next parade, let it be on August 14th, 1901.

Yours truly,

H. HEWITT GRIFFIN.

Southsea, November 10th, 1900.

P.S.—This will give Southsea caterers nine months to study cookery for the next "banquet."

Anniversary Run to Southsea.

TAKING time by the forelock, the Automobile Club arranged that the annual tour, to celebrate the coming into operation of the Light Locomotives Act on November 14th, 1896, should commence on the 10th, and accordingly, on Saturday last, the now-familiar "meet" took place. Fortunately, the dulness and the dampness of the earlier part of the week had passed away, and the morning opened brightly, giving friendly promise of a pleasant day.

Big Ben was striking nine as we arrived on the scene, and already close upon fifty vehicles were *en evidence*. The first business was that of searching out the car on which we were to make the trip. This done we had a few moments in which to take a general survey of the gathering. Cars and cycles were arriving in rapid succession, and ere the start was made, the long line of vehicles extended far down the Embankment. It is impossible for us to mention all the many

No. 24. Two or three cars turned stupid at the very beginning, but after a brief delay they were coaxed into good behaviour, and in less than a quarter of an hour Horse Guards Avenue had resumed its normal quietude. Out of the 149 vehicles entered, 103 bearing official numbers started. Seven others without numbers also joined in the procession, and many fell in *en route*.

WITH THE PRESS GANG.

BY PHANOMEN.

HOW quickly plans can be frustrated was clearly indicated to me on Saturday last. I have had many pleasant trips on petrol cars, but never have I yet had a long excursion on a steam vehicle. Some months ago a colleague was induced to try his chances with a car of this kind,

THE START FROM WHITEHALL.

[Argent Archer.

types of cars which lined up at the start. It may be stated, however, that for the first time on record all three systems of automobiles were represented—petrol, steam, and electricity. While the bulk of the cars present were familiar enough to those in close touch with the automobile movement, there were several which were seen by the public for the first time. Among these were the Darracq voiturette with its attractive *tonneau* body, and the Daimler voiturette, brief descriptions of both of which were given last week. The new 5 h.p. Motor Manufacturing Company's voiturette also attracted much attention. Cars of English, French, Belgian, German, and American construction were all represented, and it may be pointed out that just, as in the first run in 1896, an American-built petrol vehicle was present. This was No. 10, an 8 h.p. car entered and driven by Earl Russell. The builders of the vehicle are the Haynes-Apperson Company, Kokomo, Ind., the feature being the employment of a balance double-cylinder engine.

In our last issue we gave the names of 119 entries. When the list closed the total had swelled to no less than 149. Punctually at 9.30 a.m. the starting signal was given. Mr. C. Johnson, the secretary of the Club, leading the way through a double line of spectators on Mr. Alfred Harmsworth's Panhard

and although he was much commiserated with as to the risks he was running in thus accepting, as he put it, "a seat on a boiler," both he and the car returned home safe and sound from a sixty mile spin. In view of his success and a desire for an experience of my own on a steam car, it was a seat on one of the vehicles entered by the Locomobile Company of America that I selected out of the many offered me for the run to Southsea. Whatever my choice was, the fates, on this occasion at least, willed otherwise. To begin with, our car, a two-seater bearing the No. 104, was located towards the tail-end of the procession, but as we turned into Whitehall the driver assured me that once we got a chance we should be in the first flight. Having made myself comfortable, I began to consider the position generally. Here I was on a steam vehicle for the first time. It certainly was not a petrol car, for we glided along so silently and without vibration—altogether a new experience. Looking round I noticed that we had increased our speed. "How has he managed that?" thought I. "I did not see him touch any levers, nor did I feel any change in the gear." As we approached the end of Whitehall and turned into Great George Street, Westminster, the driver endeavoured to enlighten me on the subject, and by the time I reached Portsmouth my knowledge of the methods of the

working of such vehicles would no doubt have been increased. But, no; it was not to be. We had not gone far along Birdcage Walk when—crash! "Whatever in the name of fortune is that?" I cried, as terrible fears of bursting boilers and other dreadful things flashed through my mind. As quickly as he could the driver shut off steam and brought the car to a stand in the middle of the road. If there be anyone who thinks "Phänomen" is slow he should have seen him dismount from that car! Of course the driver quickly followed suit, and the cause of our stoppage was soon revealed and my fears allayed. The trouble lay in the driving chain, which had mounted the sprockets, the strain causing the fracture of a stay. Not being prepared for such an unusual eventuality, I looked at the driver and the driver looked at me, and in addition said "things." It was clear the car could not proceed, so what to do next was the point to be decided. While we had been engaged in getting the car to the side of the road the other vehicles had been speeding along, so that when my stranded position came to be considered there was not another car in sight. Deciding that the only thing to do was to get down to Guildford by train as quickly as possible, in the hopes of picking up the motor-cars, I was about to call a hay-motor cab, when, lo! a cluster of straggling cars bearing numbers hove in sight. Two ran by with a full load, but on the third, No. 54, a Motor Manufacturing Company's wagonette, driven by Mr. Sharp, a vacant seat was found, and thus once

Jarrott flashed by on some new and startling contrivance which led us to wonder if he had obtained a rival to Pennington's wonderful machine. Pitying Griffin on his lofty position on the Panhard omnibus, No. 32, as we passed it by we in turn were passed by the huge Krieger electrical car named the Powerful, which took part in the trials of electrical vehicles in the Chislehurst district last week. Its quiet running, despite its cumbersome appearance, met with commendation on the part of my companions, and all wondered whether we should see the car later on in the day in Southsea.

A call from the driver caused us all to look forward, where to our surprise we saw a huge cluster of cars. Not knowing of the contemplated stop this side of Kingston to enable the vehicles to proceed together through the ancient borough, we wondered what was the matter. Fears once more allayed—I fancy my steam car incident must have made me nervous—we all dismounted to inspect Jarrott's latest, which proved to be a single-seated skeleton car fitted with two 5 h.p. De Dion motors. It had the regulation inclined wheel steering, a two-speed gear, and a huge petrol tank, able to hold about twelve gallons. "Speed," says Jarrott, solemnly, in answer to our question, "oh anything from zero up to —." No, I will not repeat what he said, but will let it go as up to the legal limit of the year 2000!

Once again we were on the move, but ere we entered

SNAPSHOTS ON PUTNEY BRIDGE.

more the vista of a pleasurable day's outing opened itself out before me.

When comfortably ensconced in my new abode, I found myself in congenial company, for out of the other four passengers three were pressmen. Naturally, the cause of the breakdown was the subject of conversation for the next mile or so. Large crowds greeted our passage through Chelsea, and, leaving behind us that part of the metropolis known as the World's End, we reached Eelbrook Common, where Mr. F. W. Baily was seen standing by Mr. Barnes' 9 h.p. Benz car (No. 8). Further on we found Mr. Edmunds, who was accompanied by Mr. Staplee Firth, enjoying (?) the first of several little tussles with his car, No. 78. Over Putney Bridge, we were soon at the foot of Putney Hill, the first ascent of the trip. The bulk of the powerful and heavy cars were, of course, some miles in front, so, perhaps, it does not stand for much when I state that no car passed us on the way up the hill. On the other hand, we gave several little cars the go-by, including No. 137, a Humber voiturette, which required assistance at the hands of the driver. Wimbledon Common reached we felt that we were at last in the open country, and although beautifully fine there was a cold nip in the air that made those who were well protected feel content, others to regret that they had not made better provision against the cold. Reaching Kingston Vale, and passing on the way, three cars stopped for some reason or another at the roadside, we looked out for Pennington's war torpedo car which has lately been careering at a wonderful speed in Richmond Park. It was, however, not to be seen, but instead

Kingston Messrs. Brown and Banks ran up to our rear on the Brown-Whitney steam car. A loud noise indicated that "something had gone wrong with the works," necessitating a pull up at the side of the road, and we did not see the car again. Through Kingston and Surbiton we ran, and then we were at the famous Angel at Ditton Corner. No time to linger there as we had often done on Sundays during the past summer; we pushed on and felt sorry for the driver of No. 29, a Delahaye car, the internals of which he, on his back, was busy studying.

So far our car had been travelling, if not fast, at least steadily, but our contented state of mind was quickly dispelled, as the driver of a car at the rear drew our attention to the fact that we were losing our cooling water as fast as was possible. A stop was naturally necessary, and to the driver's dismay, as well as our own, we found that a screw plug had disappeared from the water-circulating pipe. Although it is to be hoped that the freemasonry of the motor-car will never cease to exist, it is always pleasant to record an instance of good fellowship among motorists,

"For a friend in need
Is a friend indeed."

Had it not been for the kindness of Mr. C. W. Brown, who most obligingly took out the plug of the petrol tank of his Benz car, a long stoppage stared us in the face. Mr. Brown was only going as far as Godalming, and substituted a cork for the plug he had lent us, and which, by a strange coincidence, was almost the very

counterpart of the one we had lost. The leakage stopped, our delay was not at an end, for it was, of course, necessary to replenish the water tank. However, we pushed along and turned into the yard of the White Lion Hotel at Cobham, where the necessary liquid was taken aboard. By this time twelve o'clock had come and gone, and as we had yet a good many miles to travel ere Godalming and lunch was reached, some of our party began to wonder at the chances of replenishing their own fuel stores. The motor was once more ron-roning merrily as we began the ascent of Pain's Hill, where Mr. Edmund's car, No. 78,

spreads its wide, watery expanse as of old, up to the very margin of the road, opposite the Hut. The sight of Wisley Pond, which on Ordnance maps is called "Boldermere," led one of our party to re-tell an oft-told story of a trick played on a German band, who were rowed to an island on the lake and induced to play to an imaginary German resident of great wealth, the rowers meanwhile stealthily and quietly rowing away, leaving the hapless members of the band stranded on the island. The ball thus set rolling, quips and jokes flew quickly, the journey through Ripley, the Mecca of the cyclist, on to Guildford,

TWO SNAPSHOTS OF THE CARS MOUNTING PUTNEY HILL.

Photos by

(Curzon, Robey & Co.)

passed us, Mr. Firth enlivening the proceedings by blowing a horn.

From the hill-top it is a succession of ups and downs across Wisley Common to Wisley Hut, as the roadside inn is named, although its hut-like character of old has been altered in recent years to something more modern and pretentious. The great poplar, too, that used to stand beside the house was blown down in a winter's storm some two years ago, and Wisley scarce looks its old self now it is gone. But Wisley Pond is inalienable, and

seemingly occupying but a very few minutes. On the way down we had passed several cars undergoing inspection at the road side, but shortly before reaching the ancient town two were seen stranded—Mr. Roger Fuller's De Dion voiturette and a Daimler voiturette, No. 108, a punctured tire being the cause of the latter's stoppage. Guildford itself is full of interest, but while its long, steep High Street is probably the most picturesque in England, the roadway of it is most uncomfortable, it being paved with granite setts of the roughest description.

It was almost on the point of one o'clock as a police-constable directed us into Quarry Street, which, skirting the Norman Castle, built in 1150, leads to the village of Shalford, where we had a passing glance at the ancient stocks. Coming up with No. 55, a sister car to our own, we found it minus one of the tires and with a damaged spoke, owing to another car having collided with it; the Panhard omnibus, No. 32, and a Benz car, No. 117, were also seen at the roadside ere Godalming, formerly known as Godliman, was reached, the time marked on one card at the inward control being 1.21 p.m. A rush for the King's Arms Hotel was next made, and our dismal anticipations of "no lunch" were fortunately quickly dispelled. Late as it was we were by no means the last, and after attending to the wants of the inner man we repaired to the yard, where a busy scene presented itself. A Clement-Panhard voiturette was being a little obstreperous, but after a little coaxing was persuaded to start. Mr. Frank Butler, whose car bore the legend No. 1, was by no means the first, for the clock was striking two as it arrived. Mr. Butler took the bad behaviour of his car in good part, and found at least some consolation therein in being able to assure the policeman that he had not exceeded the legal limit. He did not stop for lunch, but after having the wheels of his car washed down—had he an eye on Mr. Harmsworth's cup?—he set out on the second and more tedious half of the journey.

It was not till 2.30 p.m. that the signal "all aboard" was given on our car, No. 54, and we passed slowly out of Godalming for Milford. Lunch appeared to have put us all in a more contented state of mind, and even the motor seemed to be pulling strongly as we had an advance intimation, by rising ground, of the coming steep Hindhead. No. 135, a Locomobile steam car, was seen at the roadside, and a little further on we saw No. 103, one of the London Motor Company's cars, similarly placed. As we began the ascent of what may be termed the introduction to the Hindhead, a car bearing a number was seen coming down the hill with its nose pointed towards London. As it passed us we just managed to discern that it was No. 29, the Rev. Arundel Whatton's 8 h.p. Canello Durkopp.

While wondering what meant this change of direction, we overhauled No. 113, a Locomobile, the driver of which was wrestling with the tires. The country now began to open out, and the fact that we were getting higher and higher was intimated to us by the increasing keenness of the air. At last we were at the foot of the long climb of the Hindhead, which is 895ft. above the sea-level. Bidlake was there to time us, and as we passed him we heard him call 2h. 55min. 35sec. to his assistant. And now we were climbing. Fortunately the road was in good condition, so for the bulk of the way we travelled on second speed. The higher we got the more the view opened out. Around us on either side we could see miles and miles of wooded level country, behind us was a part of the hill, but in front there was still further climbing to be done. Only one car accompanied us in the climb, and that was Mr. Standley's two-seated International, which appeared to be doing well. On, on we went until we reached the romantic spot known as the Devil's Punch Bowl. Here we had an example of nature's handiwork. On the left rises abruptly Gibbet Hill, and on the right there is the great Bowl—a huge yawning gulf in the mountain range, which made us shiver at the thought of what would happen were some careless driver to fail to safely negotiate the route at night. The road at this point took us round at least one half of the circumference of the Bowl. As we skimmed along we came across Mr. Butler and Mr. Simms busy—either in admiring the scenery or arguing with the troublesome Panhard. It must have been the latter, for as we ran by Mr. Simms took off his overcoat and generally put on an air of meaning business. In front of us we saw the little flag which indicated the timekeeper at the top of the hill, the time recorded for our car being 3h. 22min. 50sec. Thus we had taken 27min. 15sec. for the climb; it should be remembered, however, that No. 54 is a waggonette, capable of seating eight or ten passengers, so that after all we did not do so badly.

After such a climb we surely deserved some recompense, and we got it in the shape of a glorious run down towards Liphook. At the Royal Huts, at the top of the Hindhead, we were in what may be termed a literary country. On our left we ran by Dr.

Conan Doyle's house, while other residences of novelists were pointed out to us. Hitherto we had nothing to complain of as regards the state of the roads; true, here and there they had been wet and heavy, but this had generally been under shaded parts. However, soon after entering the county of Hampshire, "Breakers ahead!" was the cry, and looking forward we saw the full width of the road for twenty or thirty yards covered with a thick layer of loose stones. Fortunately, these proved not to be of the sharp-cornered order, so we got through safely, only to tackle another stretch of a similar kind. Mentally hoping that we were not going to have a repetition of these stony patches, we pushed on through Liphook, where the inhabitants had all turned out to greet us. In the climb up the Hindhead one of our passengers had preferred forty winks to an appreciation of his surroundings, while now another one was in the land of nod. We wakened him up, however, with a start as we saw three policemen with arms uplifted in the road in front of us. "What is the matter now?" we exclaimed. We were going at eleven miles an hour at the time, and wondered what the men wanted. On our pulling up, one of the constables kindly explained that the "gentleman in the carriage in front" was going to turn at the next corner! He was at least 200 yards ahead, and going faster than we were; but the sanctity of the local bigwig is so great in the eyes of the man in blue, that even a motor-car has to be pulled up. It was 4.30 as we made the sharp descent into the old town of Petersfield. The sun was going down, and the temperature was falling, so that there was every likelihood of the final portion of the run having to be made in the dark. At Petersfield, an old agricultural town, with the usual style of Hampshire brewery as a prominent landmark, a number of small boys pointed out the turning. A quick run brought us to the foot of Butser Hill, quite as steep, if not as long, as the Hindhead. Not for the purpose of easing the car, but with a view of getting a little warmth-giving exercise, we all, including the driver, dismounted. As we slowly mounted the hill, some of us tried our hands at steering the car, and wondered how long it would be ere we would be driving our own voiturettes. Darkness had now come over us, so we lit up the side lamps and began to estimate the time of our arrival at Southsea. At Horndean, a pretty little village, we were told to bear to the right, and soon we were travelling at a good speed through the extensive Forest of Bere. Two bright lights at the rear, and the toot-toot of a horn, indicated the approach of a car, and as it passed us in the gloom we saw that it was the "Powerful" electrical car still going strong. Subsequent inquiries elicited the fact that, except for an hour's recharging at Guildford, the car made the 74-mile trip on a single charge of the battery—a commendable performance.

On through Waterloo and Purbrook we went, but it was too dark for us to note the surroundings. In a few minutes thousands of lights were spread out before us. "There is Portsmouth," said one of the party who had made the trip before. Beyond the lights nothing was visible, and we were for a moment inclined to envy those who had reached Portsdown Hill by daylight, and were thus able to enjoy the splendid view. However, it was no use regretting, so we contented ourselves with the expectation of a speedy termination of our long ride. At Portsdown someone ran out with a lamp to inquire our number, and with a useful warning, "Go carefully," he left us to ourselves once more. Down the hill we went, safely negotiating the sharp turn in the road, and soon found ourselves at Cosham. The appearance of tramway lines intimated that we were nearing our journey's end, a fact which the engine seemed to appreciate, for its behaviour was most exemplary. As we entered Portsmouth the crowded state of the streets indicated that the cars had met with a hearty reception. Here and there one or two urged us to "hurry up," but we were going at the full legal limit, and did not wish to fall into the clutches of the police so near our destination. It was 6.20 p.m. as we reached the Town Hall, and as we had missed the Mayor's reception, and the dispersal of the cars on Southsea Common, we made our halt at this point. Except for the incidents in the first twenty miles our trip was an uneventful one, and if we had not made a fast run we had at least the experience of a

steady-going car—one that could be relied upon to do a long journey with a minimum of trouble.

THE CARS AT GODALMING.

SATURDAY morning dawned fine and bright, giving prospect of a good muster of cars for the run, the first arrivals of which were timed by a wire from the indefatigable secretary for 11.45. So the stroke of the half-hour found us in Godalming *en route* for the inward control at the Old Station, where the sound of a rapidly nearing horn led us to believe we were late. The early arrivals, however, proved to be a De Dion tricycle and a Benz car, devoid of numbers, that had preceded the officially numbered cars. A few minutes before a quarter to twelve, the

in the direction of the outward control, where Messrs. King and Ponsford were to officiate. At 1.5 all was ready there, but as we started off along the Portsmouth road to distribute a few direction flags we overtook No. 13 beyond the bridge, having passed before the control was ready. No. 30 had been left repairing a puncture at the railway bridge, in preparation for its excellent performance on Hindhead. Before our flagging duties were quite completed Mr. Mayhew's 16 h.p. Napier passed us at a good pace, and we were not surprised to subsequently hear outstripped the Hindhead timekeepers. Ignition troubles allowed us a leisurely view of the passing of several more of the faster cars, and brought us to the top of the hill just in time for the dying struggles of the cinematograph that had already immortalised the efforts of the first dozen cars.

SOME OF THE CARS ARRIVING AT PORTSDOWN HILL.

timekeepers, Messrs. Montgomery and Marriott, arrived, and a wait of a quarter of an hour ensued, broken by the sound of Mr. Edge's horn as his 16 h.p. Napier dashed up, the first in, at twelve o'clock. Two tricycles were close behind, and after a minute or two's interval, Mr. Friswell's 12 h.p. Panhard appeared, followed by a pair of tricycles that could not be persuaded to stop for their cards. This would not do, so the arm of the law was invoked in the shape of a stalwart policeman, whose assistance was much appreciated by the timekeepers. A Decauville car and another tricycle followed, with a 6 h.p. New Orleans at 12.10. Then came an Ariel tricycle, and in rapid succession No. 119, No. 5, a Wolseley voiturette, and No. 145. Mr. Gregson followed, pursued by Mr. Barnes's 9 h.p. Benz, and at 12.20 Mr. Johnson hailed us from the seat of the 6 h.p. Panhard, on which he had come down. Next arrived Mr. Estcourt and a De Dion voiturette, when the time warned us to turn our wheels

THE ARRIVAL AT PORTSDOWN, PORTSMOUTH, AND SOUTHSEA.

THE foregoing descriptions of the run down to Southsea will no doubt be read with interest. It remains to be recorded how the cars arrived at Portsdown Hill and subsequently made their triumphant entry into Portsmouth and Southsea. Mr. Mayhew was the first to put in an appearance, he turning up on his 16 h.p. Napier (No. 23) at 2.35. Two or three minutes later Mr. S. F. Edge (No. 16) arrived, closely followed by Mr. C. Jarrott on his 10 h.p. "Wonder," and Mr. Friswell on his 12 h.p. Panhard. Then came Mr. Cecil Edge on a 5 h.p. tricycle, and at 3 p.m. Stocks and Crowdy, on Ariel tricycles, appeared. The cars now began to come in rapidly one after another; the Darracq voiturette, with Mr. Farman driving, at

3.5; a Decauville car, Moffatt Ford, next; A. J. Wilson, on a tricycle; Mr. Dennis on a tricycle, with trailer attached; Mr. Demey and Mr. Grose, both pedalling their tricycles hard up the hill, and the latter with his near side tire down. Mr. Barnes, on a double-cylinder Benz, arrived at 3.18; two minutes afterwards and then came Mr. Askell on one of the new two-cylinder New Orleans cars. At half-past three Mr. Hargreaves, with the Hon. C. S. Rolls as passenger, arrived, followed by a Locomobile steam car. Five minutes later the second Decauville arrived, and Mr. Iden on one of the Motor Manufacturing cars turned up at 3.40. Mr. Estcourt arrived just afterwards, followed by Mr. Mills on a De Dion voiturette, Mr. R. Brown on a Peugeot, Mr. Hodges on one of the London Motor Company's cars, Mr. Bickford, and Mr. Lewis on one of the new Daimler voiturettes, Mr. Lawson on a Pieper voiturette; a Motor Manufacturing Company's phaeton, Ide driving; Mr. W. Crooke, Mr. Van Toll, each on New Orleans cars; Mr. Edgerton on a steam car, Mr. Rogerson a Daimler, Mr. Barker on a Peugeot, Mr. Mannille on a Daimler, Earl Russell on an American—the Haynes-Apperson—car, steaming badly; all following each other at short intervals. A few minutes after four came Dr. Lehwess, on an Orient Express, then a tricycle; Mr. Swift, on a tricycle; Mr. Howard, on a Marshall car, travelling strong up the hill, and another Decauville. After a short interval Mr. Austin appeared on his Wolseley voiturette, having been delayed by tire troubles; Mr. Percy, on a De Dion voiturette; Mr. Livesey, on a Marshall; Mr. Roger Wallace, on a Motor Manufacturing Company's phaeton; another of the Motor-Car Company's cars; then Mr. A. Burgess, on one of his company's cars; Mr. Du Cros, jun., on an 8 h.p. Napier, followed by Mr. Mann, on a 12 h.p. Daimler, etc., etc., all before 4.30.

A punctual start was made for Portsmouth, where a committee had been appointed to receive the vehicles on their entry into the town. The chief constable (Mr. Rickett) piloted the cars through the streets, and the route was through some of the principal thoroughfares to Southsea Common, the speed being limited to eight miles an hour. Crowds had assembled to witness the passage of the procession and its arrival at its destination. Mr. A. C. Harnsworth had offered a silver cup for the car accomplishing the journey in the cleanest condition; the vehicles were judged as they approached the Town Hall by a committee, among whom were the Mayor (Mr. Alderman A. L. Emanuel) and the ex-Mayor (Mr. Harold Pink).

Of the 103 numbered vehicles which started all but seventeen are known to have arrived at Southsea on Saturday night. As to the missing cars, it must not be supposed that they all broke down. To our knowledge the owners of two or three bearing numbers only started out with the intention of going part of the way, while a few, arriving late, made their way as modestly and quietly as they could to the garage. As a collective run, the anniversary run to Southsea must therefore be written down a great success.

THE HINDHEAD CLIMB.

THE appended table shows the times occupied by the various cars in making the three-mile ascent of the Hindhead on Saturday last:—

Official No. No.	Name.	Time. m. s.	Official No. No.	Name.	Time. m. s.
1... 23	Mark Mayhew...	7 16	14... 112	A. M. Grose	13 1

ON FAIR DAY AND FOUL.

BY LOLLIVS.

WHITEHALL was a busy place on Saturday morning, and it seemed as though engineering operations were being conducted at several score of peripatetic establishments which had been set up along the roadway of the Horse Guards' Avenue. Determined looking men were making the last adjustments, giving the final overhaul, and generally preparing for some long event as I made my way to the centre of the long line of automobiles, where a trusted vehicle had a seat reserved for the writer. Punctuality is a rule of the Automobile Club when the public eye is upon the motor world, and there was only time for a casual glance at the vehicles as they stood ready for the start. It was a less motley collection than has previously been assembled for the annual run to the seaside. The first impressions of "the man in the street," who lingered to gaze upon the motor-

cars, were distinctly favourable and expressed with something less irritating to the motorist than the doubtful compliments that were hurled at the vehicles on the first anniversary run. Most of the cars were attractive in general appearance, and several were decidedly distinctive—Mr. C. Jarrott's 10-h.p. De Dion quad. and Earl Russell's American car to wit. British makers were represented by many stylish vehicles, in which comfort and luxuriousness combined to demonstrate how great has been the advance of these latter days. The thin long line of cars stretched right away from where the Horse Guards Avenue debouches into Parliament Street to far along the Embankment, and the crowd was as interesting and varied as the cars. At one corner a butcher boy conferred with the shoeblack—each doubtless thinking of the effect of motoring on his particular industry, and two or three noble lords were eagerly scanning the splendid Panhards, Daimlers, Napiers, Motor Manufacturing Co.'s., vehicles and other monarchs of the motor world, while the new voiturettes secured the attention of connoisseurs.

Such reflections must stop, for, as I was remarking,

coming of a Lord Mayor's show. At the top of the street there was a block in the traffic—not, be it known, an unusual thing in London, thanks to the frequency with which the streets are "up." So we waited awhile. The moment was not without interest, for in the gutter to the left, a motorist had lain his cloak in the roadway under his car, and had thrown himself between the two. Such devotion to the cause is heroic. His feet were within a few inches of the passing horse-drawn vehicles, and a swerve on their part would have prevented him ever pedalling again. But I would point out that these are not the days for such displays of self-sacrifice, and that such a performance was more suited to a secluded by-path and not a fit argument to place in the mouths of ribald busmen and unsympathetic cabbies. Whether the act was intended to bring fame unto the man who thus showed his dexterity, or whether it was merely a trial of skill, I know not. But if the idea was to have his name emblazoned on the Automobile Roll of Honour, I will give him disappointment by declining to print it, and pass by the incident—as I did by the man

SNAPSHOTS AT PORTSDOWN HILL.

punctuality is an attribute of the Automobile Club. I mounted the rear seat of No. 74, a Parisian Daimler, driven by Mr. Percy Richardson, by whose side sat Mrs. Richardson, about to make her *debut* in connection with such runs. In the 1,000-mile Trial I was on the last car that came to town; on this occasion I varied the position, being on the last car to start in the procession from London. There were others that left later, but we were at the rear of the procession. Such a place gives the journalist his opportunity. Had I been with Mr. Mayhew or Mr. Edge ne'er a car would I have seen on the way. They were the pioneers who never lagged. But from the rearward one has a delightful vista of the vehicles that sulk by the roadside, and even turn up narrow lanes to hide the blushes of their drivers.

And so we waited until the cavalcade had turned into Parliament Street and then went along in splendid isolation, securing the concentrated applause of the crowd. The last man in an automobile procession is always as sure of a good reception as the mail cart driver who proudly goes his way prior to the

himself. What I didn't like about it was the bold effrontery of the deed—in Parliament Street and with Big Ben ready to strike ten.

At last the block was relieved, and we were free to continue our journey, following Mr. Henry Edmunds (on whose car was a profusion of chrysanthemums that formed a bright inducement for us to keep it within view) briskly into Birdcage Walk, along Eaton Square, and into the King's Road. There we saw a Locomobile with a silk hat appearing above the hood and evidently not on holiday bent. Leaving that behind we got into Putney and saw Mr. Edmunds again. He was investigating matters, and from the front seat of the car Mr. Staplee Firth was an interested spectator. Often has Mr. Firth explained to magisterial minds the ease and absence of excessive speed in connection with automobilism. There he sat, a witness to what he has so often proclaimed. He seemed quite resigned to his fate as we drew up. Finding Mr. Richardson was of the party his optimism returned, and he asked Mr. Edmunds to state his case for appeal to my

driver with a clearness and precision that was authoritative. The arguments *pro* and *con* for non-stop runs against occasional stoppages having been briefly stated, there was a short flow of petrol talk, and after a few moments a waving of the chrysanthemums testified to the movement of the car. All this time we were on the move; and then we drew away accompanied by Dr. Lehweß, who soon swept on ahead, and the Krieger car that went on swiftly, silently, and strongly. On Putney Hill the Motor Manufacturing Company's wagonette was making its way, and then, we, too, went along and soon got into the wake of the electric car that was mounting the long ascent as though it were a familiar path.

Now we began to overhaul the cars that had got away so promptly in the morning. An Orient Express was resting, then the Dechamps car was taking things easy, and we said farewell to Mr. J. H. Gretton on his Motor Manufacturing Company's 6-h.p. phaeton, which was going across Wimbledon common very comfortably. A Decauville was the next to be left behind, and then for awhile we were alone. Women were interested spectators of our progress. They stood in their doorways and in groups chatting pleasantly enough, their conversation being diverted from their neighbours to the passing cars—a change for which all should be grateful. Several motor-cars, many of the Benz variety, came in an opposite direction, and all along the route they were to be seen, evidence that ours was not merely a transient cavalcade, but could be accepted as positive proof of the existence of an industry which is steadily growing to great things. Our little party on board the trusty Parisian Daimler was settling down to conversation when the noise as of a rushing wind swept by, and we saw a figure crouching on a peculiar-looking aluminium case whiz past in a style that defied asking questions. It was Mr. C. Jarrott travelling up to the legal limit on his new 10 h.p. De Dion quadricycle. Now, Mr. Jarrott has been on a similar machine before, and the fact that the rider was none other than he was sufficient for Mr. Richardson. We had heard of his prowess as a motorist, and although at first sight he appeared to be going considerably quicker than our own car, it was clear to all of us that he was merely endeavouring to sustain the reputation of automobilists for keeping within their legal rights. Evidently we were falling below what we could legitimately do, and so getting along to top speed we made the leaves fly and the children shout as we scurried after the aluminium body whose glistening sheen fast disappeared in the distance. On we went, past houses and policemen, round corners and up the inclines with equal celerity until we came alongside of Mr. Lyons Sampson on his well-known hooded Benz car. And then we were content.

So far, incidents of automobile interest had been few, and the roads had been remarkably good. Nothing had thwarted the universal progress until just before the ancient Borough of Kingston Mr. T. B. Browne was discerned mournfully contemplating the discomfiture of a tire. In difficulties of this sort a philosophical spirit is absolutely necessary, and, judging from the alacrity with which the owner of the Panhard prepared to return to town, I should say Mr. Browne has acquired that calm quietude under perplexities without which no motorist should venture out on a long expedition. Another Panhard that was seen somewhere in this locality was a great 'bus, with five passengers in an exalted position. They towered above the common and ordinary vehicles of the road, and were the commanding objects along the route as they passed. The motor 'bus, which has a capacity for ten passengers, did splendidly on the way down to Southsea, and was able to form into line for the start on Monday—about which more in proper sequence. Two of the Thames Valley Company's public service vehicles next attracted attention, and just before the next steep hill—and it was a hill—a Locomobile was seen backing into the kerb, probably to allow us to pass without deviating from our position in the central portion of the roadway. I take this opportunity of thanking the driver of No. 109 for his consideration. It was a curious sight to see about a score of cars climbing, crawling, and crouching up that hill. Some seemed as though it were a trial that has to be endured, but not enjoyed. Still they mounted the hill motorfully. Of course, we went along bravely, passing, first, Mr. N. B.

Kenealy's Benz car, and then, after a little contest, Mr. Harry Livesey's Marshall car, which was making very good running. Then going ahead of a Gladiator voiturette we drew in front of a Motor Manufacturing Company's wagonette with a heavy load of press men. Included in the number was a colleague whom I had last seen seated on a boiler. I was glad he was there, but I wondered what had become of his earlier seat. That worried me to such an extent that I rejoiced at a stoppage which was called a few minutes later. There was a great concourse of motor-cars of every sort and size, and it was evident that our car had made good leeway. But although the sudden halt had promised excitement, it turned out to be a very mild official affair, only calculated to bring us closer together so as to make an imposing and befitting show in passing through the busy streets of Kingston. Being nearly in the centre of the group, our car had a splendid chance of showing off its effectiveness on the circle; and it did. For as soon as command was given to restart, we caught a crab and slewed round to the right—about—the rear wheels coming to position about two inches from the kerb. Fortunately, there was a lamp-post to which I was prepared to spring on the event of further gyrations. But we didn't move. With our faces turned Londonwards, we encoun-

MR. MARK MAYHEW'S 16 H.P. NAPIER AT PORTSDOWN.

tered the gaze of about three score riders on the cars, Mr. Richardson's playful allusion to our early return being regarded in hardly a serious vein. Again we fell to the rear of the procession, and prepared to overtake those whose smiles of sympathy had seemed to be akin to grins of satisfaction. I hope I am not misjudging anyone.

In the closing up of the ranks which took place at the halt, the driver of Locomobile 109 had made good his position, and must have got ahead during our reverse, for he was next seen standing at ease beside his car. Going up behind Mr. F. H. Butler's white steed, upon which Mr. F. R. Simms was a passenger, a Decauville was heard a little way ahead, and then a flag was discerned bearing the device by which that vehicle was made known to the public all along the route. In Kingston's main street a goodly crowd awaited the procession, and although there was nothing like enthusiasm there was plenty of interest evinced, a streamer across the street giving welcome on behalf of the Kingston Motor Company. Thanks to the position of the town, its pleasant location, and its good roads, motorists have always favoured this locality and automobiles are not unfamiliar sights, but never before has such a varied collection of vehicles passed before the royal stone in the space of a couple of hours as filed by on Saturday.

The view from the town as the Thames comes in sight has been often described, and is familiar indeed to motorists. There was hardly time to appreciate its beauties, for traffic was fairly heavy, and the cars were buzzing along with splendid persistency. We saw Mr. Firth again just after leaving Kingston, and from his coign of vantage he was still observing the lackadaisical way of some cars—and also, but this is not to be heralded abroad, the energetic bustling spirit of others. Distance between vehicles increased as we gained on Sandown racecourse, and entering into the feeling of the place quick running was indulged in—with strict observance of the regulations of Captain Sant—to Esher. At the latter place a De Dion quadricycle was resting awhile. There was plenty to keep us busy on the road. We went beyond the Daimler Motor Company's wagonette with Mr. MacLeod driving, and remarked on the fineness of the day to a gentleman who appeared to be in charge of a steamer that was waiting for its driver on the roadside. Then a tinkling of bells a little way ahead caused us to look neither to the right nor to the left; for it proceeded from the rather ungainly American car on which Earl

to Guildford were a Pieper car, No. 120, Mr. J. E. Hutton's voiturette, a Locomobile, and one or two others that being unnumbered must remain unknown. On the way we saw a postman mounted on an antiquated tricycle, evidence of the old-time ideas that still animate our public services.

About noon we got into Guildford, turning off at Quarry Street on the left to go to Godalming, *via* Shalford. Here the company was joined by Mr. R. Dennis on his Speed-King motor tricycle with a trailing car attached. Passing out into the open a lovely view was unfolded, and from one side of the green we could see cars running on their way. Four miles of delightful road having been traversed, we reached Godalming, at the entrance to which a group of three private cars and a knot of sturdy youngsters gave us greeting. The police were assiduous in directing us to hostelryes, and nothing of their alleged antagonism was seen. In fact, only one policeman had I discerned on the journey from Putney to Godalming.

The town is an ancient one and originally an industrial centre. Little of its old records and few of its early glories

THE CLEANEST CAR, NO. 78, INTO PORTSMOUTH. MR. EDMUNDS TAKES THE MAYOR ABOARD.

Photo by

[West & Son, Southsea.]

Russell was mounted, and which must have been going along very well. Mr. Manville on his 6 h.p. Daimler was too busy to keep up a running conversation, and dropped the dialogue to look at his engine. Then leaving a Clement-Panhard voiturette, Mr. W. M. Hodge's, a Motor Manufacturing Company's voiturette, and a couple of Benz cars, we steadily forged across Esher Common to Cobham. A few cars passed us, and Mr. Harvey du Cros went along in capital style. Before entering Cobham's wide street, and glancing at the White Lion, where resides a motorist famous in Surrey, the dark green Daimler car belonging to Mr. Alfred Harmsworth was seen, the steering wheel being in charge of Mr. C. Johnson, the secretary of the club. Between Cobham and Ripley two new voiturettes were going gamely—viz., that of the Motor Manufacturing Company, with Mr. Burgess driving, and that of the Daimler Company, Mr. E. W. Lewis at the helm. Between Ripley and Guildford—a road familiar to motorists and cyclists alike—several vehicles were seen, and among those that went ahead to be earlier down the decline

were seen by the motorists. Some went to the Angel, not for the excellent copying of an old style of architecture which can be seen, but for luncheon. Others adjourned, as did Peter the Great about two hundred years ago, to the King's Arms, where the earlier arrivals made an excellent meal. In the yard of the King's Arms a fine crowd soon gathered, and cheery were the accounts that succeeding arrivals brought of their doings. Some took the opportunity of overhauling their motors, and Mr. Hutton put in a few minutes of useful work. Mr. C. S. Rolls left his motor-tricycle and took refuge on the car which Mr. Hargreaves had driven, little heeding the fact that only after midnight on the previous day had that gentleman been summoned for alleged furious driving. Upstairs, Mr. Mark Mayhew and Mr. Friswell were replenishing before going on the second stage of their journey, Mr. Roger Wallace was ignoring electrical development and automobile advance for creature comforts, and three score automobilists were likewise indulging. As we emerged from the luncheon room, Mr. Edmunds was coming

along with Mr. Firth, and Mr. J. J. Mann also turned up, having had a good passage. There were no tales of woe, and the trials and tribulations had been comparatively few. As for the vehicles that we had seen strewn along the roadside, it was evident many were coming along, and would be there in fair time.

Luncheon over, a re-start was made, and past the old market-place we soon got into the centre of one of Surrey's most lovely districts. Nestling behind the hedgerows were pleasant-looking cottages, around whose doorways were grouped interested spectators. Here and there were small gipsy encampments, whose strange-looking occupants recalled us from the modernities upon which we were travelling to old-time travel of antique aspect. The first car to overtake No. 74 was the Motor Manufacturing Company's vehicle, upon which rode Mr. Roger Wallace, the president of the Club, freed, for the nonce, from speech-making, and evidently enjoying a practical experience of the sport he so warmly espouses. The wind was blowing keenly in our faces, reminding us, despite the warmth of the morning, that it was not always summer in November. Beyond Mr. Hargreaves, no other driver went away to the front, and judging from his prowess in his own county it would have been remarkable had he not, with his 12-h.p. Daimler, gone

reverend gentleman who appears in Mr. Sydney Grundy's "Debt of Honour." How the broom-makers who, a century ago, settled near here to carry on their trade amid these luxurious heathlands would have been surprised and alarmed at the modern invasion! But times change and ways differ, and so their descendants living in the old cottages here about welcomed us with smiles and looked not in the least disturbed. In fact, some appeared to commiserate with the puffing and the blowing of some of the cars that struggled on the long ascent. Midway the prospect to the right was worth all the trouble, and some of the cars stopped there that their riders might have an uninterrupted view of the country around. Away to the left was Haslemere, the land of artists, and singers, and writers—Bohemians who are recognising that the motor-car is no enemy to their social instincts, but rather a helpmate and a friend. With a British motor-car geared to take hills, what a time one could have on these heathlands of Surrey. All these reflections and many more occurred as we wound our way up Hindhead. Earl Russell, Mr. R. E. Phillips, and one or two others seemed to be going well, and Mr. Lacy Scott was doing his best, but whether he would make a record run only the timekeepers can tell. Right on the top of the elevation was another gipsy encampment, from which

A GROUP OF DAIMLER CARS ON SOUTHSEA COMMON.

[Ar. ent Archer.

ahead of his smaller-powered brother in metal. Mr. Rolls had abandoned his tricycle—possibly led to such a conclusion by the cheerless aspect of some of the motor-tricyclists who came along—and, comfortably seated by Mr. Hargreaves, seemed content to trust himself with the hero of about three summonses within a month. Fortunately, Mr. Firth was a participant in the tour, and was making a very useful study in the vagaries of compression, which should stand him in good stead should the police require the attendance of any who drove on Monday—which, judging from the times up Hindhead, is hardly likely. And so we went on to the Devil's Punch Bowl to feast our eyes on Nature in her most lovely aspect. There was little of the break-neck order of running here visible, and I should have liked to have stayed to render a helpful arm to those that were inclined to linger by the way. We managed to do the journey by the spot where the "barbarous murder" was committed in twenty-two or twenty-three minutes; but others must have taken double that time, judging by the leisurely ascents that were being made. Somewhere along the line I fancied I discerned a cruel man taking an animated photograph of the scene, and remembering the police warning, vainly imagined that the authorities were becoming up-to-date in their methods. After all the operation was merely with a view to a public exhibition "in a place where they sing"—to quote from the

came a crowd of youngsters, almost like little Boers, to look askance at our coming. A few yards ahead was a car in trouble, but without a number. Possibly it had fallen off in the ascent, and would be restored later during the day.

So far the roads had been splendid, and no thoughtless surveyors had laid obstructions, nor had they placed menaces to tires. But before reaching the river Wey we went over about a hundred and twenty yards of nicely raised stones of medium size. Fortunately they had no sharpened edges, but just beyond we saw Mr. Phillips looking for things by the roadside. And then another length of road gave us further cause for congratulations at a second escape. Just before entering Liphook—forty-six miles from town—a third piece of bad road had to be negotiated, and personal congratulations turned to severe denunciations of local authorities and other heedless and careless bodies. Why cannot such patches be rolled when it is known that great processions of motorists are passing. Such conduct reminds one of the antics of the turnpike people of Scotland in the latter days of William IV. They piled great boulders on the roadway to stop the progress of the steam vehicles then plying for hire; now we have become more refined, and content ourselves with picking up long stretches, over which cars can bump along, and only the good quality of the tires saves them from unpleasant consequences. A good road enabled us to get to

Rake very quickly, and there we saw a demure-looking official in blue uniform—the first we had seen since Godalming. I thought I would like to get his impressions of the forward cars as we passed, and opened up conversation by remarking "Good-day." He evidently misunderstood me, for he was out of sight before he had time to reply—and we were, of course, only going at eight miles an hour, seeing we were so near a large village. Should his eye see this I hope he will be more civil on the next occasion he is addressed by a steady-going and law-respecting motorist.

On the hilly road between Petersfield and Portsdown our car began to jib a bit. It had gone well along but in the next few miles the burners went out more than once. Still they did not necessitate stoppages for more than a second or two, so we can claim the non-stop diploma with a clear conscience. On by Oxenbourn Down and Horndean there was little of note save the increasing coolness of the air and the gathering twilight. Near Waterlooville Mr. W. J. Peall was looking for his cue—on this occasion a little petrol sufficing to give him opportunity for a good break into Portsmouth. From Portsdown Hill the grand procession had just gone to be reviewed by the Mayor as we neared our destination. Again the advantage of position revealed itself, for the crowd that had turned out to greet the great cavalcade was returning to the naval town, and we were able to secure the united plaudits of the public.

Mr. Mark Mayhew with Mr. Rolls on the former's 16-h.p. Napier, Mr. S. F. Edge on the car that requires no name to make it clear, Mr. Cecil Edge, Mr. F. F. Wellington, Mr. G. Iden, Mr. G. H. Smith, Mr. Ilsley, and others. They caught the sunshine; we had the showers that follow bright days.

Deserted thus by the Sabbatarians, we sojourners till the Monday and travellers by the correct route were further weakened in numbers by the fact that many decided to return *via* Godalming in preference to the longer route through Winchester and Basingstoke. Consequently when the cars lined up on Southsea Common about half past-ten in the morning they were occupied by no mere fair weather travellers. We were the devoted ones, prepared—mainly because there was no way out—to follow the secretarial pennant if we soaked our skins in the effort. And it was an effort. Mr. Argent Archer brought forth his camera—a camera that had been able to contrast both automobile and railway travel on the previous day—and buoyed up with patience, at length succeeded in getting a full view of the vehicles that were starting. Behind the overgrown 'bus were a dozen other cars, but our picture fairly adequately represents the happy party that responded to Mr. Johnson's call and dared the rain to drop its heaviest, which it did after awhile.

For nearly half an hour the rain ceased, and we waited a few minutes to take a farewell glimpse at the Esplanade

Photo by]

THE START FROM SOUTHSEA COMMON FOR THE RETURN JOURNEY.

Argent Archer.

Down into the town we went in the darkness, and wending our way into the traffic arrived in front of the Town Hall in good style. Mr. Richardson's respect for the club regulations had favourably impressed me all the way; his cautious manoeuvring through the busy thoroughfares demonstrated his marked ability in that direction, and now I felt proud of my host when the whisper went around the councillors, with the Mayor (Alderman Emmanuel) that our car was the cleanest that had appeared. We went to the Drill Hall almost hugging the cup that Mr. Alfred Harmsworth had promised to the car that arrived in Portsmouth with the best appearance. But alas! at the subsequent dinner we learned that a cup actually in the hand is worth two anywhere else, for it went to Mr. Edmunds, the honour of second place being assigned to No. 74. Mr. Manville on No. 84 was accorded third mention.

Looking out of my window at 6 a.m. on Monday, I saw some rain descending, and returned to slumber awhile. Two hours later there was more rain, and the gutters ran mud—a damp prospect for those who were endeavouring to be obedient to Club regulations, and who had decided to take the prescribed route to London. Several had returned on the Sunday, taking advantage of the sunshine to make pleasant a renewed acquaintance with the Surrey lanes and the magnificent glories of Hindhead. Among those wise but rather wayward followers of the Club were Mr. C. Jarrott, on his "little beauty," Mr. Roger Fuller, on his De Dion,

and reflect on the faded glories of Saturday's dinner at a certain hotel along the front. The little dog in the car ahead, No. 38, began to look cheerful, and then with a loud toot-toot from the first car the journey was begun. I had changed from the Daimler Parisian to the new Daimler voiturette which was driven by Mr. E. W. Lewis, who had come up from Coventry with the vehicle on the preceding Friday. It had done splendidly so far, had been among the early arrivals at Portsdown, and promised to get along as rapidly as possible between the raindrops. Turning from the Common into Portsmouth we saw a crowd round the first corner, and from the centre a playful little flame revealed a sign of warmth that would have been welcome were we not so anxious to get on the journey. "Throw it into the sea," shouted one observer as we came up alongside, scattering the small boys who were bringing chestnuts to bake. Fearing trouble, Mr. Lewis dismounted, to discover Mr. Richardson battling with the flames, and his passengers encouraging him to renewed efforts. Apparently while waiting on the Common one of the burners had gone out—a fact only discovered just after starting. The petrol had flooded the wick, and the application of a match secured the fiery effect that had proved so attractive to the natives. That little incident over, we bade farewell to the Town Hall at eleven o'clock, and proceeded to our work of looking after the laggards, keeping closely in front of the 6 h.p. Daimler

Going under the railway arch we fancied we heard a little cry of surprise, and looking round, saw a car standing without occupants in the roadway. Rapidly reversing, we again drew alongside. Standing in a line by the railings was a merry party of four hugely enjoying themselves, the ground in front being strewn with wraps, leather jackets, and other miscellanea. Explanations were necessary, and after the universal laughter had subsided, we got a connected account of the incident. Seated in the front, Mr. and Mrs. Richardson had gradually become assured of the presence of a foot-warmer. The former knew that nothing of the kind had been there at the start, and wondered. Meanwhile the heat increased, and at last both occupants jumped. The rear passengers jumped too. Evidently the fire had been smouldering, causing a warmth that was strongly apparent. Fortunately it commenced to rain a few minutes later, and, as it never ceased the whole of the journey to London, one worry was off our minds. We should have no roasted carcasses to tow into the dépôt. But we kept closely in sight nevertheless. A few hundred yards further a stop was occasioned by the railway gates being closed, and Mr. R. W. Buttemer had dismounted his Benz car to take snapshots. But he was too late for the unexpected; that had happened by the railway arch.

Leaving Cosham, we ignored the main road and took the by-road to Fareham and Bishop's Waltham for Winchester. The roads were distinctly different to the hard surface we had encountered on Saturday. They resembled a custard of a khaki hue, through which we splashed and sploshed, sending out streamlets of mud to accumulate in little heaps on either side. No cyclist could have ploughed his way successfully through some of the lanes, and once, when No. 74 drew ahead twenty yards, we hardly recognised the spick-and-span car that had been placed second by the judges for neatness and cleanliness. On and on we went until Fareham was reached. Evidently we were gaining on the cars in front, and up the steep hill that leads from the town Nos. 74 and 139 went in company and at a good pace. The way our little voiturette was taking the hills and spraying the mud was glorious, and its 4-h.p. motor was tugging with an earnestness that made optimists of us all. For the heavy roads would assuredly retard some of the bigger cars in front. Strange it was that we had found none by the roadside so far—if we can except a small voiturette, by the side of which a brother journalist was standing as one who would not be comforted, between Cosham and Fareham.

But ere Bishop's Waltham was reached we discovered Mr. A. Burgess on a 6 h.p. Motor Manufacturing Company's vehicle, and shortly after Mr. J. J. Mann, on his 12 h.p. Daimler, was making his way through the storm. For it was nothing like an ordinary shower, and as we got from the shelter of the thickly overhanging trees the wind blew as though it had been inspired by a multitude of cabbies anxious to settle motoring for ever. What with the wind and the rain hitting our faces with the incisive sharpness of a whizzing bullet the experience was rather chilling. And in the tree-sheltered lanes we had little compensation, for instead of the sharpest wind we had the heaviest raindrops of the year pelting down with force upon our soaked garments, and making full points at every fall. The ladies on Mr. Richardson's car bore the ordeal well. They managed to handle umbrellas with a dexterity that deserves public recognition, and as our car travelled after their vehicle the rearward appearance with the umbrellas shining in the rain and the mud playing a duet with the drops from above was one of variety and ever-changing pleasantries. And this was all in the course of an anniversary tour. Would that we had been running round the fish-ponds in the nave of the Crystal Palace.

Coming along we had another capital run after No. 74, which was going splendidly. Evidently the little friskiness of the early morning had fired the car with an enthusiasm for the road, and it was going well indeed. A little further we came across a herd of bullocks whose meek eyes were turned towards the two cars. As is customary with their kind, they placed themselves at various angles to the oncoming objects, and after an almost unobtrusive approach, we were in their midst with quite a score of beasts running ahead. They were evidently inclined to race, and it required a little gentle music to get them out of the

way. Later we saw Mr. Hargreaves on his car with its head meeting our view. But the rain pelted too incessantly and too vigorously to permit of any stoppage, and so we went ahead, passing Mr. J. H. Gretton on his 6-h.p. Motor Manufacturing Company's car. He was going along with the tenacity of the Briton who has put his hand to the wheel and will not turn back. At various points on the way comfortable inns were passed and clean-looking villages were being washed; but we ignored their charms and heeded not their attractions. The honour and credit of the Automobile Club were at stake; more than 130 cars had left town on the Saturday, and only a few were returning on the official road. Hence the necessity for those who were returning to scorn delights and spend laborious hours in ploughing through the mud and slush.

Bishop's Waltham was one of the most lovely places *en route*. Just outside the town, in which there seemed to be a fair amount of building going on, is the fine ruin of a palace belonging to the Bishops of Winchester. In olden days the town was the scene of much Royal festivity and hunting; its quietness is now rarely disturbed. At the top of the next hill out of the town the Daimler wagonette was seen, the driver serious at the wheel and a subdued party behind. Even the most cheery passengers seemed inclined to quietness, and a saddened spirit of hopeful determination was aboard. They intended to lunch at Winchester. The next to be overhauled by our safe little voiturette was Mr. C. Johnson, carrying a full complement on Mr. Harmsworth's car. He was very intent on the journey, and although it was not likely he would appear first at Whitehall Court we wished him a good run, and ran off ourselves. Mr. Austin was next discovered paternally regarding his Wolseley voiturette, which was suffering from an attack of short circuits—a subject of dry interest on such a day.

Nearing Winchester we found a bit of road that contrasted strongly with the mud through which we had progressed. For a distance of about two hundred yards on the brow of a pretty stiff hill the road had been laid with fine large stones about four times the size of those usually employed. We saw them from the bottom of the hill, and we also saw the backs of several people who were applying pressure to the rear of a motor-vehicle. No. 74 was lost to sight. We went up on to those stones and got safely beyond just as Mr. Mulliner had been assisted to a similar height. In Winchester we passed Mr. T. B. Browne's Panhard with the hood up. Behind that hood were two passengers whose view was of the most monotonous character imaginable. But their faces were comparatively dry, and they were saved from the biting of the wind—which was a real tangible thing that could be felt.

After Winchester not a single car passed our little voiturette. At the Red Lion, Basingstoke, we found No. 74 had arrived five minutes before, and that Mr. Moffatt Ford, on his Decauville, had preceded it. The first arrival had been Mr. C. Cordingley and party on his Motor Manufacturing Company's Marlborough phaeton, which had started rather earlier from Southsea. He had had a good passage through to Basingstoke, and the car had been going splendidly right through the trip. By arrangement with some other motorists, who were returning that way, Mr. Cordingley had ordered luncheon for fifteen at the White Hart Hotel. He was there within two minutes of the appointed time; but the others were still toiling in the wet. So the first arrivals set to work on the luncheons, and on their behalf I now apologise to those of the fifteen who may have had to be content with the cold shoulder. They can accept this assurance that the hot joints were satisfactory.

Under cover in the yard a few more cars were seen as we emerged to follow the Decauville, the Marlborough phaeton, and the Parisian Daimler. Mr. J. H. Gretton had come in very wet and disconsolate; Mr. A. Burgess assumed a cheerfulness quite out of keeping with the climatic conditions; Mr. J. J. Mann went straight to the dining room, and Mr. T. B. Browne settled down to half-an-hour's work on his tire, the cover of which had burst. Evidently his party were prepared for a long stay. Setting forth on the next stage we found the rain still as attentive as ever. Our route lay through Nately Scures, Hook, and Hartley Wintney, up to Hart-

ford Bridge. It was a bleak run across Hartley Flats, and we pitied the pedestrians as much as we thought of ourselves. Mr. Lewis had never been on that road before and would probably have grown enthusiastic over the scenery; but who could wax warm under such conditions? Why do not the makers of motor-cars couple a foot-warmer with the circulating water and so make the pedal extremities bearable. That, however, is another story, as Rudyard Kipling would say.

Running into Blackwater we discerned a large car with the hood well opened in the distance. The yellow band indicated the ownership, and with a merry toot-toot (almost the only cheerful note we had sounded that day) we made after it. But the driver heard us coming and put on top speed. Leaving the Royal Military College on the left, we scurried up a hilly road and up Penny Hill into Bagshot, gradually gaining on the car in front. The roads were heavy and wet, and, bless the belt, it was slipping. Twilight was coming on, and we thought it better to dress the belt than run the risk of being stranded in a military district at that hour of the night; and so hastily dismounting, the operation was performed, the lamps were lit, and we were soon ploughing again. Over the hill into Bagshot, and then we got into the darkness of the heath beyond. Up the hills we went, our own momentum helping us considerably, and on through Sunningdale, where we hurried across the train lines just in time to avoid a lengthened stoppage, and then at Virginia Water we stood outside the Wheatsheaf five minutes after Mr. Cordingley had reached that hospitable place. Here we came across a De Dion voiturette that had started from Southsea early, but the driver had mistaken his road, and had had a longer run, with less pleasure, than the rest of the party. But the day was drawing to a close, and we entered upon the last stages for town, whither Mr. Richardson and Mr. Ford were the only motorists who had preceded us. Into Egham we went without adventure, and then into the long, wide main street of Staines, where we saw a Benz car with the hood up—just as though the passengers had settled down for the night. Leaving Staines we got on that long, solitary road leading to Hounslow, meeting few vehicles, and the only trouble being with the great railway carriers' wagons that would persist in keeping to the centre of the roadway. But we made the pace—the legal pace—for all that, and through Brentford and Hammersmith we made our way into London. It was striking 7 p.m. as we passed the Trocadero, into which a couple of automobilists were just going for dinner, and then along Shaftesbury Avenue. Mr. Moffatt Ford had arrived well and wet, and Mr. Richardson's party were comfortably before the fire as we strode into the dépôt of the Daimler Company. And thus ended a memorable trip, in which the British climate had exceeded itself. Saturday had been a pleasant day, Sunday was charming as a warm day in June, Monday was about as refractory and as unconvincing of British geniality as any I have ever endured. But the distress was over, and it was not a difficult matter to quickly forget our own discomforts in contemplating the worse troubles of those still on the road—as far distant as Basingstoke, and even, it might be, Winchester.

THE DINNER AT SOUTHSEA.

At the Esplanade Hotel, Southsea, a large company assembled on Saturday evening to indulge in petrol talk and dinner. The preliminary proceedings in connection with finding seats were interesting, and, in some cases, not without a glow of excitement.

The Hon. J. Scott Montagu, M.P. for the New Forest Division of Hampshire, presided, being supported by the Committee of the Automobile Club, and practically all who had taken part in the trip. The toast of "The Queen" having been loyally honoured that of "The Prince of Wales and Members of the Royal Family" was drunk with heartiness, the chairman remarking that the Prince was now in the ranks of automobilists.

The chairman then gave "The Mayor and the Reception Committee." He referred to the splendid way in which Portsmouth had welcomed the motorists, and said it was particularly kind of the Mayor to attend their gathering—an event occurring so recently after the Mayoral banquet. The toast was accorded musical honours, and the Mayor, on rising to reply, was received with three cheers and the singing of "He's a jolly good fellow."

His worship expressed the pleasure it gave him to welcome the automobilists to Portsmouth. He hoped they had enjoyed their ride from

London to Southsea, to the pleasure of which the fine day had contributed. He believed it was the first time that they had visited Southsea in such a procession, and he had pleasure, on behalf of the town, in hoping they would visit the borough again in the summer when it was daylight and the people could see the vehicles. If such an event were arranged, he would be pleased to give a ten-guinea cup and a second prize of five guineas, for whatever the committee of the Club should decide. They had had a good reception in the town, and the Chief Constable and the police had done their duty well in leading the automobilists into Portsmouth. He was sorry that the inhabitants had not had the opportunity of looking at the cars. Therefore, he hoped that as many as possible would accept the invitation for the summer. They certainly could be assured of a most hearty welcome. He congratulated the Club on the possession of such an enterprising secretary as Mr. Johnson. With regard to the competition for the cleanest car entering the town, his worship said they gave a maximum of 200 marks, and 192 had been awarded to car No. 78, owned and driven by Mr. Edmunds. No. 74 was second, and No. 84, belonging to a gentleman well known in Portsmouth, Mr. Manville, was third.

The chairman submitted "The Act of 1896"—the charter of the road to all automobilists. As most of the audience were aware, attempts were being made by public bodies to drive them off the roads. He did not believe that the efforts would succeed. It was notable that the same arguments which were used sixty years ago on the introduction of the railways were being applied to motor-cars. They were told they poisoned the air, that they frightened horses, women, and children; that they meant ruin to the tradesmen of the country, and all kinds of dreadful things were prophesied. Motorists were still on their trial before the public, and if they would take his advice as a humble member of Parliament they would not agitate for any alteration in the present Act. When they had more chance of making their voices heard, and had made more converts among the general public, then they might get some alterations in their favour. But at the present moment there was undoubtedly all over the country a very critical movement going on. Since history began man had been endeavouring to tame horses, but he did not know that anyone had succeeded in training the horse as a domestic animal. But they must be tolerant of the prejudices of others. They must recognise that there were people in this country who were slow to move, and who preferred the antiquated form of conveyance to mechanical traction on the roads. He (the chairman) asked all members of the Automobile Club to show every consideration to all users of the road, and to take every opportunity to convert people to automobilism. He had never heard of anyone having had a ride on a good car remaining unconverted. They always imagined that the thing was going to run away or blow up, or something else as bad. Progress had been made in the conversion of the House of Commons in the past year. Peers and M.P.'s were taking more and more to the sport, and he had himself started Mr. Arthur Balfour on his career as an automobilist. Now it remained for automobilists to appease other users of the road, and then in a few years' time their future would be assured. He coupled with the toast the name of Mr. Roger Wallace, the president of the Automobile Club.

Mr. Roger Wallace, in responding to the toast, said the chairman had given very good advice. In this country the Legislature generally managed to impose regulations which, in the first instance, tended to throttle the industry. This had happened in the case of the electric light. For twenty years the industry made no headway in the country because of the restrictive legislation imposed. But now to a certain extent all that had changed, and they saw in Portsmouth a very remarkable example of how the electric industry had developed. The Act under which automobilists existed at the present moment was an Act which removed to a certain extent the difficulties in the way of driving motor-cars and light vehicles. He was sorry to say it had not done so much for the heavy traffic as they hoped it would. They must not forget that there were others in the north of England, and in Liverpool especially, who had given a great deal of attention to this question, and thus be able to successfully represent the whole of the industry. They must not merely consider one part of the industry. They could not expect to have the Act altered for some time to come, and they must be content to go at the slow speed to which they were restricted. They must not be aggressive; they must not, because anybody held up his hands, address him in an antagonistic manner. If they did that kind of thing they would never get any alteration. He hoped automobilists in their various districts would endeavour to convert county councillors and others to look favourably on their movement.

Alderman Ellis proposed the health of the chairman. He (the speaker) was the first in Portsmouth to own a motor-tricycle.

In reply, Mr. Montagu said he regretted he had been absent from the run to Southsea. He certainly was not a novice in automobilism, having begun by practice on the footplate of a locomotive. But motor-car driving had given him far more pleasure than engine driving ever did. He intended to do what he could in the House of Commons to help their movement. He always tried to show consideration for people on the road, and if all would adopt that attitude they would go far to create a favourable public opinion in the country. He was glad Portsmouth had given such a cordial and representative welcome to the club. With regard to the resolutions now being passed by County Councils, a great many would be on the table for some time. In the south of England a great many more motor-cars were seen than in any other part of the country. In the north, where they had more commercial industries, attention was being directed to

heavy traffic. He hoped to see the steam car industry which had existed at Cowes revived in some form or other in some other part of the country. Several steam cars had come through the run from London in very good form, and that was a source of gratification. An electric car had also gone through the whole way, and he felt sure there was a future for electric cars—especially in towns. They were noiseless and could be easily worked in traffic. In conclusion Mr. Montagu hoped the club would visit Hampshire during the summer, and the local people would be delighted to make their paths easy and pleasant.

The reading of an anonymous telegram received from Oxford concluded the proceedings. It was as follows:—"May your oil cans blow you to Patagonia"—a sentiment which caused much merriment among the fleeing company.

LONDON TO SOUTHSEA NON-STOP DIPLOMAS.

It will be recollected that in connection with last Saturday's anniversary run to Southsea the committee of the Automobile Club made the announcement that non-stop diplomas would be given by the club in respect of vehicles which completed the journey from London to Godalming and from Godalming to Portsmouth without a stop, and at a speed not greater than twelve miles an hour. Stoppages of vehicles which might be caused by traffic, restive horses, etc., were not to be recorded as stoppages in connection with the non-stop diplomas. Claimants for non-stop diplomas were required to lodge their claims in writing, together with four time-cards, at the Automobile Club not later than noon on Tuesday, the 13th inst. We are requested by the club to publish the following particulars of the claims that have been received for these diplomas:—

No.

2. Mr. W. M. Hodges, London Motor Co., Ltd., 6 h.p. car.
8. Mr. G. D. Barnes, 9 h.p. Benz.
27. Mr. A. J. Wilson, Ariel tricycle.
30. Mr. D. Farman, 6 h.p. Darracq voiturette (this should have been numbered 31).
32. Mr. A. O. Bradley, 8-h.p. Panhard 'bus (stopped between Godalming and Portsmouth to assist Mr. Pearce).
35. Mr. C. Friswell, 12-h.p. Panhard.
36. Mr. R. Moffatt Ford, 8-h.p. Decauville.
40. Mr. John French, 6-h.p. Motor Manufacturing Company's car, entered by the Motor-Car Co., Limited.
48. Mr. A. Mulliner, 6-h.p. Daimler Company's car (admits stopping to speak to Messrs. Simms and Butler and to light carriage lamps).
53. Motor Manufacturing Company's 6-h.p. car (admits stopping owing to another vehicle colliding with No. 53).
55. Motor Manufacturing Company's 6-h.p. car.
56. Mr. George Iden, Motor Manufacturing Company's car.
62. Mr. George Iden, Motor Manufacturing Company's car.
66. Mr. A. H. Howard, 5-h.p. Marshall (admits stopping twice: (1) to give Lord Russell petrol; (2) because he was told he had dropped something).
69. Burford, Van Toll, 3 h.p. car.
70. Burford, Van Toll, 6 h.p. car.
84. Mr. E. Manville, 6 h.p. Daimler car.
85. Mr. H. Bevan Swift, De Dion tricycle.
89. Mr. A. A. L. Hickman, 6 h.p. Motor Manufacturing Company's car.
95. Mr. W. O. Dewey, Eadie tricycle.
96. Dr. C. Whitehall Cooke, 3 h.p. New Orleans.
99. Mr. W. Bransom, 3½ h.p. Humber.
101. Mr. F. H. Barker, 7 h.p. Peugeot.
102. Mr. W. M. Hodges, 6 h.p. car.
103. Mr. W. M. Hodges, 6 h.p. car.
122. Mr. A. E. Crowdy, Ariel tricycle.
139. 4 h.p. Daimler.
146. Dr. Lehwess, Orient Express (Horse shying caused belt to break through sudden stop, and this caused five minutes' delay).
60. Mr. J. H. Gretton, 6 h.p., Motor Manufacturing Co.'s car.
5. Mr. H. Austin, Wolseley Voiturette (admits stop for puncture, but claims that punctures should not prevent grant of certificate).

Objections to these claims should be addressed to the Secretary, Automobile Club, 4, Whitehall Court, London, S.W., not later than Tuesday noon of the 20th inst.

On the 6th inst. the action between the British Motor Company, Limited, and Messrs. Taylor, of Nottingham, was heard in the Court of Appeal. The judges upheld the decision of Mr. Justice Stirling and awarded the company damages to the extent of £135.

At the last meeting of the Shropshire County Council the chairman said a communication had been received from the Bucks County Council, asking them to join in drawing the attention of the Home Secretary to the way in which motor-cars now travelled the roads; they suggested that every such car should carry a number in a conspicuous part, that they should be registered, and that the driver of any such car should stop when requested to do so. On the motion of the chairman, the communication was referred to the Roads and Bridges Committee.

A FUEL CONSUMPTION COMPETITION.

(From Our Paris Correspondent.)

ON Wednesday, the 7th instant, I had the pleasure of assisting at one of the most interesting competitions which it has ever been my lot to witness. This was the "Concours de Consommation," an event promoted and organised by the *Auto-Vélo*, and which by reason of its real utility appealed strongly to all interested in the automobile movement. The original idea was to give to each competitor a quantity of petrol according to the classification of his car, and then despatch him with sealed tanks over a certain route. The exact distance

covered would have then been measured, and the official returns would have stated that such and such a car covered such and such a distance on so much petrol. Unfortunately this initial scheme could not be carried out, for the police took exception to the cars running round Longchamp at the finish of the course until they should be *en panne* for lack of fuel. Only notified of this at the last moment, a less resourceful man than Georges Prade would have given the event up, but the representative

of the *Auto-Vélo* quickly hit upon another scheme which if less interesting, was quite as practical. The competitors were required to cover the original route from Paris to Meulan and back, viz., seventy kilometres, but instead of starting with a limited quantity of fuel they set out with tanks quite full. Upon returning to Paris they were required to enter directly into the *contrôle* when the tanks were unsealed and sufficient petrol poured in to refill them completely. By this means the exact quantity of fuel used in covering the seventy kilometres of route was ascertained, data of the greatest interest to manufacturers and public alike. The popularity of the scheme may be appreciated when I say that no fewer than

114 entries were received by the promoters. Of these, ninety-five vehicles actually competed and ninety finished, a veritable record for an automobile competition. Starting at 7.30 a.m., the first cars had nearly completed their journey before the last of the competitors had got under way, and the difficulty of managing this great number of vehicles can only be appreciated by those actually engaged upon the work. M. Prade was fairly in his element, and after seven hours of labour he was able to satisfy himself that an exact record of every car's performance had been secured. But what a work it was, to be sure. Imagine the refilling of the tanks of ninety cars with petrol by means of a chemist's graduated glass, and one begins to get an inkling as to the labour involved. To give all the results would but weary the reader, so I will but quote the best performances in each category.

A.—Cars exceeding 1,000 kilogrammes in weight: 1, Delahaye, 7 litres, weight 1,015 kilos, time 3h. 10½sec.; 2, Delahaye, 7 litres 850, weight 1,030 kilos, time 2h. 58min. 45½sec.; 3, Panhard, 8 litres 400, weight 1,120 kilos, time 2h. 20min. 27½sec.

B.—Cars weighing from 750 to 1,000 kilogrammes: 1, Georges Richard, 6 litres 400, weight 810 kilos, time 3h. 17min. 15sec.; 2, Mors, 6 litres 750, weight 891 kilos, time 2h. 26min. 34sec.; 3, Vigneaux, 7 litres 200, weight 805 kilos, time 2h. 37min. 5sec.

C.—Cars weighing from 400 to 700 kilogrammes: 1, Delahaye, 5 litres, weight 525 kilos, time 3h. 26min. 27sec.; 2, Clément, 5 litres 250, weight 430 kilos, time 2h. 48min.; 3, Noé Boyer, 5 litres 250, weight 420 kilos, time 3h. 6min. 6sec.

D.—Voiturettes weighing from 250 to 400 kilogrammes: 1, Richard, 3 litres 600, weight 300 kilos, time 3h. 6min. 41sec.; 2, Denesle (Corre), 4 litres 200, weight 290 kilos, time 2h. 37min. 11½sec.; 3, De Dion-Bouton, 5 litres 200, weight 375 kilos, time 2h. 49min. 0½sec.

E.—Voiturettes weighing less than 250 kilogrammes: 1, De Boisse, 2 litres 240, weight 215 kilos, time 3h. 33min. 51½sec.; 2, Campagne, 3 litres 700, weight 215 kilos, time 3h. 22min. 53½sec.; 3, Gladiator, 3 litres 900, weight 245 kilos, time 2h. 54min. 26sec.

F.—Quadricycles, two occupied seats: 1, Cormier (De Dion), 1 litre 650, weight 165 kilos, time 3h. 16min. 57½sec.; 2, De Dion, 2 litres 240, weight 240 kilos, time 3h. 20½sec.; 3, Marot, 2 litres 950, weight 195 kilos, time 3h. 30min. 42sec.

The event was largely attended, and a wonderful representative crowd of French automobilism partook of the lunch at the Châtelets du Cycle. Among those present I noticed Baron de Zuylen, Comte de Dion, Comte de Chasseloup-Laubat, MM. Pinson, Fenton, Huillier, Mors, Darracq, Girardot, etc., etc. Other competitions of a similar nature are likely to be forthcoming at an early date, and the *Auto-Vélo* is to be congratulated on the good work it is doing in thus promoting such really useful events.

On Saturday, the Sirene voiturette driven by Mr. W. E. Hart, did not start from London till noon, and then made its way to Southsea in good style and in good time, fully maintaining the reputation gained in the recent 100-mile Trial.

THE Gaekwar of Baroda, who has been staying in Paris for a few days, has become an enthusiastic automobilist. He is to be seen daily in the outskirts of Paris on a motor-car, and it is reported that he intends taking one or two cars with him on his return to Baroda.

MR. E. SHRAPNELL SMITH, the hon. Secretary of the Liverpool Self-Propelled Traffic Association, is a busy man, as everybody knows, yet notwithstanding this he is to give three lectures upon motor topics before Christmas. On the 27th inst. he will read a paper at the Liverpool University College Students' Engineering Society on "The Application of Light and Heavy Mineral Oils for Motive Power"; on December 7th, a lecture entitled "Motor-Cars; Past, Present, and Future," with 100 lantern illustrations, in aid of the funds of the East Suffolk Hospital, at the Public Hall, Ipswich; while December 13th will find him at Glasgow delivering a paper to the Glasgow University Students' Engineering Society, on "Automobilism up-to-date."

AN 8 H.P. DECAUVILLE CAR.

TO the well-known two-seated voiturette La Société Decauville, of Paris, have lately added an 8 h.p. car, of which illustrations are given herewith. The new car differs from the small one in that the motor is placed in the fore part of the frame under a bonnet instead of at the rear. The engine is a two-cylinder vertical one of 8 h.p., with electrical ignition and water jackets. The engine runs at 850 revolutions per minute, and can, therefore, hardly be called a high-speed engine. Four speeds forward and one reverse are provided, the power of the

FIG. 1.—THE NEW 8-H.P. DECAUVILLE CAR.

motor being transmitted as usual through bevel gearing direct to the rear axle, no chains or belts being employed. Steering is controlled by an inclined hand wheel, while ample brake power is provided. The motor and mechanism are entirely supported on a tubular frame, to which any desired type of carriage body can be fitted. The car, which weighs only about 8 cwt., can, it is claimed, attain a speed of from 35 to 40 kilometres per hour. We may add that the Motor-Car Company, of Shaftesbury

FIG. 2. VIEW OF FRAME OF 8-H.P. DECAUVILLE CAR.

Avenue, London, W.C., are the agents for the Société Decauville's vehicles in this country, and that one of the 8 h.p. cars successfully took part in the run to Southsea and back last week end.

In view of increasing trade the Century Engineering and Motor Company, Ltd., have found it necessary to remove their works to Cumberland Park, Willesden Junction, where they are now busily engaged equipping a large new factory. In addition to Century tandems the company will shortly be placing on the market a Century voiturette on distinctly novel lines.

FURIOUS DRIVING CASES.

—88—

At Grimston Petty Sessions last week, George Gascoine, motor-car driver, King's Lynn, was charged by Superintendent Baldwin with having driven a motor-car at greater speed than twelve miles an hour at Dersingham, on October 10th. Lewis Mitchell deposed that he was on the road to Dersingham railway station with a tumbrel and two horses going for a load of coal when the motor-car approached him. When it was about sixty yards off his horses turned round and the tumbrel was overturned. Witness lay with the shaft on his ankle. The car was coming at between nine and ten miles an hour. The men in the car came and helped him up. They asked witness if he had any bones broken, and he said he thought not. Witness had been at home a month in consequence of the accident. Witness heard the horn blown. James Bunn, Dersingham, coal dealer, said he saw the motor-car on the road. It passed him, he should think, at thirty miles an hour. Police-sergeant Thompson deposed that the distance from where the accident happened to the place where the motor-car stopped was fifty-three yards. Defendant, in defence, said he was in the employ of Mr. Morris, who told him to drive with great care. He was driving the Conservative agent. Everything went satisfactorily till they were returning, when in consequence of a defect in the cylinder he was fifteen minutes starting the machine. He started at five miles an hour and went up to nine. He had had five years' experience in driving. He noticed Mitchell's horses were rather frisky and stopped the machine. They went to the man's assistance and stopped till he was right. The magistrates dismissed the case. Defendant applied for costs, but no order was made.

At East Dereham Petty Sessions on Friday last week, Mr. Reginald Lawrence, of Hilborough Hall, Stokesby, was summoned on the information of Superintendent Chambers for driving a motor-car at a greater speed than twelve miles an hour at Scarning, on October 9th. Mr. E. Reeve appeared for the defence. William Taylor, team-man, of Castleacre, stated that on October 9th he was in Scarning with a wagon and three horses. When he got near the railway bridge at Scarning he saw a motor-car coming towards him at a fast pace. It seemed to be going close to twenty miles an hour; he was sure it was going more than twelve miles an hour. His horses took fright, and the leading horse jumped at the fence, and put its fore feet over. He saw no more of the motor-car, and he could not swear to the man who was driving the car. He heard and saw the car approaching him. It went past him like a train or a gust of wind. Mr. Reeve, in defence, said Mr. Lawrence was a motor driver of great experience, and had driven much in England and France. That morning he had ridden from Norwich with Mr. Lawrence, and they met a horse which turned completely round when they were proceeding at not more than six miles an hour, and Mr. Lawrence at once sent his man to assist. It was not the speed which frightened horses, but the noise of the car. The witness Taylor in his evidence said the car passed him like an engine. Of course it did. It was an engine, and by slackening the speed it would make more noise than it would if it was running at a higher rate of speed, because when going at a higher speed it would be running more smoothly. The chairman said the Bench had decided not to convict in this case, and they were prepared to accept Mrs. Lawrence's version of the matter. In the opinion of the Bench the defendant was an experienced driver, but at the same time the horses were, no doubt, frightened, and some little upset took place. There was no proof that defendant was going at twelve miles an hour, and the case would be dismissed. He, however, advised defendant to continue to exercise caution when driving his car. There might possibly be some regulations made so that motor-cars would be compelled to stop on the approach of every vehicle. The defendant thanked the Bench for their careful consideration of the case, but he thought it was a vexatious prosecution. No doubt in many cases the drivers of motor-cars were to blame. No objection could be taken in prosecutions where the cars were recklessly driven, but there was a general tendency to prosecute where a horse was frightened. It was only right that proper consideration would be shown to other users of the highway, but he hoped that the same consideration would be shown drivers of motor-cars, and not endeavour by such vexatious prosecutions to scotch the very useful means of getting about the country. With reference to the remarks of the chairman as to some new regulations being made, he thought it much wiser to leave it to men who had had experience in driving motor-cars. There were similar troubles when bicycles first came out. Horses shied at them, but they were now used to them. He had had considerable experience in driving motors in France, and there the horses were quite used to them and took no notice of them.

A MOTORIST SUED FOR DAMAGES.

—89—

HIS HONOUR JUDGE EMDEN was engaged until a late hour on Friday last week, at Bromley County Court, in hearing, with a jury, a case of very considerable importance to owners and drivers of motor-vehicles. The plaintiffs, Messrs. H. and W. Carr, coal merchants, of Beckenham, sought to recover £29 14s. 6d. from Mr. Ruffer, a banker of Lombard Street, whose private residence is at Sydenham, for damages alleged to have been caused to their horse and cart by the negligent driving of Mr. Ruffer's motor-car by his servant, on March 20th last. Mr. Hohler was counsel for the plaintiffs; and Mr. Neville, counsel, represented Mr. Ruffer. The principal witness for the plaintiffs was Louis Penn, a labourer, who gave evidence to the effect that he was in charge of one of plaintiffs' horses and carts on March 20th in Crystal Palace Park Road. He saw the motor-car come down the hill at a furious rate, and it turned round right in front of his horse, not more than two or three yards away. It frightened the horse, which bolted on to the footway and fell down,

breaking the shafts. The driver gave no notice of his approach. In cross-examination, the witness admitted that he was a little hard of hearing, but thought he would have heard the tooting of a motor-car horn. The motor-car was not going at a very fast pace when it turned round. Witness had not the horse under perfect control, but it was untrue that he went to look at the motor-car and was too late to get back to the horse when it bolted. Mr. Henry Carr, who owned the horse at the time, said he gave equal to £40 for it in February, but after the affair in question he had to sell it for £21. The repairs to the car amounted to £5 19s. 6d.

For the defence four witnesses were called. The driver of Mr. Ruffer's motor-car, named Bryant, stated that it was a 6-h.p. car, and on March 20th he travelled down the Crystal Palace Park Road at a rate of nine miles per hour. He slowed down to 3½ miles per hour before he turned the car round and had tooted the horn. He also called to Penn, inquiring if he should stop or go on, as he wanted to turn. Penn made no reply, but caught hold of the horse's head, and witness turned round, stopped the car, and went to Mr. Ruffer's front door. The cart came on when the car was quite at rest, but the horse, after it had passed, turned and looked at the motor-car, and then bolted. The driver let the horse go, and it ran into Mr. Ruffer's fence. —Mr. Ruffer said he was never given an opportunity of seeing the damage alleged to have been done to the horse, which was sold before witness received a letter on the matter from the plaintiffs. An expert motor-car driver, named Bell, said it was impossible with any safety to turn the motor-car round at the spot in question at a speed of more than four miles per hour. —In addressing the jury, Mr. Neville submitted that no blame whatever was attached to his client's driver. The motor was lawfully using the road, and the damage to the horse was either due to a mere accident or to the nervousness and unskillfulness of the man in charge. The damages claimed were most exorbitant, even if any blame attached to defendant's driver, which he denied. —For plaintiffs, Mr. Hohler remarked that the motor was a beastly thing and a nuisance unless kept under proper control. —His Honour: You must not tell the jury that a motor-car is a nuisance *ipso facto*. —Mr. Hohler asked the jury to find that there was negligence, and that it was, in fact, a nuisance.

Judge Emden, in summing up, said a motor-car was not a nuisance *ipso facto*, and there was nothing in the case showing that it made itself a nuisance. A motor-car had a right to use a road the same as any other vehicle when properly driven and with due care, and the only point the jury had to decide was whether there was any act of negligence on the part of the driver. If there was not, they could not find a verdict for the plaintiffs. There was no collision: in fact, it was an unusual case altogether. He failed to see any negligence, but it was for the jury to decide. In order to succeed it was necessary that there should be no want of care on the part of other people, and was there any want of care on the part of the plaintiffs' driver? Everyone knew what a motor-car was nowadays, and must take proper precautions. If it came to a question of damages, he did not think he had ever heard any more unsatisfactory evidence since he had sat as a county-court judge. There had been no attempt to give the other side an opportunity of seeing the horse or the damage caused it. After a few minutes' consideration the jury found a verdict for the defendant. Defendant's counsel asked for costs, including costs of counsel, to be allowed his client, and Judge Emden allowed these.

MR. JAMES FRYER, of High Street, Kington, Herefordshire, is stocking petroleum-spirit.

WE hear that the Hon. A. J. Balfour has this week ordered two additional motor-cars.

AMONG the new songs which have been introduced into "The Casino Girl," now being played at the Shaftesbury Theatre, is a spirited piece with full chorus, "The Automobile Girl." On its first performance it was encored.

WE have received a copy of the first number of a new American weekly paper entitled *Automobile Topics*. The new paper is edited and published by Mr. E. E. Schwartzkopf, late editor of the *Automobile Magazine*, and judging from the copy lying before us gives evidence of a long and useful life.

MR. S. F. EDGE was summoned at St. Albans on Thursday to answer a charge of travelling at a speed greater than 14 miles per hour. Mr. Staplee Firth appeared for defendant and Mr. Mark Mayhew and Mr. C. Jarrott appeared as witnesses, but up to the time of going to press we have not heard the result.

A NEW company has just been formed with the title of the Roadway Autocar Company, Limited. The new concern has, we understand, acquired the stock and premises of the motor-car business which has been carried on by Mr. J. Burns, at 44, Berners Street, London, W. We further learn that the company have been appointed sole agents for the "Mors" and "Renault" cars for England and all the countries in the British Empire, and that shortly a large stock of the latest types of cars by these well-known manufacturers will be on view in London. The company will also deal in many other kinds of cars, and will keep a large stock of parts and accessories.

THE Motor-Car Journal.

Vol. II.]

LONDON, SATURDAY, NOVEMBER 24, 1900.

[No. 90.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

seats are Lord Llangattock and the Duke's equerry, Sir Charles Cust. It will be seen that all four riders are well muffled up, a circumstance due to the pouring rain in which the party was then setting out for shooting.

The Manchester Motor Club.

THE annual general meeting of the Manchester Motor Club was held on Wednesday of last week, at the Crown Hotel, Manchester. The statement of accounts, read by the honorary treasurer, Mr. R. H. Carlisle, showed assets £14 16s. 0½d., including £5 10s. 6½d. cash in hand. The subscription was reduced to half-a-guinea per annum; this, with the entrance fee of half-a-guinea, makes a charge of one guinea for the first year of membership. Various projects for the coming season were discussed, and, judging from the interest shown, the Manchester Motor Club appears likely to be heard of during 1901. Next season special week-end runs will be a prominent feature. Many of the members meet every Wednesday afternoon at the Imperial Café, Manchester, and have a sort of informal meeting. Mr. W. Cawood, 2 Parsonage, Manchester, is the honorary secretary.

Racing in Germany.

RACING has been the main factor in the prosperity of the French automobile industry, and now at Berlin a new club has been formed under the name of the Automobil-Renn-Verein, with the special object of fostering the sport in Germany. The initial events organised by this society will be decided on a trotting racecourse, but it is intended to construct a veritable automobile track, and a suitable site is now being searched for. As the new club already rejoices in a number of influential members, the difficulties in carrying out this programme will doubtless be overcome, and, in course of time, regular race meetings on a proper track will inspire constructors with that competitive spirit which is so conducive to the advancement of the industry. Moreover, regular excursions and tours will be organised; indeed, the first of these has already taken place, and, judging by its success, these runs will be very popular with the motor men of Berlin. The club's officials are:—President, Dr. Wachsmann; vice-president, Herr Gaertner, director of the Kurfürstendamm cycle track; secretary, Herr Riechen; treasurer, Herr Krüger. Good luck to the society in all its ventures will be the wish of automobilists.

The Catalogue Competition in France.

AUTOMOBILE events are usually announced in ample time, and *La France Automobile* adheres to the custom in making known its intention to again organise its annual Catalogue Competition, the selected date being Sunday, January 20th, 1901. It will be remembered that this event is one in which the various competing cars are classified according to the catalogue price of their frames and motors, and the awards made upon the following basis: 1. Load carried; 2. Time of journey; 3. Price of vehicle; 4. Consumption of fuel; 5. Regularity of running. As may be imagined, the work of the judges is difficult in the extreme; indeed, one cannot very well see by what formula they can arrive at any decision. It must largely be a question of personal opinion, never a satisfactory method of making awards. The selected route is by way of Melun, Nangis, Montereau, Fontainebleau, and Valence, a total distance of 148 kilometres.

Mr. W. K. Vanderbilt, jun., again.

MR. WILLIAM K. VANDERBILT, JUN., is probably one of the most active of the *chauffeurs* in America. He is always doing some startling feature with his great German racing car, and his latest exploit a few days ago was, states *Automobile Topics*, to race with a train on the Long Island Railroad. Mr. Vanderbilt was the winner. The race, which was wholly impromptu, took place between Garden City and Jamaica, and where the highway runs parallel with the railway track. The train was going lazily along, somewhat after the manner of local trains, when the big machine hove in sight, going at a terrific pace. As the automobile passed the engine, Mr. Vanderbilt waved him a sarcastic good-bye. This was more than the engineer could stand, and he pulled viciously at the throttle, and a race was commenced. When Jamaica was reached, the automobile had disappeared in the distance, winning by about three minutes.

The Nottingham Club's Run.

THE Nottingham and District Automobile Club has had its inaugural run, in which about twenty vehicles and fifty passengers took part. The procession from Long Row, East, was headed by the president, Mr. R. M. Knowles, J.P. Next in order came the three vice-presidents, Mr. J. H. Kirk (who acted as marshal, and drove a Peugeot), and Mr. E. W. Wells and Mr. G. Cowen, who were mounted on Daimler cars. Messrs. G. Rimington and H. Rimington and Mr. A. Watts drove vehicles of similar construction, Mr. S. Harvey an Orient Express, Mr. R. Harbidge and Mr. Ross Browne (De Dion voitures), Mr. P. Huskinson (a Gladiator voiturette), Mr. R. Cripps (a Progress voiturette, which had made the journey from Coventry to Nottingham during the morning), Mr. Collins (a Mayfair), Mr. R. R. Latham and Mr. C. L. Stevens (a Benz), Mr. H. Stevens (a De Dion tricycle), Mr. A. R. Atkey, the hon. secretary of the club (an Ariel quad), and Mr. A. Marwood and Mr. J. G. Hamerton (an Enfield quad). Another member was mounted upon a Werner motor-bicycle, while Mr. Huskinson, of the Nottingham Autocar Co., Limited, placed a public service car

at the disposal of the club for the use of friends who could not otherwise be accommodated. The party journeyed to Newark, where the Mayor of the town received the leading cars. After tea Mr. A. R. Atkey said there were already thirty-one fully paid members of the club, including one at Leicester, and they were hoping that Mr. R. M. Wright would induce some of his Lincoln colleagues to join also. The club expected to have lectures and demonstrations on automobilism by Mr. S. F. Edge, Mr. J. W. Stocks, and other leading men in the motor world.

Another Competition in France.

THE delivery of parcels by means of motor-cycles has assumed considerable proportions in Paris, and to-day these speedy little machines are seen darting about in all directions. The shopkeepers in the French capital have been quick to discover that the employment of this class of motor-vehicle economises both time and money, for not only can it transport a considerable load, but its easiness of manipulation permits of rapid progress through crowded thoroughfares. To follow the course of one of these machines through the seething traffic of the Boulevards is a revelation, and frequently have we heard passers-by express their astonishment at seeing a motor-carrier dodge in and out of that bewildering confusion of vehicles which is to be invariably found in the Place de l'Opera. With the object of further advancing this branch of the automobile movement the *Auto-Vélo* proposes to hold next month a race restricted to motor-cycle carriers, and has selected as the course Paris-Versailles-Paris, a distance of 35 kilometres, or 22 miles. No conditions have yet been decided upon, but one can depend upon their being practical, for the promoters are all men of experience and know exactly what data will be of use to the public and constructors alike. The route selected in itself will afford a capital test, for none of the great roads running out from Paris present a more varied surface than does that leading to Versailles. The detailed programme of this event will be awaited with interest, and a capital entry may be safely anticipated.

Hindhead.

ON another page we give, by the kindness of Mr. R. W. Buttemer, the contour of the famous Hindhead. This will be of value to all tourists in Surrey, and of particular interest to those who recently journeyed that way on the road to South-sea. The long and steady ascent is its characteristic feature, and that so many cars were able to go up at good speeds is tribute to the development of the industry.

Automobile Racing in America.

MR. S. T. DAVIS, JUN., of New York, calls our attention to a paragraph with this heading which appeared in our issue of September 15th. In the report of the automobile race meeting at Newport, U.S.A., he was referred to as a "professional racer"—a characterisation which appears to be entirely unwarranted, as Mr. Davis is in no sense a professional racing man. He drove his own machine and entered the contest on the same terms as the other gentlemen owners, including Messrs. Vanderbilt and Astor. We are glad Mr. Davis has enabled us thus to correct an inadvertent error.

Motor-Cars v. Trams.

OFTEN has the suggestion been made that a service of motor-cars would be valuable in enabling communication being opened up in districts where the ordinary tramway is unsuitable. Now the proposal has been given definite shape at Burton-on-Trent, where, at the last meeting of the Town Council, Councillor Thornley proposed that the Town Clerk be instructed to embody in the Bill about to be presented to Parliament a request for powers to run a service of motor-cars in the town and suburbs. He pointed out that there were many streets that could not be served by electric trams, and contended that the

immense expenditure the latter scheme would involve should not be undertaken until they had ascertained the paying capacity of the population. Councillor Tresise seconded the motion, emphasising the remarks he made at the last meeting that, in view of the strong feeling that had been expressed in favour of motors, they ought certainly to be given a trial. Upon being put to the vote, the motion was agreed to. It is to be hoped that no technicalities will involve the failure of the object desired by the proposer and seconder of the resolution.

The 1,000-Mile Non-Stop Run.

IN last week's *Journal* Mr. Moffat Ford gave particulars of the 1,000-mile motor-car trip, proposed to be run on the Crystal Palace track. It commenced at half-past nine on Wednesday morning. The 8-h.p. car covered 140 miles in 5 hrs. 48 mins. 33 secs., 150 miles in 6 hrs. 18 mins. 19 secs., and 300 miles up to eleven o'clock on Wednesday night. The 5-h.p. car travelled 268 miles between 9.30 a.m. and 11 p.m., the first 120 miles being accomplished in 5 hrs. 39 mins. 13 secs. The press is apparently taking considerable interest in the event, which will do something to further establish the reliability of motor-cars, and also the determination of their drivers, for driving through a November night is not wholly a fair-weather experience. As we go to press we learn that the 5 h.p. car had completed 621 miles in 29 hours 26 minutes.

An Italian Automobile Tour.

ON the 30th ult. a meeting took place at the offices of *Il Corriere della Sera* of a number of gentlemen prominently connected with automobilism in Italy, to consider a project suggested by that journal. The idea of an Italian automobile tour to take place in 1901, under the patronage of the journal named, with the support of the Italian Touring Club, was unanimously agreed to. The automobile clubs of Venice, Bologna, Padua, Florence, and Ferrara have also given their approval to the scheme. This event will not have the character of a race but of a tour in fixed stages, the object of which will be to record speed and the condition of the roads, as well as to see what are the systems of motor, etc. (in relation to the type of car), best adapted to Italian roads, and as it is certain that there will be many strangers among those who take part in this tour, the course has been fixed so that they may have an opportunity at the same time of admiring the natural beauties of the country, and of visiting the principal towns of Northern and Central Italy. The tour, which will occupy about a fortnight, will be through Milan, Turin, Novara, Brescia, Verona, Padua, Venice, Ferrara, Bologna, Florence, Rome, Civita Vecchia, Leghorn, Pisa, Spezzia, Genoa, Voghera, Pavia, Milan. On this occasion the Milan Automobile Club will organise an automobile exhibition, at which will be shown all the cars which shall have covered the 1,650 kilometres (1,025 miles) through Northern and Central Italy. The exhibition at Milan is to be concluded by fetes, floral races, paper hunts, etc., organised by *La Gazzetta della Sport*. Everything is arranged that foreigners shall receive every attention, and it is therefore hoped that English motor-car builders will take advantage of the occasion to show to Italian motorists the great progress that has been made by them. According to present arrangements, the tour will commence on April 21st next and conclude on May 2nd, the Exhibition opening the following day.

The Locomobile Catalogue.

RECORDING our chat with Mr. Have-mayer a few weeks ago, we incidentally mentioned the fine catalogue to be issued by the Locomobile Company. This is now ready for circulation in England and will, doubtless, arouse considerable interest by reason of the variety and novelty of the illustrations. Some photographs are given, showing the vehicle progressing through a deep fall of snow, and also in the delightful Yosemite

district, where it encountered some very awkward gradients. Another illustration shows the Locomobile being driven along the trunk of a fallen monarch of the forest. Views of different types of vehicles, and of the company's extensive factory, complete the catalogue, which is particularly well printed and arranged. We have also received a capital booklet, "How to operate the Locomobile," which, with its lucid letterpress and excellent illustrations, will be found indispensable to all owners of this type of steam vehicle. Among the latest to come into this category is Mr. S. F. Edge, whose experience with a steam-car should be interesting.

Motor-Cars in New Zealand.

WHILE progress is being made by automobilism in this country, and is being duly acknowledged in the press, little is heard of colonial developments. And yet the subject is attracting considerable attention both in Australasia and Canada. Mr. N. Oates, of Christchurch, New Zealand, has recently returned to that colony with a motor-car built at Coventry, and its performances will doubtless be keenly watched by the colonists. For in some of those newer countries there are many places and circumstances in which the automobile can be even more serviceable than at home.

Military Motor-Cars in America.

MR. JOHN BRISBEN WALKER, the president of the Mobile Company of America, has written to the U.S. Secretary of War offering to send to Washington, without expense to the War Department, the new military "Mobile," a model of which is on exhibition in New York. He guarantees the machine to carry 1,000 rounds of ammunition, four riflemen, four rifles, two intrenching shovels, food for the four men for three days, four pairs of blankets, two rubber shelters reaching down from the sides of the machine, and enough oil to cover 200 miles. The machine to cover 100 miles from sun-up to sunset, over the average country roads or unbroken prairies of Colorado and Nebraska. This "unit of fours," states an American contemporary, embraces all the requisites of the Quartermaster's Department, the Commissary Department, the Ordnance Bureau, and Cavalry Bureau. It has a movement more than five times as great as that of the average infantry corps, and more than twice as great as the average of cavalry.

Fair-Weather Vehicles.

CRITICS of motoring dub automobiles fair-weather instruments which have great limitations of usefulness to business or professional men who would try to employ them instead of horse traction. The critics, though not quite correct, have still some grounds for their objections, and it remains for designers to go more carefully into the matter of producing vehicles which will give constant satisfaction in such a variable climate as ours. Cars provided with electric ignition always run a certain amount of risk in wet weather owing to the chances of short circuiting or some other electric trouble, which is very elusive to locate in a downpour of rain when stranded by the roadside. Users of pneumatic tires have ever the bogey of side-slip before them, and many drivers after a few thrilling skids have not nerve to face the roads on a greasy day. Solid tires, though much less prone to skidding, are still far from being free from it; and slimy mud makes most drivers feel uncomfortable.

Faults and Remedies.

UNDOUBTEDLY men have painful feelings on this matter which the actual dangers really do not warrant. A properly built car can be driven slowly over the greasiest surface without extreme risk if the driver knows his business and understands the dangers of improper use of the brakes. Still the fear exists, and it is quite enough to dissuade a nervous man from motoring on a wet day. Furthermore, a motor-car driven in bad weather picks up an immensity of dirt, and, if

the owner has no servant to help him in cleaning up, he finds that the job involves a great amount of time, and becomes most tedious if it has to be performed frequently. We have heard of a man who at first started out with the intention of motoring every day, but after a few rainy weeks the task of cleaning became such a constant and tedious one that he relinquished the idea of keeping up the game daily. He was rather irrational in his objections, of course; for if he had a pony and trap he would most likely have got a boy to do most of the cleaning up work. He also forgot that in motoring one is tempted even in wet weather to pursue a higher average of speed than in horse driving; and on a muddy day every increase of pace adds to the amount of mud flung up. The mudguard position on motor-quadracycles, and indeed most cars, is not sufficient to protect the working parts as well as they might be. Makers should study this matter more carefully, and by a better system of protecting the working parts from mud and wet render the operation of cleaning as simple as possible. No doubt in time we shall come to such improvements in tires as will make the motor-car quite reliable in grease; and then—if it is not too near the millennium to have critics about—there will be no one dissatisfied about the rough weather capabilities of the automobile.

The A.C.F. Villa.

IN view of the recent announcement that the Automobile Club of France has decided not to again renew the lease of its summer quarters in the Bois de Boulogne, the accompanying photograph of that charming villa is of special interest. But very few town clubs can offer its members such a delightful retreat; but in spite of its attractions the A.C.F. villa has been but little patronised this season, and certainly has not warranted the heavy expenditure which it entailed. In 1899 the cost to the club of its summer residence was some £1,140, and this year the expenditure would scarcely be less—a considerable item in any club's balance-sheet, and one which should be certainly

eliminated where members show so little inclination to avail themselves of the privileges secured. It is somewhat difficult to explain the disinclination of A.C.F. men to make more use of the villa. Charming situated in the Route du Champ d'Entraînement, and in close proximity to the Jardin d'Acclimation, it was within easy reach of Paris. Yet so rural were its surroundings that within the grounds one would never have dreamed of the existence of a great city hardly a mile away. Yes, it was very delightful, and its loss will be a blow to the regular frequenters. Tennis courts were provided for the energetic, and lunch and dinner were served in the grounds. At regular weekly intervals, too, the orchestra of M. Bose performed, so adding greatly to the enjoyment of the *convives*. Of the many visits which I made to it, writes our Paris correspondent, none is more noteworthy than the occasion upon which some thirty members of the English Club lunched there, and, curiously enough, a number of members of the German Club were also

en file that particular Sunday, so the grounds presented a particularly animated scene. It is a pity that it passes from the club's possession, but members have only themselves to blame.

Medical Men and Motors.

THE letter from Dr. Hirsch to the *Lancet* which we reproduced a few weeks ago has brought some very effective replies, including one from Mr. C. A. P. Truman, the hon. sec. of the Reading Automobile Club, as follows:—"Mr. Hirsch takes a gloomy view of cars in general, apparently because he has had rather a rough time with his own in particular. Does not another correspondent give himself away when he confesses that he judges the capabilities of autocars by the number he sees in dock? Would it be equally fair to say that humanity is diseased because a hospital was full? Admittedly cars break down, just as horses fall, kick, shy, bolt, and smash up traps. Perfection is not yet attained in anything, not even in our profession, but we do not therefore withhold our help because we cannot guarantee a cure. I began, an absolute novice, to use a motor-trike last January in miserable weather and very unfavourable conditions. It gave me no trouble, costs next to nothing to run, and so far from making me late made my work seem very light and easy. This is the other side of the question."

Another View.

ANOTHER doctor writes to our contemporary:—"My experience is quite different to that of Dr. Hirst. I have had a small car two years. In this time I have had no trouble whatever with the engine; my only worries have been tires, chains, and wheels, etc. The car has carried me about 11,000 miles over all roads and in all weathers, including two tours, and is still going splendidly. This week I have travelled over 200 miles easily in my work. The car does the work of more than two horses. It costs me altogether between £30 and £40 a year, which is certainly much cheaper than two horses and infinitely less trouble and worry. Another advantage is the speed. I can keep up a good ten miles an hour up hill and down dale, or twelve or more miles an hour on the level, which is an immense saving of time and consequently of money. In my experience of country work a motor is a brilliant success. The only point is that one must understand the engine and take care of it, and the chains, etc., and it will repay one." Another correspondent, signing himself "Motist," says that a motor-car will shortly be placed on the market which is "moderate in price, comfortable, reliable, simple in construction, without belts, chains, or chain wheels, and capable of being understood at once, thus doing away with the necessity of having a skilled driver."

Record-Breaking Attempts in America.

WE referred in a recent issue to the late attempt of Mr. Wm. K. Vanderbilt, jun., to make a record run from Newport to New York. A similar attempt has recently been made by Mr. J. Dunbar Wright, a prominent member of the American Automobile Club, on his Winton car. Mr. Wright left Newport on Monday, October 8th, and did not arrive in New York until the following Friday, having been four days on the journey. Much of this time was taken up in waiting for good weather. Nothing happened to his vehicle, all that delayed him being mud, rain, and bad roads. Mr. Wright's actual running time for the 258 miles was 21 hours 15 minutes. When asked about the ride Mr. Wright said: "I was not attempting to beat Mr. Vanderbilt's record. I was merely trying to make a quick run. I had very bad roads for the first part of the run, and encountered a heavy storm. Even with good weather, the roads in this country are not in shape for quick automobile runs. They are so rough that they shake an automobile apart. My carriage stood the trip all right, and was in excellent condition at the finish."

Customs' Arrangements.

THE French Customs authorities are to be asked whether they will accept the valuation of the Automobile Club as to the value of a machine provided that the club first lodges a sum of money with them. The car should then be able to pass the Custom House without any other formality than the handing to the Customs officer of an official card issued by the club, stating the value of the vehicle. Such an arrangement would obviate the delays that are now incidental to all trips to France, and should it be successfully accomplished all automobilists will thank Dr. Dawson Turner for bringing the matter forward. In a communication to the Automobile Club, Dr. Turner also points out that in Scotland and France no charge is made for stabling motor-cars if the owners are staying at the hotel. Why should the practice be so very different in this country?

Finding the Average.

A CHARGE of furious driving was heard at the City of London Summons Court the other day. The police said the defendant's pace was ten miles an hour; defendant put it at four and a-half miles. "Ten and four and a-half are fourteen and a-half; divided by two, and you get seven and a-quarter," observed Sir. G. Faudel Phillips. When other judges of the pace had stated their views, Sir George said the speed worked out at five and three-quarter miles an hour. After cautioning the defendant the magistrate dismissed him. Similar discrepancies in motor-car cases would, if the averages were taken, result in similar endings, but unfortunately magistrates are bad at averages.

Jumping Automobiles.

IF we were to believe all the sanguine expectations of inventive persons the capability of the automobile would appear illimitable. When there was considerable discussion with regard to motor-vehicles for the British Army it was actually suggested that they should be made to take hedges and jump ditches after the manner of the horse. Now the proposal has gone further, and we are told that motor-cars are wanted which shall be capable of giving their owners all the exhilarating experiences of the steeplechase, and perform ordinary feats in the way of transport as well. A prominent society man of Newport, U.S.A.—why do so many such yarns emanate from Newport?—is endeavouring to "rouse the blue-bloods from their lethargy," and intends to provide a motor-vehicle steeplechase. "There are to be banks and ditches and hurdles," says our informant, "and paper screens, through which the vehicles are to dash. The course is also to be provided with obstacles." If the idea is persisted in necks will be broken, and we would suggest the originator of the scheme should have the hazard of the first attempt. Certainly he deserves it, whatever the result may be.

SIDNEY MILLET, of Pokesdown, pleaded guilty to furiously driving his motor-tricycle in the Christchurch Road, Boscombe, on November 10th, and was fined £1 and 6s. costs.

WE have received from Messrs. Hudson and Kearns, of 83, Southwark Street, S.E., some samples of the combined diaries and blotting pads they are introducing for use in the coming year. We can vouch for the usefulness of these from experience, users finding at hand almost everything they require.

A NEW catalogue of motor-cycles, motor-carriages, and accessories has been issued by the London Autocar Co., 182, Gray's Inn Road, W.C. Within the 64 pages of which it is composed will be found practically everything required by the automobilist. Particulars are given of several well-known cars and special attention is directed to the voiturettes which the company is able to supply. The sections dealing with parts and accessories are very complete, and the care with which it has been compiled will doubtless be much appreciated.

A CRUISE ON LAND—OR THE LOG OF A MOTOR-CAR.

BY MISS DOROTHY EDMUNDS.

(Concluded from page 606.)

NEXT morning we started off in good time *en route* for Carlisle, and made some of the best running over immense stretches of moorland and beautiful roads, going through Crawford and Beattock. For many miles we ran parallel with the rail-road, and had the advantage of a long down grade. The engines were pulling splendidly, and there was an indescribable charm in the exhilaration of rapid motion through the fresh moorland air, startling every now and then in our run some grouse or rabbits, occasionally passing flocks of sheep, but for the most part we had the road practically to ourselves. We exchanged salutes several times with the engine-drivers of the passing trains, they blowing their whistles and we tooting the horn, each recognising the peculiar advantages of horseless vehicles.

Near Beattock we overtook a postman carrying a heavy mail-bag, and he gladly availed himself of the proffered seat for his first run on a motor-car, and it was fortunate that he was with us, for we approached an unattended horse with a cart, and it was only by the man's timely aid in getting hold of the

but were dissuaded from giving too much time to this quest by the minister, who was in a little shop where we were making inquiries, and who explained that unless we were personally interested in the records they were not worth the trouble of looking up and of the actual old smithy there does not seem to be anything remaining. Shortly after leaving Gretna Green we had to slow down and go very cautiously over a long piece of road that was freshly covered with broken stones that were being laid by some men who seemed to have a fiendish gleam of delight in

their eyes at the annoyance and trouble this caused us; we fortunately, however, crawled through without damaging the tires and were enabled to proceed without further event to Carlisle, where we again put up at the County Hotel. As we had on several occasions experienced some trouble through the burners blowing out, my father had a small alteration made to the chimney and several holes perforated in the door of the burner chamber, which we were glad to find completely cured this trouble. Next day we proceeded from Carlisle to Barnard Castle, making a splendid run to Penrith. The broad but undulating road gave the cars an excellent chance of some switchback work, and we made capital time. After lunching at Penrith we proceeded through Temple Sowerby and Appleby, excellent roads so far, but after leaving Appleby we found the country very hilly to Brough, and from there to Bowes had the roughest piece of riding we had experienced in the whole journey. We followed

HELPING A POSTMAN ON THE ROAD FROM DUMFRIES.

ON THE SCOTCH ROAD—CATTLE PHOTOGRAPHED FROM THE FRONT OF THE CAR WHILE IN MOTION.

horse that we avoided what might have been an awkward collision. We proceeded to Lockerbie, and stayed there for lunch. Afterwards we went on, the road being in excellent condition, and soon reached Ecclefechan, where we stopped to visit the early home of Carlyle. Then we proceeded to Gretna Green, where we tried to find some traces of the old blacksmith's smithy,

THE TWO CARS READY TO LEAVE LEYBOURN (YORKS).

a mere track, it could not be called a road, with deep cart ruts in several places and covered with loose stones. The country was extremely wild, and it was very hard work for the car and certainly did the tires no good, but after leaving Bowes we again struck a piece of good road. Then we discovered that the tire which we had repaired in Scotland had become loose, and we had to crawl on very slowly in order to prevent slipping it altogether, and we did not arrive at Barnard Castle till 6.30. The climb up the hill from

the river to the hotel was about the steepest grade we had yet encountered on the whole journey, with a somewhat loose and rough road; the novelty of a motor-car attracted a considerable crowd and we found it very necessary to get up without stopping or unloading. We were heavily laden and the tire was loose, but we managed to negotiate the hill successfully. On measuring carefully next morning my father found in some places the grade was 1 in 6. We managed next day, after waiting several hours, to effect the repair of the wheel and get the tire on again, in fairly good condition by the aid of a local engineer and a cycle-repairer. The latter was an interesting man, who appeared to have his business divided between dealing in clocks, curios, and repairing cycles. In the afternoon we left Barnard Castle for Leyburn, in Yorkshire, *via* Richmond. The day was lovely, and the views of the richly-wooded country, with its hills and valleys, in the bright sunshine, left an impression of a scene of beauty never to be forgotten. We much enjoyed our ramble through the quaint old town of Richmond, with its castle and river, and cobble-stoned streets. It was here that we weighed the car with its full equipment, and found it made 31½ cwt. with everything complete, and it certainly spoke well for the Mossberg roller bearings when one considers the speed and load we could carry with only a 6-h.p. engine. Later on we proceeded up the lovely Swale Valley, across the hill over to Leyburn, where we stayed with friends who well maintained the reputation of Yorkshire hospitality. Next day, unfortunately, the weather was bad, so that we could not make some projected local trips. On the day following, Saturday, September 8, we left Leyburn for Yorks. We ran through much typical Yorkshire scenery, visited Jervaulx Abbey, also the Cathedral at Ripon, and stopped for lunch after which we hoped to make a good run on the capital road into York. Unfortunately again there were indications of coming trouble with the tire which had on previous occasions been several times repaired, so we ran very slowly and cautiously, but just as we were within about a quarter of a mile of York city ascending a slight incline the tire suddenly parted company with the wheel and came off altogether. This was most awkward and annoying, but it was fortunate we were so near our destination. The tire having become badly cut it was impracticable to replace it, so we sought shelter for the car at the hands of a friendly blacksmith, and unloading the luggage into a passing cab proceeded to the Station Hotel. It was the intention of my father to have repaired and proceeded by road to London, but as important business engagements called him up the car was shipped by rail to Mulliner's to have the painting completed and the wheel sent to Paris for repair. So ended a most enjoyable run on the new car. The old car, which had accompanied us all the time, continued her journey by road to London, stopping at Coventry to be overhauled. The record of its run, though not so quick as the new Parisian Daimler, was certainly most satisfactory. It practically never broke down or stopped for repairs and alterations during the whole run, and though by no means as swift as its new companion, it proved that it is possible to get a good average speed Daimler motor-car that can accomplish a run of this distance without fear of interruption or breakdown, which, of course, is very gratifying.

You may ride on a horse, or a mule, or a moke,
 You may drive in a carriage, or sail in a boat,
 You may swim in the water, or fly in the air,
 Go just as you like, but only take care,
 You may skate, you may walk, take train, tram, or 'bus,
 Go in great state, or without any fuss,
 You may bike on a wheel, a single or tandem,
 Go just as you please, at will or at random,
 You may stay at home near, or travel afar,
 But nothing can equal a mote on a car.

OUR Midland representative had the opportunity the early part of this week of seeing Mr. J. D. Siddeley's 16 h.p. Daimler car in its final stage of construction. It possesses all the latest improvements in design and detail, and is fitted with Mossberg Roller bearings throughout, also tube and electric ignition. The car can be moved bodily with the pressure of one finger.

THE HUDLASS SILENCER.

MR. F. W. HUDLASS, of Southport, who is devoting much attention to motor-cars, has lately devised a new silencer, of which we are able to give an illustration herewith. As will be seen, the apparatus is quite a new departure. It is built up in sections, any number of which can be bolted together to suit any size of engine. Mr. Hudlass informs me that in practice five of the sections are sufficient for a 6 h.p. engine, the size of the five-section silencer being only 5 in. by 12 in. The strong feature of the device is that there are no small holes, as in

the ordinary silencer. The smallest hole is ¾-in. in diameter, and by this means the amount of back pressure is considerably reduced.

THE AUTOMOBILE CLUB'S TRIALS OF ELECTRICAL VEHICLES.

IN our issue of the 10th inst. we were able to briefly chronicle the events of the trial on the 8th inst., the course being over thirty miles of fairly stiff road. The "Powerful," entered by the British and Foreign Electrical Vehicles Company, the Electric Motive Power Company's car, the Canadian Company's car, and the Electrical Undertakings car completed the course. Owing to the accident to the chain on the previous day, the "Joel" car started late. Further chain troubles were experienced, which caused the car to complete a distance of only sixteen miles.

The trials terminated on Friday, the 9th inst., with a run over a fairly level course, the object being to show how far the vehicles could go on one charge. Unfortunately, owing to the heavy rain on the previous night, the roads were deep in thick and greasy mud, and this considerably retarded the progress of the machines. The British and Foreign Electrical Vehicle Company's "Powerful" carriage completed sixty miles; the Canadian Electric Motor Company's car had to abandon the run at the end of twenty-three miles, owing to an accident to a ball bearing. The Electric Motive Power Company's car was also withdrawn at the end of fifteen miles; the "Joel" car was withdrawn at the end of three miles, owing to punctures; and the Electrical Undertakings car completed thirty-five and three-quarter miles.

LADY JEUNE had an article on the possibilities of the motor-car in last week's *Ladies Field*.

MESSRS. M. AND P. MOYLE, of 124, East India Dock Road, Poplar, and Charles Street, Hatton Garden, E.C., inform us that they have obtained licenses to store and sell motor spirit at both of their establishments.

THE Ariel Motor Company, Limited, of Birmingham, have sent us a copy of their new illustrated catalogue of motor tricycles, quadricycles, and trailers. Some useful instructions as to the operation of the machines are included in the catalogue, while appended is a long list of testimonials from pleased purchasers of Ariel motor-cycles.

THE PICK VOITURETTE.

WE are this week able to illustrate the voiturette which Messrs. J. H. Pick and Company, of Blackfriars Works, Stamford, are exhibiting at the Stanley Show. As will be seen, it is propelled by means of a $2\frac{3}{4}$ h.p. vertical air-cooled petrol motor geared to the rear axle. Messrs. Pick have

band brake between. The shaft coming straight out of the motor case carries a pair of friction clutches attached to pinions, one with 32 teeth meshing with the 124-teeth large gear wheel, and one with 16-teeth gearing with the 132-teeth gear wheel; the latter forms the slow gear, the former the fast—equal to twenty-five miles per hour—with a difference of about fifteen miles per hour. The two clutches are controlled by one lever;

FIG. 1.—GENERAL VIEW OF VOITURETTE.

devoted special attention to the efficient cooling of the engine and have devised a special air-cooling funnel, which gathers in the air in front and, passing it under the body of the car, blows a draught directly on to the cylinder. The makers inform us that this arrangement enables the car to run 100 miles without over-

moving the lever to the right puts in the slow gear clutch, while a movement to the left engages the high-speed gear. Messrs. Pick inform us that they recently gave this gear a good trial extending over fifty miles and found it to act satisfactorily and to be absolutely noiseless. Another feature of the car is to be found in the patent front springs connecting the front carriage with the

FIG. 2.—FRONT VIEW.

heating the cylinder. The motor is equipped with a surface carburettor of their own type, which they state uses much less petrol than the carburettors at present in use. In the transmission gear no chains or belts are employed. Two large gear wheels of different sizes (124 and 132 teeth) are mounted on the driving axle with the drum containing the combination differential gear and

FIG. 3.—REAR VIEW.

main body, these being claimed to practically do away with vibration. The frame is of tubular construction, while the road wheels are of the cycle type. The front steering wheels are carried in forks similar to those adopted on bicycles, and the seat is fitted with pneumatic cushions. The car is very light, the weight complete being only $2\frac{1}{2}$ cwt.

THE HINDHEAD CLIMB. CONTOUR OF HILL, SHOWING GRADIENTS. (see page 630.)

THE HILL-CLIMBING RACE AT GAILLON.

(From Our Own Correspondent.)

WHEN Monsieur Ernest Cuénod offered to drive me on his 10 h.p. Richard to the scene of the hill-climbing trials I gladly accepted, for the Swiss Automobile Club's vice-president is such a genial companion and his car is so speedy that the prospect of the 130-mile run was particularly attractive, and one to be eagerly anticipated. Add to this anticipation of a delightful trip the certainty of witnessing some exciting racing, and the motor man will understand the punctuality with which I put in an appearance at Georges Richard's big garage in the Avenue de la Grande Armée on the morning of the eventful day, and my punctuality was rewarded by the interesting sight of the voiturette brigade busy putting the final touches to their tiny vehicles, preparatory to starting out upon what for them was a fairly lengthy journey. Chief interest very naturally was centred in the official representative of the company, a dainty little *tonneau*, which later on in the day made excellent speed up Gaillon's steep grade, only to find upon reaching the summit that by reason of the premature closing of the *contrôle* the performance could not be included in the official returns. Hard lines for the gallant little car, which had carried its four passengers right manfully over the sixty-five miles of route from Paris and mounted them to the top of Saint-Barbe. Once the small fry had got under way I had a few minutes' leisure to admire the lines of the snowy-white *tonneau* in which, a quarter of an hour later, I was to find myself speeding down the Avenue du Bois. Thanks to M. Cuénod's skilful driving we negotiated the slippery surface of the Boulevard Bineau without mishaps, but the route to Maisons Lafitte, always bad, was in such a deplorable condition on Sunday morning that not until that horsey town had been passed and the famous forest of Saint Germain entered could our 10 h.p. be given her head. But at last over came the lever, with a bound the snowy car gets into her stride, and soon we are speeding along with a beautifully easy movement, which sends a thrill of pleasure through all three of us, for the *mécanicien* is evidently also an enthusiast, if his beaming face is to be believed. On, on, we speed, past the Croix des Noailles, down the hill and over the level crossing until the chimney tops of Poissy come into view, and then we slow up, for M. Cuénod has the welfare of the automobile movement too much at heart to drive through towns and villages at the pace affected by certain motor men, and which can but result prejudicially to the industry and to the sport. Slowly, then, through Poissy, but once clear of the bridge we can again utilise our fourth speed, and the beautifully even surface of the road flies by us at thirty-five miles an hour until Triel is reached. Here, at the bridge, we halt a moment to pay our toll,

and then on again with never a halt until Meulan, the spot beloved of yachtsmen, is entered. Greasy *pavé* calls for extra care, and it is with a sigh of relief that the hard, dry macadam is again found upon the other side of the town. From Meulan to Mantes the road is—well, an ideal French route—can one pay it a higher compliment?—and but for a fifteen minute *panne* searching for a key shaken from one of the driving pinions our time would be excellent. But it is always the “but” in automobilism, and our record is quite spoilt by this mischance. Once at Mantes, however, we pulled up, for—drinks, I think I hear you say; but no, petrol this time, my friend, and then start afresh upon our journey. Rosny is soon reached, and that something is in the air is evidenced by the groups of villagers whom we find at intervals along the route, and who have evidently taken up their points of vantage expressly to see the horseless vehicles go by *en route* for Gaillon. Then, too, we overtake and pass quite a number of “autos,” less speedy than others, and so the journey presents an ever-changing tableau. At Bolleboisse we climb the tremendous hill which mounts abruptly from the river's banks, and after passing through Bonnières we enter upon that stretch of road which, hugging the Seine, is so shut in by a ridge of hills that it always appears destitute of sun. Here it is colder than ever, and we shrink instinctively into our clothing and pull our caps well down over our ears. And the lady motor likes it, and buckles down to the work with an ardour which sends the wind whistling past us and brings tears to our eyes in spite of the protecting goggles. But here we are at Vernon, and halting at the Hôtel de Paris we decide to make a hasty lunch before starting on the remaining 14 kilomètres of our journey. In the *salle à manger* we find Count Bozon de Périgord and several other well-known automobilists, while during our hurried meal the sound of running motors is almost continuous. Now and again, too, we hear the roar of a racing car or the vindictive Maxim gun-like spattering of a *cycle de course*, and then we start to our feet to catch a glimpse of the passing monster. Now we are under way again ourselves, and heading for Gaillon. With but a couple of kilomètres or so to go, we are busily discussing the chances of the various competitors, when away down the road we see a small black speck, but a speck which, travelling at lightning-like speed upon the white surface of the route, takes shape with wonderful rapidity. Above the whistling of the wind, too, we can hear the loud report of a racing motor, and barely have we had time to hazard an opinion as to the probable rider when, with a rush, he is upon us. Crouching almost under his machine, which jumps and bounds in a manner truly terrifying, we are just able to recognise Béconais' determined-looking features before the “roi des motocyclists” is past us with a rush and a roar which leaves a veritable singing in our ears. So he has finished his trial, and we have not seen it. A pity, but we compensate ourselves with the

thought that we have seen him at full speed on level ground, which is, perhaps, even more sensational than his hill-climbing performance. And now we are at Gaillon, whose narrow, badly-paved streets resound with the snorting of motors. Before the doors of the Hôtels Saint-Nicolas and Soleil d'Or we see clusters of motor men, but the worthy villagers themselves are conspicuous by their absence, for all are witnessing the race at Sainte-Barbe. Through the town we pass, and always travelling at a slow and cautious speed, we follow the route to Rouen. About a kilomètre further on we see the famous hill rising like a wall in front of us, and fairly black with people. What a day for Gaillon! Every man, woman, and child of the little township is surely there, and the gorgeously uniformed gendarmes have evidently all their work cut out to maintain a clear passage for the racers. Three buglers of the local fire brigade are stationed upon the hill, and just as we reach the foot a

and we are not surprised to learn that the time made gives an average of 42 kilomètres per hour. Right upon the summit I find René de Knyff busily engaged upon his big Panhard, in which of late King Leopold of Belgium has so frequently made excursions. And there, too, are a number of well-known automobilists too numerous to mention, and I find that the topic of conversation is Béconnais. His mount, it appears, was a new two-cylinder motor developing 14 h.p., and his time, from a flying start, for the kilomètre of hill was 55 secs., or at the rate of 65 kilomètres an hour. No wonder, then, that he had passed us half an hour before at a terrific speed. A 14 h.p. engine should be able to push a tricycle along a bit, I fancy. What say you? A few minutes' chat and then I mount again beside M. Cuénod, who had just brought his car and full complement of passengers up the hill in the creditable time of 3 mins. 27 secs. Steadily we descend, and,

M. CUENOD, VICE-PRESIDENT SWISS AUTOMOBILE CLUB, AT VERNON.

BBEA BBEA DE DIETRICH RACING CAR AT VERNON.

A SERPOLLET STEAM-CAR STARTING ON ITS TRIAL.

LEVEGH ON HIS MORS RACER AT FOOT OF HILL.

garde à vous is sounded by the first and repeated by his companions, posted further up the course, for the purpose of warning the spectators of a coming racer. Leaving the car by the road side in company with dozens of other self-propelled vehicles of every type and make, I commence the ascent of the hill on foot, and have negotiated about half the distance when, following upon the bugle call, a car is seen to detach itself from the crowd below and mount towards us with wonderful rapidity. It is Levegh, and although the big Mors is but travelling upon her slowest speed she passes me at about 16 miles an hour. Then follows a Serpollet steamer, then a motor-bicyclist pedalling vigorously, then a quadricycle, and finally M. Brasier, the actual winner in the big car category. Less highly geared than Levegh and Hourgières the Mors car driven by Brasier mounts with great rapidity; indeed, on the easier grade, just before the finish, the fourth speed is utilised,

dodging our way through the crowd, we make for Gaillon. Once through the town we spin along in great style and overtake any number of cars, while we ourselves are overtaken by Girardot, Levegh, Hourgières, de Knyff, and other kings of the road. Vernon, Bolleboise, Bonnières, Rosny, Mantes, Meulan are all quickly passed, and then at Triel we halt a moment to warm the inner man, for it is cold I can assure you, and the *mécanicien* is wise to avoid the wind by crouching in the bottom of the *tonneau*. On to Poissy and through the forest we speed, and finally enter Paris by the gate sacred to automobilists, the Porte Maillot. We house the car, and then make tracks for the "Excelsior," the Avenue's new café-restaurant, where our appetite is appeased by an excellent dinner. Automobilists, try the "Excelsior" whenever in the neighbourhood of the Avenue de la Grande Armée, for you will not regret the experiment. And now, to conclude, I append the official returns of the race. *Les voici!*

THE INTERNATIONAL CHARETTE.

THE accompanying illustration shows the attractive little car which has just been put on the market by the International Motor-Car Company. It is some months since Mr. F. O. Seyd told us he had a new light vehicle to be sold at a popular price on the stocks, and we have awaited its appearance with interest. As will be seen, the car seats three persons, all facing forward, with plenty of room for each passenger. The motor, which can be of $3\frac{1}{2}$ h.p. or 5 h.p. as desired, is of the vertical single water-cooled type on the De Dion system. It is located in the fore of the frame under a bonnet which can be readily detached. The motor itself contains a number of commendable features, the chief among which being that both valves, which are on top of the motor, are entirely water-jacketed. The engine, though small, does not run at a high speed, a rate of 800 to 1,000 revolutions being sufficient to develop its full power. The water circulation is on the gravity system, so that pump troubles are obviated. A radiator is fitted in the front of the vehicle. Two gallons of water only are carried, and this will, it is stated, last 100 miles. The engine is started with the usual handle, which is fitted at the side of the car. The exhaust is carried to the back of the car, and is very quiet. The ignition is, of course, electrical, and it is of a simple kind, which enables the makers to claim that it will rarely give trouble.

Coming now to the transmission gear, three speeds, with reverse, are available, and any speed from three to thirty miles can be attained on good roads, the entire regulation of which is actuated by levers on the steering post. Wide belts transmit the power from the pulleys on the motor shaft to a countershaft in the rear, which gears to the live road axle by means of toothed wheels. Two brakes are fitted — one on

the countershaft, actuated by a pedal, and the other on drums connected to the hubs of the rear wheels. The axles, framework, and steering connections are very strongly made, the connection between the steering standard and the rod being by rack and pinion. The road wheels are of the cycle type shod with pneumatic tires of a special kind, with which the makers give a guarantee, a point which will be appreciated by those who have experience of the incessant repairing of pneumatics. The body can be removed in a few minutes, thus giving access to the whole of the transmission and gearing beneath the floor, whilst the back seat can be detached separately and the space used for luggage if desired. An interesting feature of these cars is that every one is run by road from Coventry to London with a non-stop run. Last week one of these vehicles ran from Coventry to Great Portland Street, London, in 4 hours 10 mins., a very creditable performance. We hope soon to have an extended trial of one of these small cars, when we shall again refer to it. In the meantime we may mention that quite a number of them are now on view on the International Company's stand at the National Cycle Show.

THE Hozier Engineering Company, Limited, of Glasgow, are about to open a London dépôt at 19, Baker Street, Oxford Street, London, W., where they purpose holding an exhibition of "Argyll" voiturettes, and also to have on view their latest pattern four-seated car fitted with 5 h.p. motor.

1. Two-seated cars weighing more than 400 kilogrammes.—Petrol: 1, Brasier (Mors), 1 min. 26 $\frac{1}{2}$ secs.; 2, Lefebvre (Bolidé), 1 min. 33 $\frac{3}{4}$ secs.; 3, Hourgières (Mors), 1 min. 33 $\frac{3}{4}$ secs.; 4, Levegh (Mors), 1 min. 35 $\frac{3}{4}$ secs.; 5, Diétrich, 2 mins. 21 $\frac{1}{2}$ secs.; 6, Compagnie Française, 4 mins. 2 $\frac{1}{2}$ secs.; 7, Hidieu, 4 mins. 58 secs. Steam:—1, Serpollet, 1 min. 58 $\frac{3}{4}$ secs.; 2, Serpollet, 2 mins. 19 $\frac{1}{4}$ secs.

2. Four-seated cars, petrol or alcohol.—1, Terront (Bardon), (petrol), 2 mins. 8 $\frac{3}{4}$ secs.; 2, Gobron-Brillié (alcohol), 4 mins. 36 $\frac{3}{4}$ secs.; 3, Bardon (petrol), 4 mins. 48 secs.; 4, Delantre (petrol), 5 mins. 42 secs. Steam:—1, Serpollet, 2 mins. 13 $\frac{3}{4}$ secs.; 2, Serpollet, 2 mins. 30 $\frac{1}{4}$ secs.

3. Voiturettes (two-seated) weighing from 250 to 400 kilogrammes.—1, Van Berendonck (Aster), 2 mins. 32 secs.; 2, Darracq, 2 mins. 49 $\frac{3}{4}$ secs.; 3, Ader, 3 mins. 5 $\frac{3}{4}$ secs.; 4, Mercier (Gladiator), 3 mins. 18 $\frac{3}{4}$ secs.; 5, Fernandez (Sirène), 3 mins. 29 $\frac{3}{4}$ secs.; 6, Bied-Charreton, 3 mins. 32 secs.; 7, Théodore (Darracq), 3 mins. 34 $\frac{3}{4}$ secs.; 8, Rudeaux (Darracq), 3 mins. 41 $\frac{1}{4}$ secs.; 9, Ader, 3 mins. 45 $\frac{1}{4}$ secs.; 10, Quérey, 4 mins. 11 secs.; 11, Itasse, 4 mins. 31 $\frac{1}{4}$ secs.; 12, Lambert, 5 mins. 3 $\frac{1}{4}$ secs.; 13, Bouffartigue, 5 mins. 12 $\frac{1}{4}$ secs.

4. Voiturettes (four-seated) weighing from 250 to 400 kilogrammes.—1, Darracq, 3 mins. 23 $\frac{1}{4}$ secs.; 2, Darracq, 3 mins. 35 $\frac{1}{4}$ secs.; 3, Darracq, 4 mins. 18 secs.

5. Voiturettes (two-seated) weighing less than 250 kilogrammes.—1, Gladiator, 4 mins. 25 $\frac{3}{4}$ secs.

6. Voiturettes (four-seated) weighing less than 250 kilogrammes. No competitors presenting themselves, this category was eliminated.

7. Motor-Cycles (one seat) with chain.—Flying start—1, Béconnais, 58 $\frac{1}{2}$ secs.; 2, Teste, 87 $\frac{3}{4}$ secs. Standing start—Bardin, 111 $\frac{1}{2}$ secs.

8. Motor-Cycles (two seats).—Flying start—1, Gustave (quadricycle), 1 min. 50 $\frac{3}{4}$ secs.; 2, Bucquet (tandem), 2 mins. 22 $\frac{3}{4}$ secs.; 3, Deckert (quadricycle), 4 mins. 30 $\frac{1}{4}$ secs.

9. Motor-bicycles.—1, Bonnard (Werner), 1 min. 48 $\frac{1}{4}$ secs.; 2, Bucquet (Lamaudière), 1 min. 58 $\frac{3}{4}$ secs.; 3, Cousin (Werner), 2 mins. 3 $\frac{1}{4}$ secs.; 4, Lesaint (Werner), 2 mins. 34 $\frac{1}{4}$ secs.; 5, Lamaudière, 2 mins. 35 $\frac{1}{4}$ secs.

10. Motor-cycles without chains.—Flying start, Béconnais, 55 $\frac{3}{4}$ secs.; standing start, Bardin, 111 $\frac{1}{2}$ secs.

In every category all previously existing records were broken, a striking testimony to the progress made during the last twelve months.

THE Columbia Motor-Car Company, Ltd., has been registered, with a capital of £1,000, to manufacture, sell, let on hire, and deal in electric motors, cycles, bicycles, velocipedes, and vehicles. Registered without articles of association.

MESSRS. HOLDING AND SON, of 7, Maddox Street, London, W., who make a speciality of clothing for motorists, have sent us a copy of a new catalogue they have just got out, in which some particularly smart and practical garments are illustrated. Mr. T. H. Holding, the head of the firm, has given great attention to the requirements of the users of motor-cars, so that the garments he has designed are well worthy of inspection. The ladies, too, are not overlooked, the catalogue giving illustrations of some special coats designed for their use.

GENERAL VIEW OF THE INTERNATIONAL CHARETTE.

HERE AND THERE.

HEAR from Mr. F. W. Baily that the Crystal Palace Company will shortly open a *garage* near the main entrance to the Palace. This will be of great convenience to the automobilists visiting this really national institution. Pending the completion of the permanent building temporary arrangements will be made during the forthcoming show, and motor-vehicles can be stored for 1s.—half that rate being charged for motor-tricycles. Members of the Automobile Club and of the English Motor Club will be allowed a reduction of 50 per cent. on showing their badges of membership.

THE Crystal Palace is not the only place where members of clubs obtain an advantage, Messrs. R. Scaife and Co., of Armley Road, Leeds, having agreed to allow a reduction on all repairs executed by them for members of the Yorkshire Motor-Car Club. This privilege is also extended to those connected with the English Motor Club.

AT last we have a motorist being charged for alleged furious driving and the case being dismissed. This is really remarkable, and Captain Digby and Mr. C. North, the two magistrates who heard the case at the Grimston (Norfolk) Petty Sessions, deserve special mention for their impartiality in the matter. As a report of the case was given last week the details need not be repeated. Suffice it to say that the police said defendant was driving at a greater speed than twelve miles an hour. In addition to the motor-car driver and the constable, there were three witnesses: one said the car was being driven at between nine and ten miles an hour; another "questioned whether the car was going more than six or seven miles an hour"; and the third saw "the car pass, I should think, at thirty miles an hour." But the strange thing was the dismissal of the case. And in Norfolk, too! Well, wonders will never cease, and magistrates may, some day—perhaps in the coming century—realise that the truth may come from tongues other than those in the mouths of the police.

PARTICULAR care should be observed in passing through the following counties, the councils of which have lately declared in favour of further restrictions on the speed of motor-cars or for numbering vehicles in a conspicuous way:—

Essex.	Oxford.	Norfolk.
Lincolnshire.	Berkshire.	Middlesex.
Hampshire.	Suffolk.	Surrey.
Worcester.	Leicester.	

GUIDED by common-sense, the West Suffolk County Council has declined to be associated with the irritating movement now being developed against automobilism. At the last meeting the Highways and Bridges Committee recommended official support to the proposal to reduce the limit of speed from twelve to ten miles an hour; but several councillors declared against the idea. Mr. Jay ridiculed the idea of a horse and trap being allowed to travel twelve miles an hour, while a motor-car, which was under greater control, was to be restricted to ten miles an hour—a view which apparently had considerable weight. Sir Henry Banbury spoke up strongly on behalf of motor-cars, but I regret to have to add the names of Sir Joshua Rowley and Colonel Barnardiston to the list of gentlemen whose automobile education has been greatly neglected. Both gentlemen should be taken for rides on the cars of any local owners. The Marquis of Granby should also be placed in the same category, because of his speech at the last meeting of the Leicester County Council.

AT a meeting of the Ramsgate Town Council Councillor Cort said he had seen a motor-car going along the High Street faster than a South-Eastern train. To those who imagine that the acme of speed has been reached on the railway such a statement will appear extraordinary, but to those who know the South-Eastern it will be regarded as the commonest commonplace.

By the way, the many suggestions for the utilisation

of motor-vehicles by the fruit growers of Kent seem to be crystallising into fact, and on Friday a meeting was held at Sittingbourne to consider whether the produce of the farmers and fruit growers of the county could be economically conveyed in motor-cars. Speaking on this point at the annual dinner of the Mid-Kent Agricultural Association Mr. F. S. Cornwallis, the deputy-president, said he was sure the railway companies themselves would be glad if they could find some alternative mode during certain months of the year by which the fruit and other produce could be promptly conveyed to the London markets. Well, if that is so, why don't they make some trials? There are a score of automobile firms who would be willing to assist.

I BELIEVE that the fruit growers have been in consultation with the British Electric Traction Company on the subject, and that the suggestion has been made to haul the trucks by means of a steam tractor. By leaving the fruit gardens about five o'clock in the evening, the produce would be in London in ample time for the early morning markets.

IN the Dovedale district of Derbyshire motorists may encounter very stiff hills and enjoy most delightful scenery at the same time. It is a favourite resort of Sheffield people, and the accompanying illustration depicts Mr. James Barber, a well-known cutlery manufacturer, of Sheffield, and a friend shortly after their arrival at Dovedale, a pleasing distance of thirty-eight miles from Sheffield. Mr. Barber is on the front seat. The journey was done in three hours' running time over a very hilly road. Altogether ninety-five miles were travelled on the day the photograph was taken, the average for the whole journey being exceedingly good. As will be readily seen, Mr. Barber owns a Marshall car. This he has had five months, during which time he has driven it more than 1,500 miles, and with the exception of a few small adjustments he has not had to spend a penny on repairs.

MOTOR-CAR poets are getting on. Here are four lines from the latest—I dare not give more:—

Oh, I love to steal away in the waning of the day,
When the sun is painting pictures on the sky.
And upon my petrol steed through the country breezes speed,
With the light of motoration in my eye.

The "light of motoration" is not nearly so blinding as dust; but it may be fatal to poets. I should like to hear what Mr. Alfred Austen has to say upon the subject.

WITH Mr. Edge as a defendant and Mr. Staplee Firth as special pleader, no wonder the St. Alban's magistrates dismissed the case last week. Probably had Mr. C. Jarrott been called as a witness, the advice from the Bench as to telling friends not to go too quickly would have been dispensed with.

LOLLIUS.

MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

Gobron and Brillié and the Alcohol Competition.

UNQUESTIONABLY, the firm who showed to best advantage in the recent Critérium de l'Alcool is MM. Gobron and Brillié, and these constructors are naturally proud of the performances made by their vehicles. Among the first fifteen arrivals at Rouen no fewer than four Gobron-Brillié cars were to be found, the first of the four being driven by Madame Gobron herself. In the course of a conversation which I had the other day with M. Brillié, he told me that all these cars used pure alcohol as fuel. Many of the other competitors used *mélanges* of petrol and alcohol, but the experiments made by M. Brillié had convinced him of the practicability of doing an excellent performance without resorting to any such mixtures, and his confidence was perfectly justified, for from start to finish the firm's cars ran without a hitch. Purchasers of these vehicles now know that they may employ either petrol or alcohol without in any way changing their motor, and that the force developed is precisely the same in either case. What a pull this gives the owner of a Gobron-Brillié over the man with another type of motor in which such a change is impossible without troublesome changes to the carburation, etc.! This fact in itself should greatly increase the already numerous orders held by this firm.

The French Automobile Club.

THE membership roll of the Automobile Club of France now includes 2,389 names, and continues to increase with unfailing steadiness. Members, too, are finding that much is now being done to render the magnificent club-house in the Place de la Concorde really attractive. I do not mean in the matter of appearance, for the Hôtel Pastoret has always been palatial, but I mean rather in the matter of amusements. Another billiard table has been added, additional chess boards, etc., have been provided, and tournaments at the latter game will probably be organised during the winter months. Billiard enthusiasts will be able to take lessons from a professor of the fascinating game, while fencing and boxing men are also provided facilities for becoming proficient in these arts of self-defence. The formation of the Motor Club is already having good results upon the A.C.F., and the member of the latter must, indeed, be difficult to please if he is not satisfied with what the society is now doing, both for the industry and for its members. A little honest competition is excellent and the best possible remedy against stagnation.

On the Versailles Road.

No route in the neighbourhood of Paris see more traffic than does the famous road joining Versailles to the capital, and none is more favoured by automobilists. Passing through charming scenery, it forms the initial stage of numberless delightful excursions, and therefore rejoices in a continual stream of pleasure-seeking motor men, while the *chauffeur* intent on business frequents it by reason of its hilly character, so admirably adapted for carriage testing purposes. Throughout its length, some fourteen miles in all, there hardly exists a quarter mile stretch of level ground; and the hills of Suresnes and Picardie are capital tests of a motor-vehicle's ability. The latter hill is particularly noteworthy, for down its long slope have rushed into Versailles the competitors of many historic races, and exciting indeed have been the struggles to reach first the *grille*. Every Sunday automobiles in their hundreds speed up and down Picardie, and not a few mishaps have there been witnessed. Some few days ago a curious accident arose, in which, however, the automobile was the victim of the horse. Two noble steeds, drawing a handsome carriage, suddenly bolted while descending the hill and ran blindly into the motor-car of M. Daudet, which successfully resisted the shock, although suffering severely in the matter of carriage work.

After this deed of deliberate aggression, the hay-motors proceeded no further, for the solidity of their would-be victim had a sobering effect upon their nerves. There must have been something radically wrong with these two horses, for, generally speaking, the noble steed is too amicably disposed towards his mechanical brother to do him deliberate injury. But they won't do it again! and they will remember to descend Picardie slowly next time.

The Late Count Cahen d'Anvers.

THE funeral of the late Count Raphael Cahen d'Anvers, whose death was recently recorded in these columns, took place on the morning of Wednesday, the 31st ult. The body of the unfortunate Count had been brought from the scene of the accident to Paris on the previous Monday night, and had been laid upon the usual *catafalque* in one of the ground floor rooms of his residence, 144, Avenue des Champs-Élysées. Then, on the Wednesday morning, in the presence of the family the funeral service was conducted by M. Zadoc-Kahn, the Grand Rabbi of France, and M. Dreyfus, the Grand Rabbi of Paris. After the conclusion of the service, the coffin was interred in the family vault at Passy. A number of automobilists assisted at the ceremony, among them being: Baron Zuylen de Nyevelt, MM. René de Knyff and Pinson. The automobile which the late Count Cahen was driving when he met his death was the vehicle used by Girardot in the Gordon-Bennett cup race. Just previously to delivery of the car to the Count, it had been mounted by King Leopold of Belgium, and, even fitted with a touring body, it could do fully eighty kilomètres an hour. Considering the terrible shock the vehicle suffered but slight damage; indeed, apart from the broken steering gear, no vital organ was touched. The car has since been sent to Charron's.

The A.C.F.'s Tour in Tunis.

THE postponed tour of the Automobile Club of France in Tunis will take place from February 22nd to March 16th, and a truly delightful programme has been prepared. Leaving Marseilles on February 22nd by one of the boats of the Compagnie Franco-Tunisienne, the tourists will arrive at Tunis a couple of days later. During the following two days the town will be visited and drives taken to Le Bardo, La Goulette, La Marsa, Carthage, and other environs. On the 27th Zaghuan will be visited, a ninety-kilometre drive, and then on the following day the party will set out from Tunis for Kairouan, *via* Soussa; this is a distance of 190 kilomètres, and a rest will be taken on the following day. On March 2nd a 170-kilometre run to Sfax will be made; one day's local drives in the wonderful olive groves will follow, and then on to Gabès, *via* Meuzel and Ghenini. Four days will be spent in and around Gabès, and then a race of 405 kilomètres back to Tunis will be indulged in by those fond of fast travelling. The other members of the party will make their way back to the capital by stages. March 13th and 14th will be devoted to excursions to Bizerta, Lake Bizeret, etc., and on the 16th the party will embark for Marseilles. Special terms have been secured for the conveyance of members and their cars to and from Marseilles, and £20 should cover the expense of this delightful tour. Entries should be made to the Club, who will return the £4 entrance fee to every starter.

An Italian Competition.

THE Fuel Consumption Competition, of which I wrote an account last week in these columns, would appear to have found special favour in Italy, for the well-known journal the *Automobile* of Turin announces its intention to organise a similar event for Saturday, December 8th. The selected route is Turin, Madonna del Pilone, Pina Torinese, Chieri, Cambiano, Monealieri, and Turin, a total distance of thirty kilomètres, or some nineteen miles. This early imitation of the *Auto-Vélo's* competition is not surprising, for the idea is of so practical a nature that it appeals strongly to all who are interested in automobilism. As Georges Prade said to me during the course of the

French event, "This is the sort of competition you English like, for it is practical and useful data is obtained." His remark was perfectly just, and such a competition would, I feel sure, find considerable favour in England.

Fresh Motor-Cycle Records.

At last! After many attempts Rigal has got his own back, and once again figures as holder of the motor-cycle hour's record. It was at absolutely his last available moment that he accomplished his darling wish, for the day following his successful attempt he was due at Beauvais, there to commence his military service. Even to the last the elements played him false, and during a portion of his record run rain descended heavily and rendered the track at the Parc des Princes in a terribly dangerous condition. Plucky little Rigal, he thoroughly deserves his

The A.C.F. Fetes.

It is interesting to note that no fewer than eighty members of the Automobile Club of France have received decorations in recognition of their services in connection with this year's Paris Exhibition, a striking proof of the part played by the Société d'Encouragement in the success of the big show. In order to do full honour to these newly-ribboned members, the club committee propose to organise a grand fête for Thursday, December 20th, at which many of the leading *artistes* of Paris will appear. The beautiful theatre will be utilised for this gathering, which will be quite one of the events of the season. Naturally it is yet too early to speak of the programme, but that it will be excellent cannot be doubted by anyone who has already had the good fortune to assist at one of the club's fêtes. They are always enjoyable, for programme and management are alike

THE 10 H.P. DE DION RACING MACHINE, DRIVEN BY MR. C. JARROTT IN THE RUN TO SOUTHSEA.

[Argent Archer

triumph. Apart from the indifferent weather, too, the motorcyclist had bad luck, for after beating Demester's distance for the hour at the end of 58 mins., the frame of his machine gave way, and instead of being able to add some $2\frac{1}{2}$ kilometres more, Rigal was compelled to stop altogether. But for this mischance the record holder would undoubtedly have covered 73 kilometres within the hour; as it was, he only improved upon Demester's distance by 298 mètres, that is to say he covered 71 kilometres 563 mètres as against 71 kilometres 265 mètres by the former holder. Here are his times, as taken by Monsieur Gaudichard, official timekeeper to the A.C.F.:—10 kilos., 8 mins. $2\frac{2}{5}$ secs.; 20 kilos., 16 mins. 14 secs.; 30 kilos., 24 mins. $24\frac{3}{5}$ secs.; 40 kilos., 32 mins. $36\frac{1}{5}$ secs.; 50 kilos., 40 mins. 47 secs.; 60 kilos., 49 mins. $0\frac{3}{5}$ secs.; 70 kilos., 57 mins. 20 secs.; 71 kilos. 563 metres, in 58 mins. 20 secs. I fear that Rigal's peace of mind at Beauvais will not be of long duration, for with the return of fine weather both Béconnais and Demester will be attacking his figures.

irreproachable, while the attendance is invariably numerous and fashionable. The club will have a very gay season this winter, for the committee intend to give a regular round of festivities and show Paris that it is not the sleepy institution that some people would appear to think it.

WE hear that a large number of English motor-car agents have lately been over to Paris purchasing cars at the Exhibition.

At the Guildhall, on Monday, the Metropolitan Motor Manufacturing Company, Limited, appeared before Sir Henry Knight, by their secretary (Mr. George Adams), in answer to a summons charging them under the 32nd section of the Companies Act, 1862, with having refused to allow inspection of their register of members. Sir Henry Knight had no doubt the case had been proved against the company, but still he did not think there was any wilful refusal or default. However, the Act had been infringed, and the company would have to pay 20s. and £3 3s. costs.

MOTOR-CARS AT THE CYCLE SHOWS.

THE annual cycle shows at the Crystal Palace and the Agricultural Hall are now in full swing. At the Stanley Show the exhibits include a fair number of motor-cars and cycles, while at the National Show practically the whole of the northern half of the nave is devoted to the automobile section, thus making an extensive and interesting display of modern motor-cars. While a good many of the vehicles will not be new to motorists, there are quite a number of fresh designs, among which we note the 5 h.p. voiturette of the Motor Manufacturing Company, Ltd. This company is also exhibiting, in addition to a number of standard 6 h.p. vehicles, a 12 h.p. Panhard car with double cabriolet body, and an 8 h.p. car with tonneau body. Another new departure is a quadricycle fitted with a 2½ h.p. motor, the combustion chamber of which is water-cooled. The Star Motor Company, Wolverhampton, in addition to their 3½ h.p. car, are showing a four-seated car fitted with a 4½ h.p. single-cylinder motor. This vehicle is gear driven and is provided with three speeds forward and a reverse motion. Another new Star car, for two, three, or four persons, is fitted with a double-cylinder engine of 6 h.p. The Daimler Motor Company, Ltd., have a large stand, prominent among which is the frame, complete with motor and transmission gear, of a 20 h.p. car; another one of 16 h.p., and one of the new 4 h.p. Kimberley voiturettes. The Progress Cycle Company, Ltd., of Coventry, have an interesting display of motor-cycles and voiturettes. The latter, which have recently been considerably improved, are fitted with De Dion water-cooled motors of 3½ or 4½ h.p., as desired. Mr. E. W. Hart, of Luton, is showing several of the Sirène 5 h.p. voiturettes recently illustrated in these columns, and which did so well in the recent 100-miles trial. A big stand is that of the Automobile Manufacturing Company, Ltd., who, in addition to motor-cycles, have three or four types of voiturettes on view, as also Richard and Delahaye cars. There are also the Cleveland electrical cars. In addition to the Mayfair voiturette, the Sports Motor-Car Company display a large four-seated car, which they have named the Sports American phaeton. It is fitted with an 8-h.p. double-cylinder engine of the Panhard type: the transmission is on the Gautier-Wehrle system, no chains or belts being used. The International Motor Company have on view a number of cars, including the new Charette, illustrated in the current issue. The Locomobile Company of America, in addition to several two-seated cars, show a four-seated car for the first time. Messrs. W. H. M. Burgess, Ltd., exhibit two new types of light cars, one fitted with a 4½ h.p. engine, the other with a 3½ h.p. De Dion motor. The Motor-Car Company, Ltd., have a big stand, on which is shown a large variety of voiturettes, prominent among which is the Decauville; an illustration of the 8-h.p. car of this make was given in our last issue. Motor-cyclists will be interested in the exhibit of the De Dion-Bouton British and Colonial Syndicate, Ltd., which, in addition to voiturettes, includes the latest model De Dion tricycle, with free engine. In addition to a 6 h.p. dogcart, Messrs. Marshall and Co. have on view a Renaux tricycle. Other exhibitors include the Orient Express Car Syndicate, Ltd., the General Agencies Syndicate, the Singer Cycle Company, Ltd., Messrs. Dennis Bros., the Riley Cycle Company, Ltd., Messrs. Allard and Co., Ltd., etc. A fully illustrated report of the motor exhibits at both shows will be published in our next issue.

THE management of the Beach Hotel, Littlehampton, have engaged the services of a practical motor-car mechanic from France, and he is in constant attendance.

IN addition to the "Rex" motor glass, Rex Patents, Ltd., of Clapham, S.W., have lately introduced a French pattern of eye protectors for motorists. The new protectors are fitted with glasses of large size and various shades of colour. A special feature to which attention may be drawn is the small space the protectors occupy when not in use. The frame, which is made of solid nickel, is hinged at the bridge, the two glasses folding over on themselves, so enabling the protectors to be carried in a pocket case measuring only 4in. by 2½in. This type of protector is said to be exceedingly popular in France.

CORRESPONDENCE.

EXPERIENCE WITH A STEAM CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think, perhaps, the experience of a beginner with a steam car may interest some of your readers. Since the passing of the Act I have had a considerable amount of experience with various types of oil cars, but until Wednesday of last week I had no experience as a driver of a steam car. Thinking I would like to see for myself what advantages or otherwise the steam car possessed, I bought a "Locomobile," and having taken delivery of it made my first run to Newmarket, a distance of about 62 miles. Had it been an oil car needless to say I should have driven alone, but I certainly think it is wise for anyone buying any type of car which they have not had to do with before to take someone who has as teacher and adviser. I therefore took one of the company's drivers, and about 10 o'clock we made a start from Kensington. One thing I saw at once, and that was the superiority over all other vehicles in thick traffic. With an ample reserve of power one can dodge in and out of the traffic, shooting past other carriages in a way which one cannot possibly do with a petrol car; then again, in case of a block the reversing of the car is much simpler and speedier a matter than in oil cars. Having got into the country we began to travel at a very good speed, so good, in fact, that the mud (it was a very wet and muddy day) began to fly up off the wheels in no pleasant fashion. We therefore made our first halt at a wheelwright's shop, where we rigged up some temporary mud-guards, which, though not ornamental, were decidedly effective. We also took the opportunity to fill our water tank. Our next stop was at Bishop's Stortford, where we put up and had lunch, taking the opportunity of refilling the petrol tank and lubricating the engines. From Stortford to Newmarket no incident worth recording occurred, the only stop made being to take in water. So far I had contented myself with observing the car's little ways, but at Newmarket I took the driver's place and drove on to Gazeley, a distance of seven miles, all by myself and in the dark, climbing a very long and steep hill on the way.

Next morning, having washed the car down, I heated the torch in the kitchen fire, and in seven minutes had raised the steam to 140 lbs., at which pressure the fire is automatically lowered. I had expected to find this "firing up" process a difficult and dirty operation, and was surprised how exceedingly simple it really was. The raising of the pressure in the petrol tank, which is done with a hand pump, the same one carries for inflating the tires, is the most laborious part of the whole proceeding. After lunch I drove my hostess to Newmarket, where the car was very much admired. The return journey to Gazeley was again made in the dark with no trouble other than the blowing out of one of the lamps used for lighting up the water gauge. I have decided to fit a little accumulator and small electric lamp in place of the oil one for this purpose, so that one can switch on the light momentarily when it is desired to observe the level of the water in the gauge. Friday morning, the 9th inst., dawned cold and wet, and I did not look forward to my return journey to town. However, I made a start at eight o'clock, and picking up the firm's driver at Newmarket, made the best of our way against half a hurricane of wind and drenching rain for London. No stops were made except to fill the water tank, which has to be done every twenty miles to avoid running out where it may not be handy to get it.

Our object in getting back was in order to have plenty of time to prepare for the following day's run of the Automobile Club to Southsea; but as it turned out there were no adjustments to make—in fact, there was nothing whatever to do beyond the mere filling of the tanks in the usual way. In the morning, however, the start was delayed by a faulty air valve; but this was put right in about twenty minutes, and away we went. We did not leave Whitehall until after 10 a.m., but at lunch time I fancy we had more cars behind us than in front, notwithstanding the one compulsory stop for water. Again no adjustments of any kind required doing, and after lunch we pursued our way and had the satisfaction of reaching Portsdown Hill and taking a good position not so very far from the front of the procession,

being the thirteenth car to enter the Drill Hall. On the descent of Hindhead I inadvertently left the pump in action too long, with the result that I had my first experience of "priming," to cure which I turned on the "blow off" cock, letting some of the water out of the boiler. This was very quickly done; and afterwards I had no further trouble, though one of the glands through which the piston passes began to blow a little—the result, no doubt, of priming—and all that was necessary to cure this was a few turns of the check nut.

The car has now run just over 300 miles in five days, and so far I have had certainly far less trouble than I anticipated. I cannot help feeling that any boiler troubles, about which I certainly have heard a great deal, must be largely due to carelessness, but in a few months' time I shall be in a position to speak on this matter from personal experience. Of course the car has evident disadvantages, such as the amount of water required and the heavy consumption of petrol entailed, but against these disadvantages are balanced absolute silence in running, easy manipulation with certainty of starting, the latter of which, at any rate, is no mean advantage, as any oil motor man will, I am sure, admit. To-morrow I intend driving my car to my home near Norwich, a distance of about 110 miles. I must admit, however, that the car is less suited for touring purposes than it is for shorter trips, while for town work I cannot conceive anything to equal it.

Yours truly,

HUBERT D. EGERTON.

London, S.W., November 14th, 1900.

THE WERNER MOTOR-CYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to "J. A.," with reference to the Werner motor-bicycle, it would be absolutely impossible to enumerate all the conditions which might be the cause of his motor refusing to work. I possess a Werner motor bike, and after eighteen months' experience have at last thoroughly mastered all the possible causes of its disorders. Mine is flame ignition (which has many disadvantages). I am having it converted to electric. Let "J. A." look to his exhaust, and satisfy himself that the pressure of burnt gases passes away before the up stroke of piston commences. To test the meshing of gear wheels, I found a bicycle spoke handy, which, when passed through the compression tap, rests on piston top. Rotate engine axle till spoke travels down to its lowest point—the connecting rod will then be at dead centre; now look at exhaust valve—it should just be open, say $\frac{1}{16}$ in. Now, if he can find no fault in that direction, let him look to the connecting rod end; perhaps one of the straps have become loose and may be lying in the crank chamber. Again, make sure that exhaust way has a clear passage and silencer (if any) is not choked. There is a possibility of axle cranks being pinched together, so as to throw axis untrue, and work tight in bearing. Inlet valve may be too tight (the spring); exhaust valve spring may be too slack or easy, lubricating oil may be too thick in crank chamber; don't use solid oil in lubricator. I found it more convenient to add a large self-feeding lubricator. The electric contact breaker may not be adjusted correctly; look to platinum contacts—they must be firm in their sockets. The piece on steel spring should have pan head on both sides for safety. Look to spark when plug is fitted; batteries may be run down. Even new ones may be spoiled entirely by a careless contact, which would short circuit itself. The mixture may be erratic in proportion. I have had to put an extra gas-cock on my intake pipe, so when an extra supply of mixture was wanted, it came without in any way interfering with the proportion. I believe if you examine the intake pipe it will be found if you want to increase the power you open gas-tap more. That then throws proportion of mixture out, so you must then alter inlet of air so as to make things right again. It was, this constant carburetting that decided me to add another gas cock on my motor. I shall be glad to hear further from "J. A.," and would be pleased to give my services if I could be of any help to him.

Yours truly,

BEECHER WARD.

London, S.E., November 5th, 1900.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The letter in your last issue contributed by "A. L. B." will doubtless arrest the attention of all your readers who take an interest in the subject of motor-bicycles. Although I have achieved no encouraging success on my motor-bicycle, yet, by many indications I am impelled to the conclusion that this machine must come to the front. "A. L. B." apparently considers that the principal difficulty which I have encountered in the complexities of the Werner is caused by some shortcoming of the accumulator. This may be so, but the trouble is that all the voltmeters by which it has been tested exhibit conflicting results, and I have yet to find a meter on which reliance can be placed. Intricacies seem to infest or obtrude in many components of the motor, and if an instrument be obtained to aid in the detection of them, it may turn out to be imperfect and misleading. These annoyances recur so diversely and frequently, that they offer a serious blemish to the allurements of the motor: unless therefore a motorist has the ability to detect, or the good fortune to meet with, so excellent a machine as "A. L. B." has secured, he may be apprised that the pleasures of the motor-bicycle are not nearly so readily procurable as might be desired. This is why I have ventured to bespeak the assistance of those amateurs who have the skill and the will to confer the benefit of the knowledge they have acquired on their less experienced confrères and in the hope that some maker may be induced to market a motor-bicycle of substantial materials and properly constructed by British workmen.

Yours truly,

J. A.

Altrincham, November 13th, 1900.

THE ESTCOURT VALVE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in your issue of October 27th a description of what is termed "an improved induction valve" invented by Mr. Estcourt, and made solely by J. Brooke and Co. I wish to point out that I introduced this idea over two years ago (Messrs. Yeates, of Suffolk Street, Dublin, made them for me), and have fitted a number of cars of different makes with the inner or buffer spring on the induction valve, as described.

Messrs. Hutton and Co., Dublin, have, on my advice, also been fitting them for over a year to various makes of cars.

Yours truly,

JOHN F. COLOHAN.

Woodville, Blackrock, co. Dublin, November 4th.

THE MOTOR TRADES' PROTECTION SOCIETY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In consequence of actions having been threatened against manufacturers, dealers, agents, and owners of motor-cars, it has been felt by automobilists that united action is necessary to prevent an unjust monopoly being established and vexatious proceedings commenced. In furtherance of this view, a meeting was called and resulted in a representative and influential gathering, which decided to form itself into a society and register a company limited by guarantee for the protection of owners, users, manufacturers, dealers, and agents in motor-cars and their accessories. A committee was appointed consisting of Messrs. J. J. Mann, Lisle, Adams, Bersey, Cappellen, Hewetson, Austin, Friswell, and Seyd, and resolutions were passed for immediately organising the society. The society has been formed for the protection of the trade generally, and also for the protection of owners and users of motor-cars.

Automobilists desirous of joining in this movement or wishing for the protection to which the efforts of the society will be directed are requested to communicate immediately to

Yours truly,

84, Chancery Lane, W.C.,

G. H. HELMORE, Secretary.

November 21st, 1900.

By an oversight, the photo of a group of Daimler cars reproduced on page 622 of our last issue was credited to Mr. Argent Archer, instead of to Messrs. Curzon, Robey and Co.

THE HURTU VOITURETTE.

A NEW light car which has lately attracted some attention in French motor circles is the voiturette recently put on the market by La Compagnie des Automobiles et Cycles Hurtu, of Neuilly-sur-Seine, of which an illustration is given herewith. The double suspension and the direct transmission employed on these cars at once attract attention, for both are special features of their construction. The motor used is the 3 h.p. water-cooled De Dion so much in favour with all constructors of voiturettes. When desired, however, a water-cooled Aster can be fitted. Three forward and one reverse speeds are provided, all intermediary variations being obtained by means of a friction clutch. A radiator is fitted in connection with the water circulation, and a tank carrying sufficient petroleum-spirit for a ninety-mile run is provided. Steering is controlled by a horizontal hand-wheel, while the wheels are of the cycle type, shod with pneumatic tires.

MR. PATRICK, cycle agent, of Ardee, Ireland, is now keeping a stock of motor car spirit on hand.

MESSRS. STANBURY AND COMPANY, cycle and accessory manufacturers, Commutation Row, Liverpool, are now catering to the want of motorists by keeping a stock of motor-car spirit.

MESSRS. MORRIS BROS., cycle and motor-car works, Pontypridd, have obtained a license to store 200 gallons of spirit, so that motorists visiting South Wales need not fear any difficulty in getting a supply of this essential article.

MESSRS. FRISWELL, LTD., of 48, Holborn Viaduct, London, E.C., have just got out a new list of the motor-cars, etc., they have on hand at the Automobile Palace. These include the Royal Enfield tri-cycle, the Renault De Dion, Clement-Panhard, Perfecta voiturettes, the Mors Petit Duc, and Peugeot phaeton, of each of which excellent illustrations are given.

IN the annual report of the Commissioner of Police of the metropolis for the year 1899, just issued by the Home Department, it is stated that licences were issued to 30,102 drivers and conductors, 124 drivers being licensed for vehicles propelled by mechanical power. Of the 3,626 omnibuses licensed for hire, five were driven by mechanical power.

THE British and Foreign Electrical Vehicle Company, Limited, has been registered with a capital of £150,000, to adopt an agreement between Mr. S. A. Cobbett, of 14, Devonshire Square, E.C., of the one part and this company of the other part; a second agreement, made between Mr. E. W. Hart, of Luton, of the one part and this company of the other part; and a third agreement, Mr. C. E. Lee, and Mr. J. K. George, of the one part, and Mr. E. W. Hart, for this company, of the other part, for the acquisition of the business, undertaking, assets, and liabilities of the Lecoll Electric Battery Company, Limited, and, generally to carry on business as mechanical and electrical engineers, etc. The registered office is 14, Devonshire Square, London, E.C.

MOTOR-TRICYCLES. SOME DEFECTS AND REMEDIES.

BY A. E. S. CRAIG.

THAT there is at present a partial slump in motor-tricycles, few will, I think, deny, and I venture to offer a few suggestions which are the outcome of my personal experience in dealing with some of the defects which have led erstwhile enthusiasts to discard them in despair. I consider that ignition troubles head the list. Let me therefore commence by referring to troubles from this cause. Firstly then, as regards the contact breaker of the De Dion pattern. Contacts become imperfect through charred oil or dirt. Owing to the high speed and the vibration of the trembler blade, the smallest amount of oil rapidly creeps along and feeds on to the platinum point. To prevent this I cut a piece of $\frac{1}{4}$ in. hollow lamp wick about $1\frac{1}{2}$ in. long and pull this wick like a stocking over the trembler, cutting a round hole opposite the platinum point. Partly to keep this in its place, but also for another reason of more importance, I fit on the back of the trembler, and hold by the same screw, a smaller and slighter blade than the trembler.

This can be made of a piece of clock spring about $\frac{1}{8}$ in. wide, and should be slightly arched in the middle so as to bear only at either extremity. This should be about $\frac{1}{4}$ in. longer than the distance from the screw to the platinum. This auxiliary blade or tongue has a wonderful effect in keeping the trembler up to its pitch and saving constant adjustment. Place a felt washer at the base of the contact screw; this prevents oil creeping up that way. If much oil comes through from the engine, along the spindle of the sparking cam, and it generally does, place a washer—string will do—between the vulcanite and the cam. Also drill a hole in the bottom of

THE HURTU VOITURETTE.

the aluminium sparking cover, so that any oil at the bottom will drain out.

Owing to the price of platinum the contacts are usually absurdly small, and sometimes some other metal is substituted for the sake of extra profit. See that the contact screw has a good wide plug of platinum and on the blade I recommend a piece of stout sheet platinum at least $\frac{1}{4}$ -in. diameter, so that if the blade is shifted slightly in tightening up the screw, it will not cause sparking on the edge of the points or, perhaps, off one altogether. I have used nickel contact on the blade with excellent results, but beware of German silver. The $\frac{1}{4}$ -in. diameter disc of platinum or nickel can be easily soldered to the blade, and if properly done, will never come loose. Another dodge I find somewhat successful is to file the tip of the contact screw "hot-cross-bun" fashion—that is to say, two grooves across the face at right angles to one another. This must be done carefully with a fine file. The chances of failure to spark are thus reduced by at least four to one, as the grooves help to break up the char or dirt, and afford channels for it to shake through, besides the fact that it is not likely that all four points of contact will fail at once. Do not do this to a screw unless it has a face of at least $\frac{1}{8}$ -in. platinum.

When it is necessary to clean the points of contact, do not rasp at them with a blacksmith's file; it is a waste of energy and platinum. In fact, it is better not to file them at all, and for this reason: filing or scouring with emery simply scores the surface with ridges which tend to hold dirt, and, moreover, takes away the hard skin that is formed by the continual hammering of the contacts, and it is obvious that the new soft surface has first of all to be made smooth of the file marks and then dented in further till a new skin is formed. Try and clean the contacts, therefore, with a piece of rag steeped in petrol, and if necessary, by gently scraping at any obstinate bits of black with a sharp knife rounded at the point.

I have read somewhere that the trembler should be adjusted to tremble, and I humbly beg to differ. It is beautiful in theory and, of course, works nicely for a time—a remarkably short time generally—and then off comes the aluminium case and you grovel with a screw driver and swear words. I do not say, do not do it this way if you have found it answer, as it is the correct orthodox method, but I will just mention my alternative. Do not bother whether the trembler trembles or not, but turn the engine until the *V* of the trembler falls into the *L* in the cam. It should nearly touch the bottom; if it does not, slacken back the contact screw until clear, and if the *V* of the blade still does not fall sufficiently into the cam, the trembler must be removed, and bent downwards until it does. Then replace the trembler and turn the engine until the *V* is on the periphery of the cam; switch on the current and tighten up the contact screw until it just touches the trembler, then screw back an eighth of a turn and try if a spark can be obtained by placing a piece of metal from blade to screw. If it cannot the points are still touching. Gently slacken back the screw a little further until a spark is obtained. Then clamp up the contact screw by the small screw at right angles to it provided for the purpose. For reliability in sparking up hills I recommend placing the points of the sparking plug very close together, about $\frac{1}{16}$ in. apart.

I prefer accumulators to dry batteries, and unless anyone is inconveniently situated for getting them recharged I advise motor-cyclists to try them. Cells of transparent celluloid enable one to see easily the height of liquid, the condition of the plates (whether sulphated or not), also to detect any pieces of paste that may fall out and short-circuit the cell. They have the further advantage of being light and unbreakable.

(To be continued.)

WE understand that Mr. Worby Beaumont's standard work on motor-vehicles has reached a second edition.

WE learn that Mr. Cecil Edge has now purchased Mr. C. Jarrott's $5\frac{1}{2}$ h.p. De Dion tricycle, and hopes shortly to have an 8 h.p. motor of the same make. Mr. Edge intends to enter for whatever motor racing may be organised in this country next spring.

MOTORISTS in the Putney and Fulham districts in need of someone to undertake repairs to their motors and cars, etc., will find Mr. W. Hemingway, Assoc.M.Inst.C.E., of the Fearless Cycle Works, 889, Fulham Road, S.W., well equipped to carry out the same.

As agents for the Daimler Company, the Nottingham Autocar Company have approached the Nottingham Corporation, with a view to supplying the fire brigade with motor tenders, for the conveyance of firemen and apparatus to scenes of conflagration.

THE business of the Electric Street Car Manufacturing Syndicate, Limited, of Wolverhampton, has been acquired by the Electric Tramway Maintenance and Construction Company, Limited. Mr. Thomas Parker, Chairman of the Electric Street Car Syndicate, will join the board of the Maintenance Company.

IN his official capacity as sole Norfolk agent for the Daimler Co. Mr. Frank Morriss, of King's Lynn, has the honour of supplying spare parts and executing minor repairs to the Prince of Wales's motor-cars. These cars were recently piloted through King's Lynn by Mr. Morriss on a Parisian Daimler.

THE ROBINSON MOTOR-CAR.

MESSRS. JOHN T. ROBINSON and Co., of Hyde Park, Boston, Mass., have sent us a photograph, reproduced herewith, of the two-seated motor-car they are exhibiting at the American Automobile Club Exhibition in New York. The frame is built of channel steel, and forms the support for the engine, transmission gear, and petrol tank. The motor, which is located in the rear of the frame, comprises two cylinders, 4 in. in diameter by 6 in. stroke. It is fitted with automatic lubrication and is water-cooled, the circulation being on the thermo-syphon system. The ignition is of the magneto-electrical type, so arranged that the speed of the engine can be varied between 150 and 1,000 revolutions per minute. The engine is fitted with a single fly-wheel, the cranks working in an oil-tight case of aluminium.

Coming now to the transmission mechanism, two speeds forward, ranging up to twenty-five miles per hour, and a reverse motion, are available. The variable speed gear adopted is that known as the Upton, illustrated and described in the *Motor-Car Journal* for July 28th last. From the variable gear shaft the power is transmitted to the rear axle by a single chain.

The road wheels are of wood, 32 in. diameter at the front and 36 in. at the rear, shod with 3 in. and 4 in. pneumatic tires on front and rear respectively. Roller bearings are used throughout. Steering is controlled by a large hand wheel, mounted on an inclined pillar. The action is positive, and the front wheels are locked in any position of the steering wheel, thus removing all danger of a sudden change of direction when running at a fast speed. The body is hung entirely separate from the engine frame on springs, thus ensuring very easy riding. Eight gallons of petroleum spirit are carried and five gallons of cooling water, sufficient for 100 miles on ordinary roads. Ready for a trip of 100 miles, with petrol and water tanks both filled, the car, with hood, weighs under 1,800 lbs.

THE fourth annual general meeting of the Liverpool Self-Propelled Traffic Association is to be held on Monday, December 17th.

MR. A. M. GROSE has applied for a non-stop diploma for his $2\frac{3}{4}$ h.p. Gladiator tricycle, No. 112 in the trip to Southsea. We are requested by the secretary of the Automobile Club to ask objectors to this claim to lodge their objections without delay.

THE Roadway Autocar Company, Limited, has been registered with a capital of £40,000, to carry on in the United Kingdom and Europe, or elsewhere, the business of motor, motor-car, and vehicle manufacturers, owners and workers of patents relating to motor-cars and vehicles propelled by mechanical appliances, etc.

THE HAUTIER VOITURETTE.

THE latest voiturette of French construction to call for notice is the "Hautier," the product of the Etablissements d'Exploitation des Brevets Hautier, of Auteuil, near Paris. As will be seen from the accompanying illustrations, the little car has an attractive appearance. The motor and mechanism, tanks, etc., are all carried on an independent tubular frame to which any type of carriage body, spider, duke,

Victoria, etc., can be fitted. The attachments are of a simple character, the makers claiming that the body can be entirely taken off in three minutes. The engine usually fitted to the voiturette is of 4 h.p., it is water-cooled, and fitted with electrical ignition. If desired an engine of 7 h.p. can be substituted, and to this the makers generally adapt their special incandescent tube ignition, which permits of the rate of the explosions being increased or retarded. Whichever engine is chosen it is located in the fore part of the frame and transmits its power through a variable gear box direct to the rear axle without the use of chains or belts. The change speed gear, the

pinions of which are continuously in mesh, is adapted to give three speeds forward, ranging up to twenty-six miles per hour, and a reverse motion. Wooden wheels, shod with pneumatic tires, are, it will be noticed, adopted, while the popular sloping wheel steering is fitted. A feature of the Hautier car to which attention may be drawn is the entire absence of controlling levers at the side, the change speed gear, the reverse motion, the friction clutch, and the brakes being all controlled by means of foot pedals. The 4 h.p. car weighs complete between 4 and 5 cwt.

THE Moto Club de France announces a contest for non-skidding rubber tires for April next.

ANNUAL DINNER OF THE AUTOMOBILE CLUB.

ON Wednesday week, in the Whitehall Rooms of the Hôtel Métropole, London, the annual dinner of the Automobile Club of Great Britain took place. Mr. Roger W. Wallace, Q.C., presided. Among those who had expressed their intention of being present were the Earl of Onslow, Lord Borthwick, the Right Hon. C. Stuart-Wortley, M.P., Sir Richard Harrison, C.E., K.C.B. (Inspector-General of Fortifications), General Sir Thomas Gordon, K.C.I.E., the Hon. J. Scott Montagu, M.P., Captain the Hon. Cecil Duncombe, J.P., Mr. J. Cumming Macdonald, M.P., the Hon. C. S. Rolls, Colonel R. E. Crompton, R.E., Captain M. L. Sant (Chief Constable of Surrey), Mr. W. E. Rowcliffe (Acting-President of the Manchester Automobile Club), Mr. W. W. Marks (Clerk to the Bedfordshire County Council), Mr. E. Archdall Ffooks (Clerk to the Dorsetshire County Council), Professor Boverton Redwood, Ph.D., F.R.S.E., Messrs. W. S. Holt, F. R. Simms, Worby Beaumont, A. Bird, J. Graham White, A. L. Jones, J.P., Henry Edmunds, J. I. Thornycroft, F.R.S., Paris Singer, Leonard, Charles Cordingley, Mark Mayhew, L.C.C., R. E. Phillips, C. Harrington Moore (Hon. Sec.), F. W. Staplee Firth, E. Shrapnell Smith (Hon. Secretary Liverpool Self-Propelled Traffic Association), Captain T. S. Tulloch, Baron de Breynne, Percy Northey, Bertram Blount, J. D. Siddeley, J. S. Critchley, R. Bearcroft, Frank Lanchester, Vernon Pugh, E. H. Bayley, John D. Hill, Theodore Chambers, W. T. Pretty, Alfred Burgess, Harold Heatley, J. J. Mann, H. F. Englehardt, O. H. Bayldon, A. Thwaites, H. W. Spiller, C. A. Smith, W. M. Hodges, J. Brown, M. H. Buckea, Tilden Smith, J. H. Gretton, A. Sennett, G. Iden, Dr. Lehweiss, Maurice Capellen, Thrupp, W. Beckett Hill, Thomas Clarkson, Herbert Austin, G. H. Kahn, J. S. Mallam, H. Perrin, H. A. House, Arney, Honk, C. D. Phillips, Julius Harvey, Horton, Schneider, R. B. Bruce, W. J. Crampton, Maurice Egerton, A. G. New, Rucker, H. J. Mulliner, S. F. Edge, C. Jarrott, Clarence Gregson, F. Strickland, Lyons Sampson, H. Ashby, T. B. Browne, S. R. Roget, Roland Browne, J. J. Acworth, and C. Johnson (Secretary). Nearly every one of these gentlemen were present.

The loyal toast having been duly honoured, the chairman proposed the toast of "Their Royal Highnesses the Prince and Princess of Wales and other members of the Royal Family." This was a toast, he said, which automobilists regarded with especial interest. The Prince had two cars, and the other day the Duke and Duchess of York were driven by Mr. Rolls, at the Hendre, Monmouth, and expressed their determination to follow this new pastime. The other member of the Royal Family who was connected with motor-cars was the German Emperor, and his example was being followed by the Shah of Persia, the Sultan of Turkey, President Loubet, and other distinguished persons.

In proposing the toast of "The Navy, the Army and the Reserve Forces," the chairman said the sentiment was of considerable interest to the members of the club. In connection with the Navy and automobilism he pointed out that many of the same terms—tiller, shaft, engine, etc., were used, and with regard to the Army they had Sir Richard Harrison with them. He would probably be able to tell them what chance there was for automobiles being developed in the Army. They knew they had been used in South Africa for heavy traffic, but they had not heard much of their adoption for the lighter kinds of haulage. They were very pleased to see Mr. Crompton back again. It had been proposed to have an automobilists' Volunteer corps, and anyone who witnessed the run to Portsmouth could see and appreciate the great advantages associated with motor-cars in that connection, and also see a large number of cars that would be at the disposal of a Volunteer corps. With the toast he felt tempted to associate the health of the police. During the recent run they had found the greatest consideration shown by the police, and he took the opportunity of acknowledging it.

Sir Richard Harrison responded. He felt honoured at having such a duty at a gathering of so important and far reaching a body as the Automobile Club. The Navy and the Army depended very much upon mechanical power. It was impossible for a navy, and almost impossible for an army, to carry out a campaign unless assisted by mechanical power. The transport of ammunition had become something beyond the power of animals, the care of the sick required an amount of transport that could hardly be understood, and all that pointed to the fact that unless along lines of communication they had a river on which vessels propelled by mechanical power could move, or railways along which engines could run they could hardly conduct a campaign. That had been borne out in South Africa, and they were beginning to feel that not only must they have mechanical power on the lines of communication but that there was also a field of usefulness on the actual battlefield close to the enemy. One of their difficulties was to bring up the heavy guns that had to be taken up to the front. How could they be better conveyed than by means of engines such as they had already sent out to the seat of war. In the future they would have to send to the front the searchlight that Colonel Crompton had been associated with. They would also have to provide some rapid transport to keep the army in touch with the railroad, and he could not help thinking that with the very extended battlefields of modern days they would require some rapid engines to enable the generals and staffs to see what was going on. The Royal Engineers had for many years past been doing their little best to further traction engines. Such engines had done useful work in the war under Colonel Templar. Besides those transport engines they had also sent out engines in connection with the electric light, and there Colonel Crompton had done a great deal of useful work. With regard

to the future he could say that Lord Roberts had recognised the value of what such engines could do and had sent Colonel Crompton to help them at the War Office with his practical advices, and to find out what kind of motors would be required in future wars.

Professor Boverton Redwood proposed the Legislature, remarking that the present position was full of danger to automobilists, and they must be watchful lest what they had was taken away from them. The Legislature had conferred powers on local bodies in anticipation that they would be properly exercised. Members of both Houses of Parliament should be informed that what they gave automobilists was in danger of being made of less value than they intended to make it. He thought they might appeal with a very great deal of confidence to members of both Houses of Parliament who showed much care in grappling with technical subjects.

Mr. J. Cumming Macdonald, M.P., responded and recalled how rapidly the Light Locomotives Act of 1896 had been passed through Parliament in less than a fortnight. He believed the future development of this movement to be illimitable, and possibly in the future one of the best batteries in the Royal Horse Artillery would be that which dispensed with the services of horses altogether.

The Right Hon. C. Stuart-Wortley, M.P., proposed "Success to Automobilmism." He promised to consider, with sympathetic candour, any proposal brought forward in Parliament for the removal of the tare limit about which the Liverpool Self-Propelled Traffic Association had interested itself. With regard to speed on the roads he asked what was the true test? Should it depend on some arbitrary fixture of a maximum number of miles per hour or should it be that in the given case there was no real danger to the public? It reminded him of a phrase once used by Sir William Harcourt, "the mastering sense of the common law." There was a law prohibiting driving to the common danger, and was not that the true test? Was not that in harmony with the rule of the club which moved the whole question to a higher plane, and which was that they should not drive in an unsportsmanlike way? In that, he thought, they had the charter of their future liberty. That brought him to consider two possible systems of public safety; that of other countries which was to teach the public to look after themselves, and that of this country, which was to prevent citizens having any possible opportunity of taking care of themselves. The loss of life was not greater under one system than the other. The interests of automobilists were threatened by the Association of County Councils. If their objects were for the welfare of the people, as a whole, they were usurping the functions of the Houses of Parliament. It was monstrous that county councils should be, by a majority vote, placed in the position they were by that Association. He proposed the toast to an important industry, which he wished to see acclimatised on English soil.

The Hon. J. Scott Montagu, M.P., responded, and, in doing so, reviewed the work of the Automobile Club during the past year. The 1,000-mile Trial was strong testimony to the reliability of motor-vehicles. Having shown how similar arguments were used against railways as were now used against automobiles, Mr. Montagu went on to say that further restrictions would not be placed upon motor-cars if their drivers showed deference and tact to the general public. In recent elections motor-cars had been largely used, and the way in which they were handled had done much to dispel prejudice. He hoped to see the industry grow on British soil. The export from France for the first nine months of the present year had been at the rate of £333,000 per annum, and half of the vehicles represented by that amount had been brought to England. Most influential people had been added to the list of supporters of automobilism during the year. If they would lie low victory would ultimately be theirs. He appealed to automobilists to be careful of the rights of other users of the road, to keep on the right side of the road and not to take a pleasure in running over dogs. No man could be a good judge of motor-cars unless he had ridden them, and he was glad the Club was about to educate county councillors in that direction. They could also congratulate themselves on the growing friendliness of the Press. In conclusion, he read a letter from Lord Kingsburgh, urging self-restraint on the part of automobilists.

Colonel R. E. Crompton proposed the toast of "The Visitors," and referred to the work he had done in South Africa during the last eight months. In Natal, traction engines had been tried in times of heavy rains when transport of any kind was very difficult. By May, engines which were capable of drawing loads across the veldt were up to the firing line, and from that time onwards the automobile had not suffered in South Africa. When Lord Roberts wanted to get guns into difficult positions, he sent for self-moving engines. South Africa was covered with dead animals that had been employed for haulage. The position would have been very different had automobiles been employed. Of 130 tons of food for two columns sent by steam traction from Pretoria to a point twenty miles to the west, 100 tons were for the horses and only 30 tons for the men. He hoped to relieve the British cavalry of the huge weight the unfortunate horses now had to carry. It was his ambition to introduce into the service a light vehicle that should carry a large portion of that load. Engines had taken 12-ton guns up inclines of 1 in 5, and if the existing engines had done that, what would those produced in the future be able to do?

General Sir Thomas Gordon replied, eulogising Colonel Crompton's work in India—work which dated from 1871. He also emphasised the value of the introduction of automobiles into Persia by the Czar.

The health of the Chairman, proposed by the Hon. Cecil Duncombe, and heartily drunk by the company, brought the interesting proceedings to a close.

FURIOUS DRIVING CASES.

At the Diss Petty Sessions last week, Frederick W. Fitt, Norwich was charged with driving a motor-car at Roydon to the common danger of passengers, on October 31st.—Mr. Reeve, solicitor, Norwich, appeared for the defence.—W. H. Berry, relieving-officer, Kenninghall, deposed that he was driving from Diss to Roydon, and when near Blackboard Farm, he heard a motor-car approaching. There was a sharp bend at this spot, and the car came at a very fast rate round that bend. Witness's pony was frightened, and, swerving to the right, ran up a bank. Witness was not prepared to judge the speed, but it was far too fast for a dangerous bend in the road.—For the defence, it was stated that a horn was blown, and the motor brought to a dead stop in passing Mr. Berry's cart.—The Bench decided to dismiss the case, but, in reply to Mr. Reeve's application for defendant's costs, the Chairman said the Bench declined to make an order, as they did not consider it a case that ought not to have been brought.

JOHN HILLS was charged at Hastings, last week, with furiously driving a light locomotive.—The case against defendant was that he drove his motor along the front at Eversfield Place in a furious manner and knocked down three University School students, who were cycling. It was alleged that the motor travelled at from twelve to fifteen miles an hour.—For the defence, it was contended that the speed had been exaggerated and that no complaint was made until after the accident.—A fine of £2 and costs was inflicted.

At the St. Albans City Sessions, on Thursday last week, a case of considerable interest to motorists and others was heard. It was one in which Mr. S. F. Edge, of London, was summoned for driving a motor-car at a greater pace than fourteen miles an hour in the Verulam Road on Saturday, November 3rd. Defendant pleaded not guilty, and was defended by Mr. Staplee Firth. Head Constable Blatch, in opening the case, said that it arose out of a report that was made to the police on November 3rd. It was alleged that three motor-cars were proceeding down the Verulam Road at such a rate that a serious collision was only just avoided. The leading car was on the wrong side of the road. Enquiries were made by the police, and the result was that the defendant was seen at Northampton and was seen again on the road back home. P.C. Cowan said that on Saturday, November 3rd, he was on duty at the fountain near the Market Cross at 2.50 p.m., and saw three motors go through together, all of one colour. The defendant was driving the first car. There were two others—one a lady—in the car. They were then going at an ordinary pace. Lady Bingham, who was next called, said that at about three o'clock on November 3rd she was in her victoria, drawn by two horses, coming out of the Branch Road into the Verulam Road. As they were nearing the corner she heard the sound of a motor coming, but there was no hooter sounded. Her coachman pulled up as shortly as he could, but the motor was practically upon them, and, although her coachman had pulled up, she thought nothing could avoid an accident. The motor was on the wrong side of the road, and the driver did not slacken speed. This was the largest of three cars which were there, and she considered that they were going at about twenty miles an hour. Edward Stanup, coachman to Lord Bingham, said that as he was driving out of the Branch Road on the afternoon in question there were three motor-cars coming down the Verulam Road. They were going at from twenty to twenty-five miles an hour, the first one going something like an express train. As soon as he saw them, he pulled up as shortly as he possibly could. P.C. Brotherton gave evidence to the effect that on Sunday, November 4th, he was in the High Street looking for three motors. At about 6.50 he saw a large motor coming round the Redbourn Road and going in the direction of London. The car was a light grey one, and Mr. Edge was driving it. Witness asked whether he went through the city the previous day, and P.C. Cowan, who came up, identified him as the gentleman who had. Witness asked him what time he went through, and Mr. Edge said about 1.30, but after witness had told him he went through with two other cars at about a quarter to three, he then said, "As to the time, I didn't notice. I was by myself in front, and I did not know what was behind me. There might have been a traction engine for what I know." He asked why he had been stopped, and witness then informed him of the occurrence of the previous day. He then said, "Was there any damage done?" and asked what was wrong. The defendant was then sworn, and said he did a good deal of motoring, having travelled nearly 70,000 miles. On November 3rd he came in St. Albans at about 1.30 p.m. and stopped for lunch. There were then three other motor-cars in the Peahen yard. He knew two of the cars, and left St. Albans with them at about a quarter to three. Mr. Mayhew, who was driving one of the cars, was in front of him at the Market Cross, witness having stopped at the hotel to pick up his wife. They were going on to the Birmingham Road, and in the Redbourn Road witness passed Mr. Mayhew to get in front, and was in front when he passed the Branch Road. Continuing, the witness said that his car was the same shape as Mr. Mayhew's, only it was not of so recent a make and not so strong. The road was exceedingly greasy, and witness was driving very slowly, and seeing the carriage coming out of the side road, he crossed over to the other side, which was a most natural thing to do. He was only going at nine miles an hour. There were three speeds on the car, which was driven by an oil engine, and on this afternoon he had the second speed on, for when the roads were greasy the car was liable to have side-slips. He had his engine slowed at this moment, as they were going down a slight slope, in order to avoid side-slips. He did not drive the car for one moment more than nine miles an hour. This was the only evidence called for the defence, and Mr. Firth proceeded to address the Bench for

the defence, submitting that no case had been made out. They had heard a great deal about what was almost a collision, but that was undoubtedly owing to the careless driving of Lady Bingham's coachman. The Bench, he was sure, knew the Branch Road corner, and he ventured to say that none of them would attempt to drive round there at a trot. It was what he called a "blind" corner, for, when coming down the Branch Road, it was impossible to see what was coming down the main road. Mr. Edge could have stopped his car immediately if he had thought that there would have been an accident. It was admitted that they had heard the motor coming, and it was perfectly clear that the coachman ought to have pulled his horses up sooner, but he could not do so because he was trotting. He would remind the Bench that the summons was for driving a motor-car at more than fourteen miles an hour. But there was no definite evidence at all on the part of the prosecution as to that point. The Bench retired, and on returning, the Mayor said they had gone very carefully into the case, and, looking at the matter fully, they thought the information was not made out, although the witnesses both for the prosecution and the defence had given their evidence very properly. If the case had been brought under a different section, that was with driving the car to the danger of the public, they would have taken a different view of it. The case would, however, be dismissed, and they were unanimous in that decision.

THE BLACKPOOL MOTOR-CAR COMPANY.

THE case of Hamilton and others v. the Blackpool Motor-Car Company came on for hearing before Mr. Justice Buckley, in the Chancery Division of the High Court of Justice last week. It was an action by four directors to enforce a mortgage alleged to have been given them by the company to secure them in respect to a guarantee they had given to the Lancashire and Yorkshire Banking Company to cover an overdraft of the defendant company. After evidence on both sides had been given, his Lordship said he had to determine two questions—one of fact and the other of law. Was this deed executed at a time when the company was unable to pay its debts, in pursuance of and performance of an antecedent obligation to execute that security when called upon? He had come to the conclusion that before December, 1898, there never was any binding engagement on the part of the company that these four directors should have such security; nor did the directors execute their guarantee in the faith of such security. The question of law was whether the directors were creditors within the meaning of Section 48 of the Bankruptcy Act, 1883. It appeared to him that they stood under a contingent liability to the bank on behalf of the company. They were sureties for the company, and came within the meaning of Section 48. Therefore their claim must fail, and he must declare the deed to be void, and the plaintiffs must pay the costs. On the application of Mr. Terrell, execution was stayed, on the usual undertaking, with the view of appealing.

A DRUNKEN MOTOR DRIVER.

At Bow Street Police Court last week, David Pullen was charged before Mr. Marsham with being drunk while in charge of a motor-car. Police-constable 252 E stated that at twenty minutes to eleven o'clock on Monday he saw the defendant driving a motor-car in the Strand at the rate of between twelve and fifteen miles an hour. The car was swerving from side to side and witness called upon the prisoner to stop. He did so, and he then saw he was drunk. At the station he denied being intoxicated, and a doctor was sent for. He said the prisoner was very drunk. There was a gentleman in the car with him. The prisoner now said he must give way to the doctor's opinion, but it was a bad night, and motors always slipped about on a wet road. A gentleman in court, whose name did not transpire, said the prisoner had brought the motor from Salisbury for him, and had been in his employ for two months. Mr. Marsham told the prisoner that he had done a very dangerous thing, and ordered him to pay a fine of 20s., and 7s. 6d. doctor's fee.

A MOTOR-CAR CASE AT FORFAR.

IN Forfar Sheriff Court last week the record was closed in an action at the instance of Mrs. Ann Cathro Mitchell, or Lumsden, wife of Philip Lumsden, Kirriemuir, and the said Philip Lumsden for himself, and as administrator-in-law of his pupil child, Lavina Smith Lumsden, in which pursuers seek to recover from Alexander Ross French, dentist, Forfar, the sum of £75 and £25 respectively in name of damages for alleged personal injuries. In the condescendence it was stated that in the afternoon of the 13th July, the defendant negligently drove a motor-car along Millar's Lane, Kirriemuir, with the result that he knocked down and drove over the pursuer, who was walking towards her home with her child in her arms. The defender, it was averred, was driving at a dangerous pace, and in a careless and reckless manner for such a locality. Without any warning, defender recklessly ran the car into the lane, injuring the female pursuer and her child. The pursuer was very seriously injured by the wheels, or one of them, passing over her legs, and was confined to bed for about six weeks, an operation on her left leg being found to be necessary. The child was knocked from her mother's arms, and was found to be seriously injured.

For the defender, it was denied that he either drove the car negli-

gently, or that he knocked down and drove the car over the pursuer. It is explained that immediately after he started in High Street, opposite the Post Office, several people from the crowd on either side of the avenue that he had cleared began to cross in front of him, and to avoid the risk of accident he altered his course into Millar's Lane. The pursuer was at the time standing on the foot pavement of the Square, and she recklessly and suddenly turned into Millar's Lane in front of the car. She then got excited, and tripped and fell in front. It was denied that the child was knocked from her mother's arms by the car. It was further denied that there was any ground for the claims, and that in any case the damages were excessive. The defender also expressed his regret, and, without admitting liability, offered £5 and to pay any necessary medical expenses.

ACTION FOR THE PRICE OF A MOTOR-CAR.

IN Forfar Sheriff Court last week, Sheriff Lee issued his decision in an action at the instance of James Macfarlane, cycle and motor car dealer, Perth, against Alexander Ross French, dentist, Forfar, to recover the sum of £135, being the price of a motor-car sold by pursuer to defender in July last. His lordship, in giving decree for the amount sued for, said the objections stated were on grounds either manifest at the time of sale or easily and immediately ascertainable. He therefore found in law that there was a completed contract of sale, and that the defender, not having returned or intimated his rejection of the car, but, on the contrary, having retained and used it for a period largely in excess of that necessary for trial and discovery of fault, was liable in the purchase price, with expenses.

WE hear that the Hon. C. S. Rolls, has ordered a 24 h.p. Mors car, which is expected to be delivered by the end of next month.

THE King of the Belgians has been elected as President d'Honneur of the Moto Club de Belgique, and as Haut Protecteur, Member d'Honneur of the Automobile Club de France.

THE Shrewsbury (S.T.) and Challiner Tyre Company, Limited, has been registered with a capital of £32,000, to carry into effect an agreement made by this company with the Challiner and Willoughby Carriage Tyre Company, Limited, and a second agreement with the Shrewsbury and Talbot (S.T.) Cab and Noiseless Tyre Company, Limited, and, generally, to maintain and to carry on the general business of manufacturers and vendors of and dealers in vehicles of all kinds, pneumatic and other tyres, etc.

CALLING some few days since upon Mr. H. Waterson, of Aston, Birmingham, with regard to the many "E. H." motor specialities, in which he has already formed a considerable business, we were agreeably surprised to find that so great has been the demand for his goods for use upon cars, voiturettes, etc., to be exhibited by makers at the cycle shows, that he has been unable to reserve a collection for exhibition on his own account. He has, however, secured a good space at the Automobile Club's Show in May next. Mr. Waterson will be staying at Holborn Viaduct Hotel, E.C., from Monday, the 26th, to Friday, the 30th instant, and any of our trade readers desiring quotations and data as to coolers, accumulators, carburettors, steering wheels, etc., would gather some useful information by a visit.

THE Motor-Car Journal.

Vol. II.]

LONDON, SATURDAY, DECEMBER 1, 1900.

[No. 91.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

ACCORDING to the secretary of the County Councils Association, that body has not yet discussed the reduction of the speed of motor-cars, nor has it even considered the numbering of such vehicles. All that it has done up to the present has been to invite the opinions of county councils on certain suggestions made by the East Suffolk Council. When these

have been ascertained the matter will be discussed. Hence the necessity for individual automobilists throughout the country to do what they can to educate county councillors and similar persons without delay, so that there may be created within the ranks of the County Council Association a strong protest against any proposals to further restrict the rights of users of the road. The Hampshire County Council may be expected to offer strong opposition to the suggestions that have lately been made, and seeing that that body has charge of one of the districts where motor-cars are most frequently seen its views should have considerable weight. Other councils should be brought to a similar state of mind, and every owner of a motor-car can do something in this direction by influencing any public men he may have among his friends.

Ten Miles an Hour.

THE proposal of the County Councils to limit the speed of motor-cars to ten miles an hour, thus reducing the present limit by two miles, does not strike us as a very happy or sensible proposal, and we are glad to see that the *County Council Times* declares: "We have not much sympathy with the proposal as to reduced speed; we think it unnecessary and impossible. If we are unable to procure observance of a twelve-mile limit, we cannot of one of ten miles." It is really a silly annoyance which prejudiced people seem desirous of inflicting upon motorists.

In Norfolk Again.

WHAT delightful councillors have been elected to look after the interests of the people of Norfolk! Apparently a great number of these learned and interesting gentlemen regard motor-cars as hooks whereon to hang their fads and fancies. At a meeting of the Western Highways Committee of the Norfolk County Council, Mr. J. B. Mitchell moved that a bye-law be passed that all motor-cars bear a number plate five inches long, the charge for these to be a guinea for private cars and five guineas for those let out to hire, the money thus obtained going to the roads account. Further, the speed of cars was not to exceed twelve miles an hour, and when a car met or passed a vehicle, the driver of the car was to stop and render assistance if necessary. The chairman advised Mr. Mitchell to take his suggestion to the full meeting of the Council, and there probably the guinea plate five inches long will be trotted out and regarded with awe by the wondering councillors. What with this plate and the

sounding gong which another Norfolk gentleman has suggested, the motorist's career will be overwhelmed with complications.

"Breakdown of the Royal Motor."

The burners of the motor-car belonging to the Prince of Wales went out on Monday, causing a delay of two minutes. This slight incident was sufficient to secure a long paragraph in the daily papers with the startling heading "Breakdown of the Royal Motor." To give the matter such a title was absurd, as the affair was in no sense a mishap—only one of those little trifles that, but for the fact that it happened when the Prince was aboard, would never have been noticed in the press. It appears that his Royal Highness, who has been spending a few days with Lord Farquhar at Castle Rising, concluded his stay on Monday morning, and left for London by the 11.47 a.m. train from Lynn. It was a bright, exhilarating morning, and His Royal Highness rode into the town in a motor-car, being accompanied by Lord Vane Tempest, the Right Hon. Henry Chaplin, and Hon. S. Grenfell (Equerry-in-Waiting). On the way a slight delay occurred, for in the jolting over the rough, uneven surface of the Gaywood road one of the burners went out. The party were already behind time, for the departure of the train was a little overdue. A large motor-brake which had conveyed the luggage of the guests to the railway-station and was returning approached, and the Prince and the others immediately transferred themselves to it and went on to the station, the other vehicle following at an interval of a couple of minutes, after the burner had been relighted. The Prince caught his train after all.

Punctuality.

MOTOR-CAR services to be prosperous must be punctual, and we would impress the fact upon all who contemplate starting such means of public convenience. A correspondent living in a Midland town writes:—"Last night I waited thirty minutes in the rain near ——— Church for a motor-car for ———. Three passed me within that time from the other end, but not one from the direction I wanted to go, and I had finally to give it up and get home by some other means. The motor-cars in question are supposed to run every quarter of an hour, but in fact they start at any time, and as happened last night three ran within the half-hour in one direction and none in the opposite one. This has been the experience of a number of persons to whom I have spoken, and all have expressed the wish that the local authority would, if they have the power, insist on a time-table being declared and adhered to."

King Leopold.

KING LEOPOLD of Belgium is enjoying all the sensations of automobilism, for since his return to Brussels he has actually been racing. True, it was neither against a rival car nor an express train that His Majesty competed, but even a cyclist affords good sport sometimes, and the King's adversary appears to have given him a good run for his money.

Following the Avenue de Tervueren, *en route* for Quatre-Bras, the royal 12 h.p. was proceeding at a moderate pace, when suddenly a cyclist darted by, crying, "Polle, the last at Quatre-Bras pays for drinks!" The King's good humour was nowise disturbed by the familiarity of the speaker, and, signing to his driver, the latter quickly had the car running on her fourth speed. Caught and passed, the challenger tried in vain to hang on behind, but all in vain, and when King Leopold reached Quatre-Bras not a sign was to be seen of his adversary. Rather mean to back out of the promised drinks, but perhaps the audacious cyclist had some qualms on the subject of his disrespectful address to the monarch, and considered flight the better part of valour.

Racing in Germany.

THE "Berliner Automobil Renn Verein," the new German club whose formation was recently announced, has just made known its intention to organise during next summer a great automobile race over a distance of 1,000 kilomètres, or 625 miles. The route selected is Berlin-Hamburg-Bremen-Berlin, but the exact itinerary is not likely to be settled upon for a long time to come. This event, together with the proposed Paris-Berlin race, should do much to heighten the interest in the new sport, and we should not be surprised to see a great development in German automobilism during the forthcoming year. Dresden-Leipzig and Berlin-Aix-la-Chapelle have already fired the racing instincts of German motor men, and with further encouragement the sport may spread as widely as it has done in France. It is further rumoured that the Automobile Club of the West of Germany will hold a race from Königsberg to Aix-la-Chapelle, in which several French *chauffeurs* will compete.

Accident to Mr. R. Egerton.

WE are sorry to hear that Mr. Reginald Egerton is laid up with a broken rib and is marked with many bruises. He was the victim of a curious accident, being crushed through the woodwork of a coach-house door by a heavy Daimler car in a most unaccountable manner. He was between the back of the car and the heavy door, which was closed and bolted. His escape was marvellous. After being repaired at the hospital, Mr. Egerton was driven home in the car, which he said did not jar him in the least. The man who came into the hospital next had his hand badly chewed up by a horse, and Mr. Egerton could not help saying to him—"Dangerous things, horses"—and he agreed.

Automobiles v. Tramways.

TRAMWAY men are apparently discontented in the United States. During the past summer there has been considerable agitation, and rumours of strikes as thick as speeches in the Presidential campaign. In this connection a meeting of the Executive Board of the International Street Railway Men's Association, held in Detroit recently, becomes of interest, for President W. D. Mahon recommended that the board start to raise funds by assessment to buy automobiles for the purpose of putting them to work in cities where the companies treat the men unfairly or where transportation facilities are meagre. President Mahon's idea is to put a complete automobile service in operation in a city as soon as a strike is declared, and to have the automobiles operated by the men who formerly operated the street cars. The board approved of the idea, and authorised the president to draft a plan of assessment.

The Automobile Club of America.

THE Automobile Club of America tendered a banquet on the 9th ult. to the exhibitors at the recent motor-car show in New York. About 200 persons sat down, the gathering being presided over by Mr. A. C. Bostwick, vice-president of the Club. Addresses were made by Messrs. A. C. Bostwick, George F. Chamberlin, Samuel T. Davis, jun., Prof.

R. H. Thurston, of Cornell University, and Arthur J. Eddy, of the Chicago Automobile Club. Professor Thurston commended the progress shown by the exhibits, and then delved into history, tracing the idea of road locomotion down through the ages to the early days of the present century. He pointed out that the work of Hancock and Gurney was as practical for their day as any at the present time, but the public was not ready for the new locomotion. Railways absorbed attention, and legislative interference finally put a quietus on the movement. Now all is different. The public is prepared for the road-motor, and powerful agencies are advancing its cause. The general principles underlying the motor-vehicles are now known, and all that remains is their application. He had seen more novelties in the mechanical line at the motor-car show than he had ever found in an international exhibition.

1,000 Miles Non-Stop Run.

LAST week we reported the early stages of the long non-stop run on the Crystal Palace track. The 5 h.p. Decauville car covered the 1,000 miles in 48h. 24min. without a single stop. The 8 h.p. car, however, stopped during Wednesday night, owing, we are informed by Mr. Moffat Ford, to the carburettor having become frozen, a large piece of ice being subsequently extracted from it. It had previously run 314 miles, and on the morning of the 22nd it was started again with the object of covering 1,000 kilomètres (625 miles) without stopping. This it successfully accomplished in 24h. 54min. During the night's run, a lantern that had been left in the body of the car overturned, and the flames quickly spread to the upholstery and woodwork. Only when he felt the heat did the driver discover what had happened. On his slowing down several men mounted the vehicle and extinguished the flames while the car was in motion.

Motor-Car Engines.

AN interesting lecture on "Motor-Car Engines" has been delivered before the Yorkshire College Engineering Society, in the Engineering Lecture-room of the College, Leeds, by Dr. J. T. Thresh. The lecturer predicted a very rosy future for the motor-car, and remarked upon the reliability of the cars manufactured now, as compared with those made a year ago, when it was thought almost impossible for any car to run forty miles without a breakdown. A thousand miles without a stop would be thought nothing of nowadays. In drawing a comparison of modern motors, Dr. Thresh prophesied that in a few years' time steam would displace oil and spirit motors, and when electricians had discovered a better kind of secondary cell or battery, electric motors would undoubtedly supersede all other types. Speaking from his own personal experience of the primary cost, safety, speed, and cost of working motor-cars, the lecturer advanced the opinion that if motor-cars must become cheaper, the workmanship would become inferior. In point of safety, the motor-car possessed every advantage over the "animal motor." It had already been perfected up to a running speed of sixty-two miles an hour and upwards on the highways. As for the cost of working, in a run of eighty miles, occupying ten hours, the expense incurred by a Serpolett steam car would be 2s. 6d., by an oil car 3s. 4d., and by an electric car 4s. 8d., including the price of electricity. The doctor illustrated his lecture by taking to pieces and reconstructing a typical internal combustion 2½ h.p. engine weighing 54 lb., capable of a speed of twenty miles an hour, the parts and *modus operandi* of the working of which he fully described.

Automobiles at Hotels.

WE recently notified that a hotel proprietor on the South Coast was purchasing a motor-vehicle to take visitors to and from the station. Then Mr. G. M. Brown, of the Central Hotel, Princes Street, Edinburgh, went a step further, and purchased a motor-phaeton from the Motor Manufacturing Company, Limited, for the conveyance of visitors to places in

the vicinity as well as for station work, when required. The experiment has proved wholly satisfactory, and another motor-vehicle is to be introduced in connection with a large hotel he owns at Annan. There is no doubt a great future for automobiles in this direction.

The Nice Automobile Club.

ON Saturday last there took place at the club-house in the Boulevard Gambetta the annual general meeting of the members of the Automobile Club of Nice, at which some sixty well-known motor-men assisted. Among them may be mentioned the names of the Baron de Zuylen, president of the Automobile Club of France, and the Count Biscarreti di Ruffia, president of the Automobile Club of Turin. It is interesting to note as an evidence of the prosperity of the A.C.N. that, in spite of an expenditure of some £2,800 during the last twelve months, £60 still remains on the credit side of the books. The business transacted was of the usual character, and the large majority of retiring officials were re-elected. For the ensuing year, therefore, M. J. Gonsin will again act as president, the other leading officials being—vice-presidents, MM. Paul Chauchard and Ernest Sardou; treasurer, M. Ferdinand Crossa; secretary, M. Pierre Clérissy. Later on in the day the club's season was formally inaugurated by a banquet at the Hôtel d'Angleterre, at which a great number of members were present. Nice is already alive with automobiles, and the number of *chauffeurs* continues to increase daily. It is going to be a great season for the new sport on the Riviera this winter.

Automobilism in Russia.

BURDENED with a multitude of vexatious regulations, the Russian automobilist does not enjoy the rosiest of times, and he therefore warmly welcomes any relaxation of the existing restrictions, no matter of how slight a nature it may be. One such concession recently granted by the authorities relates to the numbering of self-propelled vehicles. Formerly every automobile was required to carry a couple of numbered lanterns in order to permit of easy identification by night as well as by day. Naturally the numbers greatly obstructed the light given by the lanterns, and motor-men complaining bitterly of the regulation, a modification has been introduced whereby the lanterns are freed from the numbers, which in future will be placed one in front and one behind every motor-vehicle. It is not an enormous concession, but when the tendency is rather to accentuate than to relax existing regulations automobilists gladly welcome the most insignificant favour. The day when the Czar becomes *chauffeur*, Russian authorities will regard automobilism more favourably, perhaps.

Barricading the Streets.

COULD Macaulay's New Zealander be brought to London before the close of the present century he would probably imagine that the metropolis was in a state of siege, and that the visit of Mr. Kruger to Paris had caused the authorities to barricade the main thoroughfares. Curiously devised fences line some of the chief streets, and deep trenches have been dug in which scores of men are busy at work. These sights, together with the presence of great lumbering wagons, give life and actuality to such a notion. Probably some of the visitors to the capital were alarmed a few weeks ago, but now everyone has grown so accustomed to the hideous features of the streets that they are regarded with less nervous feeling. But while the fear has subsided the annoyance and irritation has developed into active hostility. This week the tradesmen of East London have met and denounced the nuisance caused by the main thoroughfare leading from the City to the east being "up," and at Wednesday's meeting of the Court of Common Council it was proposed that the companies thus hampering the traffic of the streets should be compelled to carry on their work by continuous shifts night and day. While there is little business in the streets the contractors

suspend operations, renewing work as the thoroughfares become more congested. If the work has to be done let it be done quickly and continuously, for while under the present laggard system one firm may save a pound the loss to the commercial community can scarcely be under-estimated.

M.P.s on a Motor-Car.

AMONG the successful candidates at the recent General Election who found their labours facilitated by the employment of motor-cars were Messrs. W. R. Plummer and George Renwick, of Newcastle-on-Tyne. They used Mr. William Dunn's Benz car, and on the day of the election were able to

visit all the polling-booths in the constituency in less than half the time that would have been the case had an ordinary carriage been employed. In the accompanying photograph Mr. Dunn is standing in front of the car. Mr. G. Renwick, M.P., is on the front seat with Mrs. Dunn, and Mr. G. Laidlaw, electrician, is on the back seat with Mr. W. R. Plummer, M.P.

LORD HAISBURY, the Lord Chancellor, has been for a motor car ride, and subsequently expressed his pleasure at the experience.

MESSRS. ALBERT R. SHATTUCK, Albert C. Bostwick, and Juan M. Ceballos have been appointed a committee to look for suitable quarters for the Automobile Club of America where storage and repair facilities may be had.

MEDICAL men will find much convenience in the adoption of the motor-car. Automobilism is not unlike medicine—too small a dose will probably do a person no good and too large a dose may kill him. It is in finding the happy medium that safety and exhilaration will be found.

THE New Grappler Pneumatic Tyre Company, Ltd., Dublin, have sent us a copy of their new price list of motor tires. It gives particulars and prices of tricycle, quadricycle, and voiturette tires, as also of those for cars weighing between 6 and 10 cwt., and from 10 to 15 cwt. The weight of material in the Grappler tires has, we are informed, been substantially increased. The company also claim that by the introduction of a novel method in the manufacture of the tubes they have overcome the trouble complained of by motorists arising from faulty air tubes.

A MEETING of American automobile manufacturers was held in New York, on the 10th ult., over thirty firms being represented. Mr. John Brisben Walker, of the Mobile Company of America, was elected temporary chairman. A committee of eleven was elected to take in hand the preparation of a permanent organisation of automobile and accessories makers, and to have power to draft a constitution and by-laws, select officers for the first year and to secure a certificate of incorporation. Those present signed a resolution to the effect that the object of the prospective organization would be to advance and protect the interests of trade.

MOTOR-TRICYCLES. SOME DEFECTS AND REMEDIES.

BY A. E. S. CRAIG.

(Continued from page 645.)

A great deal of trouble awaits the unwary novice who does not understand the principle of carburation. The usual form on tricycles, known as the De Dion, is the triangular box holding the best part of a gallon of spirit. There is, in my opinion, only one merit in this type, and that is simplicity. It is wrong in theory, inasmuch that the lighter gases are bound to be given off first, leaving a residue of stale petrol that is not desirable. The jet, or pulverising carburettor, is the one that will avoid this, and elegant little devices on this principle are on the market. The next defect in the triangular-box carburettor, which I need hardly say is of the surface type, is its very unequal action on varying roads. In spite of the baffle plate, the jolting over rough roads makes a considerable alteration of air mixture necessary, and this is a great nuisance. It is especially awkward at the commencement of a hill, and many a weary mile have motor-tricycle riders had to push, in hilly country, with unequal road surface, on this account. It is, moreover, a source of danger, owing to the bulk of liquid and explosive vapour in communication with a chance of ignition.

That such a danger exists I have had personal experience, and can show as a warning a discarded carburettor of the De Dion type, in which an explosion occurred through this cause, and I regard it as little short of a miracle that it did not result in a fearful accident. The usual safety discs of gauze were there; though blown out of shape by the explosion. I do not advise attempting to remedy the defects of this carburettor; the best thing to do is to discard it entirely, or convert it into an air tight supply or auxiliary tank.

Beware of stale petrol; it is an unmitigated nuisance, unreliable as to mixture and inefficient in power. In the triangular boxes one always has stale petrol more or less, and of course the best thing to do is only to put in as much spirit as you know will be consumed in one ride. Should there be a residue, it is best to empty it out and keep it for cleaning purposes. Never take it for granted that the petrol you buy is fresh, even if in an alleged air-tight can or drum; test it for yourself, and then you will know. I believe the day is coming when ordinary paraffin, or some more stable spirit than at present used, will be adopted, and then of course the specific gravity is not likely to vary; but at present we must be content to adopt all precautions to reduce the chances of things going wrong. Always carry a densimeter, but remember that if you draw some petrol to test from the bottom of a De Dion pattern carburettor it probably will not show the same density as some drawn from the top. This is especially the case when fresh spirit has been added to stale. Agitating the brass tube attached to the baffle plate will only temporarily mix new and stale spirit. A lot depends on the nature of the igniting spark as to the exact degree of density which will work in a motor, and a great deal also depends on the type of carburettor. A pulverising type is worth its weight in gold compared to a surface carburettor for using stale petrol, just as much as a fat spark is worth three thin ones.

Many *chauffeurs*, novices mostly, leave their air valves open when they stop, especially if they have it set at what was the correct mixture; in fact, some, I believe, leave them open all night, and then wonder why the mixture which worked so beautifully the day before should be so provoking after a night's rest. Just as a good engine driver can keep up a head of steam, and run to time, with a coal sheet that will earn him and his fireman a weekly premium, so can a *chauffeur*, who studies his air mixture, travel at least fifteen miles more on a tricycle with one gallon of petrol than the average happy-go-lucky amateur. Always, therefore, close the air valves on stopping; you can easily get the mixture the same again, and perhaps better than before.

When running at full speed on the level or slightly down hill, try and see how much air the motor will take. Do not

meddle with the mixture half-way up a hill, or the chances are you will want some air yourself when you get to the top! Try to find the correct hill mixture when climbing short hills.

When a motor will not start in the morning after being left over-night, there is, of course, a probability that stale petrol is the cause, but if it starts on its run all right, it is very improbable that it will cause a stoppage during the day, except in the case of a triangular tank carburettor, and then only after a stop of some duration. If your carburettor is warmed by exhaust, do not let more through than will allow the spirit to vaporise sufficiently. The colder the mixture is admitted into the cylinder the more power will be obtained, owing to the fact that a larger quantity is drawn when its density is greater than when rarefied by warmth. It is a good plan to fit a tap on to the bye-pass exhaust pipe, so as to be able to regulate this, according to the warmth, or *vice versa* of the day.

(To be continued.)

THE *Oil World* states that a Mr. Stoop, of Soerabaja, has obtained a concession from the Dutch Colonial Government to establish a service of motor-cars between Cheribon and Indramajoe.

MOTORISTS journeying through Liverpool should note the address of Messrs Watson and Co., 30, Falkner Street. They stock petroleum spirit, and repair motor-vehicles.

AMONG the repairers and suppliers of petroleum spirit in the eastern suburbs is the firm of Mathews Brothers, 10, Woodford Road, Forest Gate, E.

THE forms of official appointment as repairers of De Dion motors and cars, etc., have been forwarded to all the firms whose applications for the post have been accepted by the De Dion-Bouton British and Colonial Syndicate, Limited. A list of these will be shortly published by the syndicate.

THE popularity of the voiturette is extending, and a groom in West London who likes not motor-cars, with which he says no self-respecting person ought to have anything to do in consequence of their uncertain behaviour, mispronounces the word as "Whatcherat," a term almost worthy of Sam Weller.

THE Imperial Autocar Manufacturing Company, Limited, has been registered with a capital of £4,000 to acquire the business carried on at Manchester by H. M. Addey as the Imperial Autocar Manufacturing Company, and the business carried on by W. Tutner at Manchester, and to carry on the business of autocar, cycle, carriage, and vehicle manufacturers.

MESSRS. WERNER FRERES AND Co., Paris, write us to the effect that it has come to their knowledge that certain dealers in "job" lines of motor-cycles are selling a machine called the "Werner Moto-cyclette." They state, however, that the machine thus being sold is an obsolete model with experimental tube-ignition motor and was not manufactured by them.

ON the Automobile Club's run between Winchester and Fareham, a wire connected with the ignition on the Wolseley car broke. It took some time to find this; hence a delay of quite an hour. That was, however, the only trouble on the return journey, and the car ran from Basingstoke to Hyde Park Corner without a stop.

THE Gordon Cycle and Motor Co., 140, Seven Sisters Road, Holloway, has extensive workshops for the repair of all kinds of motor vehicles. They have facilities for coach-building and painting, and also ample storage room for cars. Their riding school is nearly half a mile in extent. The company stocks petrol and all accessories.

A CORRESPONDENT of the *Aberdeen Free Press* has been giving his experiences of driving a Peugeot phaeton from July, 1898, to October, 1900. During that time he has had 160 runs, and has covered a distance of about 10,000 miles. During the whole time he has had very few stoppages, and none have exceeded forty minutes in point of time. The car consumed, on an average, one gallon of petrol for every sixteen miles run, carrying four passengers. It was fitted with 3½ in. Michelin tires, and some of them did as much as 4,000 miles without repairs over roads made with hard Aberdeenshire granite. Ten punctures occurred over the 10,000 miles.

THE "ARDENT" MOTOR AND VICTORIETTE.

ONE of the latest cars of French construction to make its bow to the automobile world is the "Ardent" victoriette, made by Messrs. Caron and Company, of 48, Rue Saint Ferdinand, Paris, and of which illustrations are given herewith. The car has seating accommodation for four persons

FIG. 1.—GENERAL VIEW OF "ARDENT" VICTORIETTE.

sitting *vis-a-vis*, and, as will be seen, special attention has been devoted to the suspension of the carriage body, this being quite independent of the frame, on which it is supported by C springs at the rear and by a transverse plate spring at the front. Fig. 2 gives a view of the motor employed to drive the car; it is of the two-cylinder air-cooled type of 5 h.p.,

FIG. 2.—THE "ARDENT" TWO-CYLINDER MOTOR.

the two cylinders being set at an angle of 45 degrees and mounted on the same crank case. The pistons are connected up to a single crank shaft, one explosion taking place at each revolution of the latter. Notwithstanding statements to the effect that air-cooled engines of such high power do not prove satisfactory in practice, Messrs. Caron claim to have overcome all difficulties on this score. It will be noticed that there is an unusually large number

of radiating fins, extending not only around the cylinder, but also round the valve and explosion chambers; in fact, the makers state that their motors are provided with three times the amount of radiating surface usually available. The dimensions and form of the explosion chambers have also been designed to facilitate as much as possible the flow of the explosive gas, as also the products of combustion, so that the latter have but a brief contact with the walls of the cylinder and the valve chamber. Attention is also drawn to the large diameter of the inlet and exhaust pipes. The valves are so fitted that they can be quickly removed for inspection or grinding-in purposes, while the crank shaft bearings are of

FIG. 3.—FRONT VIEW OF THE "ARDENT" VICTORIETTE.

phosphor bronze, and are entirely independent of the crank case. The ignition is electrical, the sparking in the two cylinders being controlled by a single cam.

As shown by the illustrations, Figs. 1 and 3, the engine is

FIG. 4.—THE "ARDENT" SINGLE-CYLINDER MOTOR.

located under a bonnet in the fore part of the frame. Three speeds forward and a reverse motion are provided. The power of the motor is transmitted through a friction clutch to the variable speed shaft, which carries a train of spur wheels continually in mesh with corresponding wheels on a parallel shaft, which terminates in a bevel-wheel gearing, with a similar wheel surrounding the differential on the back axle. As already mentioned, the variable-

speed gear wheels are always in mesh, the desired pair being made to drive by means of sliding sleeves. Not only are the change-speed gear and the bevel gears on the rear axle all enclosed in a dust-proof case, but the driving shaft is also encased, and so protected from dust and dirt. Steering is controlled by a sloping hand-wheel; below this on the same pillar is a second—notched—wheel, in which works the lever controlling the change-speed gear. Provision is also made for starting the engine from the driver's seat. The road wheels are of wood, and shod with pneumatic tires. Ample braking power is provided, one foot pedal controlling a band brake on the differential, and another actuating similar brakes on drums attached to the hubs of the rear wheels.

In addition to cars, Messrs. Caron are also making motorcycles and small motors for the same. The latter is of 3 h.p., and is illustrated in Fig. 4; it is of the single-cylinder type, and comprises all the features already referred to in the case of the double-cylinder motor, so that no further description is necessary.

MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

Next Year's Belgian Exhibition.

AN interesting feature of next year's Belgian Automobile Exhibition, which will be held in the Pôle Nord at Brussels from the 16th to the 24th March, will be the practical testing of the various vehicles shown. These experiments will be carried out under the direction of a special committee appointed by the Chambre Syndicale de l'Automobile, and the results should afford most valuable information to intending purchasers. The universal adoption of this scheme would enormously enhance the utility of exhibitions, for as at present organised they mostly ignore the practical side of the question. The visitor is bewildered by the sight of a great variety of types, many of which have had no acquaintance whatever with the road, and he comes away not one bit nearer a decision than when he entered. But the subjection to practical tests of all the vehicles shown and the publication of the results would aid the buyer enormously, and would also put a stop to that practice of showing uncompleted cars, so frequently adopted by many makers. At Brussels the tests will take place in the hall and the park of the *Cinquantenaire*, which will be used as an annex to the exhibition. The organising committee has been fortunate in securing the patronage of Prince Albert of Belgium, whose interest in all matters relating to the new industry is well known.

The Automobile Club of Belgium.

YET another general meeting must be chronicled, and this time it is that of the Automobile Club of Belgium. Held on the afternoon of Wednesday, the 21st ultimo, it attracted an attendance of over one hundred members, for the general anticipation was that animated discussions on several subjects were likely to take place. Thanks largely, however, to the diplomacy of the president, M. F. Van der Straeten-Ponthoz, all unpleasantness was avoided and the business of the meeting was carried through with expedition. One of the most important subjects dealt with was the question of roads, and from the committee's report it would appear that the Government is likely to take steps to ameliorate these. Another matter under discussion was the proposed tour of Belgium, and it would appear probable that the itinerary will embrace the towns of Brussels, Charleroi, Namur, Spa, Liège, Antwerp, Ghent, Bruges, and Ostend. Nothing in the nature of a race will be attempted, the general idea being based much upon the lines of the 1,000-miles Trial in England. The work of organisation will not be rendered any easier by the fact that apparently the A.C.B. has not the whole-hearted support of all sections of Belgian automobilists, a fact to be sincerely deplored, for in the case of a new movement such as automobilism the efforts of all interested

should pull in the same direction, and no petty differences should be permitted to endanger the welfare of the entire cause.

Paris Motor-Cabs.

"No, let us take a motor!" cried an English visitor to Paris as I was about to hail a horse-drawn cab on the Boulevard the other day, and when I murmured something about millionaires only engaging such vehicles he pulled out a cutting from an English paper, reproducing M. Lépine's recent police ordinance fixing the tariff for automobile *fiacres* at two francs per course and two and a-half francs per day. "Very nice on paper," said I, "but in actuality quite a different story, as you will see," and, stopping an electric cab, I asked its driver what would be his fare to take us to such-and-such a spot, naming a street situated a mile away. "Ten francs," came the prompt reply, and the same figure was quoted by the driver of one of the little Peugeot voituresses whom we hailed. Now both these vehicles belong to the first class, and are quite exempt from the Préfet of Police's ruling, only as no motor vehicles appear to be running under the ordinary cab category visitors are apt to be led astray by the announcement that the fares are at such-and-such rates, and accordingly engage the first automobile that comes along in blissful ignorance that the tariff quoted does not apply to it. During a short period some insignificant number of electric cabs were plying for hire, nominally as second-class *fiacres*, but this was before the issue of the police ordinance, and to-day they are conspicuous by their absence. Therefore, the tariff as published is for a class of vehicle which, at the present moment, does not exist, and I can only warn visitors not to be entrapped into hiring self-propelled vehicles without they are prepared to pay some ten francs per hour. The figures now quoted by the first-class automobiles are moderate in comparison with what was being asked during the exhibition, for then the journey to Vincennes, for example, was frequently run up to sixty francs. And really, they were not accorded such a vast amount of patronage as to warrant any approach to charges of this sort; indeed, on the contrary, they were more often to be seen on the ranks than in active use. It is not the motor-cab which is successful in Paris, but it is the electric vehicle, hired out for lengthy periods, which is proving itself to be practical from every point of view.

Next Year's Paris Automobile Show.

AFTER much controversy and many deliberations the Automobile Club of France and the four protective associations of the automobile and cycle industries have arrived at an amicable settlement, and a combined exhibition will take place in the early spring of next year at the Grand Palais. At present the date selected for the opening is January 21st, 1901, but much depends upon the removal of the *objets d'art*, with which the Grand Palais is now filled. In the case of the show opening upon the chosen day it will continue open until the 10th of the following month. Everything then points to the success of next year's show. The building, the situation, right in the heart of fashionable Paris; the absence of outside competition, all go together to make a happy combination of circumstances, which can but bring success to the exhibition.

Motor Stealing.

THE gentleman who makes a profession of the theft of cycles would appear to be enlarging his sphere of action, for his presence has been noted in the automobile world. A few days ago a certain contractor of the Boulevard Pereire, Paris, sent one of his employés with a voiturette to call upon a Monsieur Morin, living in the Rue Bayen. Arriving at his destination the messenger alighted from the car and entered M. Morin's shop, but hardly had he crossed the threshold when the hum of a motor caused him to look round just in time to see his voiturette moving off under the guidance of an evidently

expert driver. Precipitating himself in pursuit, the victim appreciated as he had never done before the speed of his car, and after a few minutes chase he realised the impossibility of recovery and abandoned the struggle. Whether the local police, with whom particulars were promptly lodged, will be more successful in their efforts to hunt down the wily thief remains to be proved. This incident should be a lesson to those *chauffeurs*—and they form the great majority—who labour under the delusion that the man in the street knows nothing of the automobile. A chain and good padlock gives infinitely more security than the mere disconnection of the electric current, and it is but a moment's work to attach it. Be warned in time, *chauffeurs*, and take your precautions promptly.

In Belgium.

FROM Belgium comes the news that, following the example set by Antwerp, the authorities of Brussels have decided to impose taxes upon users of self-propelled vehicles. The rates, however, are not by any means exorbitant, for the four-wheeled car exceeding 800 kilogrammes in weight is only required to pay 50 francs, while for 30 francs the two-wheeler and the motor-cycle will have the right to disport themselves upon the highway. The two-wheel car being somewhat of a rarity in the automobile world, the Belgian authorities' classification is rather curious, but possibly they quote this type of car at the lower rate for the purpose of inducing manufacturers to construct such vehicles in order to secure the more advantageous terms. Poor Belgium, your *chauffeurs* do have a rough time of it between taxes, big numbers, and speed regulations. And yet in spite of all the industry thrives, a conclusive proof of the strong hold which automobilism has upon the Belgian public. And with King Leopold now developed into an enthusiast, a still greater future is opened up for the new sport. Mention of the King of the Belgians reminds me that Charron was honoured with an order from His Majesty for two cars, both Panhards, of course. The larger one, a 20 h.p., will be utilised for long excursions, while the smaller, 12 h.p., will be employed for town work. With such an example, can the Belgians do otherwise than adopt enthusiastically the new means of locomotion? I fancy not.

OWING to the pressure on our space this week several Letters to the Editor and other matters have had to be held over.

OVER twenty new members were elected to the Automobile Club of Great Britain and Ireland at the last meeting, thus bringing up the number to nearly seven hundred and fifty.

PRINCE GEORGE OF GREECE, and his uncle, Prince Waldemar of Denmark, are the latest converts to automobilism. They had a long excursion in an 8 h.p. automobile on Monday in the environs of Versailles.

ON Monday Mr. E. Shrapnell Smith gave a lecture at the Literary and Philosophical Society of Burnley, on "Motor-Cars, Past and Present." Mr. Strange, president of the Society, presided.

THE first annual exhibition of the Automobile Club of America was held at the Madison Square Garden, in New York, during the week ending November 10th. About thirty firms were represented by exhibits of complete vehicles, including steam, gasoline, and electric, and nearly two dozen others showed automobile parts, fittings, appliances and other accessories, used in motor vehicle construction, and by the drivers and users of such vehicles.

A VERY elementary attempt at humour has been made by the *South Wales Telegraph* as follows: "One of the illustrated paper contains a picture of the Automobile Club at Monmouth. The riders in their cars are depicted Car—eering along the drive to The Hendre, Lord Llangattock's beautiful seat." The only wonder is that the readers of the Welsh paper do not rise up in their wrath and slay the editor. Certainly if the prophet Job had been living now he would probably have placed his reputation for patience in jeopardy. Such efforts are more trying than an argument with refractory ignition.

CORRESPONDENCE.

THE RECENT ELECTRICAL CAR TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Although the Electrical Vehicle Trials recently undertaken on the initiative of the Automobile Club of Great Britain were the means of bringing together a good many competitors, there are very many points in connection with them which are open to criticism, and the serious consideration of every one really interested in the electrical vehicle industry—not only interested in a transitory way, but especially those who, whilst thoroughly believing in the practicability and ultimate general use of such vehicles, desire that they should only be put to such uses as they are really suited to. That such a district as Chislehurst should have been chosen is alone a matter of great surprise, as no engineer who is thoroughly conversant with the electrical accumulator, or secondary battery, could conscientiously recommend a person residing in this or any similar district to use an electrical carriage without pointing out the very heavy expense entailed in the upkeep of the batteries, resulting from the very heavy discharges necessary to propel the vehicles, on account of the condition of the roads and the steepness of the hills. Of course, in summer time and dry weather the deterioration of the plates would not be so serious, but one wants a carriage in winter time as well as in summer.

Although many of the vehicles entered got through the trials in a very satisfactory manner, no useful purpose can possibly be served by forcing a car over the hills at Green St. Green and Knockholt, and what would be the condition of the batteries if these tests were continued daily for, say, only twenty days? To give an illustration of the difference in the demand upon the cells when used as they should be used, at somewhere about their normal discharge rate, and under such conditions that the upkeep of a set of cells shall not reach a prohibitive sum, but shall be within, say, £20 per annum, a small electrical carriage seating two was taken over the same roads a few days ago. That they were in a worse condition than on the days of the trials may be admitted, as there had been continuous wet weather for some five or six days since that time. The weight of the carriage complete was 19 cwt., of which the cells weigh $7\frac{1}{2}$ cwt. The two passengers weighed $2\frac{3}{4}$ cwt. Now this carriage takes 23 amperes 80 volts when run on a level hard road, and travels at thirteen miles an hour. But when run on the route F. of flat (sic), or nearly flat road, the average consumption of current was 45 amperes, the maximum being 70.

That there was one continuous half mile of flat road is open to doubt, and to those who may be unacquainted with Chislehurst but who know London, it may be pointed out that on the following day the same car was driven up Pentonville Hill, Islington, and the maximum current taken was 58 amperes, the average being 45, and the speed eight miles an hour. This will give one a fair idea of what some of the flat (sic) roads were like which were chosen for these trials. No alterations or adjustments of any description were made to the car or the battery, which was charged at Chislehurst, and during the run over the route the car was in perfect order—no hot bearings nor sparking brushes nor any other defect only that of the bad roads to account for the large output required. The car was driven from London *via* Camberwell, Denmark Hill, College Hill, Half Moon Lane, Crystal Palace, down to Penge, through Bromley, Swan Hill, Bickley and Old Chislehurst Hill, to the Bull's Head. On this last hill the current taken was 95 amperes.

Many thanks are due to the Club, and to those gentlemen who, at very great personal inconvenience and discomfort, undertook the varied duties in connection with the trials; but why the probable competitors were kept in the dark as to the routes and districts chosen until the eleventh hour and were not consulted, as was the case when the 1,000 mile run for the oil motor-vehicles was arranged, is a matter which perhaps may be explained at a later date, although it has been suggested by a cynic that the absence of the public from the trials was a matter for congratulation in view of the rumours one hears of the friendly aid of the horse required by some of the competitors.

If there are to be trials in the future—and it is earnestly hoped that this one is only the first of many—let them be arranged so as to be carried out under conditions which the true friends of this growing industry can safely advise; under such conditions as can be carried out day after day without ruining the batteries; on good roads—whether wet or dry does not matter much as long as they are hard (and your tires do not pick the road up, as they pass over it, in lumps)—and in London for preference. For town use alone the field is large enough; to recommend their use for long country drives is a mistake. There are too many difficulties in the way, such as the charging of the cells and consequent loss of time whilst this is being done, fewness of charging stations, although this latter difficulty will be removed as time goes on, and when, as on the Continent, nearly every little village has its own electric lighting station.

Yours truly,
CARL OPPERMAN.

London, E.C., November 27, 1900.

THE LONGUEMARE CARBURETTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Could any of your readers give me a little help in the working of a Longuemare carburettor? The great difficulty I have is in starting; I have spent two hours at a time turning the motor and working the levers before I could get an explosion in the cylinder. This done, it will work all right until I have to stop, when I have the same performance to go through, and sometimes have to give it up altogether. The motor is correct, as it starts immediately when using a surface carburettor.

Yours truly,
C. G. W.

Dovercourt, November 27th, 1900.

MEDICAL MEN AND MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a medical man, I have been much interested of late in the various letters in the *Motor-Car Journal*, *Lancet*, and *British Medical Journal*, re motors for medical men, and I should be glad of advice in your columns as to the choice of a motor for my work. I keep two horses, and practise in and round a south-country town where the hills are very bad as to gradient. I am entirely ignorant from a practical point of view of motors in general, but somehow have a leaning towards a steam car. It is also an absolute necessity that I should be able to use the car in all weathers, and it must give me as much protection from the weather as the hooded buggy I use. The distances I drive on an ordinary round are from ten to twenty miles, but I should wish to be able to do 100 miles per day, if necessary. As to speed, I should be content with five to twenty miles per hour. I may add that, at present, the cost of locomotion, including everything, averages £200 to £210 per annum.

Some of the questions I should like answered are the following, though I should be glad of any other suggestions bearing on the matter: (1) Steam or petrol; (2) horse power (remembering the hills); (3) price; (4) cost of upkeep; (5) tires; (6) how long it would take to learn to drive the car and get to know its anatomy, physiology, and, I may add, pathology? Would a mechanic and driver be able to educate self and man if he came down for a month?

Yours truly,
M.R.C.S. Eng.

Bath, November 25th, 1900.

TIRE TROUBLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As we motorists know only too well, pneumatic tires at present known do puncture. It is a nuisance, but soon got over; but when a couple of inner tubes keep on "going" from internal causes, it is no joke. I have, unfortunately, been using a pair of tires (a new kind, I imagine), which shall be nameless, the outer covers of which are in perfect order, but the inner tubes have, day after day, gone asunder in the bed of the rim—little slits about three-quarters of an inch long. The tubes are

perfectly new, i.e., they have gone about 300 miles, and they are thick. At first I thought that the trouble was caused by the spokeheads, but on further examination I find that the outer cover quite covers these and the edges nearly meet. I am now led to believe that either the tubes are not good, or else that the inner edges of the outer cover damage the tubes and make them "go." "Pinching" is out of the question. A few suggestions on this point might be very useful.

It is a great bore, as it makes the hay-motor man scoff, and the anti-motorist say, "Rotten things, those motors," with their usual wisdom.

Yours very truly,
J. REGINALD EGERTON.

Battle, November, 5th, 1900.

THE HEATING OF MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am having trouble with my Benz car through heating. After about a quarter of an hour's run the cylinder gets very hot, and steam is given off strongly from the escape pipe of the condenser; after this going on for ten minutes the steam ceases, only to reappear in another ten minutes, and so on.

I can find no stoppage in the pipes. The motor gives much less power than before, presumably on account of this. Can any of your readers give me any advice?

Yours truly,
HEATED.

Stourbridge, November 16, 1900.

THE WERNER MOTOR-BICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

DEAR SIR,—I read "J. A.'s" letter with attention last week, and notice that he suggests the successful working of my Werner bicycle is due to my having been fortunate enough to buy an extra good one. I am quite convinced that this is an error on his part, for my first machine was equally as good, if not as equally powerful. I can only reiterate that when once the conditions of working are right the machine cannot but work satisfactorily; and, moreover, it does. It possesses, in common with all automobiles electrically ignited, a spirit reservoir, a carburettor, an air admission device, a motor similar to De Dion's, superior in one respect, a battery, and a sparking plug. The difficulties of getting the whole to work are no greater, and somewhat less, for it is devoid of gears, and each part is visible at all times. I notice that one of your correspondents suggests that the timing gear has been interfered with. If that is the case, the penalty of ignorant meddling is very obvious. Should, by chance, any part be defective, the makers would, I am sure, at once remedy the defect, for I found them consistently courteous and only too ready to oblige me whilst I was in Paris. I feel certain, too, that, for their own sakes, they would never send out a machine in a faulty condition. It is only fair to attest to the constant civility and kindness of the French, whom I always have found ready to respond tenfold to any civility on my part, and this everywhere I have been in France.

To return to motor matters. If one has no friend at hand to advise, one who understands the principles involved, then the only thing to do is to set to work and really learn for oneself. It can be done in a couple of hours, and then, with the aid of a little common-sense and Messrs. Werner's little guide, a solution can be quickly found for every apparent puzzle. "J. A." should remember that the Werner machine won the first prize at the Vincennes endurance competition, beating the tricycles, and doing 500 miles without any repair whatsoever, and so could his when in proper order. Just as one has to learn how to ride or drive a horse, so has one to learn to control and work a motor, but the advantage is greatly with the latter, for all the factors involved in the process are capable of control and comprehension, which is not the case with a horse.

Yours truly,
A. L. BENETT.

94, Jermyn Street, S.W.,
November 27th, 1900.

Motor-Cars at the Cycle Shows.

AUTOMOBILE exhibits are conspicuous at both the cycle shows held in London this week, and those who have not yet visited either the National Show at the Crystal Palace, or the Stanley Show at the Agricultural Hall, should certainly do so on Friday or Saturday, 30th November and 1st December respectively. In the following pages we publish the first of a series of descriptions of the leading stands, and hope, in our next issue, to conclude with reference to many interesting exhibits which pressure on our space has compelled us to withhold from the present issue.

THE NATIONAL SHOW.

The display made by the Motor Manufacturing Company, Limited, of London and Coventry, is one of the most important that this concern has so far made. Prominent on the stand is a 12 h.p. Panhard car fitted with double cabriolet body to seat four persons. The finish of this body has come in for much commendation, it being painted in rich tinges of red chocolate and heliotrope, the upholstery being in dark red morocco to match. The arrangement of the rear seats is on novel lines; half of the back is really a hinged door, the action of opening which at the

and reverse, inclined wheel-steering, and Clipper pneumatic tires. In addition to its attractive body the tasty appearance of the car is increased by the plated brass bonnet and fittings with which it is fitted.

The "Balmoral" sixteen-seated omnibus is noticeable on account of the special care that has been taken in regard to the suspension both of the frame and the body. The latter takes the form of a covered bus with garden seats inside; the body, which is so arranged that it can be quickly converted into an open charabanc with wooden canopy, is suspended on both C and helical springs. The engine comprises two horizontal cylinders developing 13 b.h.p.; it is water-cooled, a pump and radiator being provided. The ignition is by means of an incandescent tube, the burner being supplied from an independent petrol tank. The motor and transmission gear are mounted on an independent frame; four speeds forward, ranging up to sixteen miles per hour, are available, as also a reverse motion. The power is transmitted by chains and spur-gearing, the corresponding pinions being continually in mesh. Steering is controlled by a hand wheel, around which are grouped the various control levers. Three brakes are available, while solid rubber tires are fitted to the wooden road wheels. Spring lubricators are fitted to the wheel-hubs, while all the working parts are automatically lubricated from one oil-box by means of a lever on the steering column.

FIG. 1.—THE MOTOR MANUFACTURING COMPANY'S "MINIATURE PANHARD."

same time lifts the seat in front of it. The engine fitted to this car is of the four-cylinder vertical type, and has both tube and electric ignition. It is located in the fore part of the frame, the transmission being on the well-known Panhard system, giving four speeds forward and reverse motion. The petrol is fed to the carburettor by gravity, while a new method of controlling the electric sparking is fitted. The batteries in connection with the ignition are located in a box in front of the driver, where the connections can be seen without any trouble. A force-pump lubricator is fitted, which automatically supplies oil in varying quantities, as desired, to the working parts of the engine. The water-circulating pump is friction driven off the fly-wheel of the engine, while a large radiator is fitted in the fore part of the bonnet. The carriage is geared high, and is capable of a maximum speed of forty miles per hour if required. It is particularly well finished, with plated brass fittings throughout, and has 120 m.m. Clipper pneumatic tires fitted to the driving wheels and 90 m.m. ditto to the steering wheels. Aluminium is used wherever possible throughout the body, frame, and engine, rendering the car very light for its speed. Inclined wheel steering is provided, while the mud-guards are of extra width.

Another car which is attracting considerable attention is an 8 h.p. Panhard car, fitted with a special *tonneau* four or five-seated body, built at the M. M. Company's works. The under portion of the body is finished in false cane work, surmounted by bent chocolate panels, and patent calf back-rests. The entrance to the rear seats is on the same principle as that described in connection with the 12-h.p. car. The engine is of the four-cylinder type, the car having four speeds forward

Numerous little improvements have been effected in the standard 6 h.p. cars. The dashboard has been made lighter and fitted with more convenient handrails. The front apron, below the bonnet, is now supported by hinges, and can be readily turned up when it is necessary to inspect the water-circulating pump. The driving chains are of the single roller type, while the hand brakes, acting on drums attached to the two large chain wheels, are of the double-acting variety. Both the petrol tank and the exhaust boxes are concealed, and in the majority of cases—except where gravity-feed engines are fitted—the petrol tank, which has a capacity of 8 gallons, is arranged across the frame instead of longitudinally, as usual. The 6 h.p. Clifton mail phaeton, with leather hood to front seat, wheel steering, side change speed levers, and other improvements, is worthy of inspection. This car is exquisitely finished, and forms an ideal gentleman's carriage. Close by is a 6 h.p. mail phaeton, built with a long frame to give comfortable room for four persons and permit of luggage being easily carried, while a handsome 6 h.p. Iveagh phaeton, painted canary and black, is also staged. On this car we noticed that new side candle lamps of a new type, in which there is no danger of losing the candle holder, are fitted. An example of the M.M.C. 6 h.p. Panhard phaeton, painted in green, black, and gold, with 90 m.m. pneumatic tires to all the road wheels, can also be seen: while close by is a 6 h.p. Lynton wagonette, specially constructed for public passenger service, to seat eight persons, including the driver. It is fitted with wheel steering, side change-speed levers, aluminium base chamber to engine, and aluminium gear-box. A 6 h.p. Canford omnibus strikes us as being very

suitable for conveying passengers between hotels and railway stations. The car seats six persons inside and two at the front; the 'bus top can be detached by removing only six bolts. The upholstery is of a high order, while we notice that the windows are of bevelled glass, and that the window frames are cloth-covered to prevent noisy rattling. One of the most instructive exhibits in the exhibition is the M.M.C. public-service vehicle, which has been in use in Bournemouth, where it has been run by the Bournemouth Motors, Limited. It has been in service for 304 days, and during this time it has only been off the road five days for repairs. During the period named it has carried no less than 53,806 passengers, and has travelled a total of 22,009 miles; it has earned £645, the repairs bill only amounting to £29. These figures should be of considerable interest to anyone thinking of starting a public service in any part of the country.

Fig. 1 illustrates the "Miniature Panhard" voiturette, which has recently been put on the market by the Motor Manufacturing Company, Limited, and of which an example can be seen. As will be noticed, the car is provided with an attractive and comfortable body of the *tonneau* four-seated type; as the motor and transmission gear are, however, all supported on an independent tubular frame, any desired type of carriage body can be fitted. The engine, which is located under a bonnet under the fore part of the frame, is a 5 h.p. vertical single cylinder De Dion, manufactured by the company, and embodying certain modifications introduced by Mr. G. Iden. The diameter of the cylinder is 100 mm., and the stroke 110 mm., the normal speed being from 1,400 to 1,450

steering is controlled by an irreversible hand wheel, motion being given through a worm on to a toothed segment. The air and gas control levers as well as the ignition are all worked from the standard in a handy position below the wheel. The brakes consist of a band on the differential on the countershaft, actuated by a foot pedal. There are two pedals, one on either side of the steering standard. The one on the left operates the clutch and puts the engine out of engagement with the transmission gear. That on the right applies the band brake on the differential gear drum and also releases the driving clutch. Band brakes, on drums connected with each of the chain rings on the rear axle, applied by a hand lever at the side of the car, are also provided. The petrol and the lubricating oil are carried in a copper tank behind the dashboard, the capacity being sufficient for a run of 150 miles. The road wheels are of the artillery type, those at the rear being 28 in. in diameter, and the front 26 in.; they are fitted with Clipper pneumatic tires. A large box is formed beneath the front seat in which luggage and accessories can be carried, whilst the two back seats can be detached entirely by the removal of four bolts. The car complete weighs about 7 cwt. The petrol tank has a capacity sufficient for a journey of 100 miles. It has a division which holds a sufficient quantity of lubricating oil for the crank chamber of the engine for a run of over 150 miles. A tank, holding five gallons of water, is fitted underneath the footboard of the back portion of the body; flexible joints or connections are made between the water jacket and the water tank, and radiator or cooler (which is placed in front of the carriage between

FIG. 2.—THE DAIMLER "KIMBERLEY" CAR.

revolutions per minute. The carburettor is a modification of the Longuemare type, while the ignition is electrical. The water circulation is maintained by a pump, and a radiating coil is also provided. Coming now to the transmission mechanism, this is on the lines of that adopted in the Panhard cars, three speeds forward, 6, 16, and 28 miles per hour, and a reverse motion being provided. The motor shaft transmits its power through a friction clutch, to what is practically a continuation of it, the two shafts being brought into direct connection by the fact that the two discs of the clutch, which are concave and convex respectively, are held in engagement by powerful springs. Their faces can be instantly released by a foot pedal at the side of the steering column, when, of course, the engine is thrown out of gear. The shaft runs into a gear box containing a train of toothed wheels, gearing with corresponding pinions on a parallel shaft below. All the spur wheels are continually in engagement, but only one pair drives at a time, any desired pair being made to transmit the power by a sliding clutch, which locks or unlocks them from the shaft on which they revolve when free, and by which they are driven when locked. The lower parallel shaft projects through the rear end of the gear box and terminates in a bevel wheel, gearing with a corresponding wheel on a cross differential shaft from which the power is transmitted to the rear road wheels by the usual duplicate set of sprocket wheels and chains. The forward and reverse motions are controlled by a single hand lever arranged at the side of the sloping steering pillar. The

the front springs), and a rotary pump is employed to ensure efficient water circulation. This pump is worked by friction off the fly-wheel of the engine, spring bearings to the pump spindle being provided to compensate the vibration between the engine fly-wheel and that of the pump caused by inequalities of the road traversed.

Still another voiturette of new design is that known as No. 2. It is fitted with a body to seat four persons, and is propelled by a 5 h.p. M.M.C. De Dion motor located at the rear of a tubular frame. Three speeds forward and a reverse motion are provided, a pedal-operated friction clutch connecting the engine with the variable speed gear shaft. The latter carries a train of spur wheels continuously in mesh with corresponding pinions on a countershaft. Any desired pair of pinions are made to drive by means of a feather on the shaft. A single centrally-located chain transmits the power from the countershaft to the rear live axle. The water circulation is taken care of by a pump, the usual radiator being also fitted. Steering is controlled by an inclined hand wheel, on the standard of which the change-speed and other levers are grouped. The steering gear is so arranged that any wear can be taken up by an adjusting collar. The road wheels are of the artillery wood type, and are provided with pneumatic tires. Special attention has been paid to the suspension of the car, with the view of reducing vibration and jolting to a minimum. At the forward end the frame is supported on the axle by grasshopper springs, while between the body

and frame rubber buffers are interposed. At the rear the frame is supported by helical compression springs, the axle being carried on horn blocks working between horn plates, rubber buffers being also interposed between the body and frame. The weight of the car is about 8½ cwt.

In the motor-cycle section of the stand we notice a tricycle with 2½ h.p. M. M. C. De Dion air-cooled engine and Eadie frame, the motor being fitted with the Boon exhaust valve lifter. A 2½ h.p. air-cooled motor-quad can also be inspected, while at the time we visited the stand a quadricycle, fitted with an M. M. C. De Dion engine, having air-cooled cylinder and water-cooled combustion chamber, was hourly expected. This latter improvement renders the quadricycle capable of carrying its full load up the worst of hills. The engine with this combustion chamber develops up to 3½ h.p. Another type of machine is to be found in the Werner motor-bicycle, for which the M. M. Company are the British agents. The new model of

FIG. 3.—THE SIRENE VOITURETTE WITH TONNEAU BODY.

the Werner comprises many improvements and modifications. The motor is of 1½ h.p.; it is provided with a throttle valve acting on the mixture supply pipe, by means of which the speed may be regulated down to two miles per hour. Quite a novel departure is to be found in a new valve arranged above the exhaust valve; it is operated by a small hand lever attached to the handle-bar, and brings, when desired, the explosion chamber in free contact with the atmosphere. Thus the engine can, by opening the new valve, be kept in operation when riding through crowded traffic, the usual noisy compression tap being entirely done away with. A new feature is the combined petrol tank, carburettor, and battery box. The pipe conveying the explosive mixture from the carburettor to the motor passes up through the head and handle-bar of the machine, the necessary air being also taken in through an adjustable hole in the handle-bar. The trembler and commutator are well covered in, while the induction coil is carried under the saddle, where it is protected from wet. The electric circuit only comprises four wires, the high-tension wire passing through the frame of the machine. The machine complete weighs about 65lb. The identical Werner bicycle ridden by Mr. Pennell over the Alps is also on the stand, and has been the object of considerable interest.

A big display of M. M. C. De Dion air and water-cooled engines is also made, including the new 5 h.p. size, to which is fitted a new device actuated by a lever which controls the lift of the induction valve and prevents the suction of a fresh charge of explosive mixture, and in this way reducing the vibration when the car is standing still with the engine running. We learn that the company are engaged in the construction of a 16 h.p. motor, which is intended to develop 20 h.p. on the brake, and that all future public-service and other heavy cars will be fitted with a two-cylinder engine giving 9½ h.p.

The *pièce de résistance* on the stand of Mr. E. W. Hart, of Windmill Road, Luton, is undoubtedly the Sirene voiturette (Fig. 3) fitted with tonneau four-seated body; painted as it is in pure white with brass edgings, this car, with its popular form of body, has been the centre of attraction all the week. A Sirene three-seated duc and the two-seated car of the same type which went so successfully through the recent Automobile Club 100-mile Trial, are also staged. As we have previously described the Sirene car in our columns, it is only necessary to mention that it is fitted with a two-cylinder motor; it is of the air-cooled type, of 5 h.p. Three speeds forward and a reverse motion are available, any intermediary speed being obtained by the variation of the electrical ignition. The motor is located in the fore part of the frame, where air has free access to the radial fins of the cylinders. The variable-speed gear is very much on the lines of the Panhard, the box gear containing three pairs of spur wheels, any one pair of which can be brought into mesh at a time. The reverse motion is obtained by the interposition of a small pinion between the gear wheels giving the slow speed. From the gear box the power is transmitted direct to the rear axle through a universally-jointed transverse shaft and bevel gear. Mr. Hart also exhibits several interesting electrical vehicles. First we may mention the "Lutonia" victoria, a neat and attractive looking light car suitable for two persons. It is driven by a Bergmann 2 h.p. electric motor geared direct to the rear axle. The electric energy is furnished by a battery of forty Leecoll accumulators, weighing 3 cwt. 44 lbs., the

capacity being sufficient for a run of from twenty-five to thirty miles on one charge. The controller switch is adapted to give four speeds forward and two reverse, while in one position the motor is made to act as a dynamo—that is in descending hills—so recuperating the battery. Wheel steering is fitted, while the road wheels are of the artillery type shod with pneumatic tires. The car, which weighs complete about 7½ cwt., is of a taking design and is designed to meet the wants of would-be lady motorists for use in towns. Mr. Hart also exhibits the "Toujours Contenté" (Lohner-Porsche) car which took part in the recent Automobile Club Electrical Company's trials, and which was illustrated and described in these columns at the time. Naturally its strange appearance causes visitors to devote to it more than a passing glance. At the end of the stand is another interesting electric vehicle, of which we give an illustration in Fig. 4. The body of this car is worthy of notice; the frame is of channel steel, the body and mudguards being entirely made of aluminium by Messrs. Werhlé and Godard-Desmarest, of Neuilly (Seine), for whom Mr. Hart is now acting as agent in this country. There is ample accommodation for four persons, the two front seats taking the form, as it were, of two distinct arm-chairs. The front of the car is fitted with a bonnet very much of the lines of that fitted to the De Dietrich petrol cars; in it, as also in the chest at the rear, are stored the accumulators, which consist of forty Leecoll cells weighing complete about 25 cwt., and having a capacity of a run of about fifty miles on one charge. The car is driven by two 5-h.p. electric motors geared direct by spur wheels to the rear road wheels (the illustration shows chain gearing, but this is being altered). The controller is adapted to give four forward speeds, two reverse motions, and to convert the motor on down grades into a dynamo, so recuperating the battery. The regulation inclined wheel steering is fitted, as also artillery wood wheels shod with 90 mm. pneumatic tires. The battery is arranged to be charged *in situ*, and furnishes the current not only for the motors but for two side head-lights, a Bleriot acetylene lamp of large size being carried centrally in the front of the car. The car complete weighs about 35 cwt., of which, as already mentioned, 25 cwt. is represented by the battery. This completes the exhibits on view at the time we visited the stand, but Mr. Hart informed us that he was adding an electric car very much on the lines of that illustrated in Fig. 4, but smaller built, to the order of Mr. T. G. Chambers, of Weybridge, a Lohner-Porsche electric brougham fitted with 2½ h.p. hub motors to each of the front road wheels, a quadricycle fitted with a parcel chest in place of the usual front seat, suitable for tradesmen, and two Werhlé Godard-Desmarest car bodies built of aluminium.

One of the most imposing displays in the show is undoubtedly that of the Daimler Motor Company, Limited, London and Coventry. Prominent on the stand is the special two-seated racing-car, fitted with a 20 h.p. motor. The general arrangement is that of the usual Daimler vehicles, the four-cylinder gravity-feed engine being located in the fore part of the frame. Both electrical and tube ignition are fitted, and these may be used either separately or together, as desired. An improved form of carburettor is fitted, while another improvement will be found in the arrangement of the water-circulating pumps. These are of the centrifugal type, coupled in tandem and driven by the fly-wheel in contact with a friction disc on

FIG. 4.—"LA PRESQUE CONTENTÉ" ELECTRICAL CAR.

their axis. In connection with the water-circulation, a radiator, consisting of no less than 86ft. of ribbed piping is fitted. A special feature of the motor is an arrangement by which three of the exhaust valves can be held open to facilitate the starting of the engine. The change-speed gearing is of the usual Daimler type—giving four speeds forward and reverse—but arranged in a specially compact form, which admits of the use of a gear box of very small dimensions, as by effecting the speed change by shifting two of the speeds to the left and two to the right, the extra length required for the sliding of the gears has been reduced by half. The steering is of the standard Daimler irreversible inclined

wheel type, which entirely prevents any sudden deviation in the course of the car should any large obstruction in the road be touched. Efficient lubrication is assured by the use of an automatic-timed lubricator, eight sight feeds being fitted in the dashboard in front of the driver. Four speeds forward and reverse motion are provided. The speed control levers are arranged on the outside of the body at the right-hand side of the driver. Special attention has been paid to the bearings, which are extra long, as also to the suspension of the car. The road wheels are of strong construction, and are shod with Clipper 120mm. pneumatic tires. A new and powerful form of double-grip block brake, operated by a pedal, is fitted on the countershaft, and also compensating band brakes acting directly upon drums connected to the sprockets of the rear road wheels.

At the side of the 20-h.p. car is the motor, frame, and gear of another car of 16 h.p. The four-cylinder motor is of the gravity-feed type, and

FIG. 5.—THE SINGER MOTOR BICYCLE.

is fitted with both tube and electric ignition. The new 16-h.p. engine is stated to be no larger than the old 12-h.p. type. The water circulation for the cooling of the cylinders is obtained by means of a semi-rotary pump, which is coupled up between two radiators having a very large cooling surface, one fixed to the rear of the car and the other in front of the engine cover, a tell-tale water gauge being arranged in full view of the driver. The change-speed gear, of standard Daimler pattern, giving four speeds forward and reverse, is of special interest, as the whole of the gear case, as well as the countershaft and the wheel hubs, are fitted with Mossberg roller bearings, and all thrusts are taken against ball bearings. The bearings are exceptionally long, and ample width has been given to the teeth of the gear wheels. A new departure is to be found in the water-cooled brake drum mounted on the countershaft, which is acted upon by a Drake patent brake that is equally powerful whether the car is going in a forward or backward direction. Irreversible inclined wheel steering is fitted, while the control levers are arranged on the side of the car at the driver's right hand. The road wheels are of the artillery type, shod with stout Clipper pneumatic tyres. All the working parts are well lubricated by a special pressure-feed lubricator, a striking feature of the dashboard being a row of no less than a dozen sight feeds.

The new "Kimberley" voiturette for two persons is also exhibited

FIG. 6.—THE SINGER MOTOR WHEEL.

for the first time, and we give an illustration in Fig. 2. The motive power is supplied by a two-cylinder vertical engine of 4 h.p., located under the usual bonnet in the fore part of the car. Tube ignition is fitted, while the water circulation is maintained by a geared pump. The water tank and radiating coil are arranged in the fore part of the car. Three speeds forward—six, twelve, and eighteen miles per hour—are provided, as well as a reverse motion. The power of the engine is transmitted to the variable-gear shaft by a single 3½-in. copper-sewn straight belt, spur-gearing connecting the counter-shaft with the

rear axle. A novel feature of the transmission is the belt-striking gear, the belt being thrown on and off the loose pulley by means of a foot pedal. Three brakes are provided—a foot-operated expanding band brake acting on the inside of one of the pulleys, a hand-brake on the rear live axle, and a hand emergency brake acting on the tires, the brake spoons being extra long and pivoted. The belt-shipping foot pedal can occupy three positions: in one the driving belt is on the fast pulley, in the second on the loose pulley, and in the third the belt is on the loose pulley and the brake applied. The body takes the form of a Ralli dogcart, in walnut, giving ample accommodation for two persons and a large quantity of luggage. The car complete weighs about 12 cwt. Provision is made for taking up any slack of the belt whilst running, a ratchet arrangement being fitted by means of which the engine can be slightly moved forward. Steering is controlled by a vertical hand wheel at the right-hand side, the speed-varying lever being in the centre of the seats.

A 6-h.p. "York" phaeton of the standard type is also exhibited. This is fitted with both electric and tube ignition, radiator at rear set at an angle so that the air can have free access to all the ribbed pipes. The body is aluminium, and is painted French grey with blue lines, the effect being very pleasing. In the dashboard in front of the driver, in addition to the sight-feed lubricators, we noticed that one of Holt's Viameters, registering the gradient up and down and the distance travelled, is fitted. At the end of the stand is a 6-h.p. public-service wagonette, having seating accommodation for eleven persons. It is of the 6-h.p. standard type, and is fitted with a double sprag and conductor's steps. An exhibit which has attracted much attention is a Daimler motor, part of which has been cut away so that the operation of the valves may be examined.

FIG. 7.—THE MAROT-GARDON VOITURETTE.

Much has been heard during the past few weeks of the Singer motor-wheel, and the exhibit of the same by the Singer Cycle Company, Ltd., Coventry, has attracted much attention. On the stand are shown a lady's and a gent's motor-bicycle with the motor-wheel at the rear and a gentleman's tricycle with the motor-wheel in front. In another part of the Palace a large room has been reserved in which practical demonstrations of both the tricycle and the bicycle are being given daily. Judging from our brief stay in this room, the machines appear to be easily started and to run very steadily, the riding of the lady on the bicycle being much remarked upon. Fig. 5 gives a general view of the motor-bicycle, while Fig. 6 gives two views of the motor-wheel, which is the result of some twelve months' careful designing and experimenting by Messrs. Perks and Birch, of Coventry. To all intents and purposes the machine is an ordinary bicycle, built stronger throughout, with the exception of the rear wheel. This is of special construction, and contains the engine and the whole of the driving mechanism, therefore forming a complete motor wheel, which can be fitted to any suitable cycle, and can be taken out of the machine in a few minutes. The frame is of the ordinary cycle type, with the exception of the back fork ends, which are made in the form of halved clips, and grip the outer ends of the motor trunnions. The inner ends of the trunnions are bracketed to the crank chamber of the engine, which keeps the motor fixed in a vertical position, while on the centre of the trunnions the wheel sides revolve on ball bearings. The engine never alters its position with regard to the frame. The wheel sides are of aluminium, and are each made in the form of dished flanges, the arms of which are sufficiently far apart to form a fan to cool the motor, and also to give

easy access to it. The peripheries of the flanges meet, and are grooved to suit the channel of the steel Westwood rim, and grip the same when bolted together. By undoing these bolts the wheel can at once be divided and the engine taken out. The motor is air-cooled, of special construction, and develops 2 h.p. It is fitted with roller bearings to the main spindle and crank. The pinion on the motor-shaft meshes with an internal gear wheel, which fits into a recess on one of the wheel sides. The carburettor, which also acts as a supply tank, is of the surface type,

voiturette illustrated in Fig. 7. It is fitted with a $3\frac{1}{2}$ h.p. or $4\frac{1}{2}$ h.p. water-cooled De Dion motor as desired; the water circulation is maintained by a pump, a large radiating coil being also fitted around the false bonnet in front. Either a De Dion float-feed or Longuemare carburettor is used, the connection between it and the petrol tank being made by flexible tubing. The engine is located at the rear of the frame, and transmits its power direct to the rear axle through a friction-clutch and spur-gearing; three speeds forward—the maximum being twenty-

FIG. 8.—THE SPORTS AMERICAN PHAETON.

and is made to withstand vibrations from the road. It is securely fastened to a bracket cast on the front of the crank case of the motor. Ignition is effected by a Simms-Bosch magneto-electric machine. This is also fixed to a bracket cast on the back of crank case. On the rear wheel of the bicycle is a free-wheel clutch with chain ring, and a chain connects up to the usual sprocket wheel on the bottom bracket axle, the pedals being used to start the machine and assist it on steep grades. The carburettor holds half a gallon of petrol, which is stated to be sufficient for a run of fifty miles. The makers claim that the motor will carry a rider of 14 st. at twenty miles an hour on the level, and will mount a gradient of one in six without assistance by pedalling. For controlling the machine only one lever is

seven miles per hour—and a reverse motion are provided. The road wheels are of the cycle type, fitted with Clipper pneumatic tires; steering is controlled by an inclined hand-wheel, on which is mounted a small press button by which the electrical circuit is broken. A hand-lever controls a band brake on the differential shaft, while there are band brakes on drums attached to the hubs of the rear wheels, actuated by a foot pedal. The body is built of light metal with wooden panels, the mudguards being also metal. The car complete weighs about $7\frac{1}{2}$ cwt. In addition to the seat for two persons, there is ample space on a platform at the rear for luggage. In addition Messrs. Burgess show a two-seated Benz car, a Minerva motor-bicycle, and a range of motor accessories, oils, etc. At the time we visited the stand we were informed that a new four-seated car, which they have named the "Voitucar," was expected. This vehicle is fitted with a $4\frac{1}{2}$ h.p. Motor Manufacturing Company's De Dion water-cooled motor, three speeds forward, a reverse motion, and wheel steering. The engine is located in the rear part of a tubular frame, and is geared by a friction clutch and spur wheels to a live axle. Extra large water and petrol tanks are

FIG. 9.—THE LOCOMOBILE FOUR-SEATED CAR.

used, this being of the same style as the brake lever and attached to the handle-bar. This lever in one position opens the compression valve, another movement regulates the mixture of the gas and air, and a third position shuts off the explosions and causes the engine to act as a brake, the compression being retained.

Prominent on the stand of Messrs. Wm. H. M. Burgess, Limited, 21, Charterhouse Street, London, E.C., is the Marot-Gardon two-seated

FIG. 10.—THE DARRACQ VOITURETTE.

fitted to enable the car to be run long distances without replenishing.

Several handsomely-finished Mayfair voiturettes are to be seen on the stand of the Sports Motor-Car Company, South Kensington, a doctor's car painted in yellow and black and fitted with hood coming in for special attention at the hands of visitors. The motor—either a $3\frac{1}{2}$ h.p. De Dion or a $4\frac{1}{2}$ h.p. engine—is located in the fore part of the frame; it is of the water-cooled type, while the ignition is elec-

trical. The water circulation is maintained by a small pump, a radiator being also fitted. Two speeds are provided, the power being transmitted by a single straight belt to fast and loose pulleys on an intermediary shaft at the rear; the pulleys on this shaft are of equal size, but each is connected to a pinion which is always in gear with a corresponding pinion on the rear differential axle. The pinions work in a dustproof case. Steering is controlled by a sloping hand-wheel, while ample brake power is provided. The frame is spring-suspended on cycle-type wheels, shod with Clipper pneumatic tires. On the level the car can, it is claimed, attain a speed of twenty-two miles per hour, while it will also mount gradients of one in eight. The petrol tank has a capacity sufficient for a run of 120 miles. Useful features in the car are found in the provision of a belt-tightener, controlled from the seat, and of a ratchet arrangement which prevents the car running backwards. Three other Mayfair voituresses are shown, and also a motor-quadracycle fitted with a 2½ h.p. De Dion engine.

Quite a new car to this country is to be seen in the Sports American phaeton, of which we give an illustration in Fig. 8. The vehicle, which is adapted to accommodate four persons, is fitted with a double-cylinder motor developing 8 h.p. The engine is of the horizontal two-cylinder type, the pistons of the two cylinders working on to a central crank shaft. It can be fitted with tube or electrical ignition, or both. The transmission gear is of the well-known Gauthier-Werhle type, the car being, it is claimed, able to attain on good roads a speed of forty miles an hour. Four forward speeds and one backward motion are provided. The extension of the motor shaft carrying the friction clutch terminates in a bevel wheel gearing with similar bevel wheels on an intermediary shaft carrying the variable speed gear. From this first intermediary the power is transmitted through the requisite pair of spur wheels to a second intermediary, which at its centre carries a spur wheel gearing with a large spur wheel surrounding the differential gear on the rear axle. This latter is of special construction, the axle being provided with four universal joints, any jolting due to either of the wheels meeting an obstacle, etc., being, it is claimed, in this way prevented from being transmitted to the motor and transmission gear. In order that the carriage can be quickly brought to a standstill, band brakes acting on the rear wheel hubs are connected to the same foot-pedal as that which operates the friction clutch, so that by depressing the foot-pedal the engine is thrown out of gear with the power-transmitting mechanism, and a band brake applied simultaneously. The water circulation is maintained by a pump, while radiating coils are also fitted. The road wheels, which are fitted with spring lubricators, are of artillery type shod with Clipper pneumatics. We learn that a car of this type has been supplied, and driven for some time by, H.R.H. Prince Albert of Belgium.

A South of England firm which is going extensively into the motor industry is Messrs. Dennis Brothers, of Guildford, who are showing several motor-cycles of their own construction. The tricycles are fitted with 2½ h.p. De Dion air-cooled motors, but a Component 3½ h.p. engine will be fitted if desired. The quadracycles are propelled by 2½ h.p. De Dion motors, and, judging from the machine shown, are of sound construction. The machines are fitted with a comfortable pattern of saddle, to which a back rest is attached. A point of interest in the quadracycle is that the lever controlling the compression tap is also connected up to the exhaust valve in such a way that the latter is also opened after the compression tap is turned. The machine is convertible to a tricycle by simply removing four bolts. Other features are an improved telescopic axle, differential gear, and one lever controlling three brakes on the rear axle. The "Speed King" trailer is another article worthy of notice at this stand; while of larger proportions than usual, they are very light, but strong and extremely comfortable. Among the miscellaneous accessories we notice a 3½ h.p. petrol motor with air-cooled cylinder and water-jacketed combustion chamber.

A good show of motor fittings is made by the Presto Gear-Case and Components Company, Ltd., Frederick Street, Birmingham. These are well finished and of good design, making the stand one to be visited by motorists. Petrol tanks, water tanks—including a good type for Benz cars—differential gear, condensers, coolers, carburettors, multiple lubricators, etc., provide a large section of the display. A speciality in the way of a spare oil reservoir for motor-tricycles is shown. This has a special band and an adjustable clip on the top, which relieves the strain on the bars, to which the bottom of the tank is attached. It can be readily adjusted to any desired length, and seems well devised to secure its purpose.

Two types of the now well-known two-seated steam car are shown by the Locomobile Company of America, whose stand also includes, for the first time a four-seated car, of which we are able to give an illustration (Fig. 9). The Locomobile has already been fully described in these columns (see *Motor-Car Journal*, December 8th, 1899), but since that time a number of improvements have been effected with the view of increasing the capability and reliability of the car. Reference may firstly be made to the new engine. The parts have been made heavier and stronger, and all bolts, screws, and glands are carefully secured. A self-feeding cylinder oil cup is employed, and when filled with oil this should run the carriage seventy-five or 100 miles. The design of the cross-head has been changed, and it now slides between double-grooved guides so arranged that the wear can be taken up. Plain bearings have been substituted for the ball bearings on the eccentrics. The size of the balls in the crank pin bearings and main journal bearings have been enlarged. Small oil cups have been placed on these bearings for convenience in oiling. The engines are now being made in the company's own works and the valves are set accurately to give the best results. A

leather cover is supplied when desired to protect the engine from dust. The new water-gauge glass employed is a great improvement, being thicker, with rounded ends, and so packed as to prevent breaking. The check valves at the top and bottom of the glass are now provided with wheel handles so that they may be unseated conveniently. A small, coloured, hollow glass ball is placed inside the glass, making it easy to see the water level at a glance. A water column has been placed on the carriage. This is fitted with three gauge cocks, and should the water glass become broken, the position of the water level may be determined by the gauge cocks. A globe valve has been introduced between the boiler and the throttle valve. Should the ordinary throttle valve become inoperative this valve may be quickly closed, and the steam cut off from the engine. In connection with the water supply, the plunger pump is still employed, but the connections have been strengthened and the pump plunger enlarged. There is a globe valve between the boiler and the third check valve, which may be closed, should it be necessary to inspect any of the check valves while there is steam pressure in the boiler. An auxiliary hand pump provides another method of getting water into the boiler. The pump is placed in a convenient position under the seat. It is very powerful and will fill the boiler with water in a very short time, whether steam pressure is up or not. A detachable strainer, which may be removed easily and cleaned, has been placed between the water tank and the pump. The new water tank is larger, holding 50 per cent. more water than the tank formerly used. The safety valve is arranged to blow off in the water tank. The gasoline and air tanks are a great improvement on the old ones, they being better made and heavier. The capacity of the gasoline tank has also been largely increased. A check valve has been placed between the air tank and the gasoline tank so that no gasoline can make its way to the air tank. With regard to the fire, the up and down draught has been abandoned and a cross draught has been introduced. This is claimed to preclude the possibility of the fire blowing out or burning back. The frame of the car is wider than before; the springs are stronger and the stays of heavier tubing. The steering connections have been changed, a side steering lever being now used, assuring better control of the vehicle than did the old tiller; it is also said to be much steadier, and to obviate any vibration to the hand. Referring to the four-seated car (Fig. 9), its weight with water and gasoline tanks filled is about 9 cwt. It is equipped with 28-in. cycle-type wheels, these being shod with 2½-in. single-tube pneumatic tires. The capacity of the gasoline tank is 6½ gallons, and that of the water tank 21 gallons.

The Automobile Manufacturing Company, Ltd., of 48, Long Acre, W.C., have a large stand on which a number of interesting vehicles are shown. Prominent among these is the Darracq voituress (Fig. 10), which did so well in the recent 100-mile Trial and also in the run to Southsea, when its time up the Hindhead (10 min. 19 secs.) was a record for a voituress with such a heavy load as four passengers. We have already briefly alluded to this car, with its attractive *tonneau* body. It is fitted with a 6 h.p. vertical water-cooled engine having cylinder 100 mm. diameter by 102 mm. stroke. It is water-cooled and provided with electrical ignition. The carburettor is of the Phénix type, with automatic admission. The transmission gear, which is on the lines of the Panhard, except that the power is transmitted direct to the rear axle by bevel gear in place of sprocket wheels and chains, is adapted to give three speeds forward and a reverse motion. The car, which is fitted with wheel-steering and pneumatic-tired wheels, weighs 9 cwt.

The "Savoy" is the name given to a Renault voituress exhibited by this firm. As this type of car has been described and frequently alluded to in these columns, it is only necessary to mention that it is fitted with a 3½ h.p. water-cooled De Dion motor, three speeds forward and a reverse motion, and that the car is gear driven, no chains or belts being employed. Still another voituress is that known as the "Carlton." This is made by Richard, of Paris, and is on the lines of the Vivinus and New Orleans cars already well-known to motorists. The car is arranged to seat four, *vis-à-vis*, and is fitted with a 3½ h.p. engine, air-cooled by means of a fan and radial ribs. Two speeds forward are provided, the transmission being effected by a single belt and gear wheels direct to the rear axle. A foot pedal is provided on this car, by means of which the driving belt is shipped on to the loose pulley before the gear is changed, the wear and tear on the spur wheels being in this way considerably reduced. The cycle-type wheels are fitted with Dunlop pneumatic tires, while the steering is controlled by a bar. At the end of the stand we notice a neat and attractive-looking two-seated electric car—a Cleveland Stanhope of the type illustrated in our issue of July 28 last. It is fitted with a 3 h.p. electric motor, and any speed forward or backward up to fifteen miles per hour can be attained. The battery provided is stated to be capable of running the car a distance of sixty miles on one charge. A feature of the Cleveland vehicle is that the speed, steering, and brakes are all controlled by one lever. A useful machine is a tradesman's quadracycle. This is an ordinary "quad," with a parcels chest fitted in place of the usual front seat, the chest, which is detachable at will, having a capacity of about 2 cwt. The machine, many of which are now used by tradesmen in Paris for express delivery purposes, is fitted with a 2½ h.p. air-cooled De Dion motor. A comprehensive display of motor fittings and accessories for Daimlers, De Dions, Benz, Aster, etc., consisting of complete engines, cylinders, pistons, valves, springs, sparking plugs, pressure burners, lubricators, speed indicators for tricycles only, gradient meters of improved construction, new foot-rests for motor-cyclists, dry batteries, accumulators and coils, horns, goggles, and leather jackets, occupies

a prominent position on the stand. At the time we called at the stand we were informed that a 4½ h.p. Delahaye voiturette, fitted with three forward speeds and reverse motion a 7 h.p. Richard car, with *tonneau* body, and a Stanley steam-car were expected to be added to the exhibits the following day.

Since the "Star" motor-car of the Star Motor Company, of Wolverhampton, was first brought to the notice of the public it has been considerably improved, both as regards construction and design, as will be seen from an examination of the numerous vehicles on view. The types known as Standard A. have the seats arranged *vis-à-vis* for three or four persons, while in Standard B all the passengers face forward. They are fitted with a 3½ h.p. horizontal motor, two speeds, by belts, and are claimed to be capable of mounting all ordinary gradients with a full load. One of the novel features is the employment of a new form of carburettor, the claim for which is its regularity of working in all weather. The new carburettor is so arranged that it can be quickly detached, if necessary, and its location renders the sparking plug more accessible than usual. The road wheels are of the cycle type, shod with pneumatic or solid rubber tires, as desired.

In addition to the foregoing, the Star Company exhibit two quite new types of cars, which are well worthy of close inspection. That known as Standard C has a four-seated Siamese phaeton body, and has been constructed to meet the requirements of tourists, sportsmen, or for commercial use. It is driven by means of a horizontal motor of 4½ h.p., fitted with electrical ignition and the Star carburettor. The cylinder is water-jacketed, the circulation being maintained by a pump; a radiating coil is fitted in the fore-part of the car. The crank-shaft works in an oil-containing case of aluminium; in connection with the ignition an improved form of contact is employed, and the sparking can be advanced or retarded from the seat. The engine, which runs at a normal speed of 700 revolutions per minute, transmits its power by a single 3½-in. belt to a variable speed gear-shaft, on which is mounted a train of pinions arranged to give three speeds forward—4, 10, and 20 miles an hour—and a reverse motion. From the counter shaft the usual pair of sprocket wheels and chains convey the power to the rear road wheels. The forward speeds are controlled by one handle, the reverse motion by another. Steering is controlled by a hand wheel, while as regards brakes three are provided. The petrol tank is located under the front seat, and has a capacity of 150 miles. The car complete weighs about 12 cwt.

Not content with a 4½ h.p. car, the Star Company is also showing a very attractive 6 h.p. vehicle, styled Standard D. The frame is built of channel steel, in the rear part of which a two-cylinder vertical engine is fitted. The ignition is electrical, while a pump maintains the water circulation, in connection with which a radiator is also fitted. The engine runs at a normal speed of 1,000 revolutions per minute, and a useful device is provided whereby it can be started from the driver's seat. As regards the transmission only two speeds—7 and 40 miles per hour—are fitted to this car. The engine transmits its power to the rear axle through spur-gearing, the pinions being continually in mesh. The necessary pair are made rigid on the shaft by means of clutches. The rear axle is of the "live" type, the differential gear being enclosed in its own oil-containing case. Inclined wheel steering is fitted, while the road wheels are of the cycle type, fitted with pneumatic tires; two independent band-brakes are also fitted. Particular attention has been paid to the suspension of the body—in this case a four-seated *vis-à-vis*. The frame is spring suspended on the axles, while the body in turn is supported on the frame by elliptical springs at the front and helical springs at the rear. The body, which can be entirely removed by the removal of six bolts, is fitted with hinged seats, giving access to the motor and working parts, as well as to the tool and battery boxes, etc. The car complete weighs about 6 cwt. In deciding to introduce this vehicle the Star Company state that they have been somewhat influenced by the statements of Continental builders to the effect that unless a car can attain an express railway speed it does not commend itself to certain classes. Therefore, they have decided to show that such cars can be manufactured in England, and have no hesitation in claiming that the car will travel any country roads and attain a speed of forty miles an hour under favourable circumstances.

The main feature of interest at the stands of the Progress Cycle Company, Limited, Foleshill, Coventry, is the new two-seated voiturette, of which we give an illustration in Fig. 11. The cars, of which four are shown, are of an attractive form and are neatly finished, one being fitted with a Mulliner body and painted in black and primrose, with blue lines, and with a hood. The frame is of tubular construction; the motor is either a 3½ h.p. water-cooled vertical cylinder De Dion or a 4½ h.p. M.M.C. De Dion, three of the cars having 3½ h.p. engines and one a 4½ h.p. motor. A standard pattern De Dion spray carburettor is used, and the air supply to the carburettor is properly heated to a constant temperature, as the pipe conveying it is hot jacketed by the exhaust. The engine is located at the rear of the frame, and drives by pinions a small countershaft carrying the two-speed gear. The latter is enclosed in an oil-containing case, bolted to the crank case. Through the same box runs a second small shaft carrying pinions always in mesh with those on the first shaft, either pair of which can be made to transmit the power by means of clutches. From this second shaft the power is conveyed through a small pinion to a large pinion centrally located on the rear axle. The aluminium gear box is so made that by the removal of two or three bolts the top can be taken off and the countershaft, which carries the clutches and the toothed gearing, can be lifted straight out. There are two speeds, ranging from six miles an hour on the slow speed to eighteen miles an hour on the fast. They are controlled by a lever

moving over a dial-plate underneath the steering wheel. In the central position, which is shown by a notch on the dial-plate, both speeds are "out," and the motor is running free; moving the lever forward engages the fast speed, and drawing it towards the driver engages the slow gear. The two speeds are each separately clutched, so that the teeth are always in mesh, and the speed change is made without any shock or noise. The clutches are made with metal working faces throughout. The gearing and the motor bearings are fixed by stays to the main frame tubes. Above the engine, and in the base of the rear seat are located the batteries and coil. Both are easily accessible, and the length of the wiring is, of course, very much less than if the batteries were placed under the forward seat, not only reducing the possibility of short circuiting, but, should it occur, making its detection a matter of much greater ease, as there are no wires running beneath the floor of the car. By undoing a couple of buttons, the rear seat, which is hinged, can be opened forward, so that the whole of the circuit, the motor, valves, carburettor, etc., can be easily got at. The cylinder cooling water is carried in a tank in front with a capacity of four and a half gallons. A radiator, consisting of seven lengths of gilled tube, is placed below the floor at about the middle of the car. The pump is geared off the motor-shaft by a light chain, and runs at a much lower speed than usual, thus reducing the wear.

The body is built to carry three persons, and is isolated from the frame by C springs at the rear, which are claimed to prevent all vibration from the motor reaching the car, whilst above each steering head in the front it will be noticed there are cylindrical boxes. These contain spiral springs, which are compressed by the inequalities of the road, and rise and fall in such a way that the vibration is absorbed, and sufficient vertical flexibility given to the wheel base to enable the machine to run properly with all four wheels on the road, despite the fact that one or

FIG. 11.—THE PROGRESS VOITURETTE.

other may be at a much higher level than the others. A tool-box is formed underneath the front seat, and there is also a box under the back, in which, in addition to the battery or accumulators, a spare petrol tank may be carried, thus increasing the petrol-carrying capacity to at least a hundred miles. An extension of the frame at the back of the car to carry luggage is also provided. Two brakes are fitted—the usual band brake on the balance gear, and the other a double band brake applied on the hubs of the two rear road wheels. The latter are of the cycle type, 26in. diameter back and front, and fitted with 3in. pneumatic tires. The engine is started by means of a detachable handle. The car, which weighs complete about 6 or 7 cwt., has, we are glad to learn, already met with a favourable reception at the hands of motorists.

Of interest to motor-cyclists are the Progress motor-tricycles and quadricycles for one or two persons. These machines are fitted respectively with 2½ h.p. and 2½ h.p. English-made De Dion motors, and are of high-class finish throughout. The front-seat attachment on the two-seated quad is well suspended, and is connected by but four bolts, so that it can be quickly detached. Another feature of interest in the machine are the rim brakes fitted to the rear wheels, and operated by a foot pedal. An interesting machine is the quadricycle for one rider. The advantages claimed for this machine over the ordinary motor-tricycle are numerous. In the first place the conversion to a two-seated quad is so simple that anyone can do it in ten minutes. Furthermore, a large basket, or portmanteau, can be attached in front, resting on the front axle in place of the seat, and with a hundredweight of luggage in front the rider need not be inconvenienced nor the running of the machine be affected. A new departure on the motor-cycles is the fitting of an arrangement devised by Mr. West, by means of which the compression tap is opened and the exhaust valve lifted by a single lever; this facilitating the starting of the motor and enabling the machine to be easily pedalled.

THE STANLEY SHOW.

The "Liberia" is the name of the latest French petrol motor-car to be introduced into this country, and judging from the four-seated *tonneau* (Fig. 12) displayed by the East Riding Cycle and Motor Company, of Hull, it is likely to become a popular type of vehicle. The frame is of tubular construction, the general arrangement being very similar to that of the Renault and Darracq voiturettes. The motor power is supplied by a 5 h.p. water-cooled Aster motor located under a perforated bonnet. The water circulation is maintained by a pump, a radiating coil being also fitted. The ignition is electrical, while the carburettor is of the Longuemare type. There are forward speeds—five, twelve, and twenty-five miles per hour—and reverse motion, the power being transmitted direct to the rear live axle through a friction clutch, a change-speed gear of the Panhard type, and bevel gear. If desired the bevel gear can terminate on a cross shaft, and the power transmitted from the latter to the rear road wheels by the usual sprocket wheels and chains. Steering is controlled by an inclined hand-wheel, around the pillar of which the various control levers are grouped. A foot pedal controls a hand brake on the driving shaft, while there are band brakes on drums connected to the hubs of the rear wheels, actuated by a hand lever. The road wheels are of the cycle type, shod with pneumatic tires. The car is well sprung, and a feature of the *tonneau* body is that the rear seats can be detached, thus rendering the vehicle exceedingly suitable as a touring car for two persons, with ample luggage room. The petrol tank has a capacity sufficient for a run of about 100 miles.

FIG. 12. THE "LIBERIA" CAR, WITH T NNEAU BODY.

Very attractive to the general public is the well-arranged stand of Messrs. Hewetsons, Limited, of Dean Street, Soho, W. Among the vehicles shown are the 4½ h.p. New Ideal hooded Victoria with four speeds, and reverse, 3 h.p. ordinary Ideal Victoria, 3 h.p. dog cart, and a 5 h.p. Emperor car, gear driven, with four speeds and reverse. It is difficult to say much that is not already known of these cars. The various details have, however, been modified and strengthened, as experience has shown to be necessary, the result being a neat carriage, which is well designed to maintain the already great popularity of this firm. At the rear of the stand is the original Benz car of 1885—an antiquated specimen looking rather sad and demure by the side of the hooded Victoria Benz, or the smart Emperor car which typify the latest examples of these cars.

A 3 h.p. single-cylinder motor-car is shown by Messrs. Roots and Venables, 100, Westminster Bridge Road, S.E. It is a two-seated vehicle, the excellent body having been furnished by Messrs. Laurie and Marner, of Oxford Street, W., and is the only heavy oil motor-car in the exhibition. This car has been previously described and illustrated in our columns, so that extended reference is now unnecessary. The cylinder is water-jacketed, the storage tanks having a sufficient capacity for oil and water for a journey of about five hours. Two speeds are provided—two and fourteen miles per hour. The countershaft is chain driven, while the connection between the countershaft and the rear road axle is also by chain gearing and friction clutches. The low-speed chain is provided with a spring jockey wheel to take up any slack, while for a similar purpose the rear axle is so arranged as to be capable of being moved on the springs. A feature of the car is the water-condensing coil, which consists of a series of copper tubes, fitted round the fly-wheel in such a way that the latter works within the coil. Some improvements in details have lately been made with a view to the further elimination of smoke and smell. Larger kerosene and lubricating tanks are now fitted, thus enabling the car to make longer runs without

recharging. Additional water tanks are also provided, and Brampton roller chains have superseded the block chains previously used. Messrs. Roots and Venables have supplied cars on this principle of 6-h.p. for use in India, and have in hand a 12-h.p. motor-carriage.

A Locomobile is to be seen on the stand of the Automobile Supply Company, 56, Broad Street, Birmingham, who also show a 4 h.p. frame and gears which can be supplied to coachbuilders and others. A motor-tricycle is also exhibited. Visitors to the show will doubtless be interested in the De Dion water-cooled cylinder heads here shown. They can be easily fitted to the ordinary air-cooled motor. The company will shortly bring out a new motor-car of English manufacture.

A very neat type of two or three-seated motor-voiturette is shown by Les Etablissements Pieper, 38, Snow Hill, E.C. The motor—a single-cylinder vertical one of 3 h.p.—is located in a bonnet at the front of the car. It is fitted with radial ribs to the cylinder for cooling purposes and electrical ignition. Two speeds are provided, the power being transmitted by a single belt working on fast and loose pulleys on a counter-shaft at the rear. The pulleys are of equal diameter, the variation in speed being obtained by different-sized spur wheels connected with the pulleys, which mesh with the corresponding spur wheels on the rear axle. The wheels are of the cycle type with pneumatic tires; ample brake power is provided, while the steering is controlled by a hand wheel. Two cars of the newest design form the company's exhibit.

In addition to the little two-seated car illustrated in our last issue Messrs. J. H. Pick and Company, of Stamford, exhibit an attractive little dogcart capable of seating three or four persons. It is propelled by means of a 4½ h.p. vertical water-cooled petrol motor geared to the rear axle. The engine is equipped with a surface carburettor of their own type,

which they state uses much less petrol than the carburettors at present in use. The transmission gear is similar to that adopted in the two-seated car, no chains or belts being employed. Another feature of the car is to be found in the patent front springs connecting the front carriage with the main body, these being claimed to practically do away with vibration. The frame is of tubular construction, while the road wheels are of the cycle type. The front steering wheels are carried in forks similar to those adopted on bicycles, and the seat is fitted with pneumatic cushions. The car is very light, the weight complete being only 4½ cwt. Special attention has been paid to the water-cooling of the engine; only three gallons of water are carried, and this, the makers inform us, was found not to be hot at the end of an eighty-mile run.

A very interesting display of motor-cars and cycles is that made by Messrs. Humber and Co., Limited, Coventry. To deal first with cars, we may refer to the Humber M.D. voiturette. This is a light two-seated car, weighing complete only 3½ cwt. The motive power is supplied by a 2½ h.p. De Dion motor, located in a perforated metal case in the front of the car in such a position that the air has free access to the cylinder and combustion chamber. The latter is water-cooled, a pump and radiating coil being fitted. The ignition is electrical, while two speeds, eight and twenty-two miles per hour, are provided, the variable speed gear wheels being always in mesh, but only in operation when the low gear is thrown in. The motor transmits its power by spur wheels to the front axle, steering being effected by a hand wheel mounted on a standard at the right-hand side of the car and acting on the rear wheels. A novel device is provided to start the motor from the driver's seat: this is effected by raising the steering hand wheel several inches in the standard. This disengages the hand wheel from the steering gear, and by giving it a few turns the engine is quickly started. Ample brake power is provided, while the "body" is comfortably sprung on C springs. A neat car is to be found in the "Humber" two-seated phaeton (Fig. 13). The engine is of the hori-

zontal type of $3\frac{1}{2}$ h.p.; it is fitted with electric ignition and radial discs for cooling purposes, the location of the engine, with the combustion chamber to the front, in the fore part of the frame, enabling air to have free access to the cylinder. Three speeds and a reverse motion are provided, the power of the motor being transmitted by belts to a countershaft at the rear and from the latter to the rear road axle by spur gearing. The wheels are of the cycle type, fitted with Dunlop pneumatic tires, while the steering is controlled by a hand wheel acting on the front wheels. The car weighs about 7 cwt.; it can attain any desired speed up to a maximum of twenty-two miles per hour. Provision is made

FIG. 13.—THE HUMBER $3\frac{1}{2}$ -H.P. PHAETON.

for the tightening of the belts from the seat; the petrol tank is fitted in the dashboard, and has a capacity sufficient for a run of 100 miles.

An entirely new car, exhibited for the first time, is the Humber four-seated mail phaeton. The frame is of tubular construction, a 5 h.p. horizontal water-cooled motor being located in the front. The water circulation is maintained by a pump, a radiating coil being also provided. The power of the motor is transmitted to the rear axle by means of two belts and spur-gearing, four speeds forward and a reverse motion being available, the top speed being about twenty-six miles per hour. Steering is controlled by an inclined handwheel, on top of which is fitted a disc carrying the various control levers, i.e., change speed, ignition, and throttle valve. Band brakes on both the countershaft and on drums connected to the hubs of the rear wheels are provided. The water tank has a capacity of five gallons, that of the petrol tank being sufficient for a run of 120 miles. The car body is built of aluminium, edged with D-tubing, and fitted with detachable cushions. The rear seats can also be quickly detached, thus converting the car, which weighs about 12 cwt., into a two-seated vehicle with ample luggage room. Cycle-type wheels are fitted, and these are shod with Dunlop pneumatic tires. The Humber Company also exhibit specimens of their motor-trikes and quads. The non-convertible quadricycle is fitted with a $2\frac{1}{2}$ h.p. motor and special tanks to enable a run of 100 miles to be made. For the comfort of the rear rider a special spring footboard is provided.

Messrs. Brown Brothers, Limited, of Great Eastern Street, London, E.C., have, as usual, a very large exhibit of motor-tricycles, quadricycles, trailers, front seat attachments, small petrol motors, parts and accessories of every kind, such as frames, carburettors, batteries, tanks, etc. The leading exhibit on the stand is, of course, the Brown-Whitney four-seated steam car, which has already been illustrated and described in these columns. In addition to the foregoing Messrs. Brown Brothers made a display of motor-tricycles and quadricycles fitted with $2\frac{1}{2}$ and $2\frac{3}{4}$ h.p. motors, front-seat attachments for tricycles, as also trailing cars, air and water cooled motors, motor-car chains and chain wheels, and accessories of every kind for automobilists and motor-vehicle builders.

The Canada Cycle and Motor Company, of Toronto and 57, Holborn Viaduct, E.C., intends to place upon the market within a short time a light motor-car; meanwhile it has introduced itself to the public with a quadricycle known as the "Imperial of Canada." The quad form is attained by attaching a front section to their motor-tricycle—an operation easily performed by simply removing the front wheel and connecting by means of nuts and bolts. All the parts are of the firm's own construction, and an improvement in the form of the pipe between the exhaust and the muffler has been made. This consists in making the ordinary pipe of a taper form, thus helping to relieve the back pressure and increasing the speed of the motor. It is fitted with an aluminium gear case and 28 in. wheels. Two and a-half inch Dunlop detachable tires are used.

One of the cars which is attracting considerable attention at the Agricultural Hall is the "Ivel" landaulette (Fig. 14), exhibited by Mr. Dan Albone, of Biggleswade. The frame of the "Ivel" car is con-

structed of steel tubing, and the arrangement of the tubes is such that all the various strains to which the frame is exposed, both from road vibration and that caused by the motor itself, are scientifically taken up, a cantilever system being adopted. The frame is mounted upon spiral springs, those of the rear axle being enclosed in steel cylinders, which are inclined towards the rear of the car, in order that the springs may act in the same plane as the lines of vibration from the wheels. These cylinders further prevent any movement of one spring without the duplicate motion on the other. This arrangement is claimed to keep the chain wheels in proper alignment, thus not only saving a great deal of friction, but also greatly prolonging the wearing powers of the chains. The front axle springs are vertical, and are designed to allow the wheels to rise or fall to accommodate themselves to the inequalities of the road. Upon this frame a double-cylinder petrol motor of 8 h.p. is carried. Electric ignition is adopted. The engine is water cooled; no pump is employed, while the water in the tanks is kept cool by means of tubes through the tank, air being conveyed to and through the same by specially arranged funnels. The body of the car, which takes the form of a landaulette, designed to seat two persons inside, with the driver and another person on the box, is supported on four C springs, being thus entirely separate from the frame and working parts. An additional seat, which can be readily detached, is also provided at the back of the car for a servant, if desired. The front of the landaulette can be let down and also the back and roof at the rear, thus converting the vehicle into an open car. The occupants of the car are completely insulated from the vibration of the motor, as well as from that caused by road inequalities, and, in addition to this, a different body can at any moment be attached to the frame in a short time, so that the purchaser may have practically two or three cars to one frame and motor. The main brakes act upon large drums within the chain wheels. A pair of tire brakes are also provided. A feature of the car is that all the levers are within easy reach of the driver, while the steering is remarkably steady, a special irreversible arrangement being adopted whereby the wheels cannot under any circumstances be deflected by obstacles on the road. The petrol tank is situated under the front seat, and the water tank is of large capacity. The tubes which pass through the tank take the place of the condenser commonly employed, while as the tank is placed well above the motor there is no necessity for the employment of pumps and their attendant complications. A three-speed gearing is provided and also a reversing gear. The motor and chains are enclosed, so that the wear and cleaning are greatly reduced. The power of the engine is transmitted to the countershaft by means of belts and a Crypto gear, Renold bushed silent chains conveying the power to the rear axle. The motor is so arranged that the flywheel runs in the same direction as the car, and a certain amount of power is thus saved which would otherwise be wasted. Moreover, as the driving belts are not crossed, there is a considerable saving of friction. The vehicle is fitted with "Ivel" ball bearings which are larger and wider

FIG. 14.—THE "IVEL" LANDAULETTE.

apart than usual. The convenience of the driver has been most carefully studied, and attention is drawn to the fact that every part of the machinery can be easily reached, so that all adjustments can be made with the greatest nicety without the trouble usually involved. Steering is controlled by a hand-wheel, while the road wheels are of the cycle type shod with solid rubber tires. The car complete weighs about 15 cwt. and can attain a speed of twenty miles an hour. A vehicle of this type has been supplied to Mr. R. C. Vyner, of Newby Hall, Ripon, where it has been attracting much attention. Mr. Albone drove the car down to Yorkshire, and while there took quite a number of Society people for a trip, including the Duchess

of St. Albans, the Marchioness of Ripon, and Lady Rosalyn, all of whom were delighted with their experience. The car was also driven one day to the Hurst race meeting, where naturally it attracted much attention.

Messrs. Burford, Van Toll, and Co., of the Orleans Works, Twickenham, occupy their stand with three voiturettes of the New Orleans type. Fig. 15 gives a general view of the attractive 6-h.p. three-seated car, recently introduced by the firm, and of which an example is on view. The car in its general arrangement follows the lines of the New Orleans voiturette, the feature being the employment of two motors arranged side by side under a bonnet in the fore part of the tubular frame. The motors, which collectively develop

FIG. 15.—THE NEW ORLEANS 6-H.P. VOITURETTE.

6-h.p., and are of the Vivinus type, are air-cooled both externally and internally. The internal cooling is obtained by the entry of cold air into the crank chamber and cylinder each time the piston rises through the gauze-protected ports formed in the top part of the crank chamber. The external cooling is effected by means of a high-speed fan driven by the flywheel. This causes a fierce current of cold air to pass across the interior of the motor bonnet, the makers stating that they are willing to give any reasonable guarantee that the engines do not over-heat. It may be mentioned that the two motors are connected up to a single engine shaft, between them being mounted the fly-wheel and the belt pulley. A single carburettor—of an improved float-feed type—furnishes a regular explosive charge to the two motors. Ignition is of the make and break electrical type, a lever being provided on the steering standard by means of which the sparking can be advanced or retarded as desired. The parts of the motors are of easy access, the valves being arranged so as to be quickly removed when necessary. Coming now to the transmission mechanism, there are two speeds, ranging from 8 to 10, and 20 to 30 miles per hour. A long crossed belt connects the pulley on the engine shaft to fast and loose pulleys on a counter shaft just in front of the rear axle, to which the power is transmitted through one or other of two pairs of spur wheels provided. The fast pulley is fixed to the shaft upon which the sliding piece with its two toothed pinions moves. By means of a lever set horizontally beneath the steering wheel, this sliding piece is moved either to the right or left, according as it is desired to drive on the high or low speed. The belt shifter is actuated by depressing a pedal on the footboard. The manipulation is very simple, the foot lever for striking the belt being always depressed before changing speed, or for throwing the motor out of gear altogether. Steering is controlled by a horizontal hand wheel; cycle type wheels, 26in. and 30in. diameter, shod with 3in. pneumatic tires, are fitted. A foot pedal operates a hand brake on the countershaft, while similar brakes, actuated by a hand lever, are fitted on to drums attached to the hubs of each of the rear road wheels. The petrol tank has a capacity of 2½ gallons, this quantity being stated by the makers to be sufficient for a journey of eighty miles. The car measures 8 ft. by 4 ft. 6 in., and weighs complete about 6½ cwt. The two-seated car has a 3-h.p. Orleans air-cooled motor, and has two speeds. On the stand is also a long frame voiturette, which is in all respects similar to the regular type except that the frame, being 9in. longer, enables a spare petrol tank and basket to be carried.

By reason of its display of electrical vehicles the British and Foreign Electric Vehicle Company, Limited, 4, Bloomsbury Place, W.C., has been able to arrange a very attractive stand. First and foremost is the "Powerful" car, built for this company by the Krieger Company, of Paris, and carrying sixty 30 E.C. type Leecoll cells, giving 275 ampere hours. Its recent performance on the run to Southsea was so uniformly good that it is naturally receiving much attention at this show. The Crénache Co.'s "Victor" voiturette, intended to run thirty-five to forty miles on one charge, and the Stanhope Phaeton, built by the Columbia Co., are also shown. This is essentially for use in towns, and its running capacity is thirty miles on one charge. The Leecoll accumulator or second battery for electric motor-vehicles is exhibited. This is made without plates of lead, nor is free sulphuric acid used. The electrolyte consists of a neutral solution

of metallic salts, and in charging the battery these salts are transformed into a metallic coating, which is deposited on a negative consisting of a cylinder of metal gauze after the manner of electroplating. The positive plate is encased in a porous tube, and is surrounded by the negative cylinder. The Leecoll battery is claimed to give a higher E.M.F. than a lead cell—i.e., 2.5 volts, instead of only 2 volts. Owing to this high E.M.F. 32 of these cells will, it is stated, give the same voltage as 40 cells of the ordinary type. The traction-type cells weigh 18lb. each, and have a capacity of 90 ampere-hours.

Occupying a prominent position on entering the hall, Messrs. Friswell, Limited, 48, Holborn Viaduct, E.C., make a very effective display, and the vehicles being nicely staged contributes to the convenience with which they can be inspected. The fine 12 h.p. Panhard upon which Mr. Friswell has lately been seen is a central feature of the stand, while a water-cooled Renault car, fitted with the De Dion motor, is having a considerable share of attention. A petit Duc Mors, which can be adapted to seat two or three persons, a 3½ h.p. De Dion voiturette, and a four-seated Peugeot carriage complete a good exhibit. These cars are so well known to our readers that further description seems unnecessary on the present occasion.

Mr. J. L. Thomas, Barnet, exhibits a new front spring fork for cycles and motor-cycles as well as a 2½ h.p. motor-tricycle fitted with a novel design of rear frame. So far as the fork is concerned, to the ordinary front fork is attached a subsidiary one bent out at right angles four inches from the fork ends, and pivoted to the fork ends proper at the elbow formed by such bend. The upper ends of the subsidiary fork are joined together by a tubular strut, to which is fastened one end of a helical spring, the other end of the spring being attached to the fork crown proper. The motor-trike has a single rear axle, the new feature being the introduction of a pair of additional stays extending from the apex of the triangular frame to the top of the gear case, this addition, it is claimed, resulting in a more rigid frame.

A good show of motor-tricycles and quadricycles is made by the Enfield Cycle Company, Limited, Hunt End Works, Redditch. The new auto-quadricycle has a 2½ h.p. engine, water-cooled. It has an ordinary quad frame without pedals, the rear rider being on a comfortable seat instead of a saddle. There are two speeds—seven and twenty miles per hour respectively—with a double friction cone and clutch. These are put in and out of gear by a worm wheel and pinion, which works a screw at the end of the gear-box. Both the mixture levers are on a standard, and the brakes are actuated by the feet. The ball thrust is fitted with ball bearings, and the axle also has ball bearings. A Longuemare carburettor is used. The water tanks are fluted so as to present a greater surface than usual to the air, and the shape has been registered. The footboard is connected with the springs, to prevent the jolting that otherwise takes place. The petrol tank is under the rear seat, the battery box being carried under that in front.

Motor-cyclists will be interested by the new compression tap shown fitted to a motor-tricycle by Messrs. H. Lygoe and Sons, of 27, Compton Street, London, W.C. The tap Fig. 16 has been devised by Mr. C. Fitzroy Farlow; it consists of a double cock tap fitting into the top of the motor, one cock being for lubricating and the other connected to the silencer (which is opened in the same manner as an ordinary tap) and

FIG. 16.—FARLOW'S COMPRESSION TAP.

having a valve closing on the suction stroke, thus enabling a full mixture to be drawn through the inlet valve instead of a quantity of non-explosive mixture (air) as in the case of an ordinary tap. The advantages of this contrivance will be obvious to all users of motor-cycles; it not only reduces the hissing noise on starting, but facilitates the operation of putting the engine in motion, and also enables the machine to be driven at a slow speed without the engine stopping.

At the stand of the Eadie Manufacturing Company, Limited, Redditch, are specimens of the firm's well-known motor-tricycles and quadricycles. Water-cooled engines are now being fitted to all the firm's quads. The Clark Brothers Cycle Company, Ltd., 24 and 26, Dames Road, Forest Gate, E., exhibit a 2½ De Dion motor-tricycle.

THE BIG EVENT OF 1901.

THE Sub-Committee of the Automobile Club which was appointed at the meeting of 31st October, to recommend as to the route for the big event of 1901, met at the Club on the 23rd November. The recommendations of the Sub-Committee, which are to be submitted to the Big Event Committee, are shown below. The Big Event Committee will be asked to adopt and forward these proposals to the Club Committee, who, as in 1900, will organise the Trial.

TWELVE HUNDRED MILES TRIAL.

August, 1901.

	*C.T.C.	†C.B.	Miles.	Miles per day.
Monday, 12th August :—				
London to Basingstoke.....	VOL. I. 206	S.E. 513	45½	—
Basingstoke to Shaftesbury.....	233	W. 689	55½	101½
Tuesday, 13th August :—				
Shaftesbury to Exeter	233	W. 718	68½	—
Exeter to Plymouth	343	W. 724	43½	112
Wednesday, 14th August :—				
Plymouth to Taunton	343	W. 724	76	—
Taunton to Bristol	306	W. (730) (846)	44	120
Thursday, 15th August :—				
Bristol to Worcester	66	W. (855) (862) (855)	59½	—
Worcester.....	66	W. 952	47½	107½
via Bridgnorth to Shrewsbury ...	197	W. 979		
Friday, 16th August :—				
Shrewsbury via Whitchurch (19½ m.).....	241	—	—	—
Tarporley (13½ m.).....	66	—	—	—
to Warrington (18½ m.).....	VOL. III. 2	N. 258	51½	—
Warrington to Lancaster.....	2	N. (209) (203)	50½	102
Saturday, 17th August :—				
Lancaster to Kendal (21 m.) ...	2	N. 203	—	—
Kendal to Dunmail Summit (20 m.)	277	186	—	—
Dunmail to Kendal (20 m.).....	277	186	61	—
Kendal over Shap to Carlisle	2	161	44½	105½
Sunday, 18th August :—				
At Carlisle	—	—	—	—
Monday, 19th August :—				
Carlisle to Glasgow	IV. 1	S. (51) (121)	95	95
				743
Tuesday, 20th August, until and including Sunday, 25th August } At Glasgow Exhibition.				
Monday, 26th August :—				
Glasgow to Dumfries.....	VOL. IV. 20	S. (119) (104)	79½	—
Dumfries to Carlisle	2	(67) (62)	34	113½
Tuesday, 27th August :—				
Carlisle to Penrith	VOL. III. 2	N. 161	18	—
Penrith to Scotch Corner.....	350	N. 181	49½	—
Scotch Corner to Borough Bridge	1 (2)	66	27	—
Borough Bridge to York.....	226	92	17½	112½

Wednesday, 28th August :—

York to Doncaster.....	1 (1)	85	33	—
Doncaster to Newark	1	137	38	—
Newark to Lincoln	27	S.E. 303	15½	86½
(Including speed trials at Welbeck)				

Thursday, 29th August :—

Lincoln to Sleaford	VOL. II. 13	323	17½	—
Sleaford to Lynn	377	399	45½	—
Lynn to Norwich	436	429	43½	106½

Friday, 30th August :—

Norwich to Thetford	401	427	29	—
Thetford to Bury St. Edmunds ...	452	449	12	—
Bury St. Edmunds to Newmarket	404	387	14½	—
Newmarket via Chesterford to	401	(391)	30½	—
Bishops Stortford.....		(537)		
Bishops Stortford to Hertford	353	473	13½	—
Hertford via Hatfield	195	477	—	—
and Barnet to London	354	525	28	127½

546

Summary :—London, Glasgow, London, August 12th to 30th August, 19 days, of which 12 are running days, 5 days at Glasgow††, 2 being Sundays. Total distance, 1,289 miles.

* C.T.C., Volume and No. of Route in *Cyclists' Touring Club Road Book*.
† C.B., Contour Road Books (4 Vols.); S., Scotland; N., North of England; S.E., South-east England; W., West England.

†† Vehicles in Section I. (carrying observers), will during this period be exhibited at the Glasgow International Exhibition. It is proposed that there should be arrangements by which they may be taken out of the Exhibition during certain hours daily to enable manufacturers to demonstrate their vehicles to purchasers, provided that they also carry official observers.

Hill-Climbing Trials.—The route includes many hills on which valuable hill-climbing records may be obtained, for instance :—

Crewkerne to top of St. Rayne Hill	3 miles.
Chard	1 mile.
Yarcombe	1 "
Straightway Head	2 miles.
Kenford	2½ "
Chudleigh	3 "
Red Hill (W. 846)	2 "
Dunmail Raise (N. 186)	2 "
Shap Fell (N. 161)	10 "
Beetock (S. 51)	10 "
Cross Hands (S. 104)	4 "
Holford Bridge (S. 104)	1½ "
Cumlock (S. 104)	2½ "
Brough (N. 181)	7 "

Classification.—It is recommended that the classification should be by prices as follows :—

- Class A.—Vehicles selling at £200 or under.
- Class B.—Vehicles selling at more than £200 but not more than £300.
- Class C.—Vehicles selling at more than £300 but not more than £450.
- Class D.—Vehicles selling at more than £450 but not more than £650.
- Class E.—Vehicles selling at more than £650 but not more than £1,000.
- Class F.—Vehicles selling at over £1,000.
- Class G.—Motor-cycles carrying two persons.
- Class H.—Public service vehicles and delivery vans : (a) Carrying not less than 5 cwt., or four persons including driver; (b) Carrying not less than 15 cwt., or eleven persons including driver.

Time of Start.—It was agreed that the time of start should be 7.30 in the morning, that there should be no stop for breakfast, but there should be three-quarters of an hour compulsory stop for lunch.

Controls.—It was agreed that the official programme should state what time should be taken by a vehicle in passing from one end to the other of a control at eight miles an hour, in order that drivers may have this assistance in regulating their speed.

Observers.—

- (a) It was agreed that vehicles carrying only one person could not be entered for competition in Section I.
- (b) That all other vehicles entered by manufacturers or agents should be required to carry an observer.
- (c) That the allotment of vehicles to the various observers should be by daily rotation.
- (d) That vehicles in Section II. on which no observers are carried should not be eligible for a prize, but their owners should receive a suitable memento of the satisfactory completion of the whole tour.

Class H.—The formation of Class H for public service vehicles and light goods delivery vans was, on the suggestion of Mr. Foster Pedley, recommended. It is proposed that these vehicles should start from London at the same time as the other vehicles, but should be allowed two days longer for the completion of the journey to Glasgow, and also that they should start two days earlier from Glasgow, and be thus allowed two days longer for the journey to London.

It was suggested that the observers on these cars should take careful note of the fuel consumption.

LEAVING A HORSE UNATTENDED.

BEFORE the Guildford Borough Bench last week, Andrew Gunner, of Ash, was summoned for having been at such a distance from his cart as not to have proper control over the animal drawing it in Friary Street on the 13th ult. According to the evidence of P.C. Rickman, defendant left the horse and cart unattended outside the Bear Inn, Friary Street. A passing motor-car frightened the horse, which bolted up North Street, but was stopped by Charles Taylor, who brought the animal back to Friary Street. Defendant said he left the horse and cart in the street while on business. Defendant, who did not appear, was fined 10s.

FURIOUS DRIVING CASES.

AT the West London Police Court, last week, George Sparks, of Staines-road, Bedfont, was summoned by the police before Mr. Lane, Q.C., for driving a four-wheeled motor-car on Sunday afternoon, the 28th Oct., at a greater speed than twelve miles an hour on the High-road, Chiswick.—There was a summons previously heard against the same defendant for driving at a greater speed than reasonable having regard to the traffic, and on that occasion he was defended by Mr. Staplee Firth.—The evidence of Police-constable Alker, 517 T, went to prove that on the Sunday afternoon in question he followed the motor-car for a distance of two miles in the direction of Hammersmith, while patrolling on a bicycle which was a racing machine. He judged the speed of the car at sixteen miles an hour, but he admitted that the defendant eased up as he passed vehicles. The magistrate found that defendant, who had been summoned under sub-section 1, was not driving at a greater speed than reasonable, having regard to the traffic, and suggested an amendment for the case to be heard under sub-section 2, which limited the speed to twelve miles an hour. Taking the two sections together he was of opinion that under no circumstances a car could be driven at a greater speed than twelve miles an hour. Mr. Staplee Firth objected to an amendment, and asked for judgment on that summons. In reply the magistrate said he would grant another under sub-section 2, but Mr. Firth argued that it would be *res judicata*. Not so, the magistrate observed, and granted the summons, and adjourned the other one.—On this occasion the defendant was not represented.—Mr. Lane, Q.C., pointed out that the penalty was £10, but under the circumstances said he should only fine the defendant 40s. with 2s. costs. He dismissed the original summons.

THE RIGHTS OF MOTOR-CAR DRIVERS.

AT the Woolwich County Court last week a lad named Stephen Williams, aged twelve years, living at Abbey Wood, brought an action, through his father, against Mr. T. Whomes, a pianoforte maker, of Bexley Heath, to recover damages for injuries caused by the alleged negligent driving of a motor-car in Woolwich. Counsel for plaintiff said that on November 18th of last year he was living with his parents in Powis Street, Woolwich, and whilst he was playing in the street with a hoop a motor-car came along at an excessive speed. Defendant and his son were on the motor, and sounded a "hooter," or horn, which caused a horse attached to one of Messrs. Thomas and Edge's carts to take fright. The cart knocked the plaintiff down, and the wheel passed over his leg, which was fractured. He was afterwards removed to the Woolwich Union infirmary, where he remained thirteen weeks. An action had previously been commenced against Messrs. Thomas and Edge, builders, of Woolwich, but enquiries went to show that the cart was on the right side of the road, and that it was being driven slowly by a man named Clarke. That action was relinquished, and the present one begun against the defendant, who, counsel contended, would not have been liable if he had not driven his car at an excessive speed. Plaintiff having borne out counsel's statement as to the injuries he received, John Collyer, chief horsekeeper in the employ of the Royal Arsenal Co-operative Society, said that the rattling noise of the motor-car, which was going at a reasonable rate, frightened the horse, and the driver of the cart could not have avoided the accident.

The defence was that the car was only being driven at the rate of five miles an hour, and that the driver sounded the "hooter" as a warning to people to get out of the way. After a long legal argument counsel withdrew the statement that the car was going at an excessive speed. Mr. Whomes said that after the accident he offered to send the lad to a convalescent home and pay £10 towards the expenses. His Honour instructed the jury to give a verdict for the defendant, and remarked that the action could not be sustained, the use of motor-cars on the highway being authorised by the Locomotives on Highways Act, 1896, and the Light Locomotives on Highways Act, 1896. The jury accordingly returned a verdict for the defendant, and counsel on both sides consented to waive all costs.

It is stated that a company has been formed to operate automobiles on the Yukon. Five cars are said to have been shipped, and these are to be operated between White Horse, the terminus of the railway, and Dawson city. Their practicability demonstrated, the company will then try the automobile in the Klondike district, running them wherever possible between Dawson and the numerous creeks of the mining camp.

"SHOULD cycle agents take up the sale of motors?" is the title of a paper which Mr. F. D. Nawell will read before the Manchester Cycle Trade Association on December 6th.

MESSRS. DE DION-BOUTON AND Co., of Puteaux, have lately completed an electric voiturette. The car in general appearance closely resembles the well known De Dion voiturette, electricity forming, however, the motive power instead of petroleum spirit.

Automobile Topics, of New York, states that Messrs. J. Howard Johnson and Clarence Gray Dinsmore, both members of the Automobile Club of America, were to sail for New York on the 14th ult. Mr. Johnson was taking with him a 24 h.p. Mors car and Mr. Dinsmore three 12 h.p. Panhard cars.

IN a recent issue we mentioned that some trials were being made at Shaerbeek, near Brussels, with a motor fire engine. The trials included an interesting experiment with the automobile versus a horse-drawn engine. Both vehicles were several times unexpectedly called out on a false alarm, to see which would be first in arriving at the scene of operations, and each time the motor-vehicle gained the victory. The latter could make, when fully manned and loaded, 32 miles an hour, the whole weight being 28 cwt. Several commanders of the Belgian fire brigade were present to report on the trials to their authorities.

A RELIABLE brake is one of the most important features of a motor-car, and motor engineers are continually striving to bring out new forms. The other day we had an opportunity of inspecting a new double-purchase brake on the Daimler car belonging to Mr. Frank Sheppard, of Putney, which has been fitted by Messrs. H. J. Taylor and Co., of Earlsfield, S.W. The brakes act on drums attached to the hubs of the rear wheels; the connecting levers are fixed well up out of the way of the chains, while the brake, which consists of a band of steel, to the interior of which wooden blocks are fixed, works, it is claimed, equally well whether the car is running in a forward or rearward direction. The band brake proper is supported by a special casting, and is so connected to the controlling lever that the band is drawn on to the drum from both ends simultaneously. In addition to its double-acting properties, the new brake is stated to weigh considerably less than the usual form.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editor's hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

Vol. II.]

LONDON, SATURDAY, DECEMBER 8, 1900.

[No. 92.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

MOTORIVE CARRIAGE 1114

THE Liverpool Self-Propelled Traffic Association gave another testimony of its energy and enterprise in the great gathering of Monday to welcome M. Forestier. M. Forestier knows the conditions of heavy motor traffic in France and its possibilities in other countries as well as any man, and the interesting paper with which he favoured the meeting should give considerable impetus to the heavy motor traffic movement in this country. On Tuesday a large party of those attending the meeting visited several places of interest, and after luncheon at the Town Hall, the Lord Mayor and Mr. C. Johnson, secretary of the Automobile Club of Great Britain and Ireland, joined the party in an automobile belonging to Mr. Alfred J. Boulton, and fitted with a special hydraulic variable-speed gear, invented by Mr. W. Hall. M. Forestier greatly admired his run through Sefton Park to the Lord Mayor's residence, and his run back to town to visit the Exchange Flags and Newsroom. He left Liverpool for London on Wednesday morning, being accompanied by a number of the members of the council of the Liverpool Self-Propelled Traffic Association. We would congratulate Mr. Shrapnell Smith, the Hon. Secretary of the Association, on the success of the meeting, and also give testimony to the appreciation of the guests at the Lord Mayor's luncheon.

A Military Motor.

RUMOURS have been rife lately of the great speed attained by a Pennington war car in Richmond Park, special permission having been accorded Mr. Pennington for the use of the park for the purpose of experiment. We understand that a company with a capital of seven figures is being formed, and that some of the leading people in the armour-plate trade have already joined the board. The company, we hear, will be brought before the public some time this month, and perhaps those interested in automobilism will be surprised to see that amongst other inclusions will be that of a firm well known in automobile circles. In the meantime, Mr. Pennington is at Kendal with his three cars—each of which has cost somewhere about £3,000 to build—preparing to go up and down Shap Fell. This is ten miles long, from Mint Bridge to the summit, and the idea is to go up and down several times on non-stop runs. Such a test will be a good one, and the honesty of the effort will do much to rehabilitate the doubts of those who, like doubting Thomas, have previously not believed. There is no doubt the present armour-plated cars, like the old torpedo car, are flyers, and that the water-cooled cylinders enable them to travel distances previously regarded as impossible.

Electric Trams.

IN Liverpool there is a most complete system of electric trams, and to the Londoner the celerity with which these speed about is a subject of great wonderment. The legal speed allowed, we understand, is eight miles an hour, but where police, trams, etc. are all under one authority, a sort of "go as you please" arrangement exists, and twelve miles an hour

seems nearer the prevailing rate, although we are credibly informed that the limit is frequently extended to nearly twenty miles an hour, especially in the outskirts of the city. The Automobile Club propose sending invitations to county councillors throughout the kingdom offering them trial rides to prove the perfect control motorists have over their vehicles; but it seems to us, and this suggestion we respectfully offer to the committee, that it would be advisable for the Club to first invite the county councillors to Liverpool, and then they will be able to see for themselves how perfectly safe, even in towns, is the legal speed allowed motor-cars, and which they seek to get reduced. Their agitation may only have the result of doing away altogether with the speed limit. The common law of the land is sufficient to provide for the safety of all, and those who drive to the common danger must pay the penalty, and all true motorists interested in the success of the industry will help the authorities in punishing reckless drivers.

Heavy Motor Vehicles.

AT all the functions of the Liverpool branch of the Automobile Club builders of heavy vehicles have been in force. Those present on Monday included Messrs. Thornycroft, Toulmin, Simpson, Musker, Spurrier, Norris, and others. Hearing that Messrs. Simpson and Bodman had ready for trial a new vehicle, ordered for use in South Africa, we took advantage of the opportunity while up north of inspecting the new vehicle, and of noting the improvements which have been made. The lorry is about 18 feet long, and is built to carry five tons. It has only one speed, instead of, as previously, three, and is capable of travelling, when fully loaded, at seven miles an hour. The engines and boiler have a capacity of 40 h.p.; coke is used instead of the Welsh smokeless coal formerly employed. Another new departure is the fitting of a positive clutch which couples the engines and rear road wheels. This clutch is controlled by means of a foot lever, and of course, when the vehicle is turning a corner, the clutch is released.

The Club and County Councils.

WITH characteristic energy, consistent with the acquisition of full knowledge on the subject, the committee of the Automobile Club is engaged in an attempt to educate county councils on automobile matters. It is proposed to urge that furious driving endangering life should be the basis of prosecution, and that as owners of motor-vehicles pay a carriage tax they have a right to claim the same privilege of privacy as is granted to private vehicles propelled by other means. A letter is to be sent to all persons interested in the matter pointing out the efforts to be made in the spring to demonstrate the control which motor-car drivers have over their vehicles, and asking councils to suspend judgment until then.

Prospective Arrangements.

SEVERAL interesting events have been arranged by the Automobile Club. On Wednesday next there will be a house dinner at the Club, followed by a paper on Motor Bicycles to be read by Mr. Joseph Pennell. Arrangements already made for 1901 include the quarterly 100-miles trials on January

1st and April 2nd, an Easter tour to Ireland or Normandy from the 4th to the 9th April, a petroleum-spirit distance contest on April 13th, hill climbing and consumption trials on May 2nd, the exhibition at the Agricultural Hall from the 4th to the 11th May, and other interesting events, including tours to Liverpool, Portsmouth, and France, as well as "the big event." A trial of the horse-power of motors and horse-power on road wheels of motor-vehicles has also been suggested.

A Christmas Tour.

MOTORISTS wishing to spend Christmas Day at Plymouth should, if they are members of the Automobile Club, join the informal tour which is being arranged to begin on the 21st inst. On that day it is proposed to go to Salisbury—a distance of eighty-eight miles—and on Saturday from that city to Exeter (eighty-nine miles). On Christmas Eve the party will go *via* Chudleigh and Ashburton to the great naval town, which by that road is forty-three miles from Exeter. On Boxing Day the return journey will be commenced, and Taunton (seventy-six miles distant) will be the stopping place for the night. On the 27th inst. eighty-eight miles will be traversed, *via* Bristol to Marlborough, and on the Friday London will be the destination.

Conference of Chief Constables.

IN consequence of the endeavours to be made in May next to secure the education of county councillors and others with regard to automobilism a conference of chief constables with the committee of the Automobile Club is proposed. Already several chief constables, including those of Surrey, Bedford, Cornwall, Durham, Essex, Yorkshire, Sussex, Kent, Buckingham, and Dorset have promised to attend. Major Bower, the chief constable of the North Riding of Yorkshire, is sanguine as to the value of the proposed conference, "as there are large numbers of people throughout the country who do not understand the extraordinary control which the driver of a motor-car has over his vehicle." Lieut.-Colonel H. M. A. Warde, the chief constable of Kent, expresses himself in favour of the numbering of motor-vehicles.

Drivers' Certificates.

SEEING that some motorists have declined to stop when asked to do so by the police several chief constables have suggested that as an alternative to the numbering of cars—to which every automobilist is strongly opposed—certificates of competency should be regarded as necessary for drivers. It is suggested that the certificate should be issued by a central authority on which the Club should be fairly represented, and motorists failing to stop when desired by the police or by drivers of restive horses should be liable to a suspension of their certificates with the consequent loss of the right to drive a motor-vehicle.

A New Tire Trouble.

THOSE who exhibited motor-cars fitted with Michelin tires at the recent shows in London have been served with writs restraining them from selling, offering for sale, using, or exhibiting such tires in this country. We believe that injunctions have been granted against fourteen firms. Last Saturday several amusing conversations took place at both shows in consequence of these legal developments, and at the National Show tireless motor-cars were exhibited on several stands; whether as a result of the writs or in order to lower the height of the vehicle we do not know, and did not stay to inquire.

Tolls.

DURING the last fortnight or so the writer has been a dozen or more times on his car to the Crystal Palace, but rather than pay toll has gone a couple of miles out of his way on the villainous roads which, we should imagine, are only to be found around the Crystal Palace. Only on one occasion

when with a party of friends from the Automobile Club, did we venture through the toll gate in order to save time. We had been told previously that the toll was only 4d. The night was dark, the gate was shut, no light was shown, and it was only the extreme care of the driver that prevented an accident. The lady in charge wanted 1s.; we handed 6d. and demanded change, but were informed we could well afford the shilling. After some palaver the gate was opened; no change or ticket was given, and we passed through. Another excessive toll is that on the Great Western main road at Maidenhead. The Berks and Bucks County Councils and the various local authorities are taking action in regard to the freeing of the bridges at Cookham and Maidenhead. One of the suggestions made is that the toll should be continued for twenty-five years, so as to extinguish the capital liabilities of the county authorities.

A Novel Contest.

TO-DAY, when the future of automobile racing in France is obscured by threatening clouds, motor men are turning their thoughts towards the organisation of automobile events, which, while avoiding any conflicts with the authorities, shall yet prove interesting alike to the public and to the competitors. The promotion of a competition upon really new lines calls for considerable ingenuity, for already a hundred and one different schemes have been employed, many of which by their complexity have bewildered both competitors and officials. To steer clear of intricate regulations while presenting entirely new features is no light task for the organiser, and he should therefore welcome the recent wager between two Belgian motorists as giving him an idea for a novel contest. Simplicity itself, the scheme might with but little alteration form the basis of an excellent and instructive automobile event. The idea originated at the A.C.B.'s club-house in the course of a discussion between two members as to the reliability of their respective cars. To arrive at a decisive conclusion the two gentlemen, M. Fentaure and M. de Reus, agreed to drive their vehicles from Brussels to Marseilles and back, noting *en route* all breakdowns and incidents. In case either competitor suffered a "panne" lasting more than six hours he was to be disqualified, and the wager of £40 was to go to his rival. I may add that the vehicles engaged were a Germain Panhard and a Gobron-Brillié. There should be no great difficulty in following such instructions, and a competition on similar lines should prove of great interest.

Horses' Hoofs on the Roads.

AUTOMOBILISTS should urge upon county councillors and members of public bodies responsible for maintenance of highways the economy of motor-cars as compared with horse-drawn vehicles so far as the condition of the roads is concerned. In a paper contributed to the Society of Arts by Mr. Howard Humphreys, A.M.I.C.E., he says that the substitution of automobile "for horse traffic will result in a vast annual saving in road wear, as, from experiments made a few years since, the hammering action of the horses' hoofs was proved to have been responsible for some 45 per cent. of the total road destruction, while atmospheric changes brought about 20 per cent. and wheels 35 per cent."

A Berlin-Vienna Event.

IT is extremely probable that following upon the Paris-Berlin event of next year there will take place a race from Berlin to Vienna, for already the Austrian Automobile Club is in communication with the French and German clubs as to the practicabilities of the scheme. The distance between the two capitals, *via* Reichenberg, is rather less than 600 kilometres (375 miles), and the idea at present is to run the event off in a single stage, that is, so far as the racing category is concerned. Any touring division would certainly require to make a couple of stages of the journey, as for them the jaunt would prove somewhat long. The idea seems a capital one, and if decided three or four days after the Paris-Berlin event, no lack of entries should be forthcoming.

If carried out, the race would take place about June next, but more definite news is likely to be soon made known, and all particulars will be duly registered in the columns of the *Motor-Car Journal*.

The Gordon-Bennett Race of 1901.

OWNERS of racing vehicles will be interested to know that entries of British vehicles for the Gordon-Bennett Race of 1901 must be made by the Automobile Club of Great Britain and Ireland before the end of the present month, and that gentlemen who intend to enter vehicles are requested to communicate with the secretary without delay. Count Zborowski, the Hon. C. S. Rolls, Mr. Mark Mayhew, and Mr. S. F. Edge have already signified their intention to enter vehicles—in each case a 50 h.p. Napier car. As only three vehicles may run in the race to represent the United Kingdom, there will be an eliminating race. This will probably be the Paris-Bordeaux Race.

London Traffic.

COULD country motorists see the streets of London at the present time they would extend sympathy to their brethren in the metropolis. The *Financial News* gives a list of twenty-seven thoroughfares, portions of which are "up." These include Eastcheap, Fenchurch Street, Cornhill, Cheapside, Newgate Street, Ludgate Hill, Farringdon Street, Fleet Street, Holborn, Cannon Street, and Queen Victoria Street, so that it will be seen that nearly all the important streets are being dealt with. We do not complain of the necessary work that has to be done, but the leisurely way in which it is said to progress is annoying, irritating, and troublesome in the extreme.

From Motors to Horses.

THE natural tendency is for the automobile world to recruit from the ranks of horse owners, and dozens of instances may be cited of devotees of the noble steed developing into enthusiastic motor men. Cases of an inverse evolution are infinitely rarer, and for that reason the *début* of Charron last year as a racehorse owner caused quite a sensation in the Parisian sporting world. And now another famous *chauffeur* has entered the horsey arena, and the name of Antony must be added to the list of owners. It was at Auteuil on Sunday last, in a steeplechase event, that the representative of the Mors champion competed, and if not rejoicing in the powers of endurance of the 32 h.p., he at any rate showed greater ability in the matter of jumps. From cycling to automobilism and from automobilism to horse racing, Mr. Debray, to give Antony his real name, would appear desirous to taste the pleasures of every form of racing.

Opening in India.

THERE is likely to be a good market for automobiles in India, and we have an idea that the medical profession of our great Dependency will shortly be as interested in motor-cars as are the doctors in many English places. Confirmation of this comes in a letter just received from a subscriber in Simla. He is an Indian medical man with a fairly large practice, and has felt the inconvenience and uncertainty of horse-traction so much that he is on the look-out for a reliable light motor-vehicle. Hence his interest in the columns of the *Motor-Car Journal*. Probably in our full reports of the shows in London he will find something which may lead him to make direct inquiry to some of our makers of motor-vehicles.

Necessity for Knowledge.

A VISITOR to one of the stands at the National Show was so impressed with the ease with which a certain voiturette was started and made to canter round the North Terrace Gardens, that he nearly ordered a machine on the spot—regarding it as having a relation to the kodak's way of doing things, "You

press the button, etc." It should be the endeavour of motorists to dispel that notion of the simplicity of motor-car driving, as it is an incontrovertible fact that it is absolutely necessary, if the driver is to get out of his vehicle the amount of pleasure that it is capable of giving, that he should have a thorough and comprehensive knowledge of its working. To acquire this is no small task, but it is worth all the trouble; for to be stranded on a lonely country lane or in a busy street with a stubborn motor-car is no delightful experience.

The Big Event of 1901.

LAST week we gave the suggested itinerary of the event with which it is proposed to inaugurate the new century. Starting on the Monday following the August Bank Holiday, the route will be *via* Shaftesbury to Plymouth, and thence by way of Taunton to the destination of the first day's run last year, viz., Bristol. Through Shrewsbury and Warrington the party will get upon the road to Carlisle going through Lancaster and Kendal and over Shap Fell. On August 19th, the automobilists are timed to reach Glasgow, where a week's stay will give manufacturers a good opportunity to interest the many wealthy people in that part of Scotland in motor-cars. A return visit will be paid to Carlisle, and the route will then be to York, *via* Penrith and Boroughbridge. Leaving the cathedral city, Doncaster will be passed through on the way to Norwich and Lincoln, with speed trials at Welbeck. On through Sleaford and Lynn to Norwich, the journey will be continued to Bury St. Edmunds, Newmarket, Hertford, and Barnet, to London. The total distance to be traversed is 1,289 miles, and there will be twelve running days in the three weeks over which the Trial will extend.

Horses v. Automobiles.

ONE advantage of the automobile as compared with horses is that the former can be used without the bother of always taking a man—an advantage that is frequently appreciated by residents in the country. This remark cannot fail to strike thousands of men who dislike the fuss, irrespective of expense, of keeping horses, and in country life, for instance, it is already a common sight to see an automobile on the grass plot standing alone in front of the house just like a bicycle, while its owner is inside fulfilling his errand and giving no thought of the possibility of flies and small boys making his silent steed restless.

The Kaiser's New Cars.

THE automobile carriage delivered to the Emperor of Germany has evidently given complete satisfaction to its royal owner, for from Potsdam comes the interesting news that two additional vehicles have just arrived at the New Palace—one of these cars is a baggage wagon; so the practical, as well as the pleasurable side of automobilism, is to receive its tests at the hands of the Emperor William. What an enormous fillip to the industry in Germany will this royal patronage give, and how grateful should constructors be to the Emperor, to whose personal interest in the movement German automobilism owes so much. Throughout the Empire appreciation of the possibilities of the self-propelled vehicle is now awakened, and the future of the industry is particularly bright. The proposed races, too, will do much to increase the interest, and it is not impossible that in a few years time Germany will be seriously menacing the position of France as the leading country in automobilism.

The Cost of Horses.

COMMENT is being made on the fact that the price of horses of almost every kind has gone up. That, of course, is largely due to the war; but if motor-cars had made more advance the rise would not have been to anything like the extent it is. For example, an omnibus horse now costs 50 per cent. more than it did eighteen months ago, and it is clear that this should help our industry. It may be said that motor-

omnibuses cost a great deal of money to build, and that they cannot be turned out quickly; but it is equally true that you cannot hasten the growth of a horse, and a considerable time must elapse before the present tightness of the market can be relieved. In these circumstances the wonder is that, alike for the carriage of goods and of passengers, no general attempt has been made to use the new power for conveyance by road. The advance in the value of horseflesh is not an advance which, once met, is done with. Omnibus horses last only a very few years, and it is unlikely that the prices will have come down to their old level before fresh animals have to be bought to replace those now stocked. Indeed, there is a constant sale going on. No doubt the companies in London made a nice little sum by the sale of horses for the war; but they have more than lost that advantage since.

The Prince of Wales' New Motor-Cars.

EARLY in August last we were able to announce that as a result of his experience with the 6 h.p. phaeton delivered in June last, H.R.H. the Prince of Wales had placed orders with the Daimler Motor Company for two additional cars—a 12 h.p. wagonette with seating accommodation for eight persons, and a fifteen-seated car of special design for the use of gamekeepers, gun loaders and other servants on the Sandringham estate. Both cars have now been delivered, and this week we are able to publish an illustration of the fifteen-seated wagonette. It is fitted with a 12 h.p. engine, located, as will be seen, under the front seat which is sufficiently wide to accommodate two persons in addition to the driver. Horizontal wheel steering and solid rubber tired wheels are fitted. A feature of the vehicle is that the wagonette seats can be readily detached and the car quickly converted into a luggage wagon. The canopy is carried on telescopic standards, so that when the car is used for the last named purposes, the canopy can be lowered, thus forming a protection in bad weather, etc., to the luggage. The carriage work has been executed by Messrs. Hooper and Co., Limited, St. James Street, W., and it is needless to add that they have carried out the same in an eminently satisfactory manner.

Through Crowded Traffic.

PILOTING a motor-car through the traffic of a crowded thoroughfare is an art which, to be most successfully attained, should be very gradually attempted. Long after the novitiate stage has been passed the average owner of a motor-vehicle frequently lacks such complete mastery over it as renders the art of controlling or the action of steering so impersonal a matter as is the great problem of progression, which, when afoot, solves itself at every step; and until he is conscious of this sense of absolute control of his car, any attempt to traverse crowded thoroughfares merely should be delayed. Even when the attempt is made, the ordinary rules of the road of vehicles should be adhered to. It is most necessary, above all things, to keep perfectly cool and collected. The traffic at the rear will look after itself, so that his watchword should be, in the words of a popular and prudent periodical, "Forward, but not too fast."

MR. FRANK G. CUNDY, 161, Great Portland Street, W., has facilities for storing motors and making repairs.

THE distance from the milestone at the bottom of Dashwood Hill to the danger board at the top is 1,180 yards. The average ascent is 1 in 16, including 352 yards of 1 in 10.9.

SUBSCRIPTIONS to the testimonial to the courteous steward of the Automobile Club are now being received by Mr. H. Edmunds. As the list will be closed on the 15th inst., contributions should be sent without delay. At present the fund amounts to £14 12s.

MR. J. E. HUTTON intends to go to Cannes by motor-car next month, and will be glad to hear from members of the Automobile Club who would like to join him on their cars. The charge for storing an automobile at the *garage* at Cannes is, including cleaning, two francs per day.

HEAVY MOTOR TRAFFIC IN FRANCE.

UNDER the auspices of the Liverpool Self-Propelled Traffic Association, Mons. Forestier, the engineer-in-chief to the Department of Roads and Bridges in France, read a paper on the above subject on Monday in the small concert room of the St. George's Hall, Liverpool. Mr. A. L. Jones, chairman of the council, occupied the chair, and there was a distinguished gathering, including the Earl of Derby (president) and most of the officials of the Association.

The chairman said they were very much indebted to M. Forestier for coming to speak to them. There was no doubt great changes were taking place in this motor question in these days. They had only to see the electric cars which were running through Liverpool to have some idea of what they might expect in the future. He would not go further at present than to anticipate the use of motor-vehicles for work within a short radius of Liverpool—the delivery of coal from Wigan or St. Helens. He would not yet deal with bales and goods from Manchester. It would be better for the present to confine themselves to goods which would not cause much inconvenience if there was a breakdown. From a railway point of view this development was likely to be one of the most valuable that they had ever had. The great difficulty in this country was the cheap transport of agricultural produce. If this could be supplied quickly and cheaply by means of these motor-vehicles there would be a great demand for it, and the cost would be reduced by more than one-half.

M. Forestier then read his paper, which we propose to publish *in extenso*, the first portion appearing on page 686 of the present issue. Upon the conclusion of the paper

The Lord Mayor (Councillor Arthur Crosthwaite) proposed a vote of thanks to M. Forestier for his address on a subject about which so little was at present known in this country, and which would be of the greatest important benefit in the future. They could not afford to neglect any subject that in any way affected commerce. The importance of their relations with France was shown by the increase in their trade. For instance, the growth of imports and exports had been as under since 1861, when they were:—Imports 18 millions, exports 17 millions; 1870, imports 38 millions, exports 22 millions; 1880, imports 42 millions, exports 28 millions; 1890, imports 45 millions, exports 25 millions; 1899, imports 53 millions, exports 22 millions.

Mr. A. G. Lyster, M.Inst.C.E., seconded. He said that Liverpool had to deal with an enormous import and export trade—many millions of tons in the year. Sooner or later that traffic had to be dealt with by the railways, but for the most part it had only to traverse a short distance owing to the favourable position Liverpool occupied in regard to the manufacturing districts she served. Probably the transit of the greater part of the goods did not amount to fifty miles. Whatever might be the reason, the cost by railway was very high. For instance, the cost of carrying a ton of goods to Manchester was about 7s. 6d. Sir Geo. Finlay, the late manager of the L. and N.W. Railway, explained the cause to a Parliamentary Committee by saying that the actual haulage was only about one halfpenny per ton per mile, so that the 35 miles should cost under 1s. 6d. per ton. The difference between this and 7s. 6d. was accounted for by the terminal charges. If they compared this 6s. with the fifteen pence M. Forestier spoke of they would see one strong reason why automotor wagons might succeed in Liverpool, though it might not be the same in France. But 7s. 6d. was not the whole of the charge, for there was something like 10s. per ton removal from the quay to the warehouses in Manchester, or *vice versa*. If they applied the costs of motors given by M. Forestier they would see the entire charge between the Liverpool quays and Manchester warehouses should be something less than 6s. per ton. Therefore what M. Forestier had to tell them should be matter for encouragement for the association, and should promise success for the heavy motor-wagon in Liverpool and its neighbourhood. The question of the roads was a great bogie to many. M. Forestier practically said that macadamised roads would not stand heavy motor-wagons. Why not, therefore, pave the roads? The cost of paving the road to Manchester, ten

yards wide, would be half a million, and the interest on that capital at 4 per cent. would be repaid by a tax of 6d. per ton or less on a million tons of traffic a year. This did not look as if the question of the roads was a serious one. But it would be unnecessary to pave the whole of the road. It would be quite ample to pave wide wing tracks, which could be done at one-third the cost, he maintained. Therefore he was glad to see that the cost of the roads was not likely to be a serious addition to the outlay for running a motor service between Liverpool and Manchester. He thought that after the trials next year the Association would practically, if not absolutely, cease to exist, and then he would hope to see a great development in practical auto-motor work. It was a matter of the highest congratulation to them that the closing scenes of the existence of the Association were marked by the highest praise and sympathy from one of the most distinguished Continental engineers.

Professor Strong supported the motion conveying a high appreciation of the paper in a graceful and amusing way. The resolution was heartily approved, and M. Forestier briefly responded.

Several cinematographs were then exhibited on the screen showing the working of automobiles, both self-propelled and worked with a trolley, and other views of motors were also shown.

On Tuesday, M. Forestier was entertained at luncheon at the Town Hall. The toasts of "The Queen" and "The President of the French Republic" were proposed by the Lord Mayor, and pledged with musical honours. To the latter the consul for France at Liverpool responded.

The Lord Mayor said it was his good fortune to occupy the post of Chief Magistrate at a time when the Liverpool Self-Propelled Traffic Association were being honoured with a visit from their illustrious guest, Mons. Forestier.

Mr. Alderman Stolterfoht, who spoke in French, proposed the health of Mons. Forestier. He said he desired to take advantage of that occasion to renew the thanks of his fellow citizens to Mons. Forestier for his kindness in accepting the invitation to come to Liverpool, and for his having given them so much useful information on the automobile. We had much to learn from France on this subject, as the French had made great advances in the construction and management of these machines.

H. R. H. THE PRINCE OF WALES'S NEW DAIMLER CAR FOR SERVICE AT SANDRINGHAM (see opposite page.)

Photo by]

[Crosby, Robey, and Co.

The Chairman, having referred to the assistance always given to the council by Professor Hele-Shaw, said that that gentleman's wife had greatly helped them by translating M. Forestier's address, and he had pleasure in presenting her with a souvenir of the occasion.

Professor Hele-Shaw briefly expressed thanks on behalf of his wife and himself.

Lord Derby proposed a hearty vote of thanks to the chairman, and said Mr. Jones had taken this matter in hand from a practical point of view, and, as in other matters, he would follow it up. He said what the Association saw to be wanted in Lancashire was the greater diffusion of traffic when it had passed over the main lines. Terminal charges formed too great a burden on short distance traffic. He hoped Lancashire would flatter France by imitation on the automobile question.

The Chairman said that Liverpool had scarcely any railways alongside its quays, and it had a very large manufacturing centre close at hand; if they connected the two they would greatly strengthen the port of Liverpool.

The lecture which Mons. Forestier had the goodness to give them on the previous evening was extremely interesting, and would be extremely useful. As the Lord Mayor said at the lecture, they welcomed all these occasions where the two countries could enter into friendly rivalry in the paths of commerce, inventions, and arts. They believed that the more France and Britain learned to know each other, the more closely would they draw together in ties of eternal friendship.

M. Forestier thanked the Lord Mayor and the company for their very kind reception, and also the Self-Propelled Traffic Association for their invitation to Liverpool. With reference to heavy motor traffic, he remarked that our macadamised roads seemed fairly good, but he was afraid that heavy traffic would be likely to make a considerable impression on them. He was very pleased to revisit Liverpool after an interval of a good many years. He visited the city as a young man, and he had been gratified to see the magnificent progress the great seaport had made since then.

Mr. Alfred L. Jones proposed the health of the Lord Mayor, and on behalf of the company thanked him for his hospitality.

The Lord Mayor, in reply, said he felt honoured by the presence of so distinguished a visitor, and he would only add that on every occasion when he could in any way be of service to commercial associations interested in the trade of Liverpool he would only be too pleased to do his duty as host.

The proceedings then terminated.

MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

The "Chauffeurs- Mecaniciens."

A GOODLY number of automobilists have probably never heard of La Société Amicale des Chauffeurs-Mécaniciens, but nevertheless it is an existing, nay, flourishing institution, with offices in the Avenue de la Grande Armée, right in the heart of automobile Paris. It is to this society that one should write when in need of an engineer, for the man recommended is sure to be perfectly competent and can be engaged with every confidence. Founded some twelve months ago, over 150 names stand upon the books as members, and it is to be sincerely hoped that the institution will rapidly increase until it is a power in the land, for with its aid the existing difficulties with regard to procuring competent engineers and drivers should largely, if not entirely, disappear. Saturday evening last saw the young society *en fete*, and with the Count H. de la Valette presiding, a very excellent dinner was done full justice to by a gathering of some eighty members. The work of the society, and the lines on which it is being carried out, received full recognition from the various speakers, and it is evident that the great society, the Automobile Club of France itself, realises the importance of the movements by the *chauffeurs-mecaniciens*.

A Thieving Motor.

LAST week I related in these columns the history of the purloiner of automobiles, and to-day I regret to have to record the performance of a thieving motor. Fuel is scarce, and consequently dear in Paris this winter, and M. Jean Callenet, of Charenton, was cold, very cold. So he called to his aid a client's voiturette, which he had under repair, and with that innocent little machine he hatched a diabolical plot. Together they went to the Boulevard Menilmontant, stealthy and by night, and they just helped themselves from a quantity of wooden blocks intended for the paving of the Boulevard. But, unfortunately for the success of their plan, the only policeman who was not guarding "Oom Paul" at the Hôtel Scribe happened to be at Menilmontant, and moreover was sufficiently awake to perceive the theft and arrest the thieves. The voiturette was sent home to her owners, and poor Mr. Jean was packed off to the *dépôt*.

Motors in a Lottery.

THERE are but few visitors in Paris at the present time, and the wretched weather now prevalent probably prevents the majority of these from indulging in many walks on the Boulevards. Those, however, who are courageous enough to brave the rain may frequently see a somewhat curious little automobile procession. First of all there comes a De Dion motor-cycle, then a Georges-Richard voiturette, and finally a 6 h.p. Panhard phaeton. Each vehicle carries a banner, and, following one another in the order named, they would appear to pass the entire day in driving through all the better-class districts of Paris. All three form part of a multitude of prizes, totalling up to a value of £2,000, which *Le Journal* offers in a lottery to its subscribers for the ensuing year, and although the prices with which the three autos are labelled exaggerate somewhat their actual cost, still one would be heartily content to win any one of them. The new 6 h.p. Panhard, with carriage work by Rothschild, may still total up to £600, but one cannot attach such a value to any but the most recent models. One would hardly consider such a means of attracting subscribers as a sign

of a journal's prosperity, but some of the dailies here have ideas of so extraordinary a nature that *Le Journal's* scheme seems to excite no great surprise.

A Professor's Experiment.

AMONG the stands in the Champ de Mars section of the Paris Exhibition which attracted considerable attention was that of Professor Nernst, of Göttingen, for it was there that samples were shown of the Nernst wire which becomes incandescent in the atmosphere, and yet requires but a third of the electric energy utilised by the ordinary wire placed in a vacuum. The professor would now appear to be experimenting in automobiles, and recently has had an adventure which might well have resulted seriously. Whilst driving a motor-vehicle the indifferent running of the engine caused him to dismount, and he had just commenced an inspection when the carburettor exploded, and in spite of all his efforts the car was entirely burnt. This is what the pioneers of a new movement have to put up with, and the professor's car is by no means the first which has come to an untimely end.

At Achères.

IN order to revive the interest in automobile races, now somewhat flagging by reason of the Government's attitude with regard to the organisation of "courses," the Moto Club of France has hit upon the capital idea of reopening, if possible, the famous route in the Park of Achères, and it is not anticipated that the authorities will raise any objection to the proposed step. For those English readers who do not know this track-like road I may state that it is nearly three kilometres in length, and runs through the agricultural park of Achères in a straight line. Its surface is wonderfully good; indeed, it is altogether an ideal route for speed trials. The most sensational performances ever achieved there were undoubtedly those in connection with the match between the Comte de Chasseloup-Laubat and M. Jenatzy, in the spring of 1899. This series of attacks upon the record eventually culminated in M. Jenatzy's extraordinary performance of April 29th, 1899, when, mounted on his electric torpedo—for the car was nothing else—he covered a kilometre from a flying start in thirty four and one-fifth seconds, which represents a speed of 105 kilometres (sixty-five and five-eighths miles) per hour. The motor cyclists, too, greatly favoured Achères until the park was formally closed for speed trials, and once opened again the Béconnais, Marcellins and Rigals will quickly avail themselves of that marvellous stretch of road upon which to make existing records sing small. The park was closed to would-be record breakers in the late spring of last year, just at the time, indeed, when the anti-automobile agitation was in full swing; but with the almost entire disappearance of public feeling upon the matter it is not likely that the authorities will stand in the way of a renewal of the speed trials. Racing is obviously dangerous under any conditions, but upon the track at Achères the risks are reduced to a minimum, and unless the authorities are determined to entirely stamp out speed trials they cannot refuse the request of the Moto Club. And I cannot believe that total suppression is intended, for racing has done so much in the past for French automobilism that the Government cannot be blind to the advantages offered by its continuance. So, then, we may safely count upon again seeing many exciting attacks upon record at Achères, and with the new and more powerful vehicles the majority of existing figures must inevitably fall.

A Sequel to the Consumption Competition.

SATURDAY last witnessed an interesting sequel to the "consumption competition" which was decided a month ago. It may be remembered that during that competition the two vehicles entered by MM. Gillet-Forest et Cie made the best records in their respective categories, but that neither received official mention by reason of some slight irregularity in connection with the operation of filling their petrol tanks. The organisers of the event, frankly recognising the unfortunate character of

the affair, agreed to afford the constructors an opportunity of publicly demonstrating the capacities of the two competing cars, and accordingly an exact repetition of the original event was carried out last Saturday. The weather was anything but favourable for the demonstration of an automobile, while the recent heavy rains had rendered the roads in a pitiable condition. However, MM. Gillet-Forest were not disturbed by these circumstances, and the two vehicles, having been duly weighed at the Water Company's works at Suresnes, were despatched upon their journey shortly after two o'clock in the afternoon. M. Gentilhomme, secretary to the technical committee of the Automobile Club, and M. Georges Prade accompanied the competing cars as "commissaires," and after an uneventful run the party returned to the Chalets des Cycles. There the tanks were refilled, and the following is the complete return of the test:—Small voiturette—Weight (empty), 541 kilogrammes; weight in complete running order, 685 kilogrammes. Time for distance of seventy kilometres, 3 hours 1 minute; consumption, 4 litres 160. Voiturette—Weight (empty), 710 kilogrammes; weight in complete running order, 873 kilogrammes. Time for distance of 70 kilometres, 3 hours 27 minutes; consumption, 4 litres 850; the consumption per ton kilométrique was therefore for the small voiturette 0 litre 0867, and for the larger vehicle 0 litre 0793, truly excellent records, and sufficient to place both cars at the head of their respective categories. Both automobiles were provided with similar motors, developing 5 h.p. at 800 revolutions per minute. The diameter of the cylinder of this engine is 115 mm. and the piston stroke 140 mm. These tests entirely confirm the results obtained in the competition proper, and have drawn considerable attention to MM. Gillet-Forest and Co.'s production.

Count Potocki.

No one who has passed through that superb Parisian thoroughfare, the Avenue Friedland, can have failed to notice the magnificent residence of Count Potocki, which is situated on the left hand side of the avenue as one mounts towards the Place de l'Etoile. The Count, who is of Polish nationality, is an enthusiast of the new sport, and one frequently sees one or another type of automobile passing through the gateway of his beautiful *hôtel*. In other capitals of Europe, too, the name of Potocki is well-known in automobile circles, and quite recently Count J. Potocki made a tour from Vienna to St. Petersburg and back by way Kiew, Warsaw, and Moscow. The nine horse-power car upon which the Count and Countess made the journey acquitted itself so well, in spite of the heavy going, that a number of vehicles of similar construction are likely to be put to work at the great sugar manufactories owned by the Count in Russia. So once again does automobilism find its way into an industrial sphere through a sporting introduction.

A COMPANY has just been formed in Brussels with a capital of £12,000, to be known as La Société L'Automobile D'Incendie.

THE Roadway Autocar Company, Ltd., 44, Berners Street, Oxford Street, W.C., have on view a new type of Mors voiturette with its 5 h.p. located under a bonnet in the fore part of the frame. With its *tonneau* body, the car has an attractive appearance.

MR. PERCY HUNTER and Mr. W. J. Elliott have arrived at Melbourne with motor-cycles to convey a despatch from the Lieutenant-Governor to Lord Beauchamp. The object of the trial was not only to test the motor-cycle as a despatch-carrier in time of war, but to give these machines a really honest trial over Australian roads.

AT the recent Automobile Show in New York the De Dion-Bouton Motorette Co. exhibited what they term their physician's model. The frame design, speed changing gear, levers for operating, etc., are similar to the well-known De Dion Voiturette, but, in addition to the advantages possessed by that carriage, the doctor's coupé affords complete protection from storms, etc. It has a box of neat design, mounted in front, which affords a large storage space.

THE KNOWLES-CHAIN VOITURETTE.

WE give an illustration of a new voiturette which is being introduced by Messrs. Knowles-Chain, of No. 10 bis, Avenue de la Grande Armée, Paris, for the 1901 season. The motive power is supplied by a Buchet double-cylindred motor of either 8 or 12 h.p., whilst the approximate weight of the car complete is 400 kilos. Three speeds and reverse are fitted, and with the 8 h.p. motor sixty kilometres can be accomplished in the hour. The Panhard system of transmission is adopted and the gear is enclosed in an aluminium case. There is but one side lever for the various speeds; powerful brakes are fitted, and the artillery type road wheels are shod with 80 mm. pneumatic tires. The car is solidly built throughout, and its exceptionally long wheel base ensures stability on the road. A high-powered voiturette at a reasonable price is an article for which the public has long been waiting, and whose advent will be hailed with alacrity in a variety of quarters, for, excellent as are the voiturettes on the market, many are deficient in hill-climbing power. Several forms of bodies can be fitted to the car, from the favourite *tonneau*, which gives it a very smart appearance, to the useful delivery van. Later on we look

forward to an extended trial of the Knowles-Chain voiturette, and entertain no doubt but what it will successfully fulfil all the claims made for it.

PROOF was led in the Sheriff Court, Forfar, last week, in an action for damages for alleged injuries caused through a motor-car accident, the defendant being Dr. French, of Forfar. The case was adjourned.

MR. MARK MAYHEW, L.C.C., has been elected to the committee of the Automobile Club. Twenty-eight gentlemen have just been elected to membership, among them being the Hon. Ivor C. Guest, M.P.

MESSRS JOSEPH LUCAS, LTD., of Birmingham, have been appointed sole agents for the United Kingdom for the motor lubricants made by the Henry Wells Oil Company of the Imperial Oil Works, Deansgate, Manchester. They will be sold under the name of the "Wells-Lucas" specialities, and a full range of samples may be seen at the London office of Messrs. Joseph Lucas, Ltd., 1, Dyer's Buildings, Holborn, E.C.

THE Simms Manufacturing Company, Limited, has been registered with a capital of £25,000 to adopt agreements (1) with F. R. Simms, and (2) with Bryan Donkin and Clinch, Limited, and to carry on the business of motor, motor and other carriages, van, wagon, boat, launch, and flying machine builders etc., The first directors are Mr. F. R. Simms and Mr. E. B. Donkin, or other nominee of Bryan Donkin and Clinch, Limited.

THE Holden Motor Patents Syndicate, Limited, has been registered with a capital of £10,000 to carry on the business of omnibus, van, carriage, launch, boat, and vehicle builders, cycle, motor-car, and flying machine manufacturers, etc. The first directors are Lieut.-Colonel C. E. McDonald, Lieut.-Colonel C. M. Davidson, E. P. Favarger, and G. L. Hillier. The Motor Traction Company, Ltd., and Major H. C. L. Holden have certain rights of nominating directors.

CORRESPONDENCE.

THE HEATING OF MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In replying to "Heated" respecting his Benz car, let him see if the water in the tank is hot after running the car for a short period. If it is not, let him look to the joints connected to the water jacket, as there must be a stoppage somewhere, preventing circulation. If he finds that the water in the tank does get hot, let the quality of lubricant used be enquired into, and also the speed of engine, which should not exceed 500 revolutions per minute.

Yours truly,

Manchester, Dec. 3rd, 1900.

S. S.

MOTOR CYCLES WITH FREE MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am sorry to see that there are not more motor-cycles on the market fitted with free motors. It seems to me that a motor-cycle should have a clutch, applied in such a way that it cannot possibly cause an accident by acting of itself, and so placed that the motor can be started by the pedals in preference to key-starting.

I have hitherto found the difficulty of obtaining a friction clutch a great hindrance to purchasing a motor-cycle, as many of the roads in this neighbourhood are too narrow to allow of running back and turning round in case of a stoppage halfway up a hill.

Yours truly,

Windermere, Harpenden, Herts,
Dec. 4, 1900.

CECIL JACKSON.

THE WERNER MOTOR-BICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in your last issue another letter from Mr. A. L. Bennett, speaking highly of the Werner motor-bicycle. In his former letter I think Mr. Bennett mentioned a long ride over Devonshire roads, at an average speed of seventeen miles an hour.

I also have a Werner, and, although I think well of the little machine in many respects, I have not found its average over a hilly country anything remarkable.

If Mr. Bennett is likely to bring his machine to Devonshire again, I should be very pleased to have a trial with him, my mount to be nothing more formidable than a standard 2½ De Dion tricycle of medium gear, the distance to be 20 or 30 miles over high roads, and the conditions that neither rider pedals except to restart in case of accidental stoppage; stakes or no stakes, as desired.

We constantly hear the Werner men say they can beat any tricycle; I want to see it done. I say nothing against the Werner. It is a handy little machine, of elegant design, very fast on the level; the ignition is capital, and I do not find sideslips frequent. The belt is a nuisance, and the carburation troublesome. As to amateur adjustments being detrimental, I cannot agree. My machine when sent me used to backfire at any speed less than ten miles an hour, and could not be started up a hill. Now that I have altered the cam, I can start anywhere and run at three miles an hour if desired.

Yours truly,

W. E. TESCHEMAKER.

Ringmore, Teignmouth.
Dec. 3rd, 1900.

THE RECENT ELECTRICAL CAR TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. Opperman's letter which appeared in your issue of the 1st inst. calls for a few remarks. As a body, I think the owners of the cars would repudiate the suggestion that the trials were too severe, or that the constant running under the difficult conditions ruined or tended to ruin the batteries. It appears that such a suggestion is far more calculated to injure the growing industry than the trials themselves. It is well known that one firm ran their car upon the Southsea tour with the same batteries that had been used throughout the trials, and it may be

interesting to say that the identical set of batteries has now been sold for lighting purposes. This does not seem to indicate that they were damaged by the severe conditions of the trials.

It is quite true that some dissatisfaction was felt by the manufacturers engaged. These points will no doubt be remedied in future trials of electromobiles which the Automobile Club may conduct.

The matters which chiefly affected the owners were:—

(a) The trials being only suitable for certain classes of vehicles. It is well known that light electromobiles are constructed for town use and for light work. On such cars powerful motors are unnecessary, and they are not provided. The trials all took place under the same severe conditions, thus excluding several types of carriage. Manufacturers, not being consulted as to the trials, were consequently quite in the dark as to what class of car they should enter. It was naturally presumed that the trials would be varied. As a matter of fact, it was a prolonged hill-climbing test.

(b) No decent arrangements were made to enable carriages to be attended to; expensive cars were housed in broken-down sheds of the most filthy description; there were inches of liquid mud on the floors; rain came through the roof; the sheds were doorless and the cars and attendants were nightly exposed to the full force of wind and rain. On the first night two cars had to stand in the open. It rained the whole night! No information being given as to where the trials were to be held, no arrangements could be made for the lodging of the attendants. One company which had entered several cars found that the hotels near the charging station were already occupied. As a result, their staff had to be divided between two hotels, each more than a mile from the charging station and over two miles from each other. As all charging of cars took place at night, the inconvenience and expense of this arrangement was considerable.

(c) Those who had entered cars were treated as competitors instead of as manufacturers with one object in view, namely, the progress of electromobilism. Most stringent and unprecedented rules were enforced with the utmost severity, and the conditions generally were not calculated to bring out the advantages of electrical self-propelled traction. In spite of these restrictions the following is the unbiased view of one of the leading electrical papers: "The results obtained under great disadvantages must be accepted as proving the practicability of electrical propulsion on common roads. The trials in every way established the commercial utility of the electromobile once for all in this country. The long-distance run on rough roads and through hilly districts on one charge, the ease of control, their reliability, smoothness in running, absence of vibration, and economy of electric energy, make the electrically-propelled carriage an assured success."

It is necessary to add that the officials at the charging station did everything in their power to assist those engaged on the trials, and their courtesy was the redeeming feature of the week. It is, however, to be hoped that much more efficient charging arrangements will be made on any future occasion.

Yours truly,

4, Bloomsbury Place, W.C.,
December 5, 1900.

THEODORE G. CHAMBERS.

ELECTRIC IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to a paragraph on page 631 of your last issue, of the 24th ult. in writing about motor-vehicles, you suggest that those carriages fitted with electric ignition run a certain risk in wet weather of short circuiting. I am afraid that electric ignition has acquired this reputation not through the experience of people who have used it on cars, but through its use on tricycles in absolutely exposed positions. On any modern car the induction coil is set on the foot-board and the high tension wire has only a few inches to run from the coil to the sparking plug, and as it is inside the motor bonnet, where the warmth of the engine keeps everything perfectly dry, I do not think you could put high tension electric wires under better conditions, and no amount of external wet or rain can affect them. The low tension wires are also brought over comparatively speaking short

distances, but in their case even if they were carried right through water it would not cause short circuiting.

After a very lengthy experience of both lamp and electric ignition, I unhesitatingly state that electric ignition is infinitely more reliable than tube ignition under all conditions of use and weather. Its one drawback is that to fit it properly on large carriages it is rather costly, costing many more pounds to fit than tube ignition.

Yours truly,
S. F. EDGE.

14, Regent Street, London, S.W.,
November 29th, 1900.

ALCOHOL VERSUS PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Concerning the performances of the Gobron-Brillié alcohol-driven motors referred to in your issue of the 24th ult., it would be of greatest interest if any of your readers could afford information as to the quantity and quality of alcohol consumed by these cars, with a comparison as to the amount of petrol consumed by the same or similar cars.

Yours truly,
JOHN ABBOTT.

Mirasol, Granville Road, Eastbourne,
1st December, 1900.

COMPARATIVE RUNNING COST OF OIL AND STEAM MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of the 24th November one of your correspondents gives a very interesting account of his steam-car's work. As he evidently has had considerable experience with oil-driven cars, will he state what quantity of fuel, and its kind, he finds from experience is used in the two cases per unit? This information from actual experience will, I feel sure, interest many of your readers.

Yours truly,
Rugby, December 3, 1900. CUSH.

THE ESTCOURT INDUCTION VALVE FOR DAIMLER MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the description of the above in your issue of Oct. 27th, I have had my valves converted, at the most reasonable cost of 4s. each, and can endorse all the claims made for the device—my car pulls double, so to say. Excepting some very steep hills, of which we have only too many, I take all rising ground on second speed where it was hard work for first speed formerly.

Yours truly,
JOHN G. KIRSTEN.

Southborough, Tunbridge Wells,
Nov. 30th, 1900.

THE 1,000-MILE NON-STOP RUN OF THE DECAUVILLE CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read the note on above, and am much surprised at same, as many more must be. Now it is generally understood that motors generate heat, but here we find frost—Is it a skit or actual truth? If the latter, surely the owners have been using a refrigerator or ice-cream affair to keep their coppers (cylinders) cool. Now, if this is so, it is hardly fair for the public, as no such ice-makers are included in the specification of the 5 h.p. car, but probably they were only used in the 8 h.p., and the 5 h.p. was not ice-cooled.

The 5 h.p. cars have lever steering, wire wheels, no aluminium gear covers and no reverse, so are not very much up to date, but probably refrigerator manufacturers and such make up for these in the price. Evidently

there is no snowstorm manufactory provided, or the driver would have switched it on and put out the fire; probably he was too petrified to do so.

I hope we shall have an explanation of this frost; how it came about, and what was frozen; it might benefit your correspondent "Heated," and others.

Yours,
Scarborough, December 4, 1900. AMATEUR.

CARBURETTORS FOR MOTOR-TRICYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a constant reader of your paper and an enthusiastic motor-tricycle rider, I was not a little surprised to see in the current issue those remarks (re the dangerous character of the surface carburettor) which appeared in the article on motor-tricycles. Having recently purchased a machine with carburettor of this kind, I am bound to say it has aroused a considerable degree of uneasiness in my mind, as I have not the slightest desire to leave earth just yet. I think that the statement in question is calculated to cause no small amount of alarm to tricycle riders. What have your numerous readers to say on the matter? I shall look forward to replies with much interest.

Yours truly,
Birmingham, December 5, 1900. ALARMED.

MOTOR-CARS FOR MEDICAL MEN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The letter of "M.R.C.S.," in your last week's issue, really speaks from the voice of scores of medical men who I know are all anxiously waiting to find out what motor-car will suit their requirements.

I for one feel afraid to purchase, in case I should find that in use it did not suit my purposes; therefore, in my humble mind, it behoves makers to study clients' requirements, and more particularly medical men, for in that profession there is, and will be, a very great demand.

What is required is a machine to hold two persons, high power, covered in from the weather, and nice looking. Speed is not of such great importance; power is important, so that we country men may push through mud and stony roads. Pneumatic tires are a great trouble. I had them (Dunlops) on my trap, and they were most troublesome and expensive, therefore solids are to be preferred.

Personally, I think no car should be purchased that does not reverse, and if possible it ought to be started from the seat, that turning the wheel from the back is so undignified.

A friend of mine has lately bought a "Hurtu." It holds two, with a small seat in front for a third person, if required; it is well hooded and has a glass front for wet weather (I believe the Marshall is a copy of it). It appears to me to be the most suitable car for a medical man that I have seen yet, for it has plenty of power (5 or 6 h.p.), does not make more than the average noise, and climbs hills, but I hear it is often stopping and being towed home by a pony.

Fancy a poor country medical man, getting ten miles from home at night and his motor jibs! The air would be "blue" for miles. I am most anxious to purchase a car, but I must be satisfied it will go in all weathers and not jib with me when far from home.

I shall carefully take your journal, study it, and watch until I can see the thing to suit me, and trust in the meantime you will allow letters to be written by medical men stating their failures as well as their successes, so that the poor parish surgeon may not be advised to buy a machine that will fail him in the critical moment.

Yours truly,
Romford, December 3rd, 1900. M. D.

By reading papers at local literary societies, etc., those interested in automobilism may do much to popularise the motor-car. Mr. H. Edmunds has recently performed such service before the Streatham and Tulse Hill Literary Society, and we notice in a syllabus of a Wandsworth literary society that a paper is being prepared on "Twentieth Century Travelling," by a well-known contributor to the automobile press.

Motor-Cars at the Cycle Shows.

IN our last issue we described many of the stands of interest to automobilists at the two cycle shows then in progress at the Crystal Palace and the Agricultural Hall respectively. Considerations of space prevented the completion of our report; hence the further pages devoted to the subject in our current number. The reports appearing during the two weeks present the fullest account of the motor and accessories exhibits that has been published, and will doubtless be of interest to the public and of value to the trade.

THE NATIONAL SHOW.

The Orient Express Car Syndicate, of Balderton Street, Oxford Street, W., had on view a number of Orient Express cars, including a

FIG. 1.—THE ORIENT EXPRESS 6-H.P. PHAETON.

duc, a *vis-a-vis* dog-cart, and a four-seated hooded phaeton. Of the latter we are able to give an illustration in Fig. 1. It is fitted with a 6 h.p. horizontal single cylinder motor. The ignition is magneto-electrical, the cylinders are water-cooled, and the transmission is by means of belts with jockey tighteners. The "Orient Express" cars, which are of German construction, are exceedingly elegant in design, and by reason of their relatively low cost should become very popular. Three forward speeds and one reverse motion are available, belt transmission being adopted. The speeds are actuated by a jockey pulley, which is pulled down on to the belts by a lever worked by hand. The car is easily driven, the whole of the lever, etc., being close to hand. It is fitted with artillery wood wheels, shod with either pneumatic or solid rubber tires as desired. The belt pulleys are made of aluminium, and, although no pump is usually fitted, provision is made so that one can readily be affixed. The engine is lubricated by a central oiler, actuated from the seat, while a useful feature is that the motor and gearing are protected from dirt and wet by a detachable guard. A pedal controls a hand brake on the countershaft. The pedal has two positions; if the countershaft brake is not sufficient to pull up the car, the further depression of the pedal put on the double acting brakes (also operated by a hand lever) on the rear wheel hubs slackens the driving belt. The car weighs about 14 cwt., and can attain a speed of from twenty to twenty-five miles per hour. In addition to the "Orient Express" cars, the company were showing their new "Bergmann" magneto-electric ignition apparatus, which has the advantage over the ordinary magneto that it is rotary. We hope to illustrate and describe this in a later issue.

The *tonneau*, or four-seated wagonette, has so rapidly sprung into popularity that it was not surprising to find a De Dion voiturette fitted with a body of this type forming a prominent feature on the stand of the De Dion-Bouton British and Colonial Syndicate, Limited. It is driven by a 4½ h.p. water-cooled De Dion motor fitted with electric ignition and an exhaust valve lifter; the engine is located in the rear part of a tubular frame. Two speeds—six and twenty-five miles per hour—are

provided, the power being transmitted to the rear axle by a special gear. The differential gear runs on ball bearings, and is mounted on supports fixed upon the frame. The two axles driven by it have two steel sleeves in each end, in which are fitted the extremities of the universally-jointed axles. The opposite extremities of these axles fit in the same manner in the sleeves which complete the spindle. The ends of these axles are solid, with square joints, which serve to drive the hubs of the rear wheels. The carriage body is constructed with all the sides in sheet aluminium, so that the total weight of the voiturette does not exceed 800 lbs. It is made to carry four persons comfortably seated. The four wheels are all 26 in. diameter, fitted with 3 in. Dunlop pneumatic tires. The length of the carriage over all is 8 ft., and the width is 4 ft. 4 in. There are two brakes—one acting upon the drum on differential gear, and one on the brake drums on the two back wheels. The petrol tank contains about two gallons of spirit, and this quantity is said to be sufficient to run the car from fifty to seventy miles, according to the weather and state of the roads. The water circulation is maintained by a pump, a radiating coil being also fitted in the fore-part of the frame. The Victoria voiturette displayed was arranged to seat four persons, all persons facing forward. This car is identical with the *tonneau* as regards the motor and transmission, the body in this case being of English manufacture. A "Standard" voiturette of similar build, but with the seats arranged for the four passengers to sit *vis à vis*, was also to be seen. A machine which attracted considerable attention was the 8 h.p. De Dion tricycle on which Mr. C. Jarrott recently established a new hour record. An example of the 1901 model De Dion 2½ h.p. motor-tricycle was also on view. Numerous improvements have been recently effected in this machine, a rear view of which is given in Fig. 2. The most striking departure is the fitting of a clutch which permits of the motor being started by pedalling in the usual way, but of course much more easily than is usual, for the tricycle itself remains stationary. The clutch can be seen in the illustration at the right side of the gear case. It is a simple cone clutch, but the leather lining is placed on the male drum edgewise and crosswise in sections of about a quarter of an inch square and one and a half inches long. The drum is recessed on its outer face, and the pieces of leather are cemented into the recesses, but project above the metal face. To prevent any slipping round the drum of these leathers, pieces of metal, the same shape, but not so thick as the leathers, are pinned crosswise into the recess at intervals. The female portion of the clutch is all metal, and the gripping cone is kept up to its place by a number of spiral springs placed as near as possible to the outer circumference of the cone, and exerting an equal pressure all round. The clutch is worked in a simple manner. The front wheel brake is done away with, but the lever on the handle-bar remains, and this actuates a rod in connection with the clutch over the back axle. When the lever is down the friction clutch is engaged, and the tricycle moves forward in the usual manner. When the lever is slightly pulled towards the handle bar the clutch is disengaged and the engine runs free, the tri-

FIG. 2.—THE NEW DE DION TRICYCLE WITH FREE MOTOR.

cycle standing still on the road. Pulling the lever yet harder applies a brake on the back axle. This brake is an addition to other hand brakes placed near the driving wheels, so that although the front brake is abolished the brake power is really much greater than on an ordinary

motor-tricycle. The two side hand brakes are worked by the left-hand lever on the handle-bar. It should be mentioned that the normal position of the clutch is "in." It is only necessary to use the lever when it is desired to free the engine. Another change in the tricycle is that the induction coil has been removed from its old position under the axle bridge and is now fitted in the end of the tank, which is prolonged for the purpose, the vital high tension wire being thus protected from short circuiting. Hitherto in wet weather the water running along the high tension wire on the coil on the axle to the sparking plug has frequently caused short circuiting, but now the high tension wire to the coil is protected at the top by an inverted vulcanite cap, and, as this also covers the top terminal, that cannot get wet, so that surface connection between it and the plug cannot be made by heavy rain. The new De Dion lubricating pump is also fitted to the central division of the tank, whilst the right-hand side is devoted to the carriage of a reserve supply of petroleum spirit. It is interesting to note that Messrs. De Dion and Bouton are now making their own electrical dry batteries, and have fitted up a special department at their works at Puteaux for the purpose of dealing with the electrical part of their business.

It has been known for some time that the New Centaur Cycle Company, Ltd., of Coventry, have been making experiments with motor-vehicles, so that the car and frame they exhibited last week were inspected with keen interest by motorists. A complete car, as also a frame replete with motor and transmission gear, were staged. The vehicle (Fig. 3) takes the form of an attractive four-seated dog-cart mounted on an independent tubular frame, in the rear of which the engine is situated. The latter is of the horizontal petrol type and is of 4½ h.p.; it is fitted with electric ignition and a float-feed carburettor, while the water-circulation is on the thermo-siphon system, the water tank and a radiator being fitted in front. A special timing-lever is fitted, which is actuated by a lever placed conveniently beneath the steering wheel. The mixture lever is placed near the timing lever, and the electric switch is on the steering wheel in a position to be manipulated with the thumb of the right hand. The sparking plug is protected from injury by a metal case which surrounds it. As regards the transmission, this is on the Benz system—that is to say, it is effected by means of two belts working on fast and loose pulleys on to a counter-shaft, Renold roller chains conveying the power from the latter to the rear road wheels. Three speeds forward are available, the low hill-climbing speed being obtained by a Crypto gear controlled by a foot pedal; a reverse motion can be fitted if desired.

Inclined wheel steering is provided, and on the pillar are grouped the various controlling handles, the switch making and breaking the electrical circuit being mounted on the steering wheel. A foot pedal controls a band brake on the counter-shaft, while similar brakes, actuated by a hand lever, are fitted on drums attached to the hubs of the rear road wheels. A special feature of the hand brakes is that they are fitted with a compensating arrangement, which distributes the pressure equally upon both wheels, thus preventing the tendency to swerve. The engine is started by a detachable handle at the rear. The countershaft, which plays such an important part in the transmission of the power from the motor to the driving wheels, is mounted upon ball bearings of special construction. They are of the long barrel type, and similar to those used for the crank bearings of cycles. There are three of them—the two outside ones running upon two rows of balls, and the middle one upon a single row. They are disc-adjusting, with large oil-retaining chambers. These bearings are so mounted as to resist cross winding strains, and to admit of the countershaft being moved forward in perfect alignment. The car exhibited was fitted with cycle type wheels and Dunlop pneumatic tires, but the makers will also fit wood wheels if these are preferred by purchasers. Sufficient petroleum spirit can be carried for a run of 110 miles; the top speed available is about twenty-five miles per hour, while we may add that the car complete weighs about 10½ cwt. That much care has been devoted to the production of this car is evidenced by the workmanship of the various parts, such as engine cranks, steering gear, etc., examples of which were to be seen on the stand. In this connection, too, we may mention that a neat adjustment is provided for taking up any wear of the driving chains and that the chain wheels on the counter-shaft run on a double row of ball bearings. The car body is so constructed that ready access can be had to the engine and working parts.

The International Motor Company had two large stands, one of which was entirely devoted to the new "Charette" illustrated and

described in our issue of the 24th ult. Of these four complete cars were shown, one painted black with red lines, one gray with red lines, one red and black, and one blue and black. In order that visitors might inspect the working parts and workmanship of these vehicles, the company exhibited a frame, complete with motor and transmission, but minus the body. On the other stand, in addition to a light delivery van and three or four of their well-known International cars on Benz lines to seat two and three persons, the company shewed a frame fitted with motor and transmission gear complete of their 10 h.p. car. It has often been complained of by exhibition visitors that the working parts of automobiles are not exposed to view, but nothing could be said against the International Company on this score. The cars are now too well known to need a lengthy description at this time, so we devote the space at our disposal to a brief mention of the new frame, which bears the legend "Made in England." The engine is of the tandem type of 10 h.p., it is mounted on a channel steel frame. The motor has two cylinders, the pistons of which work on to a common crank shaft; the cranks work in an oil containing case. Three speeds, by means of belts working on fast and loose pulleys, are provided, as also a reverse motion. A new feature is the arrangement of the pedal controlling the hand brakes, the belts being all shipped on to the loose pulleys on the application of the brakes. The motor-cylinders are water-jacketed, two cooling coils being fitted—one at the front and one at the rear of the car. Steering is controlled by a hand-wheel, so placed that the driver may sit either on the right or left hand. Automatic lubrication is provided throughout; while another new feature is the employment of a double exhaust silencer. The car, which weighs complete about 12 cwt., has petrol and water storage capacity sufficient for a run of 120 miles. Another interesting vehicle was a 6 h.p. dogcart with hood. This is fitted with a two-cylinder

motor, three speeds forward and one reverse, pump, and two radiators. Considerable interest was shown in the International 3 h.p. dogcart which had been driven 9,982 miles. During this time there has been no accident, the total actual repairs being three cones to the ball bearings, costing a few shillings only. In addition, by fair wear and tear, a pair of chains and a pair of small sprockets have been worn out, and owing to the heavy district the car has been used, a new brake drum was necessary. We may state that the car has been run almost the entire distance by a doctor, who used it in his professional duties.

The novelty on the stand of the Hozier Engineering Company, Ltd., Hozier Street, Bridgeton, Glasgow, was the four-seated "Argyll" car, which was

exhibited for the first time. The frame is of tubular construction, in the fore part of which, under a light bonnet, is mounted a 5-h.p. vertical De Dion motor. It is of the water-jacketed type; no pump is employed, the circulation being on the thermo-siphon system. Only a relatively small quantity of water is carried, a radiating coil being fitted around the bonnet. In the transmission mechanism no chains or belts are employed; two forward speeds and a reverse motion are provided, and a maximum speed of thirty miles an hour can be obtained. The engine, which is set transversely in the frame, transmits its power through a friction clutch to a train of spur wheels meshing with a similar train on a parallel shaft, a bevel wheel on the rear end of the latter gearing with a bevel pinion on the rear live axle. The gears are all enclosed in oil-containing cases, and a feature of the variable-speed gear is that the wheels are always in mesh. The forward speeds are controlled by a hand lever at the side of the car; the reverse motion is obtained by a special device controlled by a foot pedal. Ample brakes are provided, there being a band brake on the countershaft and similar brakes on drums attached to the hubs of the rear wheels. Wheel steering is fitted, while the cycle-type road wheels are shod with pneumatic tires. The car body is neatly upholstered, and is painted red and black; the rear can be detached, thus giving ample room for luggage, in addition to two passengers. The vehicle complete weighs about 8 cwt. The Hozier Company also displayed a couple of their well-known two or three-seated "Argyll" voiturettes; these are fitted with 3 h.p. water-cooled De Dion motors; no pump is employed, but a Clarkson-Capel radiator is fitted in the front part of the car. The general arrangement is the same as in the 5 h.p. car; the motor is placed in front, the main shaft being at right angles to the axles. To the motor a friction clutch is fitted in conjunction with a band brake; by pressure on a foot pedal the motor runs free, and simultaneously the band brake pulls the car up. The variable gear is arranged to give approximately eighteen, twelve, and six miles per hour; also a slow reverse. The power is transmitted from the gear box to the differential gear on the back axle by means of bevel gear. The road wheels are of

FIG. 3.—THE "CENTAUR" MOTOR-CAR.

the cycle type, 26 in. diameter at the front and 30 in. at the rear, all being shod with Clipper 2½ in. pneumatic tires. The two-seated cars weigh complete about 4½ cwt.

An exhibit which attracted considerable attention was the "Traveller" voiturette, displayed by the Alldays and Onions Pneumatic Engineering Company, Ltd., of Birmingham, and illustrated in Fig. 4. The well-known motor-quad serves as the basis of this vehicle, but an attempt has

FIG. 4.—ALLDAY'S "TRAVELLER" VOITURETTE.

been made to improve on the popular form of two-seater. The width of the car is the same as that of a "quad," but in place of a front seat and a rear saddle, it has two upholstered comfortable seats one behind the other. The frame is of the usual tubular construction, and under the rear seat is fitted a 2½ h.p. air-cooled De Dion motor. We are glad to learn that in future vehicles it is proposed to fit a 3 h.p. water-cooled engine of the same type. A two-speed gear and a friction clutch are provided, the motor being geared to the rear axle through spur gearing. No pedals or chains are provided, as, in view of the provision of the friction clutch, it is possible to start the motor by means of a detachable handle before mounting the car. A Longuemare carburettor is fitted, while a special primary battery, known as the Doe, is used in connection with the electric ignition. The driver occupies the rear seat, and steers the car by means of an inclined hand wheel; he also has at his command a foot pedal controlling a band brake on the rear axle, and a band brake, operated by a hand lever, on the counter-shaft. Clipper pneumatic tires are fitted to the cycle-type road wheels, while the two speeds provided are equal to about 4 and 18 miles per hour. The front seat, which is suspended on springs, can be easily detached, and a small sample-carrying box fitted in its place, rendering the machine very suitable for the use of commercial travellers.

Considerable interest was centred in the new motor-bicycle shown by Messrs. Burrow, Strutt, and Co., of 10, Basinghall Street, London, E.C. The machine, which is known as the "Minerva," is of German construction. The motor is of the air-cooled single-cylinder petrol type, and is of 1½ h.p. It is fixed with four screws below the tube extending from the ball-head to the bottom bracket of the main frame, and the box containing the carburettor and petrol tank is attached to the horizontal tube by two loops. The box also carries the battery and induction coil, the latter being thus protected against wind or rain. At ordinary speed the engine runs at 1,500 revolutions per minute, equal to about 20 miles an hour. By varying the sparking and mixture any speed from 5 miles up to 32 miles per hour may, however, be obtained. The motor shaft carries at its end a small pulley, which is connected by a strap to a light pulley attached to the rear wheel. The engine, petrol tank, and driving arrangement weighs complete about 40 lb., and can be fitted to any bicycle having a frame from 23 in. to 26 in. The "Minerva" motor-bicycle weighs complete 66 lb., and its low price (£35) is likely to cause it to be enquired into further.

Another exhibit of interest was to be found in a new three-seated car of German construction, fitted with what is known as the Balance motor. The frame of the car is of tubular construction, and this is fitted with a body having accommodation for three persons. The engine is of the horizontal water-cooled type of 5 h.p. Two speeds are fitted, the transmission being effected by means of a single belt and spur gearing. The car, which weighs about 5 cwt., is provided with cycle type wheels, pneumatic tires, a water-cooling coil being fitted in front. A two-cylinder Balance motor of 9 h.p. was also shown separately, while on the same stand was a 2½ h.p. motor-tricycle of Belgian construction.

The Motor Fittings and Engineering Company, of Redhill, Surrey, had on view a light three-seated car, built from the Wilbury set of fittings they are supplying to the trade. The frame, which is of tubular construction, is fitted at the rear with an M.M.C. De Dion water-cooled motor of 5 h.p., provided with pump and radiator. Three speeds forward and a reverse motion are available. The motor is connected with the change of speed gears by friction clutches, which are controlled by a pedal lever on the floor of the car opposite the driver's seat, by which the car is put into motion or instantly stopped, acting as it does at the same time on the band brake on the differential. The change of speed is regulated by a circular lever on the steering column under the steering wheel. The gears are fixed on the differential axle, being supported by a second parallel tube forming the frame, upon which is also fixed the motor, the whole being absolutely rigid and in perfect alignment

and of very strong construction. The motor is started either from the seat or from the back of the car. There are two brakes, one on the differential, applied simultaneously by the right pedal lever and by the lever controlling the friction clutch on the steering column. There is one band brake on each of the rear hubs, applied by the left pedal lever. This brake can be kept on permanently if desired, or, by pressing a small button with the foot, can be instantly released. Steering is controlled by an inclined hand-wheel, on the standard of which the various control levers are mounted. The body is entirely independent of the frame, while the front axle is carried in a special manner, so that it may compensate for any inequalities in the roads traversed. The car complete weighs between 6 and 7 cwt. In addition to the foregoing, a large range of motor fittings and component parts were shown.

FIG. 5.—THE DARRACQ VOITURETTE WITH TONNEAU BODY.

Prominent among the tire displays was that of the North British Rubber Company, Ltd., Castle Mills, Edinburgh. Here were to be seen the Clincher pneumatic tires (Bartlett's patents) for motor-cycles and motor-cars. This company's tires are standing good tests in various parts of the kingdom, and among the specialties is a 2½ in. tire for light vehicles, as well as a solid rubber tire for heavier cars.

Naturally the stand of the Motor-Car Company, Ltd., of Shaftesbury Avenue, W.C., was visited by large numbers of people during the week, anxious to inspect the two Decauville cars—an 8 h.p. and a 5 h.p.—which were recently submitted to a long-distance trial on the Crystal Palace track. Both cars were to be seen, but as they have already been described in these columns, no lengthy reference is necessary on the present occasion. It may be mentioned, however, that both are provided with two-cylinder water-cooled motors, and in the case of the smaller car, the motor is started while the driver is actually seated. An attractive car exhibited was the Renault voiturette fitted with a red-painted *tonneau* body. This vehicle is similar to the usual Renault cars, with the exception that it is adapted to seat four persons. It is fitted with a 3½ h.p. water-cooled De Dion motor, three speeds forward and a reverse motion, the power of the engine being transmitted to the rear live axle by spur and bevel gearing. A 5 h.p. Soncin racing motor-tricycle—a machine on which many records have been made—completed the exhibit.

Messrs. R. M. Wright and Company, Mint Street, Lincoln, exhibited for the first time one of their "Stonebow" four-seated dogcarts (Fig. 6). The frame of this vehicle is of channel steel; at the rear it is fitted with a 5-h.p. horizontal motor of their own construction. The water circulation is maintained by a pump, and a radiator is provided in the fore part of the frame. In passing it may be noted that every effort has been made to render the parts easy of access, the induction and exhaust valves of the engine being fitted on the top of the cylinder end. The transmission is effected by means of three 2 inch belts working on fast and loose pulleys and a Crypto gear; three forward speeds—ranging from 4 to 18 miles per hour—are provided, as is also a reverse motion. From the countershaft a duplicate pair of sprocket wheels and roller chains transmit the power to the rear road wheels. Wheel steering is fitted, the various levers being mounted on the steering pillar. The road wheels are of the cycle type, fitted with Clincher pneumatic tires. The body, which is painted black and primrose, with polished birch concave sides, can be readily detached from the frame by removing four bolts. The petrol and water tanks are arranged under a false

FIG. 6.—THE "STONEBOW" CAR.

bonnet in the fore part of the frame; storage capacity sufficient for a run of 140 miles is provided. A band-brake on the countershaft, as also emergency shoe brakes on the tires, are provided. The car complete weighs about 12 cwt. While following somewhat on the lines of the Benz type, the "Stonebow" car is of English construction throughout, and a proof of its reliability is to be found in the fact that Messrs. Wright offer to take all intending purchasers a 100-miles trial trip.

The Yorkshire Motor-Car Manufacturing Company, Limited, Hipperholme, Bradford, Yorkshire, showed one of the Jackson doctor's cars. This is a two or four seated car with long wheel base. It is propelled by a 4½-h.p. two-cylinder horizontal petroleum-spirit motor, located in the fore part of the frame. The engine runs at a normal speed of 700 revolutions per minute, and is fitted with automatic governor and hand-lever accelerator, by means of which the engine speed can be varied up to 1,000 revolutions. The governor is arranged to actuate a valve on the inlet pipe, and is so arranged that when the speed becomes too great the inlet of vapour is closed and cold air drawn in instead. Three forward speeds are provided, the power being transmitted to a first counter-shaft by means of a belt, which can be tightened or slackened as desired by means of a jockey pulley, this device taking the place of a friction clutch. The pedal which actuates the jockey pulley also applies a band brake on the differential shaft. From the first counter-shaft the power is conveyed to a second shaft by two chains and one belt, any one of which can be brought in operation, according to the speed, by means of clutches controlled by a single lever. From this second counter-shaft chains and sprocket wheels transmit the power to the rear axle. The frame of the car is built up of channel steel, to which any type of body can be attached by means of four bolts. In addition to this car, the company are building a new vehicle, which they have named the Mytholm doctor's car; this is fitted with a 4½-h.p. single-cylinder horizontal engine located in the fore part of the frame. Three speeds and reverse motion are provided, only one chain and one belt being employed.

A neat three-seated motor-voiturette built by the Fabrique Nationale d'Armes de Guerre, of Herstal, near Liège, Belgium, was exhibited by Messrs. Treece and Funk, of Dashwood House, E.C. The

motor is located in the front portion of the car, under a bonnet, so as to be readily accessible. It is of the vertical petroleum-spirit type; it comprises two cylinders set side by side, and is stated to be capable of working up to 3½ h.p.; the cylinders are water-cooled, the circulation being maintained by means of a pump. The ignition is electrical, a special ratchet device being fitted on the steering pillar to advance or retard the sparking. Passing to the transmission mechanism, from the motor shaft to the intermediary shaft the power is transmitted by two belts, and from the intermediary to the rear road-wheel axle by means of the usual chains and sprocket wheels. Two mechanical forward speeds and a reverse motion are provided, the variable-speed gear being controlled by a single handle mounted on the steering-standard. It is claimed that by means of the variable-speed gear and the variation of the electrical ignition any speed from zero up to twenty-eight miles per hour can be obtained. The road wheels are of the cycle type, fitted with pneumatic tires. The steering hand-wheel and the speed control handle are mounted on a standard within convenient reach of the driver, provision being also made for the starting of the motor, and also for the tightening of the driving belts from the driver's seat.

Towards the end of last week the Automobile Manufacturing Company, Limited, added several cars to their stand, including a steam-vehicle and a handsome 7-h.p. Richard car with *tonneau* body, the latter coming from the Paris Exhibition. We gave some particulars last week

FIGS. 7 AND 8.—ELEVATION AND PLAN OF DARRACQ VOITURETTE.

of the Darracq 6-h.p. voiturette shown on this stand; we are now able to publish some illustrations (Figs. 5, 7, and 8) which show the general arrangement of the motor and transmission gear in this interesting vehicle.

Messrs. Grose, Limited, of Gold Street, Northampton, exhibited three cars on Benz lines, but fitted with neat and attractive dog-cart bodies. One of the vehicles was fitted with a 5-h.p. horizontal water-cooled engine, provided with pump and radiator. The power of the engine is transmitted by belts working on fast and loose pulleys on to a counter-shaft, and from the latter to the rear road wheels by the usual sprocket wheels and chains. Three speeds forward, ranging up to 16 miles per hour, as also a reverse motion, are available. Dunlop pneumatic tires are fitted to the road wheels, the car altogether having a taking appearance. One of the other cars was on similar lines, but was provided with a 3½-h.p. Benz engine, two speeds being obtained by belts and a hill-climbing speed by means of a Crypto gear. The form of carriage body appears to afford not only comfortable accommodation for the passengers, but also room for a fair quantity of luggage. The water and petrol tanks are placed one above the other, and are of cylindrical form. They are carried immediately in front of

the splashboard, and are enclosed in a bonnet, which gives the vehicle the appearance of a car having a motor in front.

Messrs. Marshall and Company, of the Belsize Works, Clayton, Manchester, were present with a couple of their well-known Marshall phaetons. They are fitted with a 5-h.p. horizontal petroleum spirit motor, with electric ignition and water jacket. The circulation is

FIG. 9.—THE MARSHALL 6 H.P. DOG-CART.

maintained by a small pump, radiating coils being now fitted to all cars. Three speeds forward and reverse motion are available, the transmission being effected by belts working on fast and loose pulleys. A neat car is the Marshall four-seated dogcart (Fig. 9). This is fitted with a 6 h.p. motor, radiating coil in front; three speeds forward and reverse, etc. The water circulation is maintained by a special pump in which the spindle is fitted with bearings on both sides. Another feature is that the water tank is so arranged that should the pump go wrong the circulation can be maintained by gravity. The car is equipped with a petrol tank of a capacity permitting of a run of 200 miles; it is fitted with cycle-type wheels and pneumatic tires. The top speed is about thirty miles per hour, while gradients of one in ten can, we are informed, be taken at ten miles per hour. An interesting machine shown by Messrs. Marshall was the first English-built Renarx motor-tricycle. As we described this machine at length some time ago, it is only necessary to briefly refer to it now. The machine differs from those of the De Dion type in that it is provided with a horizontal motor. It is stated to be capable of working up to 3½ h.p. at a normal speed of 1,200 revolutions per minute. It is located between the bottom bracket and the rear axle, its horizontal position being claimed to greatly reduce the amount of vibration experienced in motor-tricycles. There are a number of special features in the motor, one of which is that the piston rod is connected by means of a satellite pinion to two toothed wheels which form the differential. The motor is started in the usual way by the pedals, a clutch mechanism being provided to the bottom-bracket chain wheel. It may here be mentioned that a Renaux quadricycle was the winner in its section in the recent hill-climbing competition at Gaillon, France.

A novel two-seated tricycle was to be found on the stand of Messrs. Frank H. Parkyn, Limited, Granville Street, Wolverhampton. The frame is of rectangular tubular construction; the motor—a 2½ h.p. air-cooled De Dion—which is located about the centre, drives the rear axle by chain gearing. A feature of the machine is that no pedals are provided; at the rear hub a special hand brake free-wheel device is provided. This is operated by the left-hand foot rest, which is also connected by a hand lever. By means of this device the engine can be instantly put out of gear with the single rear road wheel, thus enabling hills to be "coasted." To start the motor, the hand brake of the drum is applied, the electrical current switched on, and the machine pushed a short distance; immediately the motor is in operation, the hand brake is released, thus allowing the engine to run free until the driver is ready to start. After mounting, the left foot pedal is pressed down, applying the hand brake device at the rear, and completing the connection between the motor and the rear wheel. A second hand brake is provided on the opposite side of the rear hub. Steering is controlled by a bar. The machine is purposely only speeded up to about fifteen miles per hour, but the makers claim that it will

maintain this speed even up ordinary hills. The weight of the machine is about 2½ cwt. In place of the front seat a parcels delivery chest can be fitted if desired.

Only one car was shown by Messrs. Lewis and Lewis, of Tow-mead Road, Fulham, S.W. This car, which is being introduced into this country under the name "Diana," follows, generally speaking, the lines adopted in the Benz cars. The engine, a horizontal one of 4 h.p., is located in the rear of the frame. The cylinder is water-jacketed, the circulation being on the thermo-siphon system; a radiating coil is provided. Three speeds forward, ranging from 4 to 20 miles per hour, are available. The power of the engine is transmitted by two belts, working on fast and loose pulleys, to a countershaft, from which it is conveyed to the rear axle by a duplicate set of sprocket wheels and Brampton chains; the low speed is obtained by means of a Crypto gear. The car, which has seating accommodation, is fitted with special hand-brakes to the hubs of the rear wheels, they acting equally well whether the car is running in a forward or backward direction. The vehicle, which is fitted with wood wheels and pneumatic tires, weighs about 11 cwt., and can attain a speed of 20 miles per hour.

Two attractive cars were shown by the Farringdon Motor Company, 15, Charles Street, Farringdon Road, E.C., agents for the Pfälzischen Nähmaschinen und Fahrradfabrik Gesellschaft (vorm. Gebrüder Kayser) Kaiserslautern, Germany. The Kayser Primus car (Fig. 10) is adapted to carry three persons. It has a tubular frame, on which is mounted at the front a Kayser vertical petrol engine of 4 h.p. under a perforated metal bonnet. The ignition of the explosive charge is effected electrically, the company employing a system of their own for which they claim several advantages. The motor is water-cooled, the circulation of the water being maintained by a pump, a cooling coil being also fitted. Coming now to the transmission gear, this is a combination of belting, spur wheels, and chains. Three speeds and are verse motion are available. The motor transmits its power by a single belt to a countershaft. On the latter is a train of cog-wheels, any one of which can be made to mesh with similar wheels on the differential shaft, which is connected to the rear axle by the usual duplicate set of chains and chain-wheels. The steering is controlled by a small hand-wheel on a vertical standard, on which the variable-speed control handles are mounted. There are both hand and foot brakes, the former acting on the tires and the latter on the differential shaft. The levers controlling the foot brake are so arranged that when it is applied the driving belt is at the same time slipped on to the loose pulley, thus throwing the engine out of gear from the transmission mechanism. The crank shaft of the engine and the variable-speed gear work in oil-containing cases, while the road wheels, which are of the cycle type, shod with pneumatic tires, are mounted on ball-bearings. A light 4-h.p. two-seated racing car built by the same company was also staged. This followed the same lines as regards the engine and transmission as the car above described, the striking feature

FIG. 10.—THE KAYSER PRIMUS CAR.

being the raky-looking bonnet in the front of the car. An example of the Kayser motor-tricycle with detachable trailing delivery van was also on view.

Motor-tricycles or quadricycles were shown on several stands occupied by cycle-makers, and the presence of even a solitary specimen adds to the interest of the particular firm's display. Mr. J. F. Jones, Sydenham Road, S.E., had a motor-quadricycle surrounded by his "Royal Roebuck" cycles, and at a neighbouring stand Messrs. H. F. Copland and Company, 108 and 110 Stanstead Road, Forest Hill, S.E., had a "Grand

National" quad. This is fitted with a 2½ h.p. De Dion engine, and has an extra stout axle. There is a double seat in front, which may, however, be removed if necessary. The Rothwell motor-tricycle was shown by the Eclipse Machine Company, Ltd., of Oldham. It is fitted with the company's own 2½ h.p. motor, and is well finished. A "Royal Riley" motor-tricycle on the stand of the Riley Cycle Company, Ltd., City Cycle Works, Coventry, was a good example of the firm's work. The engine is a 2½ h.p. De Dion.

The Chinnock Davis Manufacturing Company, Ltd., Penge, S.E., exhibited a 2½ h.p. De Dion motor-tricycle, as also a couple of New Orleans 3½ h.p. voiturettes, one adapted for two persons and one for three passengers.

The General Agencies Syndicate, of Dashwood House, New Broad Street, E.C., had an exhibit which appealed more particularly to builders of motor-cars, consisting as it does of a display of frames, wheels, axles, springs, etc., of all kinds. Several samples of wheels and axles were shown suitable for use on voiturettes as well as on heavy motor-wagons. Steering gears, car bodies, and differential gears are all shown, while mention may be made of a special hub fitted with both balls and rollers.

Prominent in the display made by Hans Renold, of Manchester, was a range of new motor-roller chains, shown publicly for the first time. The chains are made in various widths, and in pitches ranging from ½ in. up to 1½ in. The special features of these chains to which attention is drawn are the specially durable wearing surfaces, the bushes, rollers, and rivets being all made of hardened steel. Of the Renold silent chain two types were shown, each being made in a variety of pitches. The bushed silent chain, which is being largely used by builders of heavy motor-wagons, is an improvement on the old pattern: hardened steel bushes are now interposed between the rivets and the link holes, the life of the chain being thereby greatly increased. Another new departure is the block silent chain, the inner links in this case being replaced by a solid block. Small sprockets for both the roller and silent chains, and also cutters for milling the same completed an interesting stand.

Patent grease cups were the special feature of interest to automobilists on the stand of Messrs. Rotherham and Sons, Coventry. These are made to lock in such a way that they cannot be jarred off, however great is the vibration to which they are subjected. The feed of grease is also regulated by means of a spring in the top. Motor roller chains are shown by the Coventry Chain Company, of Dale Street, Coventry. The roller is of half-inch width with a 1½ in. pitch, and is said to have a breaking strain of 5680 lbs. These chains are made in all sizes from special crucible steel. The Angular Hole Machine Company, Ltd., Dashwood House, New Broad Street, E.C., had a wide collection of spanners of every variety, including special box spanners for motor-cars. These are blued by a special process. Spokes and nipples for motor-vehicles were to be found on the stand occupied by Messrs. Teale and Company, 150, Edmund Street, Birmingham. Light trailing cars suitable for motor-cycles were shown by Messrs. John Marston, Limited, Wolverhampton Mills, and Fulford, Crown Works, Coventry.

La Société des Usines Delin, of Louvain, Belgium, had intended to show a new voiturette, and also motor bicycles and tricycles, but at the time we visited the stand only a collection of motor parts, such as axles, hubs, etc., was on view.

The "King" Motor-Car Company, 83, Rye Lane, Peckham, S.E., attempted to give realism to their exhibit of leather clothing by the presence of a Benz victoria whereon was mounted a driver snugly attired in a calf motoring suit. The various leather garments on this stand were well finished and had a good appearance, being smart as well as serviceable. As protection for the ordinary clothes worn beneath, many motorists prefer leather garments, and they doubtless found many points of interest at this stand. The firm's "dominoes" (silk and glass) for protecting the eyes and face from dust, etc., were also shown.

A neat show-case contained the exhibit of Mr. Frank Bevan, 3, Bayer Street, Golden Lane, Barbican, E.C. This included a careful selection of garments for automobilists, jackets, gloves, and leggings being the main features of the display. These are all made in leather, and have a good appearance.

Saddles for motor-tricycles and small motor tool bags were the exhibits of most interest to motorists on the stand occupied by Messrs. J. B. Brooks and Company, Ltd., Great Charles Street, Birmingham. The slant of the saddle in some types is as much the cause of constant leaning as the unevenness of the road, and the B 80 pattern has been designed specially to counteract that tendency. B 90 is another good design. It will not sag in the centre, but, yielding along the entire length, gives an easy and resilient seat. Fitted with a three-coil spring, these saddles appear well adapted for motor-cycles. The firm's motor tool bags are in two styles, consisting of a long leather strip about 12 in. wide, fitted with three pockets, which can be folded into a small compass. The other consists of a single compartment.

Mr. H. G. Turner, Eldon Grove, Manchester, had a good assortment of carriers for luggage, etc., including a special type made for fitting to an Ariel quadricycle. He also makes carriers to fit to any other motor-tricycle.

An anti-vibratory handle-bar and seat-pillar arrangement was shown by Mr. Fred Sadler, 15, Gray's Inn Road, W.C., which, fitted to motor-cycles, is claimed to render them free from vibration.

Messrs. W. and A. Bates, St. Mary's Mills, Leicester, showed a good range of outer covers, wearing treads, and inner tubes for motor-vehicle work. Their wearing tread for fixing on the outside of the cover of motor-car tires is made in three weights:—(1) Special light; (2) light; (3) heavy. Messrs. Bates are prepared to go fully into the subject of

automobile tires, making every size from that for a motor-tricycle to those for large cars.

Solid rubber tires for motor-vehicles were shown on the stands of the Tubeless Pneumatic Tire Company and Capon Heaton, Ltd., Moor Street, Birmingham.

At the stand of the Self-Sealing Air Chamber Company, Ltd., Hinkley Street, Birmingham, the leading feature was naturally that indicated in the title of the concern. Where the tube of the tire comes in actual contact with the road surface it is lined with compressed rubber, which is vulcanised on to the tube while the latter is fully stretched. Thus the slit caused by a puncture closes at once, minimising to a considerable degree the annoyances caused by surfaces which may be strewn with undesirable substances.

The Self-Inflating Tire Company, Ltd., 31, King William Street, E.C., gave daily demonstrations of their self-inflating tires applied to cycles. This is on a principle which, we are informed, is applicable to motor-cars. Solid and rubber tires formed the main features of the display made by the Avon India-Rubber Company, Ltd., of Melksham, Wilts. which makes a large variety of rubber goods. Rubbers and tubes for motor-car tires were shown by Messrs. David Moseley and Sons, Ardwick, Manchester, who do a large trade in these goods with French automobile firms.

The New Premier Cycle Company, Limited, Coventry, had booked space for a display of motor-cars, but they inform us that they could not get the vehicle ready in time. Messrs. Allard and Co., of Coventry, were also in a similar position.

THE STANLEY SHOW.

Mr. Louis Bernstein, 78, Milton Street, E.C., showed the "Presto" car of Messrs. Günther and Co., Chemnitz (Fig. 11). This is fitted at the rear with the maker's own 5½ h.p. water-cooled motor, and has seating accommodation for four people. Direct cog-wheel gearing has been adopted, and there are two speeds of 6 and 30 miles per hour. Foot

FIG. 11.—THE PRESTO MOTOR-CAR.

brakes have been provided, and all the controlling levers are grouped around the steering column. The oil tanks are below the seat, which can be raised to obtain access to them. The car is also made fitted with 3½ h.p. or 4½ h.p. motors. Cycle type road wheels are fitted, these being shod with pneumatic tires.

The Simms Manufacturing Company, Limited, 55, Southwark Park Road, Bermondsey, made a big display of the Simms 3-b.h.p. air-cooled vertical, 2½ b.h.p. air-cooled horizontal, and 3½ b.h.p. water-cooled vertical petrol motors. All were fitted with the Simms-Bosch magneto-electric ignition and with Simms's timing gear, by which the time of the ignition can be advanced or retarded, thus enabling the speed of the motor to be altered at will, the maximum being about 2,200 and the minimum about 200 revolutions per minute. By means of a constant level float-feed attached to the engine the supply of petrol is rendered entirely automatic, no regulation of mixing valves being necessary. It may be noted here that the cylinder and head of these engines are cast in one piece; the valves are arranged one above the other, the induction valve being self-contained, and so fitted that it can be readily removed. Prominent on the stand was a neat two-seated voiturette, in the fore part of which, under a bonnet, is fitted a Simms 3½ h.p. water-cooled engine, equipped with pump and radiator. Three speeds forward, ranging up to twenty miles per hour, and a

verse motion are provided, the power being transmitted through a friction clutch and a variable speed gear on Panhard lines to a countershaft, the latter being connected to the rear axle by a single centrally located driving chain. Provision is made for the starting of the engine from the driver's seat; steering is controlled by an inclined hand wheel, while a foot pedal actuates a band brake on the gear shaft, and a hand lever one on the differential. Wooden wheels shod with Clipper pneumatic tyres are provided, the weight of the car complete being about 6½ cwt.

One of the novelties of the show was the Lawson motor-bicycle, to be seen on the stand of the Crypto Works Company, Limited, Clerkenwell Road, E.C. The machine has been altered since it was first introduced, in that its 1½-h.p. air-cooled motor is connected to the front wheel instead of to the rear one. The engine is suspended on one side of the wheel, the fly-wheel being, for balancing purposes, on the opposite side, the engine shaft passing through the hub. The machine is strengthened by an auxiliary head, in which the combination petrol tank and carburettor, which has a capacity sufficient for a run of 75 miles, is located. The engine drives the front wheel by means of epicyclic gearing connected up to the inside of the hub by a clutch. To take up any vibration which may arise from the motor, a spring handle-bar is fitted. The machine complete weighs 80lbs., and on a brief trial has covered a mile in 1½ min.

The British and Colonial Motor Car Company, Limited, of 38, Snow Hill, E.C., and Baker Street, W., showed a 16 h.p. Canello-Durkopp car and two and three-seated Pieper voiturettes among their exhibits. The motor in the Pieper voiturette (Fig. 12) is of the 4 h.p. single cylinder vertical water-cooled type. A supply of water sufficient for a 230-mile run is carried in the water tank which is placed inside the carriage body.

From there the water is pumped through the water jacket of the motor to the radiator, a centrifugal type of pump being employed and driven direct from the motor. Belt transmission has been adopted, and also inclined wheel steering. A single wide belt connects the pulley on the motor shaft to three pulleys arranged on a countershaft. This belt is moved on to any one of the three pulleys—two fast and one loose—by means of a speed handle placed to the left hand of the steering post. The belt can be tightened or loosened by means of a detachable key fitted to the front of the car. By rotating this key the motor is moved backward or forward, thus

loosening or tightening the belt. The two outer pulleys each have connected to them spur wheels meshing with corresponding pinions on the rear axle. Two brakes are provided, and the speeds arranged for are from ten miles and twenty-two miles per hour; these may be varied largely by the ignition timing device. At this stand was the Schwanemeyer voiturette, and also a sectional model of the engine, illustrated and described in our columns on May 26th. This is being introduced by the Bassett Motor Syndicate. The car is fitted with a 3½ h.p. water-cooled motor. This, with the transmission gear and main axle balance gear, are formed in one set of mechanism, all contained inside one aluminium oil chamber. Two speeds are fitted, these being operated by levers governed by the left foot. Two band brakes are fitted to the hubs of the driving wheels, and are applied by a lever under the right foot. Two persons can be accommodated on the front seat, and a tiger seat is also provided if desired. An excellent tool outfit for carrying on motor-vehicles was also shown on the stand.

Two stands were occupied by Messrs. Benetfink and Co., 107 and 108, Cheapside, E.C., on one of which were an Ariel quadricycle and an Ariel motor-tricycle, the other being occupied by a complete selection of motor lamps, motor horns and bells in great variety, petrol tanks, inflators, odometers, etc.

Messrs. Perry and Co., Limited, Lancaster Street, Birmingham, had a motor-tricycle with a 2½ h.p. De Dion engine. It is fitted with the company's own fittings, specimens of which were also on the stand. A special feature is just now being made of a motor chain.

A large show of motor-tricycles and accessories was made by Messrs. Manning and Son, Limited, 8, Bevis Marks, E.C. Their selection included a 2½ h.p. Eadie quadricycle and a 2½ h.p. Progress motor-tricycle.

De Dion engines, one by the Motor Manufacturing Company, and a variety of accessories made up a very complete exhibit.

The Bowden Brake Co. showed how their brake wire and conduit can be applied to lifting the exhaust valve of motor tricycles and quadricycles. This takes the form of a shaped bar, which can be easily attached to any existing De Dion engine.

Water cooled heads for the De Dion motor were exhibited among accessories on the stand of Messrs. Gianoli and Lacoste, 26, Boulevard Magenta, Paris. Here were to be seen the well known Leclanché batteries, and also some good types of induction coils, including some in which the contacts are covered in to prevent the wet getting to them.

The Meyra Electric Company, Ltd., 78, York Road, King's Cross, N., had a large display of the "Meyra" dry batteries for use in connection with the electric ignition of the explosive charge in petroleum spirit motors, either on tricycles or cars. These batteries are manufactured in England, and among their merits are high efficiency, voltage, and ampère, combined with low internal resistance. With a steady discharge and no local action long life is attained; the life for a sparking set on a motor-cycle being between three to four hundred working hours. A set of "Meyra" dry batteries will not only give a constant ignition spark for several months, but will also supply current to light a 5-volt portable reflector lamp used to examine the machinery of the motor at night. At the stand of the Meyra Company was also exhibited the Preston petrol motor, which, although only 86 lbs. in weight, is said to give an efficiency of 6½ h.p. The engine, which is being manufactured by Messrs. Bridgwater and Co., 78, York Road, King's Cross, N., is of a four-stroke cycle type with two vertical cylinders which are air-cooled. The ignition is electric by means of a double induction coil and primary batteries or accumulators, and the consumption of petrol calculated at about 11 oz. per horse power per hour.

Accumulators and ignition specialities were shown at the stand of Mr. H. W. Van Raden, 7, Ellys Road, Coventry. Special attention was drawn to the patent woven glass accumulators for voiturettes, and also to the controllers for electric cars. A combined volt and ampere meter was shown. This is specially designed for use on electric cars, and is in an aluminium case. The face is covered by ground glass, and is divided to order, the standard pattern being 60 to 120 volts for 60 amp.

Le Carbone (late Lacombe and Cie), of Levallois-Perret, Paris, and 36, Lime Street, London, E.C. had an interesting

display of electric accessories for use in connection with motor-carriages. Chief among them may be mentioned the "Sanspareil" dry battery for use with the ignition apparatus of petroleum spirit motors on carriages, yachts, tricycles, bicycles, etc. It is claimed for these cells that they give the maximum output for the minimum of weight and dimensions. The cells offered for tricycles, with suitable coils, will last between 300 and 500 working hours, according to the conditions in which they are employed. A specially light set of batteries for use on racing tricycles is now being marketed by this concern. The batteries are made up in sets of five, and are much lighter than usual. Le Carbone Company also makes a speciality of carbon brushes.

Acetylene lamps specially intended for use on motor-vehicles were displayed on several stands. Good types were to be seen at the stall of Mr. C. Lohmann, 36, Aldersgate Street, E.C. Here, too, were shown motor-bells to be operated by the foot. Messrs. Powell and Hammer, Chester Street, Birmingham, had a lamp particularly designed for carrying on a quadricycle. It gives a splendid light ahead with a side ruby light and a smaller one at the back. Acetylene lamps and candle lamps for motor-carriages were displayed by Mr. Frank Albert, 48, Redcross Street, E.C., who had also a hand bell which can be conveniently fixed to any car. Lamps formed the main feature of the display of Mr. Otto Scharlach, of Nuremberg.

A good lamp is one of the prime necessities in connection with motor-cars, and visitors to the exhibition were attracted to the stand of Messrs. Salisbury and Son, of Green Street, Blackfriars, S.E., who make a special feature of light-giving articles. The firm are the British agents for the Dietz paraffin lamps, and were showing samples of the latest

FIG. 12.—THE PIEPER VOITURETTE.

improved patterns. For those who prefer an acetylene lamp the firm are introducing a novelty in an acetylene candle, which will fit into an ordinary carriage lamp. Among other exhibits were the new model motor-car lamp, the Salisbury motor-cycle lamp, the Invincible motor-cycle lamp, the Sun Ray acetylene motor-cycle lamp, and an acetylene generator attachment for motor lamps. The firm are also introducing a new system of acetylene gas lighting for omnibuses and public vehicles. Two lamps are employed, each giving a 30-candle power light, a total of 60-candle power as against 10 obtainable with the present methods of lighting public vehicles. The lamps are arranged upon a new principle, which secures equal diffusion of light in every part of the vehicle. The front lamp throws an exceptionally brilliant light ahead, but at the same time not of such a dazzling nature as to cause any inconvenience to traffic coming in the reverse direction. The rear lamp throws a light which fully illuminates the stairway of the omnibus, the conductor's stand, the step of the omnibus, &c., so that it is impossible for accidents to happen to passengers from lack of light. An automatic governing apparatus is used in connection with the generator, which ensures the light always being maintained at a uniform power. When the gas is turned off the ordinary pressure of the atmosphere is brought into operation in the generator to prevent the further generation of gas. One charge of the special carbide preparation is stated to be sufficient for three nights' supply of light.

An interesting display was made by Messrs. Joseph Lucas, Limited, Great King Street, Birmingham, who had a good show of lamps, horns, bells, etc., for use on motor-cars. A pump for motor-cycles was a feature of special interest, having a metal delivery pipe from the bottom to the top of the barrel, from whence a short length of flexible tubing reaches the wheel. Oil and grease for motor-vehicles generally were also included in this exhibit.

A capital tire designed for use on motor-vehicles was shown by the Radax Pneumatic Tire Company, Limited, 51, Fountain Street, Manchester, and 32, Bread Street, London, E.C. It has been fully tested, and has given very satisfactory results. Hence the confidence with which an inspection of this company's stand may be made. The "Radax" tire possesses a patent canvas so woven that the sides of the outer cover fit closely in the rim and form a sound principle of attachment. Being woven in a circle it is possible to secure the threads being small at the edges or smallest circumference of the tire, and to gradually increase in size as the circumference becomes larger. In this way the tire is made to perfectly fit the rim and so obviate any possibility of rolling friction. There are thus no wires, hooks, bands, or thick edges in connection with the "Radax" tire. Whilst in use, it cannot be forced from the rim—even if it is punctured or but slightly inflated. Despite its tenacity when in actual service, there is no difficulty in connection with taking the tire off or putting it on, while the fact that it is made to fit all kinds of rims now in use should lead to its adoption by many who have not yet found a tire to their liking. When used on motor-vehicles the "Radax" motor tires have been proved to be speedy and reliable. The fact that the strain is not on the edges but is distributed over the whole surface of the tire secures elasticity and easy running and has the additional advantage of greater durability. On this stand was shown the wheel of a quad on which the "Radax" tire has been in use since February, 1900, and which has by the strength of the fabric turned a two-inch nail and prevented puncture. A carriage wheel which has been in use for six months was also shown.

The Collier Twin Tire Company, Limited, Camp Road, St. Albans, exhibited their tire for motor-vehicles. This consists of a combination of the pneumatic and solid tire, the pneumatic being between the wheel and the solid rubber, but both the pneumatic tube and the solid rubber tire are contained in one piece of fabric, or outer cover, by which great strength and durability are stated to be obtained. The advantages claimed for the tire are freedom from puncture, as the pneumatic tube is kept well off the ground, and narrow tread, the twin tire being deep without being broad. These tires have been specially designed for automobiles, and have been designated "twin tires" because the resilient solid rubber and an "air-tube" are enclosed in the one cover. The "fastening" of these tires enables them to hold securely to any flanged rim, while they are also easily adjustable by the user. The Collier twin tire is vulcanised throughout, the usual joints of the tubes being thus practically done away with.

Naturally enough makers of tires are giving increased attention to the demands of the automobile industry, and the Continental Caoutchouc and Gutta Percha Company, 64 and 65, Holborn Viaduct, E.C., made a good display in this line. The Swain motor tire was on the stand of the Swain Patents Syndicate, Ltd., of Horwich. This has been prepared for motor-tricycles, quadricycles, and light cars, and it is claimed that by the longitudinal strands of the fabric great strength is ensured. The tires require no wires, nor have they thickened edges to secure being held to the rim. Remarkably easy to put on and off, the tires are also fast and resilient. The Midland Rubber Company, Ltd., 89, Ryland Street, Birmingham, had also some good types of motor-car tires.

Tires vulcanised by the Prague Rubber Company were shown by Messrs. C. H. Lucas and Co., 75, Red Lion Street, Holborn, W.C. On the stand of Messrs. Grimes Bros., Limited, 22, Long Lane, Aldersgate, S.E., was a collection of air tubes and covers.

The Clifton Rubber Company, of Crouch End, showed raw hide belting for motor-cars and also covers for tires.

Saddles for motor tricycles promise to add another branch of activity to several firms, and among the makers of cycle saddles who exhibited saddles specially adapted for motor-cyclists were Messrs. E. and A. Noirit, Walsall, and the Leatheries, Limited, Henstead Street, Brooms-

grove Street, Birmingham. Messrs. Lycett, Limited, of High Street, Deritend, Birmingham, had a motor-tricycle saddle on five coils and fitted with a patent back rest. This is being adopted by some of the leading makers, and is calculated to add to the comfort of riding. At Messrs. Lamplugh and Co.'s (Garfield Road, Coventry) stand were motor-tricycle saddles with the firm's patent tensioned webbing base that has been familiar in connection with cycles.

Some very useful motor-car accessories were to be found at the stand of Messrs. Alfred Dunhill and Company, of 145 and 147, Euston Road, N.W., in the way of rubber mats, rugs, and gloves, all necessary articles, especially now that the winter season is upon us. Mr. Dunhill's products in this direction are now too well known in the automobile world to need any lengthy mention in connection with the present show, but we may add that he is also making a speciality of outfits for the repair of punctured pneumatic tires of motor cycles and cars. The repair of a tire on the roadside is anything but a pleasant task, but it is better to be equipped for emergencies than to be stranded on the roadside, miles from a railway station. Gauntlet gloves are another speciality, and he has also a large collection of rubber mats of excellent quality and appearance. Among the mats we specially noticed those made from Imperial fibre, which are having good sale. The "pure white" indiarubber footboard mats are excellent. Some capital water and dust-proof covers for motor-cars were also to be seen on this stand.

Most complete, so far as the motorist's personal equipment is concerned, was the stand occupied by Messrs. A. W. Gamage, Limited, of Holborn, upon which were shown some fashionable designs in motor clothing, including black and brown leather suits, overcoats, riding breeches, etc. Among the novelties is a tweed coat of the latest pattern with sanitary wool fittings and deer-skin lining. For those who prefer a more expensive coat there is a jacket of French kid, which has a remarkably good appearance, and should become popular among Society votaries of the motor-car. In addition to a very complete selection of clothing for automobilists, there was a capital display of motor caps, gloves, and leggings, while several specialities in gauntlets seemed to attract general attention. A special novelty was a combination rug and garment. This is made of leather, and can be thrown over the knees, while by an ingenious system of overlapping and buttoning it can be converted into a pair of trousers with good capacious pockets; it is a capital idea for the motorist in wet and dirty weather. Another speciality was a cover to be placed on the front seat of a quad. It is so devised that the lady's feet receive full protection, being practically enclosed in a fur muff. Among the sundries exhibited by Messrs. Gamage were motor-bells and horns. One of the latter has a gauze cover to prevent, as far as possible, dust getting to the reed, and another is fitted with a long tube so that it can be placed anywhere on the car, according to the wish of the driver.

Eye protectors and goggles were matters of motor interest at the stand of the "Rex" Patents, Limited, 3, The Exchange, Clapham High Street, S.W. This company showed the "Rex" goggles of the original French pattern, which being made to fold up into a very small case have the advantage of easily going into the pocket. The "Rex" eye protectors fitted with side flanges to prevent draught also deserve passing notice, being evidently well made. Among the miscellaneous goods here shown was a chain lubricant for motor-vehicles.

Mr. John Piggott, of Cheapside, E.C., had a varied show in the gallery, and among his display of clothing we noticed several good types of garments suitable for motorists. A speciality is made of leather goods, all of which are well and warmly lined. In addition to these Irish friezes are also being utilised, and a good assortment of head-gear was conspicuous on this stand. Adjoining the clothing department was the firm's motor accessories branch, where petrol cans, etc., were to be seen as well as a motor horn worked by means of a bellows placed in the floor of the car and operated by the foot.

Neat liveries for the servants of automobilists were on view at the stand of Mr. Charles R. Base, 310, High Holborn, W.C. One of these was in black or brown leather cut to fasten at the front with hooks, and faced with box-cloth of any colour desired. Breeches are generally worn with these, made of the same leather as the coat, and boots or gaiters. The cap can have a peak to match the facings of the jacket, and, nicely braided, makes a very effective livery. Double-breasted leather Chesterfields with Melton collars and wool lined were another exhibit, the whole being completed with a good selection of leather-lined tweed coats, breeches, etc.

The "Autocoat" was shown by Messrs. Hoare and Sons, of High Holborn, and attracted considerable attention. This is made of a rain proof cloth and lined with all-wool material and interlined with "antiletheret"—a speciality of the firm's, which is said to be absolutely wind and rain proof. Across the back and sleeves a yoke is given, ensuring extra warmth, and the style of buttoning secures ample protection for the chest, while the provision of wind-proof cuffs and special map pockets shows that no detail has been omitted in the endeavour to provide a really serviceable coat. In addition to Autocoats and Autosuits—the latter made in the same serviceable way as the Autocoat—Messrs. Hoare and Sons gave a conspicuous place to the "Aquatecta" waterproof cloth overcoat, a garment combining the warmth of the overcoat with the rain-repelling qualities of the waterproof.

Foot-gear is an important item in connection with the motorist's outings, and to meet a difficulty that has hitherto been felt, Mr. George Norris, 55 and 56, Bishopsgate Street Within, E.C., has introduced a new design in boots specially intended for the use of automobilists. This is a neat leather boot with a flap that overlaps and is

buckled in two places, thus securing thorough protection to the foot and providing a hoot that is easily put on and quickly taken off.

The "Compound" foot pump shown by Messrs. Hattersley and Davidson, 139, Norfolk Street, Sheffield, is specially intended for the rapid inflation of pneumatic tires, and should prove of great convenience to motorists. There are two barrels $1\frac{1}{2}$ in. and 2 in. diameter which are connected at the top by a cross air channel. Two plungers fitted with collapsible leather valves working in opposite directions are connected to the double handle. The up-stroke compresses the air of the larger barrel into the smaller one, while the down-stroke expels the compressed air. At the same time the pump feeds itself through the larger barrel. The result is that a pressure of 150 lbs is obtained with ease and a 28 in. tire can, it is claimed, be inflated in three strokes. From Sheffield also came Mr. Ernest H. Hill, of Broomhall Street, with several good accessories for motor-cars, one of the most useful being a pump so jointed that it will lie flat in the car.

The stand occupied by Messrs. Benton and Stone, Bracebridge Street, Birmingham, was of interest to motorists generally, two or three excellent specialties being shown. One was a motor-car tire pump of good design with a detachable rubber tube and a detachable lever handle. In the same category may be placed a pump with a large cross handle and specially intended for workshop or depot use. In motor-car reservoirs Messrs. Benton and Stone have a tank with lubricating pump and filler feed. This has a steel barrel and bands, and the pump is provided with double valves to prevent the return of the oil to the tank. There are several adjustable clips and the connecting tube is twenty-two inches long. Weighing, complete, 10½ lbs., the reservoir has a capacity of eight pints of petrol and two pints of lubricating oil. At this stand was also to be seen a lubricating reservoir of oval design for attaching to the splash board.

Lubricants for motor-cars formed the feature of the display made by Messrs. Stern Bros., 57, Gracechurch Street, E.C. Among the specialties shown were Sternoline paste for the chains, Fram lubricants for axle bearings and gear boxes, Sternoline motor-car oil, Sternoline cylinder oil, Sternoline rust preventive, etc. The Sternoline paste must be applied in a liquid state to chains and cogs. It cools rapidly, and forms a strong, smooth surface which neither comes off nor blisters. The makers claim that the use of this elastic paste diminishes wear and avoids all direct friction. Dust will not mix with it, so that the cogs are kept perfectly clean, and although quite dry in appearance they are well lubricated. As the paste is entirely free from acids and all impurities, its elasticity is easily preserved and it will not harden. Another speciality at this stand was Stern's adhesive belting brick, which is made in a very compact and handy form, and is very clean. It prevents the belts from slipping or coming off the pulleys, keeping them pliable and counteracting the looseness produced by stretching. Attention may also be directed to Stern's commutator paste for preserving the brushes and commutators of electric motors and preventing sparking, etc.

Among exhibitors of lubricants for motor chains, motor grease, etc., were to be found the Elephant Chemical Company, Neate Street, Camberwell, S.E., who also showed their rubber solution; the Ferrubron Manufacturing Company, 143, Queen Victoria Street, E.C., who make a feature of the Garton motor chain lubricant; the High Level Brand Company, 6, Prudhoe Street, Newcastle-on-Tyne, and Messrs. Moebius and Son, Lion Works, Homerton, N.E.

Motor-car cylinder oil and motor-car lubricating oil were shown by Messrs. Pilchers, Limited, Morgan's Lane, Tooley Street, S.E. These oils have a high flash point and great viscosity at high temperatures; consequently dependence may be placed upon their ability to work clean and free without clogging the various parts to which they are applied.

Solutions for repairing pneumatic tires found a place on the stand of Messrs. Stanley, Feast and Co., Limited, 9, Farringdon Road, E.C., and on that of Messrs. Tomcox, Limited, 50, Loveday Street Birmingham, was a selection of oil cans, inflators, etc.

Specimens of enamelling, lining, and embellishments in artistic designs and good colours were shown by Messrs. F. Attwood and Co., 141 and 142, Great Saffron Hill, W.C. Special attention is being directed to the suitability of close plating for motor-car work, as great durability is thereby secured. The firm also undertake the engraving of wheel caps, etc.

Among the miscellaneous exhibits were the celluloid mud-guards for motor-cycles displayed by Messrs. Bluemel and Bros., Globe Road, E., who are prepared to make similar guards for motor-vehicles of every description. The Cable Rim Brake Company, 146, Brixton Hill, S.W., had a cycle brake on the principle indicated in their title, and this is being applied to motor-cycles.

Spokes and nipples of the "Anchor Brand" for motor-cars and motor-cycles were shown by Messrs. D. F. Taylor and Company, Ltd., New Hall Works, Birmingham—a firm that is prepared to make such parts in every size. Messrs. Ross, Courtney and Company, Ltd., Ashbrook Road, Upper Holloway, N., had a spoke-cutting machine, and also showed their valves, nipples, etc. Dies for motor-car spokes were also shown by Mr. Joseph Bradbury, of New Street Works, Baintree. From the same town came Messrs. Lake and Elliot, of the Albion Works, with tools for cutting motor-spokes. They make dies for every size from the motor-tricycle to the largest car made in this country. Mr. H. Friedenham, 16 20, Farringdon Avenue, E.C., had a collection of fittings, etc., including spokes, nipples, etc., for motor-cars.

Motor horns and bells for motor-cars formed an increasingly interesting section of the show, and their constant demonstrations added a new trial to tired exhibitors. At the stand of Messrs. Markt and Company,

25 and 26, Shoe Lane, E.C., several varieties of bells were shown including those with a double stroke and electric bells, very penetrating in their results. Odometers, etc., and pumps for motor-cars were also displayed by Messrs. Markt and Company. Another good motor bell as well as horns of various patterns were exhibited by Messrs. O'Halloran Bros. and Co., of 184, Clerkenwell Road, E.C., special attention being drawn to a bell for fixing on the footboard, from whence it is operated. Bells and similar motor accessories found a conspicuous place on the stands occupied by Mr. Louis Bernstein, 78, Milton Street, E.C., and Messrs. Steiner and Co., 141, Houndsditch, E.C.

HEAVY MOTOR TRAFFIC IN FRANCE.*

By M. GEORGES FORESTIER, Inspector-General of Roads and Bridges in France.

The Council of your Association has decided that the opening address of your fifth session should turn on the state of the question of *Poids Lourds* in France, in order to furnish you with food for comparison regarding the progress made in this direction on either side of the Channel. The French term *Poids Lourds* is perfectly translated by "Heavy Motor Traffic," but does not apply to the same vehicles on both sides of the Channel. On your side, "Heavy Motor Traffic" seems to me to apply to vehicles employed in the transit of heavy merchandise, two tons being the minimum load. On our side, *Poids Lourds* comprises all vehicles adapted for a quick service for passengers or the slower transport of heavy merchandise, the minima being either ten travellers with their baggage or one ton of goods. The expression *Poids Lourds* also implies, with us, the idea of a regular service, in which the itinerary is always the same. The hours of departure and arrival and the time spent on the journey are fixed; hence the supplies for the motors can be always ready in advance at certain points arranged beforehand. This allows every source of energy to be used for the motor, such as even electricity or compressed air, as well as petrol and solid fuel.

An Historical Retrospect.—A letter, dated July 2nd, 1771, from Grébaud, the great reorganiser of French artillery, which is preserved in the archives of St. Thomas d'Aquin, informs us that in 1769—"M. Cugnot had orders from M. le Duc de Choiseul to make a model of his machine at the expense of the king. This carriage ran last year, 1770, in the presence of M. de Choiseul. It carried four people and ran at the rate of two miles an hour, but the feed pumps were too large for the boiler's capacity. It could not run for more than twelve or fifteen minutes, and was obliged to stand an equal time for the steam to recover its original pressure. The grate and flue were badly designed, and allowed the heat to be wasted. The boiler appeared, also, to be too weak for some of the pressures obtained." It was judged from this trial that a carriage built the proper size and better proportioned might succeed, and Cugnot received orders to construct a new one to carry a load of four to five tons, and run regularly at the rate of a little over two miles an hour.

This carriage was built, and on July 2nd, 1771, Grébaud informed the Marquis of Monteynard, then Minister of War, that the "fire carriage" was at the Paris Arsenal ready to undergo the trials, subject to eight days' notice being given to the inventor. The Marquis of Monteynard replied, on July 7th, that he was afraid he would not have the time to make any trials before leaving for his country seat. No official account of the proceedings has been found, but there is a legend that the carriage was thrown against a wall as it was leaving the manufactory, an accident which put an end to the trial.

In a recent article in the *Revue d'Artillerie* (October, 1900), M. le Commandant Ferrus refers to this legend, and shows that the vehicle never was experimented on. This "fire carriage" of Cugnot is now in the Conservatoire des Arts et Métiers. It is seen from a photograph that it is a three-wheeled vehicle, in which the front wheel combines both the steering and driving functions.

Ever since the first attempt of this "fire carriage" it has been recognised—

- (a) That it is necessary to have a boiler with ample evaporative power, and one easily fed.
- (b) That the steering gear must act truly and promptly.
- (c) That it is very difficult to dispose the driven wheel or wheels so as to retain full mobility in turning.

This first "fire machine" was a self-propelled lorry or motor-wagon.

From 1771 to 1828 several other trials of carriages of this type were made in France. They are, however, of more interest as a study of the steam engine than of the development of the steam vehicle. On the other hand, in the drawings of the carriage designed in 1828 by Onésiphore Pecqueur, Chief of the Laboratories des Arts et Métiers, one finds, at least in the germ, all the essentials which have to-day assured the success of automobile vehicles.

The wagon of Pecqueur was, like that of Cugnot, an auto-motor lorry or truck, but it had four wheels. The front wheels were the guiding, the back the driving ones. Chain transmission was adopted between the engine shaft and the driving axle. In order that each driving wheel, when turning, should roll tangentially to the radius of its curve, the axle on which they were keyed was in two parts, joined together by a satellite gear. As to the steering, it was controlled, through an arrangement of pinions and toothed wheels, by two rods fastened to the frames in which the wheels were fixed.

* Opening Address of Fifth Session of the Liverpool Self-Propelled Traffic Association, being the local centre of the Automobile Club of Great Britain and Ireland, December 3rd, 1900.

This system was suggested in 1817 by Langensperger, of Munich, and was brought to England in 1818 by Akermann. It had one serious drawback. In their displacements, owing to the straight arms, the wheels travelled parallel instead of taking positions which would enable the projected axles of all the four to meet at the point of the centre of rotation of the system. One thus sees that the Pecqueur wagon contained, at least in the germ, all the parts necessary for a perfect auto-motor wagon. Through not knowing them, many inventors have since wasted their time in useless researches.

From 1828 to 1835 we have not, it seems to me, had attempts worthy of being mentioned. On February 10th, 1835, an English automobile carriage, built by Maceroni, and brought over by Asda, traversed the road from Paris to Versailles and back in four and a half hours, with a stop of forty-two minutes at Versailles, a distance of twenty-seven miles. On March 15th, the same carriage accomplished in four hours and twenty-nine minutes the journey from Paris to St. Germain and back, inclusive of a sixty-two minutes' rest at St. Germain and stops at Nanterre (both going and coming) in order to renew the water. The boiler pressure rose to eleven atmospheres. The engine was 14 i.h.p. The weight of the carriage when fully loaded was four and a-half tons. No accident whatever occurred in these journeys, and the *Constitutionnel* after having given an account of the experiment, adds:—"What is certain is that in a short time one or more regular services will be established from Paris to St. Germain and Versailles."

The French inventors seem to have abandoned the auto-motor or self-propelled vehicle for tractors. To illustrate this one may cite Dietz, who, in 1835, took out a patent for a steam locomotive to travel on common roads. The first type had three wheels, but, different from the Cugnot lorry, the two back wheels were the drivers. The carriages constructed afterwards by Dietz had three pairs of carrying wheels fixed in horn plates, which permitted them to follow the windings of the road. Dietz merits special mention because he seems to have been the first person who tried to build wheels with elastic tires. He tried to realise this desideratum by interposing either a layer of tarred cloth or of cork, or finally of india-rubber, maintained between the felloe and the tire by side plates bolted on to the felloe. Dietz also attempted to replace the wooded nave by a metal one. On September 26th, 1835, one of Dietz vehicles made the journey from Paris to St. Germain, a distance of thirteen miles, in one and a half hours. This run included the steep hill at Peq, the ascent of which occupied only five minutes. This performance aroused the enthusiasm of a commission, including such men as Poncelet, Savary, Gainby, with Baron Séguier as secretary, appointed by the Institute to follow these trials. This enthusiasm lasted long enough for Charles Olivier, Professor of the Central School, to declare in 1840, in a report read at a meeting of the National Society of Encouragement experiments, that the problem of steam locomotion on roads had been solved.

In 1835 two other French constructors, Caby-Cazalat and C. Muyaude, tried to introduce another steam vehicle of their own invention. From 1835 one must jump to 1856 before finding a practical steam vehicle. It was, in fact, at this epoch that the firm of Lotz, of Nantes, acquired its reputation through an agricultural road locomotive, which was destined to fill a double rôle, viz., either to be a steam ploughing or thrashing machine, or a traction engine for conveying these different machines from one farm to another. In the first type the fore part of the carriage with two wheels was manipulated by a chain and drum, controlled by a hand-wheel placed conveniently for the driver at the back, as in road rollers.

In 1865, in order to render these road locomotives specially useful for towing boats, M. Lotz adopted a means of steering through a single front wheel placed in the centre of a horizontal toothed ring. This was moved by a pinion carried at the bottom of a vertical shaft, at the top of which was fixed a helical wheel gearing into an endless screw on the steering spindle. Only one of the back wheels was fast on the axle. The other could run loose on curves.

M. Lotz, whilst specially devoting himself to tractors, constructed a steam carriage for passengers steered by the front wheel. The carriage, as a whole, presented the features which have eventually prevailed. The vertical boiler and the engine were placed in front in a kind of half-circular fore part, which was supported by the steering wheel. The driver, seated between the control levers and the compartment occupied by the passengers, had under his own hand all that was necessary for guiding the carriage as well as managing the boiler and the engine. Chain transmission was used, but one of the driving wheels had, in this carriage also, to be thrown out of gear to avoid skidding and scraping in turning corners.

It was in order to avoid this inconvenience that, in 1866, Baron Séguier strongly urged the employment of a separate engine for each driving wheel, and proposed to have a special valve between the two cylinders in order to supply steam to each in the proportions necessary for their trajectory differences. An arrangement of this kind was adopted by M. Bollée, in 1873, on his first steam carriage, "L'Obéissante."

This carriage of M. A. Bollée merits special mention, for it was the first in France that was provided with two guiding wheels so arranged that the axes converged towards the centre point of the back axle. In this first attempt each of the front wheels was movable, as in the Pecqueur car, round a vertical spindle, carrying a cap fixed on the end of the axle-box. These two pivots had rims which were connected by chains to two elliptical plates, set one over the other and controlled by a lever.

In 1878 M. A. Bollée constructed another carriage, "La Mancelle," in which a single motor drove on to a differential gear, and from that, by pinions and chains, to the driving wheels, which were loose on the back

axle. In this carriage the steering was altered. The wheels were moveable round pivots fixed to the extremities of the fore-axle. The short axles fixed to these pivots were connected by two rods, forming a V, and given the necessary movement by suitable gearing. This new carriage of M. Bollée was thus provided with all the necessary parts for an automobile carriage. In 1882 M. Jeantaud patented an improvement of the Akermann steering, the two arms being inclined forward, in opposite directions, instead of being straight. This principle has been adopted in the greater number of the steering arrangements in France.

From about the same period date the first applications of the De Dion boiler to automobile carriages, which finally developed into the tractor which, on July 19th, 1894, arrived first in the race for "carriages without horses" between Paris and Rouen, organised by *Le Petit Journal*, and which really inaugurated the era of automobilism. The runs of 1895, Paris to Bordeaux and back, and of 1896, Paris to Marseilles and back, drew the attention of the public more closely to the advantages of the new mode of locomotion, not only for touring excursions but also for the purposes of industrial transport.

In 1897, the Automobile Club of France, which had been founded by the organisers of the run from Paris to Bordeaux, arranged at Versailles the trials for *Poids Lourds* which have succeeded so well. In the steam section, there was a De Dion and Bouton tractor, an omnibus belonging to the same firm, a Scotte omnibus, and a lorry by the same maker; in the explosion engine section, an omnibus for ten passengers built by Messrs. Panhard and Levassor, and a De Dietrich car. The success of these trials was such that, in the Financial Budget of 1898, the French Parliament voted article 86, which authorised the Government to grant subsidies to regular public transport services for passengers and goods, by means of automobile vehicles, under the same rules as for tramways or light railways.

In 1898, the second *Poids Lourds* saw presented for trial.

STEAM.

- | | |
|---|-------------------------|
| (1) Heated by coke—De Dion and Bouton omnibus | ... with 20 seats. |

| " " " " " " " " " " " " | " " " " " " " " " " " " |
| (2) " " petrol—Leyland sporting car | ... " 15 cwt. |
| (3) " " heavy oil—Serpellet omnibus | ... " 12 seats. |

EXPLOSIVE ENGINES.

- | | |
|---|-----------------|
| Panhard and Levassor parcel delivery carriage | ... with 1 ton. |
| Roger-Mazurier omnibus with compound motor | ... " 12 seats. |
| De Dietrich lorry | ... " 1½ tons. |
| " " brake | ... " 10 seats. |

ACCUMULATORS.

- | | |
|--|-----------------|
| Society of Electromobiles—Parcel delivery carriage | .. with 15 cwt. |
| Krieger System | ... " 10 " |
| Janatzky | ... " 25 " |

In 1899, the *Poids Lourds* was as brilliant. To the systems represented at the previous competitions was a new steam motor—a lorry built by Messrs. Purrey, of Bordeaux, which carried 3 tons.

In 1900, the fourth Congress took place at the Vincennes Annexe, and at this meeting we have to add to the competitors already mentioned the following:—

STEAM.

- | | |
|--------------------------------------|--------------------|
| Le Blant tractor, hauling an omnibus | ... with 30 seats. |
| The Turgan van | ... " 1 ton. |

EXPLOSIVE ENGINES.

- | | |
|---|------------------|
| Panhard and Levassor lorry (solid rubber tires on steering wheels)... | ... with 2 tons. |
| Peugeot lorry (compound rubber and metal tires) | ... " 1 ton. |

ACCUMULATORS.

- | | |
|----------------------------|-----------------|
| Rike parcel delivery van | ... with 1 ton. |
| Say's sugar refinery lorry | ... " 10 tons. |

Moreover, at the competition for urban parcel delivery vehicles, which took place in August, a steam motor participated which was provided with a Chaboche boiler heated with coal. Finally, in the Vincennes Annexe, the conveyance of passengers by electric omnibus has been proved a success by one carrying twenty-four people, and provided with an electric motor and a self-propelling trolley.

With so many types of *Poids Lourds* it is impossible for me to give you even a brief description of any of them. Besides, it would be inadmissible in an address calling for a general review of the principles which are revealed by the study of the results obtained since 1897. Let us deal first, then, with the steam motors employed for passenger services.

One is struck by the ever-increasing power of the motor compared with the number of horses which have to be employed for similar omnibuses. Thus in 1897 the power of the engines was:—

- | |
|--|
| 25 h.p. for an omnibus for sixteen people (De Dion). |
| 35 " " a "Pauline" for thirty-five people (De Dion). |
| 14 " " an omnibus for twelve people (Scotte). |

In 1898.

- | |
|--|
| 30 h.p. for an omnibus with twenty seats (De Dion). |
| 30 " " a "Pauline" with twenty-four seats (De Dion). |
| 15 " " an omnibus with fourteen seats (Serpellet). |

In 1899.

- | |
|---|
| 30 h.p. for an omnibus with twenty seats (De Dion). |
|---|

In 1900.

- | |
|---|
| 35 h.p. for an omnibus for twenty people (De Dion). |
| 50 " " a tractor for twenty passengers (Le Blant). |
| 40 " " a roulotte for ten passengers (Turgan). |

This tendency, which is displayed in all the De Dion omnibuses that have taken part in our meetings, arises from a double cause:—First.—The outlay per passenger is largely due to the wages of the mechanic

and stoker. In order to reduce this, it is necessary to increase the number of passengers carried each journey, which means an increase of the total moving weight. Second—Interest and sinking fund charges call for an increase in the number of journeys made each day, and this means that the commercial speed must be augmented.

An increase of power follows, and, unfortunately, this greatly increases the weight of the vehicle. For example, the omnibus of De Dion and Bouton at the 1897 trials weighed five tons empty, and 6·7 tons when fully loaded. Its commercial speed was 8·6 miles per hour. That at the 1900 trials weighed 6·6 tons empty, and 8·6 tons when fully loaded. Its commercial speed was 11·2 miles per hour.

The estimated cost per traveller per mile with luggage, ten persons being reckoned to the ton, has fallen as follows:—

In 1897	0·48d.
" 1898	0·24d.
" 1899	0·23d.

But in these calculations no allowance has been made for damage done to the roads, for in France, at least on public roads, no tolls are levied upon the transport companies for damage. If this side of the question were taken into account the expenses would probably be much increased, and the constructors would doubtless be obliged to study the reduction of the total weight of their high-speed public service vehicles to that of the former diligences, viz., to about four tons when ready for the road. It is desirable, therefore, to inquire as to which part of the actual vehicles could be lessened in weight without damaging the efficiency of the whole.

(To be continued.)

FURIOUS DRIVING CASE.

MR. C. A. SMITH, of the White Lion Hotel, Cobham, was fined £5 at Kingston-on-Thames on Thursday, last week, for driving a motor-tricycle on the highway at Esher, on November 20, at a greater speed than was reasonable, having regard to the traffic. A police-constable stated that defendant was travelling at the rate of eighteen miles an hour. Notice of appeal was given.

DRIVING WITHOUT A LICENCE.

HENRY NEWMAN was summoned at the Merthyr Police Court, last week, for driving a motor-car without being licensed as a driver on 22nd ult. Mr. J. T. Vaughan prosecuted on behalf of the Urban District Council, and quoted the Town's Police Clauses Act. P.C. Venn, and Mr. J. E. Biddle, assistant clerk to the Council, having proved what was necessary, defendant was called upon for his defence, and he pleaded that he had expected the car owner, Mr. Jenkins, to take out his licence. A fine of 40s. and costs was imposed.

REFUSING TO STOP.

AT the Hove Petty Sessions, on Monday, William Griffiths, of Beauchief, Harrington-villas, Brighton, was summoned for, that being in charge of a light locomotive upon the highway, he did not stop on the request of George Henry Lake, of 19, Chesham-road, Kemp Town, having charge of a restive horse, upon his putting up his hand for the purpose of causing such light locomotive to stop, and to remain stationary so long as was reasonably necessary in Lower Shoreham-road, on November 28th.—Complainant said he was riding a high-spirited horse in Lower Shoreham-road about noon, when he heard a motor-car coming behind him. As the horse became restive, witness signalled to the driver to slow down when the car was about sixty yards off. Defendant took no notice, but drove straight on. Witness was able to keep the animal under control. In reply to the defendant witness said the horse was going at a walking pace, and the motor was travelling very fast.—Defendant said when he saw complainant put his hand up he passed the horse as far as he could on the opposite side of the road. The animal took no notice whatever, but after witness got about twelve yards in front of it complainant trotted it close up to the car, and said he would summons the defendant.—A fine of £2 and 8s. costs was imposed.

MOTOR CAR AND CAB HORSE.

At the Sheffield County Court on Monday, his Honour Judge Waddy, Q. C., heard an action which was a sequel to a nasty cab smash which occurred in Fitzalan Square on 14th October. The plaintiff was George Hobson, cab proprietor, 75, Milton Street, Sheffield, and the defendant Fredrick Rodgers, of the Royal Viagraph Company, who was at the time in question staying at the Green Dragon Hotel, Fargate, Sheffield. The action was brought to recover £40 damages for injury to a cab caused by the negligence of the defendant, who had charge of a motor-car in Fitzalan Square, on the afternoon named. Mr. Walpole Hiller was for the plaintiff, and Mr. Arthur Neal for the defendant. The case for the plaintiff was that about half-past four several cabs and hansoms were standing on the Fitzalan Square cab stand, including Hobson's vehicle. Defendant came up Commercial Street on a motor-cycle, which he was testing for Mr. Jasper Redfern, and as he proceeded along Fitzalan Square something went wrong with the machine. The cycle slowed up, and eventually stopped, and defendant got off and tried to put it in order.

All at once it went off with a big noise. Some of the witnesses said the noise was like an explosion, and others said it was like a small cannon going off! Hobson's horse was startled, and made off. The cab was so badly smashed that it was rendered useless. The evidence for the defence was that Rodgers had been to Attercliffe, his object being to test the machine. Coming up Commercial Street, the power was not sufficient to carry him, and he had to work the pedals. Instead of going up High Street he turned into Fitzalan Square, intending to leave the machine there with a cabman or someone else, and send for it later. While he was wiping his hands with a piece of waste—he was not doing anything at the machine—defendant noticed one cab horse trying to get the food out of the nose-bag of the plaintiff's horse. The latter became restive, and threw itself back. The jerk caused the cab door to fly open, and it crashed against another cab. The noise startled the horse, and it made off, and was stopped near the Post Office. There was no noise from the cycle, and this, therefore, could not have been the cause of the accident. After the mishap he proceeded up High Street, pedalling the machine for some distance. The first time he heard that he was suspected of being the cause of the mishaps, he went and saw the police at the Central Police Offices. Mrs. Bolt, who lives in Fitzalan Square, said she saw the accident, and did not think the defendant was to blame at all. His Honour found for the plaintiff for £15 and costs.

SOME trials with a light motor-car have lately been made in the neighbourhood of Berne by the Swiss military authorities.

THE Mayor of Portsmouth has suggested a floral decoration procession, in connection with the motor-car run to Southsea next summer.

IT is proposed to organise a club for motorists in Glasgow and the West of Scotland, and a meeting will shortly be called to consider the project.

AMONG the lady members of Washington's diplomatic circle who have taken to automobilism are Miss Marguerite Cassini, the niece of the Russian Envoy, and Madame Wilde, the wife of the Minister for the Argentine Republic.

FOR the motor as against the horse the following eight points of superiority readily suggest themselves: Economy in working; increased possibilities in speed; greater safety; infinitely greater radius of action; humanity; economy in road repairs; cleanliness in streets, and increased volume of traffic over a not increased street surface.

THE current issue of Automobile Club's Notes and Notices gives a list of sixteen cars that started for Southsea, but did not arrive there on the occasion of the Club's recent tour. Broken bearings, broken crank-shaft, mis-firing, faulty differential, and broken steering arm were the causes of trouble. One driver was "believed to have given up at Petersfield," and another went by train from that place to Portsmouth.

MESSRS. ALLARD AND CO., LTD., of Coventry, have sent us a copy of their 1901 catalogue of motors and cycles. The first fourteen pages are devoted to illustrations and descriptions of the company's motors and automobiles, these including a 3½ h.p. vertical water-cooled motor, air-cooled vertical engine, 4½ h.p. horizontal water-cooled motor, the Express 4½ h.p. dog-cart, the Rapid 3½ h.p. two-seated voiturette, and the Allard motor-tricycle.

REFERRING to the Hurtu voiturette, illustrated in our issue of the 24th ult., we may mention that the United Motor Industries, Limited, are British agents for this car, and that they will shortly have some over here. The standard body, however, will be somewhat different to the illustration we published, a *tonneau* body being adopted. The steering pillar will be raked, while a De Dion-Bouton 4½ h.p. water-cooled motor, with pump circulation and radiators, will be fitted.

THE Motor-Car Journal.

VOL. II.]

LONDON, SATURDAY, DECEMBER 15, 1900.

[No. 93.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

WE have already referred to the steps about to be taken by the Automobile Club to secure something like reasonable regard for the future of the motor car industry, now seriously menaced by the threatening attitude of many county councils—to say nothing of lesser and equally irritant bodies. The letter to county councillors on the subject has just been sent out, and is, we are inclined to think, well calculated to prove of educational value. It is a lengthy document of twenty-six foolscap pages, an excellent index, and a careful division of subjects, securing easy reference and facilitating study of the report. The arguments which are given and the facts presented are aimed at proving two things; firstly, that the reduction of the speed to ten miles an hour would be an injurious procedure and cannot be justified by any unprejudiced person, and secondly, that the compulsory numbering of motor-vehicles would cripple, if not destroy, an important industry.

For Automobiles.

THE contents of the memorial are divided into sections. The first deals with the importance of the motor-vehicle from the standpoint of the general public, and it is urged that “unless further restrictions again kill the industry in this country there is reason to believe that, owing to the excellence of English workmanship and material, English made carriages ere long will be sold abroad.” Then the question of speed is dealt with, and it is pointed out that it is inability to stop within a required distance which is dangerous. Reference is made to the speeds of stage coaches of 1830, and the Club Committee submit that any alteration in the law affecting motor-vehicles, should place them on the same basis as other vehicles, viz., that they should not be driven to the “common danger.” With regard to the proposed compulsory numbering of motor-carriages the repugnance of gentlemen owning private cars to be numbered is rightly insisted on; and further that, as motor-vehicles pay the Inland Revenue Tax required of other vehicles, their owners have a right to claim the same privacy in respect of their automobiles as is permitted in the case of other vehicles.

Opposition to Railways.

THE serious and official character of the letter to county councillors is relieved by some capital instances of the opposition to railways. In opposing in the House of Commons the Liverpool and Manchester Railway Bill Sir Isaac Coffin asked if the House was “aware of the smoke and noise, the hiss and whirl which locomotive engines passing at the rate of ten or twelve miles an hour would occasion.” At the time of the Stephenson period of railways it was asserted, in the evidence before the Parliamentary Committee, that “if railways became general a million of horses would be thrown out of service, to the deterioration of the breed, and it would mean the abandonment of the 8,100,000 acres of land required to grow oats for the animals.”

These and other fantastic statements made against railways, and resembling in many aspects the objections urged against motor-cars, are amusing and instructive. The letter is concluded with some extracts from recent speeches and articles on mechanical road locomotion, and should do much to educate county councillors, or, at least, prepare them for the practical demonstrations which will be afforded them in the early spring.

To Chief Constables.

IN addition to the letter to councillors and the warning to motor-car drivers, the Automobile Club has sent a letter to all the chief constables in which they are asked to inform the club of any cases of refusing to stop which come to their notice. It is suggested that the proper form of the inquiry to police authorities would be to ask whether the number of accidents caused by motor-vehicles to other users of the road is such as to demand that the numbering of motor-vehicles should be compulsory. It is suggested that in answering such a question accidents caused by shying horses should be excluded, as they are a temporary evil incidental to the introduction of every new method of locomotion, but already disappearing in the case of automobiles.

The Gordon-Bennett Race of 1901.

ALTHOUGH nothing has as yet been made public of what is being done by French competitors in regard to next year's Gordon-Bennett Cup race, it is freely reported that the leading builders across the Channel are not overlooking the enterprise of English motorists, and are determined to retain the trophy. With this in view, we hear that some very “dark horses” are in preparation. Germany, too, does not mean to be behindhand in next year's race, for we learn that the German Automobile Club have already received entries from three firms, the Daimler Motoren Gesellschaft, of Cannstatt, having entered two cars, and Messrs. Benz and Co., of Mannheim, and the Canello-Durkopp Company, of Bielefeld, one each. No particulars of these vehicles have as yet been made public, but it is more than probable that the Cannstatt-Daimler cars will be fitted with the new 40-h.p. “Mercedes” motor, illustrated in the present issue. As already announced, four entries have been received by the A.C.G.B., the car in each case being a 50-h.p. Napier.

Warning to Drivers.

As the fact that some motorists have failed to stop when properly required to do so is urged as the reason for the proposed numbering, the Automobile Club is prepared to assist the police by expelling any known delinquents from the Club. And in our advertisement columns this week will be found an indication of the serious view which is entertained of the matter. For the Committee “give warning to members of the Club that if any member be proved, to their satisfaction, to be guilty of failing to stop when called upon to do so by a person in charge of a restive horse, or by a police constable, he shall be liable to be expelled. If any other motorist be similarly proved guilty of

this offence, he will be liable to be prevented from taking part in any trials, competitions, tours, or meets held under the auspices of the Club, and from becoming a visitor to, or a member of, the Club. As regards speed, the Club Committee beg motorists to avoid the employment of excessive speeds, and to drive very slowly through towns and villages, and in approaching corners and cross roads. Provided that the offence of failing to stop when required to do so is eradicated, the police will, without assistance from the Club, be able to deal with those who are guilty of dangerous driving." In connection with this, attention is drawn to the suggestion that no person should be allowed to drive a motor-vehicle until he has obtained a certificate as to his capability to do so. The Automobile Club would be prepared to organise a scheme by means of which persons would be able to acquire the requisite knowledge for the driving of motor-vehicles to enable them to obtain certificates of competence.

The Prince of Wales's New Motor-Car.

SINCE we illustrated the Prince of Wales's new Daimler car for service at Sandringham, we have obtained a few additional particulars of the vehicle, which is known as the Loaders' car. It is geared up to only twelve miles per hour, and is used to convey the gun-loaders to the place where the royal shooting parties are to commence operations and to take the loaders and keepers back again in the afternoon. The vehicle is also employed in conveying servants and luggage to and from the railway station, and so far has given every satisfaction, notwithstanding some bad roads and lanes in the Sandringham district. The other new Royal car is a 12 h.p. Lonsdale wagonette, and is employed for the conveyance of His Royal Highness's guests. Among the first to enjoy a trip on the new car was Mr. Balfour, who, accompanied by Lady Alice Stanley, was one day last week driven from Sandringham to Brancaster golf links, a distance of seventeen miles, while on Sunday last Mr. Joseph Chamberlain was conveyed from Sandringham to Lynn railway station in the Royal automobile.

Cycle Traders and Motor-Cars.

"SHOULD Cycle Traders Take Up the Sale of Motor Cycles, Cars, and Fittings?" was the title of a paper read by Mr. F. D. Nawell before the members of the Manchester and District Cycle Traders' Association last week. Considering the question of the sale of motor cycles and cars as a side line to the legitimate business, Mr. Nawell replied in the negative to his self-set question. The sale of motor-cycles must, the author stated, run concurrently with the ordinary cycle business, and as cycle traders need all the time and energies for their legitimate and staple trade of cycles and accessories, he did not think that the average agent would make a success of any branch of the motor business. On the other hand, he considered that for any practical man with capital the opening of a depot in suitable or large centres exclusively for the sale of motor-cycles, cars, fittings, accessories, and motor spirit would be one of the best investments he could think of, as the automobile is one of the coming things. A discussion followed, the general feeling being that the motor business ran concurrent with the cycle industry, but that it was a separate branch, which needed extra capital and special attention to secure success.

The Belgian Tour.

THE "Tour of Belgium," which is being organised for next year by the Belgian Automobile Club, is attracting considerable attention, and already a provisional programme has been sketched out. This provides for a seven days' excursion, the daily runs being sufficiently short to permit of exhibitions being given upon the completion of each stage. The tour is intended to serve three purposes in particular. Firstly, it will demonstrate to the general public that automobiles are to-day being built capable of performing, daily and continuously, runs over considerable distances. Then, by means of the exhibitions, the propaganda of evolution will be made more

widely known, and many unbelievers will be forced to recognise the fact that in numerous directions the horse's services will be superseded by those of the motor. Finally, the tour will afford the best of opportunities to the participants of visiting and studying some of the most interesting and ancient towns of Belgium. The seven days' programme, as at present prepared, is as follows:—First day: Brussels to Charleroi; exhibition and visits to principal works in the locality. Second day: Charleroi to Namur; exhibition and visit to local places of interest. Third day: Namur to Spa; exhibition and excursions in neighbourhood. Fourth day: Spa to Liège; exhibition and inspection of various manufactories. Fifth day: Liège to Antwerp; visits to ports and local works. Sixth day: Antwerp to Ghent; exhibition. Seventh day: Ghent to Ostend *via* Bruges; exhibition at Bruges and at Ostend; automobile sports and public sale of vehicles having participated in the tour. This programme is distinctly attractive and when elaborated will assuredly meet with universal approval. The exact date is not yet decided.

Mr. Pennington in Court again.

IN the Westminster County Court on Tuesday Mr. Egerton claimed the sum of £463 from Mr. Pennington, who has lately been residing at the Hotel Metropole, London, and who, it was said, had patented about eighty things appertaining to motor-vehicles. He had banking accounts in America, and represented the Anglo-American Rapid Vehicle Co. For the defendant it was said he owed £16,000. Some shares had been offered to the plaintiff, who had returned them. "It is clear," said Judge Lumley Smith, "that this gentleman's affairs require the fostering care of the Bankruptcy Court." And an order was made accordingly.

Professionals and Automobilmism.

MRS. LANGTRY among actresses and Lafayette among performers at the music halls have proved themselves adepts in the art of motoring, and now we see that the leader of a troupe of well-known pantomime artistes has joined those of the "mechanical horse." He is often to be seen in the West End careering along on a motor-tricycle to which a trailer is attached. The passenger is generally a lady, and the way in which the machine is got through traffic testifies to the ability of the driver. We believe the tricycle and the trailer are "stabled" in Bloomsbury, and that the speciality of the artistes is "flying"—they being engaged in one of the leading pantomimes about to be seen in London.

Royal Automobilists.

THAT automobilism is attracting the notice of the highest in the land has been amply proved of late, and all the world is aware that the Prince of Wales, the Emperor of Germany, the King of the Belgians, and the Shah of Persia have already become ardent *chauffeurs*. But the list by no means ends there, for other royal personages are also showing a taste for the joys of the horseless vehicle. The Prince and Princess Albert of Belgium, together with the Princess Clementine, make frequent excursions *en automobile*, and it is reported that the heir to the Belgian throne will shortly acquire a dainty little voiturette. Prince George of Greece, who has been staying in Paris for some time, has also demonstrated a keen interest in the new means of locomotion, and has on several occasions been seen speeding along in an electric landau. Recently he, in company with Prince Waldemar of Denmark and the Count de Moltke Huitfeldt, visited the works of the Etablissement Hautier. There the royal party spent upwards of two hours in examining the productions of Monsieur Hautier, and manifested the liveliest interest in the various motors and parts exhibited to them. The new system of advancing the moment of ignition devised by M. Hautier proved of special interest to the royal visitors, and they finally left after being given a practical demonstration of one of the voiturettes constructed by the firm. It is evident that before long we shall

witness all the crowned heads of Europe indulging in the fascinating sport, and with their adhesion the industry will advance by leaps and bounds.

A Stubborn Traction Engine.

THERE was fun in Holborn on Wednesday. A traction engine bearing the name "Kate Webster" stood still at the end of Chancery Lane. The policeman moved from the front of the machine and gave the order for the giant automobile to "move on." But it didn't. The constable entered into explanations with the driver, assuring him that he meant the vehicle to depart. The driver acquiesced in the idea; but the engine didn't understand. Passing that way half an hour later, we found the affair had moved quite thirty yards, and was in front of the Avenue Hotel. Sand had been plentifully applied to its path, but even then the wheels did not seem to grip the greasy surface. The incident afforded a good illustration of the ease with which a great crowd can be gathered in London. An hour earlier the cumbrous vehicle had blocked the traffic at Holborn Circus, and in the evening rumours of its approach were current in the Charing Cross Road. And yet people complain of the speed of mechanical traction! Such examples, to say nothing of the South-Eastern Railway, should disprove many allegations.

Motor-Cars for Medical Men.

THIS is a subject which has been exciting considerable interest of late—judging from our correspondence columns—and in this week's issue are two or three diverse opinions. One gentleman calls our attention to a letter in the *Lancet* in which Mr. Harry Lupton, of Stratford-on-Avon, gives his experience of a motor-car. He says his bills for the maintenance of the car, as distinct from running it, have come to about £43 for the year, to which must be added at least 10 per cent. written off the value of the car. Seeing that his car has been laid up nearly as long as it has been in use, "the economy, as compared with horse-keep, is not remarkable." Curiously enough, by the same post we received a letter from the hon. secretary of the Reading Automobile Club which meets the situation very well. It is a question of obtaining the wrong car for a particular class of work. Fortunately experience on this point is being accumulated and the difficulties of intending purchasers are being surmounted. In this connection the letter of "L. R. C. P." is interesting.

Automobile Prospects in Ireland.

TRADE in Ireland shows promise of being very brisk for next season. A great many people are seriously enquiring into the merits and demerits of the various cars, and a fair proportion of them are likely purchasers. Owing to the meagre railway facilities in Ireland there is very fine scope for reliable motor-cars, as journeys have often to be accomplished which are quite too much for the average horse. But makers who intend to cultivate a trade there should strongly recommend purchasers to have the best and strongest grades of cars, as the conditions of roads and weather are often very trying. Rough roads and an almost perpetual dampness exert many adverse influences; and the result of a breakdown is very serious, owing to the scarcity of repair shops and the expensiveness of hauling a derelict back to some big town. Indeed, the experience may be so unpleasant as to turn the embryo motorist completely against the pastime, and most probably he will vent his disgust in condemning that particular brand of car all over the country. Thus, for the sake of their own reputation, it would be well for makers to give special attention to the cars they send to Ireland.

Lady Motorists.

IN order to write a paragraph in a morning paper some enterprising journalist has asked "What is the proper designation for ladies who drive their own motor-cars?" Engineeriste and motress are suggested in order to be shown to be impossible. We fail to see why the readers of

daily journals should be worried with such matters; meanwhile, let us be content with the term "lady motorist," and express the hope that there will be many of them.

Lecture at Ipswich.

AT Ipswich, Mr. E. Shrapnell Smith has been lecturing on Automobilmism Up to Date, and included in those who who attended the lecture were the Mayor (Mr. W. F. Paul), who presided, the Hon. C. S. Rolls, Mr. W. T. Pretty, Mr. C. Johnson, and Mr. Julius Harvey. The resolution of thanks to the lecturer was supported by Mr. Rolls, who said he regretted to see that Suffolk was one of the counties using the greatest exertion to block the successful progress of automobilism. In the course of his lecture, Mr. Shrapnell Smith displayed on the screen the picture of a traction engine exhibited at Liverpool in 1841. It was built by Messrs. Ransomes, Sims, and Jefferies, of Ipswich, and was the first of its kind shown in this country. He pointed out that traffic could be controlled more easily with motor-vehicles, as they did not take up so much room in the street as those drawn by horses; damage to the roads would be less than by the horses' hoofs; the effect upon existing interests would be practically nil; their use would be economical, for the cost of running from Ipswich to London would be about 5s. a ton of goods, including cartage and delivery. In conclusion, the lecturer dealt with the possibility of the use of the motor in warfare, and his final lantern slide was from an old plate published in the thirties, depicting the year 2000, showing motor-cars, a cast-iron parson preaching by steam, flying machines, houses on wheels, etc.

A New Heavy Oil-Motor for Launches and Motor-Cars.

OUR illustration shows a launch which is driven by a heavy-oil motor, built to the designs of Mr. John F. Walters, of Twickenham. Mr. Walters has been at work on the engine for over two years with the view of developing it for heavy motor-car work and we understand that it will shortly appear on the road. From

the experience gained he is convinced that the oil motor of the future will be one using heavy oil. The two figures in the stern are Mr. Van Toll and Mr. Walters.

French Automobile Clubs.

AT the present moment there are no fewer than twenty-two automobile societies in France, and this number is being steadily increased, for with the spread of the new sport its disciples find a need to band themselves together so that united excursions may be made and the thousand and one knotty points of motoring talked over. It is in Southern France especially that the clubs flourish, for the delightful climate is conducive to an out-door life, and surely no more pleasurable way of enjoying the fresh air than automobilism exists. No wonder then that the societies of the Midi thrive exceedingly. But here is the list: Automobile Club of France, Automobile Clubs of Auvergne, Béziers, Bordeaux, Dieppe, Dijon, Grenoble, Lons-le-Saunier, Lorraine, Marseilles,

Nantes, Nice, Pau, Périgueux, Rouen, Salon, Seine-et-Oise and Toulouse, Les Chauffeurs du Midi at Avignon, the Automobile and Bicycle Club of Lyons, the Moto Club of France and the Moto Club of Lyons. Then, too, Roubaix is shortly to have its club, and with the approaching season many others will be forthcoming. As regards members, the "A.C.F." naturally leads the way, for its roll-call exceeds 2,300. Then comes the Moto Club of France with some 750 members, followed by the A.C. of Nice.

Why Not Tolls?

Earlier in the century Mr. Gurney's steam carriage was charged £2 8s., and in some instances £3 8s. at the gates on the Liverpool and Prescott roads. Were they to advocate such a revival, county councillors could more effectually hinder the progress of the automobile industry.

No Half Measures.

SHOULD county councils secure the further reduction of the speed of motor-cars and be successful in their attempts at numbering such vehicles, they may become emboldened and revive toll-gates for the special annoyance of automobilists.

TOLLS are an acknowledged nuisance, and a survival of olden times; hence they should appeal very strongly to the councillors and others who would thwart all progress and prevent all advance.

When councils are playing the game of obstruction and restriction they should not stick at trifles, and should show their antipathy in its full force. There should be no half measures. As it is, the opposition to automobiles is of that character which half agrees with that which it is intended to throttle.

Despatch Carrying on Motor-Cycles in Australia.

EVIDENCES are not wanting that increasing attention is being devoted to the automobile movement in Australia. By the last mail particulars have come to hand of an attempt, which unfortunately did not altogether prove entirely successful,

of carrying a despatch by motor-cycle from Sir John Madden in Melbourne to Earl Beauchamp in Sydney. Two enterprising motor-cyclists—Mr. J. C. Elliott and Mr. P. Hunter—left Melbourne on the morning of the 30th October mounted on De Dion motor-trikes. The party were due to arrive at Albury—159 miles—the same night, but that town was not reached until 10 a.m. on October 31st. The delay was owing to the riders missing the track between Wangaratta and Chiltern. Germanton was reached on November 1st, an accident to Mr. Hunter's motor having delayed the riders. While the machines were travelling at a great speed between Bowna and Mullengandra a turn and a sudden dip in the road disclosed a small creek. The tricycle dashed into the water, which turned out to be nearly 3ft. deep, with a soft bottom. The consequence was that the machine stuck and had to be hauled out. Mr. Elliott, profiting by experience, pulled up before entering the creek, and managed to get round over a shallow place. The water flooded the case containing the induction coil in Mr. Hunter's machine, and short circuited the current. The attempt came to an end at Tarcutta on November 2nd. While travelling on a fairly good road, between Kyamba and Tarcutta, one of the tricycles crashed into a small deep hole in a broken culvert. The frame was broken in two places, and the riders reached Tarcutta with difficulty. Temporary repairs were effected there, and Messrs. Hunter and Elliott left for Wagga to catch the express, a thirty miles journey over bad roads. In consequence of the accident the trip through Sydney had to be abandoned. Considerable interest was evinced in the plucky ride, and, in view of the bad roads, the wonder is that the riders managed to travel as far as they did.

THE Motorwagenfabrik, Rudolf, Nagen, and Co. is the name of a new concern which has just been formed in Cologne, with a nominal capital of £12,500.

THE "MERCEDES" PETROLEUM-SPIRIT MOTOR.

WE are this week able to give an illustration of the new motor which is being adopted by the Daimler Motoren Gesellschaft, of Cannstatt, Wurtemberg. The engine, which is known as the "Mercedes," comprises four cylinders and is rated at 35 h.p. but gives 40 h.p. on the brake at 900 revolutions per minute. It is provided with a governor and also a hand "accelerator" by means of which the speed can be regulated as desired between 500 and 1,300 revolutions per minute. A new departure is the adoption of an improved rotary magneto-electrical sparking arrangement devised by Herr Maybach, this being fitted with a timing device which enables the sparking to be advanced and retarded as desired. The cylinders and combustion chambers are cast in one piece; the governor is adapted to act on the inlet pipe, and is so arranged that one, two, or three cylinders may be entirely cut out. In connection with the engine a new form of carburettor and the Maybach water-cooler is fitted. Of these

Cliché de

[La France Automobile.

devices we hope to have more to say in a subsequent issue. In the meantime, we may mention that with the new cooler seven litres of water will, it is claimed, run the car thousands of miles without the temperature exceeding 50 to 60 deg. Centigrade. Including the fly wheel, the weight of the 40 h.p. motor is about 4 cwt.; the new engine is also being made in 11 and 20 h.p. sizes.

ON Tuesday morning, Mr. H. W. Egerton started from John O'Groats with the intention of journeying to Land's End on a Locomobile.

In the Italian province of Pavia a motor-omnibus for twenty persons, and with room for 12cwt. of luggage, has been placed on the road between Pavia, Abbiategrasso, Vigevano, and Belgiojoso for the service of passengers between those places. The car, which runs at an average rate of twelve miles an hour, is regarded as an important addition to the means of communication between the outlying districts in Lombardy which are not served by railway or tramway.

MOTOR-TRICYCLES.—SOME DEFECTS AND REMEDIES.

BY A. E. S. CRAIG.

(Continued from page 652.)

IT is very interesting, when travelling the same journey frequently, to check the petrol consumed over a stated distance with varying mixtures; the atmospheric conditions being, of course, practically the same.

Considering that the matter of lubrication is one of real importance in motors developing the amount of heat and running at the high speed that tricycle engines do, I think that much is left to be improved in this direction. The De Dion system of lubricating tricycle motors on the splash principle is very efficient if certain conditions are fulfilled. These are, first, that a bath of oil of a certain determinable measure is always present. Secondly, that there is no undue feed or leak of oil in channels where less would be beneficial. Thirdly, that the bath or measure of oil in the crank chamber should vary according to the quality and viscosity of the oil used. The present method in universal use in all motors of the De Dion type, to pour or pump a certain measure of oil (more often guessed at than not) every twenty miles, or according to the whim of the driver, is exceedingly faulty in theory and pernicious in practice. Granted that the motor is lucky enough to start away with a proper supply of oil, is it not obvious, even to a novice, that every revolution of the fly-wheels is reducing this quantity, and that by the time the overheated motor has accomplished, say, ten miles at a fast pace, the oil bath is very appreciably reduced, there is no longer the proper amount of oil to splash, and this at the very time when the piston is groaning for more, and some other part of the motor seriously considering whether it shall not go on strike and refuse to work another second?

Some fatuous motorists imagine that by being very generous in the way of oil, they overcome this difficulty. One individual of this type, who, by-the-way, is always having his induction valve "glued" up and his exhaust valve leaking like a sieve, always starts off with a cloud of white smoke pouring from his exhaust box, and repeats the dose at nearly every hill he comes to. This man's tricycle can be smelt afar off, and, with the best intentions in the world, his one little motor does more harm in prejudicing the "man in the street" than half a dozen full-fledged Daimlers. Another man I know is exactly his opposite, and his one boast is the number of miles he can run without stopping to oil his motor. Needless to say, he has benefited the railway companies on more than one expedition; his nearly red-hot motor has suddenly jibbed, and a funereal procession to the nearest station has resulted.

It is evident, therefore, that so long as the present happy-go-lucky method of lubricating motors of tricycles is in vogue, so long will troubles emanate therefrom. The man who uses too much oil has valve troubles, and is an unmitigated nuisance; the man who uses too little has the inevitable seizures; and the man who religiously carries out the maker's instructions, and pours or pumps at regular intervals, is lubricating his motor unequally. It is like being by the sad sea waves, high tide at one time, and pebbly beach the next.

The remedy is obvious. Motors lubricated on the oil-bath or splash principle must have a regular automatic feed of oil, that will keep a certain determinable measure always present in the crank chamber. Some motors are very wasteful of oil, and start dripping wherever they stop. This is entirely due to a leak, which can easily be remedied, and economy and cleanliness point to the advisability of doing so. Sometimes the leak is at the joint in the crank pit, but more often through the axle bearings, and also at some joint between the oil tank, pump, or pipe leading to the crank chamber. Leaks along axle spindles must be stopped with suitable washers, fitted tightly to resist the forcing of oil outwards on each compression in the crank pit; leaks in joints by remaking same with fresh packing. The joint down the centre of the crank pit should, however, require no packing.

The plug, or tap, at the bottom of the crank pit should

frequently be opened to drain out dirty oil, and occasionally paraffin should be squirted in to wash it out more thoroughly. Needless to say, the paraffin must also be all drained out, and a correct measure of motor oil poured in afterwards. The ordinary ball bearings throughout the tricycle, of course, merely require the same oil and attention that those on an ordinary cycle should have, although the axle bearings should, I think, be oiled more often than they usually are, especially those warmed by the motor.

For the pinions in the aluminium box I find nothing better than pure flaked graphite, with occasionally a little oil or grease, but there is always a certain amount of oil working through from the engine, which in itself renders the powder into a paste. And I am sure that a stiff paste reduces wear and noise more than one which is more like a liquid, and it certainly is less likely to leak out and make a black mess of all the parts adjacent. The chain is best cleaned and lubricated with a stiff brush, vigorously worked into the links with paraffin and graphite. On no account oil the valve spindles of motor, merely clean with paraffin or petrol.

(To be continued.)

THE "LIVER" MOTOR-CARS.

FRONTING the main entrance to the beautiful Birkenhead Park, Birkenhead, and within ten minutes' ride of the centre of Liverpool, is situated the "Liver" Motor-Car Works, owned by Mr. Wm. Lea, an enthusiastic motorist. Some idea of the extent of the premises may be gleaned from the fact that it is possible to manipulate fifty cars at one time round the track inside the building. In addition to being district agent

for the Benz cars, Mr. Lea manufactures two types of "Liver" cars. These are fitted with genuine Benz motors, but all other parts are of English make, including the body, frame, chains, etc. The smaller of the two cars is capable of carrying four persons at a speed from one up to eighteen miles an hour, and is claimed capable of transporting persons up a gradient of one in four. The engine fitted to the car develops 3 b.h.p. at a speed of 650 revolutions per minute. The larger car, of which we give an illustration, is driven by a 6 b.h.p. motor, and has a speed ratio of from one to thirty miles an hour. It takes the form of a dogcart, and owing to a special system of springing, even with solid rubber tires, very little vibration is transmitted to the passengers. The speed-changing levers are placed very conveniently within reach of the left hand side, and are very simple in manipulation. In the smaller car one handle works both medium and high speeds, while a separate lifting-up handle in front actuates the Crypto or hill-climbing gear. In the larger car, one handle actuates the medium, Crypto and reverse gears, while the other is entirely devoted to the high-speed gear.

Mr. J. H. KNIGHT, of Farnham, has been giving his two years' experience of a Benz car in one of the county papers.

MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

The "A. C. F." Fete.

THE Automobile Club of France announces its intention to hold a great *fête* on the evening of Thursday, December 20th, at which members of the club will be permitted to introduce ladies in accordance with the society's governing regulations. A most elaborate programme is in course of preparation, and the services of several leading Parisian artists have been already secured. Immediately after the *soirée* held in honour of the exhibition commissioners the club's theatre was again given over to the contractors to complete the installation, but the work is now finished, and the 20th instant will witness this beautiful *salle* looking its very best. It is undoubtedly the feature of the Hôtel Pastoret, and is a marvel of decorative art. The "A. C. F." has indeed good reason to be grateful to M. Rives for making 6, Place de la Concorde, such a beautiful club-house as it is.

The "Auto-Velo's" Hill-Climbing Contest.

THE *Auto-Velo's* hill-climbing contest, the approaching organisation of which I spoke the other day in these columns, is not likely to be held until the weather prospects are more favourable than at present. The new daily has notified the automobile world to this effect, and the resolution is a wise one, for under existing atmospheric conditions but few motor men would care to compete in, or even assist at, a race held so far afield as that proposed by the *Auto-Velo*. The big hill at Reims is a good long run from the French capital, and as I look out to-day upon the drizzling rain and dark, gloomy sky, the prospect of such a journey, even upon an automobile, has no charms for me. Leave the event over, then, for two or three months, when with fine weather it is certain to secure a success.

Exhibition at Hamburg.

THERE will certainly be no lack of automobile exhibitions in Germany during the forthcoming year, for in addition to those already announced, Hamburg proposes to have its show of horseless vehicles, and that, too, during a period of three weeks. It is the Syndicate of Cycle Manufacturers of Northern Germany who are moving in the matter, and the well-known Herr Löffler is acting as president of the organising committee. The show will be held from April 1st to the 20th, the selected spot being the Rotherbaum cycle track. The large expensive car has so far found but little favour in Germany, but for some time past a steadily increasing demand for the more comfortable type of *voiturette* has existed, and English constructors of this style of vehicle might do worse than send specimens to next year's Hamburg Show. German makers will doubtless exhibit extensively, and many French firms will also send their productions to the free town.

Beconnais' Appeal.

BECONNAIS' appeal against the judgment of the police-court, by which he was condemned to one day's imprisonment and mulcted in a fine of sixteen francs, came before the higher tribunal at Lille last week, and the result was altogether unfavourable to the motor-cyclist. The previous sentence was confirmed, and the court expressed some strong opinions as to the rights and responsibilities of *chauffeurs*. Although Béconnais has never, to the best of my knowledge, been the cause of an accident, I cannot agree that this fact should be put forward as the strongest of reasons for his acquittal, and neither do I consider the sentence a heavy one. Racing men, as indeed all motorists who mount fast-speeded machines, must learn to drive at a rational pace through towns and villages, whatever they may do on deserted stretches of road, and all automobilists who have the welfare of the industry really at heart will assist the authori-

ties in their endeavours to put a stop to the dangerous practice of driving through inhabited spots at lightning speed. Unfortunately there are only too many motor men who seem to find a malicious delight in terrifying pedestrians, and if one could weed these individuals out the whole automobile movement would benefit largely, and would secure a higher place in public esteem than it holds to-day.

A Public Service in Belgium.

ADVOCATES of steam as the ideal motive power of self-propelled vehicles will learn with interest that a service of steam omnibuses has recently been inaugurated between the Belgian villages of Malonne and Fosses, the route followed being by way of Florefte, Sart-Saint-Lambert, and Saint-Laurent. This is the first public automobile service in the Sambre-et-Meuse district. The vehicles employed each carry twenty passengers, and although for this class of work steam almost invariably secures the preference, I fancy that petrol cars would do the work equally efficiently. None of the large steam omnibuses which I have ever seen at work have impressed me very favourably, for they appear clumsy, unwieldy vehicles. Apparently, however, they give satisfaction from a purely commercial point of view, for one hears of certain Spanish automobile transport companies paying dividends of 20 per cent. It would be extremely interesting to obtain the exact returns of some of these prosperous concerns, for at the present moment there exists profound ignorance as to the possibilities of public automobile services. Reliable figures would be of immense service to those transport contractors at present hesitating as to the practicability of substituting automobiles for the horse-drawn vehicles now in use.

To-morrow at Achères.

TO-MORROW we shall have a little sport to brighten up the terrible monotony of the dead season. No long journey into the country, oh! no; the weather is too unsettled to look forward with any pleasure to such an expedition, but just a run out to Achères, where on the famous route of the agricultural park we shall see the fastest cars and cycles at work. Thanks be to the Moto Club for thus relieving this dreary, desolate time. Commencing at 9.30 a.m., these trials against the watch will continue until mid-day, when the *contrôles* will be closed. No fewer than ten categories are provided, so that every type of motor-vehicle will find a classification suitable to its powers. The three times taken will be those for—(1) Two kilomètres from stationary start; (2) one kilomètre from stationary start; (3) one kilomètre from flying start. In the big car class we shall once again see Levegh, who never misses an opportunity of running his flying Mors, Gilles Hourgières, who will be driving a similar class of vehicle, and Mors himself, who will mount the winner of the Gaillon hill-climbing race. A goodly trio! Among the motor-cyclists, Béconnais is figuring a grand favourite, but Gasté and other speed-merchants will give him a tough fight. We are told of phenomenal performances being made in this category, but to-morrow will show us all about that. Serpollet's steamers and Darracq's already celebrated little car will all doubtless acquit themselves with credit, as also will the Lefebvre cars. Let us hope, then, for dry roads and fine weather to-morrow, so that some of those long-standing records may be demolished. I don't like to see these figures, dating back ages, on the list of current automobile records. They look out of place there.

A Race at Antwerp.

A THIRTY-SIX kilomètre (25 miles) automobile race took place the other Sunday over the stretch of road which separates Antwerp from Bergen-op-Zoom, the latter place being a little Dutch township. Promoted by the Antwerp Automobile Club, this event was confined to its members, otherwise the number of competitors would undoubtedly have been much greater. As it was, however, twenty-two names were sent in, and favoured with

excellent weather the race attracted a considerable gathering of the general public. Three categories were provided, and that reserved for voituresses secured the largest entry, for in that class ten competitors lined up at the start. The big car and the motor-cycle divisions each had five racers. If the weather was excellent, the same cannot be said of the roads, which were distinctly heavy, and by no means conducive to fast times. But here are the official returns. Cars of more than 6 h.p. and carrying at least three persons:—1, Baron Pierre de Caters, 24 h.p., four persons, time, 41min.; 2, Baron Aug. de O'Serclaes 30 h.p., three persons; 3, Théo Bal, 15 h.p., four persons, time, 1h. 15min. 30sec.; 4, Baron Eug. de Caters, 8 h.p., five persons; 5, R. Geelhand de la Bistrade, 7 h.p., time, 1h. 30min. 30sec.; not classed, Dermanet and Servais. Voituresses:—1, Emile de Beukelar, 3½ h.p., time, 1h. 14min. 30sec.; 2, Van der Beken, 3 h.p., 1h. 28min. 30sec.; 3, Xavier de Beukelar, 3 h.p., 1h. 32m. 30sec.; 4, P. Spelten, 3 h.p., 1h. 41min. 30sec.; 5, H. Cogels, 3 h.p., 1h. 42min. 20sec.; 6, Siaens, 4 h.p., 1h. 55min.; not classed, E. Van Mieghens, Wilford, Daniel de Pret, and Spirlet. Motor-cycles:—1, Alex. Joostens, 3 h.p., time, 1h. 3min. 30sec.; 2, Jos de Kock, 2 h.p., 1h. 5min.; 3, Elskampf (bicycle), 1 h.p., 1h. 12min.; 4, J. Della Faille, 3 h.p., 1h. 32min.; not classed, Van de Werve.

At Nice.

It is interesting to learn that active measures are being taken to render the scene of the Nice speed trials absolutely perfect from an automobile point of view, and there is but little doubt that the competitors in the short distance events will be delighted with the track prepared for them. The Promenade des Anglais is actually being widened from ten to twenty metres, and, furthermore, the Automobile Club of Nice is requesting the town authorities to remove the only obstacle which mars the cement-covered surface of this splendid track. This is a palm tree, and as most probably the municipality will accede to the request, the three kilometres of the track will present an unbroken surface. It is on Thursday, March 28th, that the short-distance trials will take place, the distances being as usual, one mile and one kilometre, the latter from a flying start. The prizes will also be as formerly, *objets d'art* and medals, and in this connection Baron Arthur de Rothschild has just presented to the club a sum of £40 for the purpose of striking the latter. It is said that the Baron has decided to abandon his favourite sport, that of yachting, in order to devote more time to automobilism. So much the better for the motor, will agree *chauffeurs*. Baron Arthur de Rothschild is a member of the English and French clubs, as well as of the A.C.N.

"L'ARMÉE AUTOMOBILE" is the name of a new paper which is about to be published in France.

MESSRS. BURROW, STRUTT AND CO. call our attention to a misprint in our last issue in the description of the Minerva motor-bicycle. The machine is of Belgian construction and the price is £38 not £35 as stated last week.

UNTIL an electric tramway is constructed at Hemel Hempstead a suggestion has been made that an up-to-date motor omnibus service should be organised. The expense of laying a tramway would thus be avoided, and the town would secure what is greatly needed—facilities for travelling at cheap rates.

WE have already referred to the improved carburettor recently introduced by the Star Motor Company, of Wolverhampton, which is claimed to effect a saving in petrol consumption and to increase the efficiency of the motor. We learn that, in addition to using the new carburettor in their own cars, the Star Company are arranging to fit the same to cars on the Benz system and to supply them separately.

THE London County Council has tested the Clarkson and Capel Steam Car Syndicate's oil burner on a fire-engine in regular commission during the last six months. We understand that the experiment has so far succeeded that the Council has now decided to have one of the syndicate's 200-h.p. burners fitted to a fire raft on the Thames. This burner was originally designed for automobiles, but its usefulness is now being demonstrated for other purposes as well.

THE SPEEDWELL STEAM MOTOR-WAGON.

AS we recently mentioned in these columns, experiments have been made at Persley Quarries with the view of testing the practical utility of a motor-lorry built by the Speedwell Motor Car and Cycle Company, Limited, at Aberdeen. We are now able to publish an illustration of the vehicle together with some additional particulars. Steam is supplied by a Toward boiler of the latest type, located in the fore part of a steel frame. The engine, which is of 26-a.h.p., is of the compound type, the cylinders being 4 inches and 7 inches diameter respectively by 5-inch stroke, the number of revolutions of the crank shaft being 500 per minute, with steam at 200 lbs. pressure. A two speed gear to give 5½ and 3 miles per hour is fitted, the engine and gear being suspended from the main frame between the front and rear axles. There are carried seventy gallons of water, and this quantity suffices to cover about five miles with a full load and eight miles with an empty vehicle. The platform has an area of 60 sq. feet; it is easily detached from the main frame, and can be made any form to suit the goods to be transported. The road wheels are of the gun-carriage type, the rear pair being 42 inches in diameter with 5-inch tires, while the steering wheels are 36

inches in diameter, and shod with 4-inch tires. The weight of the wagon is 2 tons 18 cwt. At the trial referred to above a load of stones weighing 3 tons 16 cwt. 1 qr. was placed on the motor-lorry, while a trailing wagon with a load of 2 tons 14 cwt. 1 qr. was attached, thus making a total of 6 tons 10 cwt. 2 qr. With this burden, the wagon successfully mounted an incline 400 yards long on the high speed, the gradient being 1 in 10.

IN the Bill promoted by the Chester Corporation for the purchase, conversion, and extension of the city tramway a clause has been inserted to run a service of motor-cars.

THE *Electro-Chemist and Metallurgist* is the name of a new monthly which is to make its appearance early in January, the publishers being Messrs. Sherard Cowper-Coles and Co., Limited. The journal is intended to be the organ of the important electro-chemical sciences and industries which at present have no representation among the English technical press.

ON Saturday, November 17th, the Automobile Club of America held a club run, in which seventeen vehicles participated. Starting from Astor Court, New York, the vehicles proceeded via Kingsbridge and Yonkers to Ardsley, where lunch was taken at the Ardsley Casino. After lunch the vehicles continued the run from Ardsley to White Plains, to Mamaroneck, over the Boston Post Road to New Rochelle, through Bronx Park to Fordham, and back to New York over the same course as at the start. The run was favoured with fair weather and good roads, and was thoroughly enjoyed by all.

CORRESPONDENCE.

THE LONGUEMARE CARBURETTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to "C. G. W.'s" letter in your issue of the 1st inst., with reference to the Longuemare carburettor, I may mention that one way of overcoming the difficulty he refers to is by dipping a cloth in hot water and wrapping it round the carburettor.—Yours truly,

S. S.

THE 1,000-MILE NON-STOP RUN OF THE DECAU-VILLE CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—On Friday, November 30th, I rode a Butler tricycle from Sheffield to Birmingham. On arriving in Birmingham I dismounted, owing to traffic and to the fact that I had no chain on, as I found it rapidly clogged with mud. The carburettor—a Longuemare—was thickly coated with snow, the pipe from the silencer having dropped off while riding and the evaporation doing the rest. This may be of interest to "Amateur," who sends a letter about this.—Yours truly,

"MOTOR-MAD."

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the letter signed "Amateur" in your last issue, in which he apparently wishes to throw doubt on the fact of the carburettor freezing, if he only studied the carburettor of any car he would find that the faster the petrol is evaporated the greater is the cold produced, and you have only to travel fast through the air on a cold day for it to be a very short time before the carburettor has simply one solid piece of ice in it, unless, of course, sufficient hot air is conducted to the carburettor to counteract the low temperature produced by the rapid evaporation of the petrol.

In the Napier car, owing to our using electrical ignition and the inside of the bonnet, of course, being relatively cool, we have had to employ a hot air-chamber entirely round the carburettor, which is kept warm with the aid of a bye-pass from the exhaust.

It seems rather a pity that "Amateur" did not get a little information on this subject before rushing into print to try and throw doubt on those facts which are known to every user of a petrol engine.—Yours truly,

S. F. EDGE.

ELECTRIC IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It may interest those of your readers who have electric ignition troubles with their cars to hear of a recent experience I have had in connection with this matter. I was sufficiently satisfied with the results obtained with my car "Antrona," which had both electric and tube ignition, to arrange to change over from the tube to the electric in my older car "Rhoda," but as the cylinder heads had not been previously prepared for ignition plugs, I deemed it desirable to remove the platinum burners entirely, and substitute the electric, practically "burning my boats" in so doing, as I had no alternative in the event of failure. I am inclined to think that the results, if anything, are slightly better with the ignition plug placed in the site originally occupied by the platinum burner rather than in the top of the cylinder, where, among other things, the contacts are liable to be covered with grease, and trouble ensue in consequence.

But the other day, while experimenting with the engine, I noticed a certain intermittence in the firing, which I naturally put down to faulty electric connection. On going very carefully over the circuit I found there was nothing wrong there, and in consequence removed the suspected ignition plug to see if it was sparking all right, and, on examination, found there was no trouble with regard to this. The spark was long and brilliant. In fact, on testing I noticed I could readily get from my coil and four-volt cells a good spark from $\frac{3}{8}$ to $\frac{1}{2}$ in. long. The spark-gap in the plug I opened to about $\frac{1}{16}$ in., as it then appeared to me to be somewhat close. On replacing it and starting the engine, firing late, it fired for a time; but as I gradually altered the period of

firing to earlier it seemed to be somewhat intermittent. It then occurred to me that the width of the spark-gap should have some relation to the amount of compression when firing took place. On removing the said plug and closing the points to about $\frac{1}{32}$ in. or perhaps less, it fired every time at all periods of compression. I mentioned this subject afterwards to a friend of mine, who made a somewhat elaborate experiment in which, in a glass tube with convenient pump and pressure gauge and adjustable spark-gap, he found that at atmospheric pressure a spark of $\frac{1}{8}$ in. passed readily between two points, but it would not jump $\frac{1}{8}$ in. at one atmosphere; and when he increased the pressure to ten atmospheres it ceased to jump at $\frac{1}{32}$ in.; but as the pressure was reduced the sparking took place again. He also noted that there was a variation in the colour of the spark under the different pressures, it getting thinner and more attenuated previous to ceasing to jump as the pressure increased.

It occurs to me that this may be one of the causes of a good deal of apparent difficulty with the use of electric ignition, viz., that we often take out other plugs to see if they are sparking, which they do under normal conditions, but when reinserted in the cylinder under a higher pressure they may cease to spark, and give rise to difficulty and intermittent firing. This is a subject which I think would be worthy of more careful attention. But I trust that my experience may be useful to others who, like myself, have been bothered with so-called intermittent faults, which may be the natural consequence of variations in pressure, and have nothing to do with bad contacts, or anything that is wrong in the rest of the electrical circuit. I would therefore advise motorists to see that their spark-gap is not too wide, among other things, when going into this question.

Yours truly,

HENRY EDMUNDS.

CARBURETTORS FOR MOTOR-TRICYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent "Alarmed" in your issue of the 8th inst., comments upon the remarks *re* the dangerous character of the surface carburettor appearing in an article on motor-cycles in one of your recent issues, and I quite understand that the assertions in the article caused him some uneasiness. Nevertheless, I do not think he need have any cause to fear. Having ridden myself tricycles fitted with the surface carburettor for the last four years many thousands of miles, and also having come into contact with a large number of other motor-cyclists using surface carburettors, on only one occasion have I come across an instance where the carburettor has exploded, and upon examination it was found that the owner had taken down the pipe from the carburettor to the motor and taken out the safety gauzes which are fitted by the manufacturers, with the result that there was nothing to prevent any flame passing back.

Messrs. De Dion and Bouton, in making their machines, fit a large number of these gauzes, so there is absolutely no possibility of an explosion, and the universal use of electric ignition also makes the safety margin a very broad one. Anyhow, "Alarm" can still ride his motor-tricycle with equanimity and rest assured that the "dangerous character" of the surface carburettor merely exists in the imagination.

Yours truly,

CHARLES JARROTT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent "Alarmed" need be alarmed no longer. The dangers of a surface carburettor, like the disadvantages of motor-cars, are more imaginary than real. He is probably aware that these carburettors are fitted with a layer of wire gauze, which protects him from the danger which he fears. I have heard of only two accidents from this cause, and in neither case was any damage done except to the carburettor.

He can therefore, I think, afford to sit astride it with no misgivings beyond those associated with stale petrol—and even this evil can very easily be remedied.

Yours truly,

CLAUDE A. P. TRUMAN,
Hon. Sec. Reading Automobile Club.

MEDICAL MEN AND MOTOR-CARRIAGES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "M.R.C.S.," it may interest him to know that I am a medical man in a country practice, and that it takes three horses to work it. A medical friend in practice in the Highlands of Scotland, who uses a motor-carriage manufactured by the Mo-Car Syndicate, Camlachie, Glasgow, advised me to get a carriage like his, which has been doing a tremendous amount of hard work on the worst of roads, and has been running magnificently for the past two years. Thinking this was a good enough recommendation I ordered a carriage from the syndicate, and they have given me truly a machine of the very highest class of workmanship, and one that goes on under all conditions of weather or roads without bother. It is a four-seated dogcart, with walnut body, the upholstery being composed of spiral springs, padded with horsehair and covered with strong morocco leather, which gives a most comfortable seat, and prevents one feeling any jolting over the roughest roads. The engine comprises four horizontal cylinders, developing 9 h.p. It is water-cooled, the circulation being maintained by means of a pump driven off the fly-wheel. A radiating coil is also provided; the ignition is electrical. There are three speeds forward, ranging up to about 20 miles an hour, and one reverse motion. The road wheels are of the artillery wooden type, and provided with solid rubber tires. Some of the special features of the carriage are its marvellously silent running, which is a perfect treat, and the absence of vibration. I often on a quiet country road run up to within thirty yards of pedestrians before they hear me, and after a long run I never have that shaky feeling that one so often has on alighting even from an ordinary dogcart. Another great point about the carriage is the ease and quickness of starting it. This is done from the driver's seat by a clever arrangement, and I am able at any time, night or day, to start off within five seconds of stepping into the carriage.

I need not go into the anatomy any further, as "M.R.C.S." will be able to get more correct and fuller information from the makers. He need not fear being unable to master the carriage very soon; my coachman was never in a motor in his life, and he drove me on my rounds after only two days' practice. My roads are pretty bad as regards gradients, one or two being 1 in 7; the carriage takes them all, and nothing I have met stops it. I drive over fields or anywhere where there are wheel tracks. Two friends who lately drove with me were so pleased with it that they each ordered one, and I can confidently recommend it to anyone who wants a carriage that will go and is thoroughly reliable.

Yours truly,
G. D. LOGAN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with great interest the opinions of numerous medical men, as set forth in your journal from week to week, and am astounded at the great enterprise shown. I am a poor parish surgeon, and have for some time been studying the question of horses for my practice, but still am undecided. I hear constantly of accidents to carriages, of horses falling, jibbing, running away, casting shoes, getting ill and old, and for other reasons becoming temporarily or permanently disabled from work, and I hesitate to embark in what seems a costly and eminently unsatisfactory venture.

What is required is a horse and cart to hold two; the horse must be powerful, nice-looking, and able to push along through mud and stony roads, never tire, stumble, get ill or lame; it must need neither whip nor jerking of the reins to start it, as this is so undignified. Fancy a poor country medical man getting ten miles from home, and his horse falling and cutting his knees and having to be led home, and being unfit for weeks! I shall carefully study the subject, but, until I can find an animal perfect in every respect, prefer to keep to my motor-car, which I have had for over a year in constant use without any troublesome breakdown.—Yours truly,

L. R. C. P.

THE WERNER MOTOR-BICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Mr. Teschemaker's letter in your last issue I write to say that I shall be in Devon before Christmas, remaining till the end of January, possibly. I should be delighted to test my Werner bicycle against his 2½ De Dion tricycle, as he suggests, but there are difficulties, for I shall be near Tavistock, and that is a long way from Teignmouth, as he knows. Weather has to be considered, nor am I at all fond of racing at top speed along West-country roads, where horses and their drivers, especially the drivers, take fright so uncomfortably. Neither do I, on my part, wish to cause them undue annoyance. Perhaps we can arrange the trial when I am in the West. I think he has misunderstood my first letter, for I merely wrote to prove, by relating a certain day's ride of mine, that the Werner machine will, and can, carry one for long distances over hilly roads at a decent speed without breakdowns. I never claimed the average speed to be anything remarkable, though I personally consider it excellent, knowing that I could have gone much faster had I chosen to open the throttle-valve of my motor completely. He should know what West-country roads are like, from north to south Devon—precipitous and winding, most unfavourable to speed. Since he raises the question, I do assert that the little machine can maintain an average speed over hilly roads which is very remarkable considering its small 1½ h.p. engine. There is a vast deal of difference between the way it responds to pedalling as compared to a tricycle, for one can maintain fifteen miles an hour up a stiff hill with but very small aid from the pedals. So very thoroughly do I appreciate the difficulties of adapting an engine and its accessories to a bicycle that I cannot refrain from expressing my admiration for the clever solution of the problem. Mr. Teschemaker must have misunderstood the Werner men, whoever they are, for no sane person would claim that he could "beat any tricycle," when we all know that 8 h.p., and more, are used on racing tricycles. If the Werner machine beat tricycles at the Exhibition official trials at Vincennes this year it was for many reasons, for speed was but one of the many points under consideration.

If Mr. Teschemaker will glance at my last letter he will see that I never used the term "amateur adjustments" at all, but "ignorant meddling." There is a vast deal of difference between the two. "Amateur" is not at all synonymous with "ignorant," above all if the true sense of the word, the French one, is adhered to. I cannot help quoting the *Motor-Car Journal* of last week, for it spoke words of deepest wisdom *re* "Necessity for Knowledge": "It should be the endeavour of motorists to dispel that notion of the simplicity of motor-car driving, as it is an incontrovertible fact that it is absolutely necessary, if the driver is to get out of his vehicle the amount of pleasure that it is capable of giving, that he should have a thorough and comprehensive knowledge of its working." That is the key to the whole wearisome string of objections, prejudices and difficulties we perpetually meet, that "necessity for knowledge!"

Yours truly,
A. L. BENETT.

MOTOR PATENT MATTERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In regard to the recent formation of the Motor Trade Protection Society, a body amongst whose members I have some friends, I think that they are being led away from the real facts of the question of motor patents without having given the matter the careful attention that they give to other portions of their business. Without even discussing the matter with the owners of the patents, they have assumed that it is a matter against their best interests. This idea I hope in this letter to entirely remove, and place my position in the matter clearly forward. How the situation has developed I will now explain. Some three or four years ago I felt that there was a large field in the manufacture and selling of motor carriages, and with that end in view I purchased from time to time samples from the leading motor makers, both here and abroad, and I then used their various vehicles many thousands of miles, both summer and winter, with the result that I came to

the conclusion that nearly all other practical users have come to, namely, that there were two great practical types of oil motor: first, the Daimler, from which common origin have sprung the great houses of Panhard and Levassor, Peugeot, the English Daimler Co., the Motor Manufacturing Co., the Napier, etc. Then, taking the small type of vehicle, there was the great parent De Dion and Bouton, to whose aid almost every successful small carriage or motor-cycle owes its driving force.

With these facts staring me in the face the next thing to be done was to find out what patents, if any, controlled their use; these I found in large numbers nearly all detail patents, but of serious importance to those wishing to manufacture these motors or those on similar lines. After consideration I decided that those companies with which I was identified would be best advised to apply for licences to manufacture from the then parent motor patent-owning company in this country, viz., the British Motor Company, Limited. Licences were in due course granted, and the manufacture and sale was commenced with the idea that the owners of the patents would give us some measure of protection from the already strong and robust foreign maker. But on this score we were sadly mistaken; on the particular patents under which we held licence little was done, and foreign importation continued almost unchecked.

However, during this summer the patent-owning company had occasion to call its shareholders together, and then I obtained the opportunity, as a shareholder and licensee, I wished for, to put clearly before the owners of the patents that I, as representing several companies which worked under their patents, must join the ranks of the infringers or give up manufacture, at any rate ceasing to pay money into the coffers of the company unless they took active steps to uphold their patent rights. With these facts before them the shareholders of the British Motor Company, Limited, were not long in making up their minds, and a call of 3s. per share was, for the purpose of legal action, soon agreed to almost unanimously. At the same time I was honoured by having offered to me a seat on the Board of the reconstructed company, now called the British Motor Traction Company, Limited, and it is purely as a member of the Board and trustee for the shareholders of this company that I am in any way interested in the service of writs and commencement of legal proceedings that have been taken and are being proceeded with against every motor vehicle seller or user, private owner or manufacturer, who the Board are advised are infringing their patents. Surely this course, which is the one the law of the land prescribes, is not one that requires the previously referred to society to combat. It seems to me that if this combination has any practical being it is for them to carefully consider the patents for which hundreds of thousands of pounds of English money have gone abroad to purchase, and see whether, in the event of their considering them good, it would not be better for all concerned to fight under their banner, and pay some consideration, as I have done, and then all of us together try and bring the manufacture of automobiles in England to the importance and prestige that it enjoys in France, Germany, and some other countries. This seems to me better than wasting time and money in the law courts, and this must inevitably come to pass if the English dealers and agents and unenlightened public still use unlicensed motors rather than follow the lead of the chief English manufacturing companies.—Yours truly, S. F. EDGE.

THE HEATING OF MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Heated," as the tubes are not clogged, the trouble must be that the water-jacket or the space between the two walls of the cylinder is partly clogged with rust, mud, and sediment, just enough not to let sufficient cooling water to pass in. The water will enter by drops and fill the jacket after a certain time, and this will evaporate on the part of the surface which is still clean; the result is that steam will be blown out, the cylinder gets heated, the engine stops, cools, and refills, and so on *ad infinitum*.—Yours truly, L. HAILER.

Breisgauer Automobile Club, Freiburg in B.

THE LOHNER-PORSCHE ELECTRICAL BROUGHAM AND VICTORIA.

TOWARDS the end of the National Cycle Show week, Mr. E. W. Hart, of Luton, added an interesting car to his stand in the shape of an electrical brougham, which is well represented by the illustration (Fig. 1) on page 699. The peculiarity of the vehicle resides in the motors, which are placed in the hubs of the front road wheels. The armature of the motor is fastened to the hub of the wheel, and the stationary field is fastened to the axle. The speed of rotation of the wheels is, therefore, the same as the speed of the motor. In order to keep down the width of the motor, the commutator is placed inside the armature, so that the width of the armature winding constitutes the whole width of the motor. The motors, of which there are two, have each $2\frac{1}{2}$ h.p. normal capacity, but it is claimed that they will work up to 7 h.p. for short periods. The battery comprises forty cells of the Leecoll type, the weight being 1,000 lbs., and the capacity 135 ampere-hours. The controller is arranged to give three speeds ahead and two reverse, electrical brakes, and is also provided with a switch by means of which the motor can be made to act as a generator in running down hill, so recuperating the battery. The car is fitted with horizontal wheel steering, and weighs complete under 15 cwt. Pneumatic tires are fitted to the road wheels. Fig. 2 illustrates an electrical victoria, identical with the brougham so far as the motor, battery, etc., are concerned. The cars are built in Vienna by Messrs. Jacob Lohner and Company, for whom Mr. Hart is agent in this country. A glance at the illustrations will show that the cars are not only attractive in design, but are luxuriously upholstered and finished.

JUST as we go to press we have received a letter from Mr. H. E. Wilkinson, manager of the Motor Trades Employment Agency, on the subject of Drivers' Certificates, which, together with a number of other interesting letters, we are compelled to hold over until next week. In his letter, Mr. Wilkinson incidentally mentions that since the Employment Agency was started, they have had over 300 replies to their advertisement in the *Motor-Car Journal*.

THE fourth annual general meeting of the Liverpool Self-Propelled Traffic Association is to be held at the Royal Institution, Colquitt Street, Liverpool, on Monday next, the 17th inst.

THE Duke of Oporto, brother of the King of Portugal, has joined the ranks of *chauffeurs*, he having lately received a 6 h.p. Panhard car from Paris.

FROM Italy we learn that a service of motor-cars for the transport of both passengers and goods has just been inaugurated between Modena and Bologna.

WE hear that the Swift Cycle Co., Limited, of Coventry, intend making their *début* early in the new year as motor-car builders. A 5 h.p. car with a gear on Panhard lines, and a body of the *tonneau* type, is at present in course of construction.

FROM an American source comes the news that the Rev. H. A. Frantz, Tamaqua, Pa., who retired from the ministry several years ago to build automobiles, has resumed his former calling—an intimation the significance of which depends entirely upon the point of view.

THE *Auto-Velo* gives some further details respecting its proposed hill contest near Rheims. The climb will be about six kilometres long, ending with a kilometre on the flat. This will be a test for the speed of the machines after the strain of the up-hill work. Times will be taken at the start of the climb and at the start of the level.

PUBLIC automobiles in Paris during the Exhibition have been almost prohibitive owing to the fancy prices demanded by the conductors. Now, however, owing to a decision of the Prefect of Police, these vehicles, like the public fiacres, will be subject to the police regulations, and will be controlled by a fixed tariff. The maximum fare will be for the numbered automobile, accommodating four persons, 2fr. the "course," and 2fr. 50c. per hour inside Paris.

FROM PARIS TO HALIFAX.

THREE gentlemen living in Halifax recently journeyed to Paris to secure a motor-car, upon which they returned to their Yorkshire home. Writing to the local *Guardian*, one of the party says:—"We had our first lesson in motor-

FIG. 1.—THE LOHNER-PORSCHÉ ELECTRICAL BROUGHAM. (See opposite page.)

car driving at the works, and on commencing our homeward journey we were accompanied by a mechanic as far as Dieppe. About six miles out of Paris we arrived at St. Cloud. Here there is a long stiff hill, where the cars are generally brought for climbing tests. Our car, with its three passengers, mounted the hill admirably, at a rate of eight miles an hour. It was night; rain poured heavily. Our driver pushed on at top speed, or about thirty miles an hour. It was an exciting experience, as we could not see many yards ahead, but we had confidence both in the machine and the driver, and duly arrived at Gaillon, where we put up for the night. The next morning we were again under way in an endeavour to reach Dieppe about 6 p.m. We soon covered twenty miles, and then came up with a funeral. In France it is the custom for vehicles not to pass a cortege on its way to the place of burial. Our mechanic explained that our desire was to catch the night boat, but custom proved too strong. Some of the men clustered in front of the car to prevent our passing, and we were compelled to follow, until the procession at length reached the cemetery, and left us in undisputed possession of the road. We dined at Rouen, and in the afternoon pushed on rapidly to Dieppe. When all appeared smooth sailing, however, the car suddenly stopped, and no power could make it budge. An examination revealed the fact that we had run out of oil, and we were four miles from the next village, and nine from Dieppe. Our attempts to get oil from the shops close at hand were fruitless, and we were just on the point of completing negotiations by which it might be brought to us from the next hamlet, when another motor-car came along, the driver of which spared us a quart of the necessary liquid. When things

were again made ready we put on a spurt, and reached Dieppe just in time to pass through the customs.

"The journey across the Channel was uneventful, and New-haven was duly reached. Here we were fortunate in finding at once a merchant who could supply us with oil, and with the tank filled we commenced our homeward journey, this time without the assistance of the mechanic, whom we left at Dieppe. However, we managed all right, and, though the road was hilly, our car mounted one stiff slope after the other with ease and celerity. It was curious to notice the different manner with which horses regarded the car. In France they took no notice, but here we had to drive with great caution, and after leaving Enfield two miles we found that our oil was once more exhausted. As this was our first experience we had no real idea for how long the oil would last, and so we had to submit to this inconvenience. One of our members walked back to Enfield, and returned in due course with a fluid that proved utterly unsuitable. The commission was entrusted then to another, who trudged off to get the necessary petrol. The third, tired of waiting by the roadside, eventually made a bargain with a passing driver, and the car and himself were towed back to the village at the tail-board of a pony cart, much to the amusement of the country folk. Difficulty was still experienced in securing the necessary oil, but this was eventually overcome by the kindness of a medical man in the neighbourhood, who owned a motor-tricycle, and kindly let us have a gallon of petrol. We stayed the night at Woking, and on leaving in the morning passed through beautiful scenery by Windsor and Oxford, and ultimately reached Birmingham. We pushed on, however, to Stafford, and there spent the night and the succeeding day. Our homeward journey was then

FIG. 2.—THE LOHNER-PORSCHÉ ELECTRICAL VICTORIA. (See opposite page.)

resumed, *via* Manchester, Littleborough, and Blackstone Edge, reaching Halifax safely, having thoroughly enjoyed our first experience of a long ride on a motor."

THE California Automobile Company has been organised at San Francisco, with a capital of £30,000.

MOTOR-BICYCLES.

MR. JOSEPH PENNELL ON HIS EXPERIENCES.

THE announcement that Mr. Joseph Pennell, who recently journeyed to Switzerland on his motor-bicycle, was to read a paper on the subject attracted a goodly number of members to the Automobile Club on Wednesday. Professor C. V. Boys presided, and briefly introduced the lecturer.

Mr. Pennell gave his address in a conversational manner, illustrating the various points with some excellent photographs thrown upon the screen. Living as he did in the heart of London, it was absolutely impossible for him to take up any form of motor-car, and there were many in the same position. If they wanted a motor-tricycle or a quad or a car they must have a stable and pay a man to look after the machine, or else make themselves slaves. Some had not the time to do that; and if they could get a machine they could look after and take care of and which would run he thought it would be an improvement on the ordinary safety of to-day. He did not pretend to be an engineer or a scientific man, but an ordinary person who loved to ride on a bicycle, but who wanted something that would go uphill and against the wind. Motor-bicycles he divided into three categories:—1. Those specially built as motors. 2. Those bicycles to which the motor could be attached. 3. Those motor-bicycles which would run and those which would not. Mr. Pennell then showed a series of sixteen views of various motor-bicycles. These included a photograph of the Singer motor-bicycle, which was described as the most beautiful piece of mechanism the lecturer had ever come across; he had seen it run very well on the asphalt at the Crystal Palace. He asked the makers to give him a chance of trying it for a week; but the matter had not yet materialised. In dismounting a motor-bicycle there should be no difficulty either in jumping off backwards or simply putting the feet down. Side-slip was rather a bogey. People had frequently told him he would kill himself some day, but that had not happened yet; and he did not see any reason why it should. The idea that side-slip arose from the weight being at the top was a mistake. He did not think the side-slip came from the weight. It came from the fact that the motor-bicycle drove straight ahead, and unless they stopped the thing the motor continued to drive. If on a bad road the rider stopped pedalling and the motor went on it would go straight ahead. He had only had one attempt at side-slip, and then he and the machine turned a beautiful somersault. It came from the direct driving on the machine. Where the motor-bicycle was driven on the front wheel it went along like the old ordinary bicycle. From correspondence which he had received from all parts of the world it was clear that intending owners of motor-bicycles wanted a machine that would go up hills and against the wind. He had no personal interest in the Werner motor-bicycle, but it had taken him half across Europe very satisfactorily. He had ridden bicycles for twenty-five years, but had had more fun and more amusement out of this machine than anything he had previously had. Some time ago he bought a motor-bicycle. He gave it up and bought a motor-tricycle; then he went in for a quad. But he had given them up because the vibration on those machines, owing to the motor being under or on the rear wheel, was so excessive that it was impossible for him to stand it. At the end of the only long ride he took on a motor-tricycle his eyes were dissolved in water, and he never suffered such excruciating agonies as during those rides. He next took to the motor-bicycle again, after reading a letter from Mr. Mansell Jones. From the factory of the makers of the Werner he took the machine on the last Saturday in August, and went over the Juras to Andermatt and Lausanne and up the first portion of the Furka Pass. With the aid of photographs and a delightfully unconventional manner Mr. Pennell gave a capital résumé of his trip, showing the zigzag character of the roads which threatened danger at many points and testifying to the remarkable roads and railways in the Swiss passes. On the whole of the trip through Switzerland he never saw a car or motor-tricycle which could hold its own with his "little beast." He did not mean to say it always went without pedalling, but a certain amount of simple, rational pedalling on a cold day was enjoyable, and enabled him to get up the hills at a surprising rate. Reference was made to the recent hill-climbing competitions at Gaillon, when out of thirty-seven cars that were entered the Werner bicycle beat every type of machine with the exception of six. Of those three were tricycles and three were cars, the latter including Levegh's 30-h.p. car. Mr. Pennell arrived at Lausanne three days after leaving Paris, having ridden 525 kilometres in eighteen hours of actual riding time. In Switzerland he could not get petrol, but got benzine. Nothing burned so well either in France or Switzerland. Motor-cars were forbidden on the Swiss passes, and at one point the gendarme turned out to stop his journey, but he (the speaker) simply slipped off the belt and pedalled round as on an ordinary bicycle—an advantage upon which Mr. Pennell expatiated in characteristic vein. On one occasion the motor-bicycle would not go, and all he did was to put it on a penny steamboat and take it to Lucerne. There he found no one who understood it; all they could do there was to entertain tourists. So he put it in a train and returned with it to Paris, where in about an hour he got it put right. From Paris to London the journey, excluding the sea trip, took thirteen hours. In conclusion he dealt upon the motor-bicycle as a form of locomotion that would be highly popular in the future.

THE DISCUSSION.

Mr. P. W. Northey opened the discussion, and, while thanking Mr. Pennell for his address, referred to the fact that he had rather decried other bicycles without giving them a trial. He (the speaker) believed

the motor-bicycle was in an embryo state and they should not discourage attempts to improve it. He had admired the arrangement of the Singer bicycle, but thought it would necessitate much cleaning of the clothes of the man who rode it sixty miles on a dirty road. Major Holden's bicycle had not been put on the market, but he had been fortunate enough to be shown some of the details, and could not help remarking upon the skill shown in getting over difficulties in some of the details. An automatic feed for the lubrication was provided, and other improvements had been adopted. The noise of all motor-bicycles was too great. He believed that the bicycle would, in the future, become an important means of locomotion, because the tendency was for people to get very quickly from place to place. Side-slip was rather a bogus fear. If a man rode a motor-bicycle on greasy roads he would not find any great difficulty as regards side slip, especially if the motor was driven on the front wheel. The Werner bicycle had an advantage in driving through a belt, as the vibration was less. With reference to speed Mr. Northey referred to a race he had had with a train between Bath and Box, he being on a Werner bicycle. After running parallel about two miles the train finally got the better of him.

Mr. H. J. Swindley thought Mr. Pennell had not dealt fully enough with the Shaw motor-bicycle. In that machine the motor was in the lower part of the frame in front of the back wheel, and was driven by means of pinion and chain wheels, through two chains on to the back wheel. He had ridden the Shaw motor-bicycle from Sutton to Burford Bridge, and found it very powerful uphill. When it was put on the market and some means of pedalling added it might take a good place. He had also ridden on Major Holden's bicycle, which was a very remarkable machine. Side slip in connection with motor bicycles was a terror for him.

Mr. S. F. Edge said the motor-bicycle was cheap, and would therefore appeal to thousands of people who could not buy anything else; but he did not regard it as a vehicle for everyday use. Certainly, as Mr. Pennell had shown, it would be extremely serviceable for a holiday. Major Holden's bicycle was very clever, but the man who bought a motor-bicycle was generally little concerned with the motor portion, and to duplicate the cylinders to the number of four was a distinct complication, especially when one might be made to suffice. The early experience with the Werner, eighteen months ago, was that it was a complete frost. It was a bicycle with a motor attached, and had all the disadvantages of the motor without sufficient power. But now a decent motor was given. He was glad Mr. Pennell liked the motor-bicycle, and had no doubt he would creep on to something bigger, for everybody would come to that. The nicest of all was the best, and to that everybody would come sooner or later. Mr. Pennell had had remarkable luck; had the Club sent forth a hundred people on such a journey only a few would have survived. The Singer motor-bicycle was something very pretty to run round a ring, but he did not think it was a practical vehicle.

Mr. New thought the bulk of the weight on a motor-bicycle should be on the steering wheel. The alternative was to put the weight on the back wheel, and he thought that the tendency then was for the machine to skid. On the other hand, it was more difficult to steer with the weight on the front wheel because that weight had to be shifted bodily. The weight on the Werner motor-bicycle should be carried lower down. On the Singer machine they had an example of the weight being placed not only on the rear part of the machine, but actually inside the back wheel, and very low down indeed. He had had two or three runs on the Singer machine, and it seemed to him that it was wonderfully free from skidding. Generally speaking, it seemed the Werner bicycle was the most satisfactory. They had not yet seen a motor-bicycle which was likely to be of a permanent type. Experience would probably alter the whole design of the machine considerably, and in a few years they would look back upon the Werner bicycle much as they regarded the old bone-shaker. On a motor-bicycle they could not stand still in traffic. On a motor-tricycle if they had to stop in the traffic it was by no means pleasant, and although they had the pedals to enable a start being made the small amount of uncertainty as to whether the motor would take up the running or not, and the trouble of having to pedal to bring the machine into a state of motion, was not pleasant.

Mr. W. Worby Beaumont said that after hearing Mr. Pennell's experiences he felt an unbounded admiration for what the high-speed petrol motor would stand. It had been suggested that Major Holden's bicycle had a complicated motor, because it had what was equivalent to four cylinders. In reality, although there were four pistons, those four pistons were in two cylinders, and were coupled together, and it was not right to say that the motor was a complicated one. It was one of the simplest motors that were made. The arrangement of its valves was also simple. It might be a question whether it was desirable to use a slow-speed motor for a purpose of this kind, but as soon as the bicycle reached anything like speed that objection died away, and the advantages of the simplicity in other parts became apparent. Major Holden's bicycle was very little known, but it was now being taken in hand by people who saw its good points. Whether the bicycle at all as a means of locomotion was likely to grow in favour he should not like to say. His own feeling was that when once on a bicycle he would rather use his own legs than a motor. It was quite true the latter would keep on going longer distances and getting up hills with more ease, but there was the objection of carrying about a much greater weight than with an ordinary bicycle, while the danger of side-slip was increased. A bicycle was only safe from side-slip when the rider took very great care.

Mr. C. Jarrott said he had ridden a considerable number of motor-bicycles. From a practical point of view the question of side-slip alone

was sufficient to prevent him from using one. He started in 1897 with the Wulfmüller. In Paris he had seen a long queer-looking motor-bicycle, about the length of a triplet. He purchased it, and one Saturday started from Holborn for a trip along the Strand. He believed he got as far as Battersea Park. He had the help of a lamp-post in mounting, and with much pedalling and assistance from two passers-by he got going. The thing weighed about 2 cwt. Then he had a De Dion machine. He had to turn on the machine and hop into the saddle. When he came to a hill he got off and ran up. Not seeing the fun of running half the way on a trip to Brighton, he got rid of that machine. He rode the first Werner machine in London, had a side-slip, turned a somersault, smashed the front wheel, and came to the conclusion that he was not a convert. He had ridden a number of such machines since then, and was of opinion that a serious accident would, sooner or later, happen to any ordinary individual in whose hands they were placed.

Professor Boys said nothing terrified him so much as side-slip, whether on a bicycle or a motor-car. On a motor-bicycle it must be very bad. As to the height of the motor and side-slip, his impression was that height was, in the case of the ordinary cycle, an advantage. But if side-slip did occur it was all the worse. In the early days of mechanical cycle locomotion they were told that these machines were to be aids to the ordinary machine, as a sort of help in case of difficulty. But anybody would see that such an aid on the hill would need more carrying about on the level. Unless the machine was capable of making the rider the help it would be no good at all. They had now got to that point in which the rider admitted himself as being a sort of help only in case of some unforeseen circumstance. Mr. Pennell had shown that he was able to get about with more risk and more excitement upon a machine of this sort than upon any other. With regard to Major Holden's bicycle, the complication of what were called four cylinders was imaginary. The extreme simplicity of the construction was due to the fact that two steel tubes which did not need boring out were used. With the four-cylindered motor he had a distribution which gave an explosion to take place 1, 2, 3, 4; 1, 2, 3, 4, round the two ends of the explosion chambers, which gave at every half turn an impetus resulting in an equable kind of driving. This was a valuable point, tending to minimise to a large extent the evil effects of side-slips. Professor Boys concluded by putting to the lecturer an interesting problem with regard to the direction of rotation of the motor with respect to the rotation of the wheels of the machine, and also as to the gyroscopic influence of the motor upon the stability of the machine.

Mr. Pennell replied, after which a hearty vote of thanks to him and the chairman concluded the proceedings.

THE Daimler Motoren-Gesellschaft, of Cannstatt, reports a profit of £9,484 for the last financial year and is declaring a dividend of 5 per cent.

THE Blood-Mille Motor Vehicle Company has been formed at Minneapolis, U.S.A., with a capital of £100,000, to manufacture and deal in automobiles.

THE importation of a steam motor wagon into Pietermaritzburg is another evidence of the steady creeping into favour of these machines, says a South African paper.

THE Russian representative of the firm of Messrs. De Dion et Bouton has obtained permission from the authorities to run ten motor-cars for public hire in Warsaw. The permission is granted for a year as an experiment. No tax will be charged until the utility of the new method of locomotion has been demonstrated.

THE Automobile Club of America has lately issued its first club book. It contains a vast amount of information that should prove valuable to all users of motor vehicles in America. Among other things, it contains names of officers of various automobile clubs, road ordinances, legal opinions on motor-cars, road books and maps, etc. It also contains full names and addresses of members.

In Washington, Minister Wu Ting Fang, of China, has attracted a great deal of attention with his locomobile. He was, states *Automobile Topics*, one of the first of the foreign representatives in America to take up automobiling, and he has become an expert chauffeur. When he returns to China, and takes his machine with him, he will no doubt open the eyes of his fellow countrymen.

THE Trinity Manufacturing Co., of Keene, R.I., has just completed a light steam-car. The boiler is of the upright and tubular type. The engine is a two-cylinder machine, the cylinders being 3 inches dia. by 3½ inches stroke. The petrol tank has a capacity of 8½ gallons, which is claimed to run the vehicle about 60 miles on hilly roads, or 100 miles on well-graded macadam roads. At the right of the driver are a reversing lever and a throttle lever, which latter is said to return to the "off" position automatically, if the operator releases his hold, but which may be locked in position if desired.

HEAVY MOTOR TRAFFIC IN FRANCE.*

By M. GEORGES FORESTIER, Inspector General of Roads and Bridges in France.

(Continued from page 688.)

ROAD traction presents the very great drawback of varying considerably, not only on the same surface through inclines, but also and especially by as much as three to one, according to the season of the year. Hence the motor must be sufficiently powerful to overcome the resistance which the most hilly part of the road will present on the day when the road is in the worst state, unless on that particular day the useful load can be reduced without inconvenience. The steam engine, which enjoys the precious advantages of a variable cut-off and boiler pressure, seems to be the motor that is preferred for the *Poids Lourds* which have to convey passengers at relatively high speeds. When the dimensions are calculated for average resistances, it is able to meet occasional increased demands, provided the boiler is in a state to furnish the extra steam. The weight of and space occupied by the motor and its boiler, as well as the evaporative power of the latter, are, then, the most important problems which constructors have to solve.

Regarding evaporative performance, the boilers which, in France, give the best results are the "Field," which is employed on the Scottie vehicles; the De Dion and Bouton, which is employed on the vehicles of this firm; the "Nielaue," which is employed in the Le Blant tractor; the Turgan, which is employed in that vehicle; and the Serpollet, which is of the instantaneous generation type.

In addition to the water and fuel required for the actual journey, there must also be taken into account the weight of the quantities carried in order to avoid running short between points of supply. In a regular service to a suburb of an important centre, an omnibus will generally have to carry out its usual functions of taking up and putting down passengers and goods at points close enough for the re-equipping to be done without loss of time. At the trials a little over nine miles was allowed, and this is obviously excessive.

The Serpollet boiler, which does not contain water, would seem at first sight to have a higher evaporative efficiency than is the case, but the reserve of heat provided in the mass of the heated tubes is, by reason of the low specific heat of iron, obtained only at a cost of greatly increased weight. In order to reduce this weight, it is necessary to apply fuel producing the greatest number of units of heat per unit of weight. In practice the following evaporations per lb. of fuel are obtained:—

Coal	7.0 lbs.
Coke	5.5 "
Petrol	6.5 "
Heavy Oils	13.0 "

Hence it would seem that coal is superior to coke, but with this fuel the control of the firing is very delicate, especially if one wishes to avoid smoke, which should be strictly prohibited, if not in the country at least in a populous district. Heating by liquid fuel, which saves considerable weight and dispenses with the presence of a stoker, seems the ideal method of firing. Unhappily, in France the rights for petroleum and its derivatives constitute a monopoly which renders their employment too costly for industrial automobilism. Again, creosote oil is employed for preserving railway sleepers, and its industrial worth for that purpose eclipses its calorific value.

The internal combustion engine, of which the heat efficiency is notably greater, offers for this kind of traffic prospects which we are now going to examine. The 12 h.p. four-cylinder omnibuses of Messrs. Panhard and Levassor, which have taken part in our trials, were as follows:—In 1897, total weight, with fourteen passengers, 3.8 tons; commercial speed, 10 miles per hour. In 1899 and 1900, total weight, with fifteen passengers, 4.6 tons; commercial speed, 9.4 miles per hour. If the itinerary did not admit of ups and downs, the explosion engine would be much superior to the steam engine on account of its lightness, which is so desirable. But, unfortunately, the power of the explosion engine is practically constant, and any increase of resistance has, therefore, to be compensated for by a corresponding decrease of speed. Again, the spirit costs much more than coke, as will be seen when it is mentioned that in the De Dion and Bouton system the consumption of gas coke per net ton-mile was 5.75 lbs., compared with 0.173 gallon of petroleum spirit in the Panhard and Levassor system. In 1898, in an omnibus fitted with a 9 h.p. Rozer-Mazurier two-cylinder explosion engine, the consumption was reduced to 0.104 gallon of commercial spirit per mile, for ten travellers.

At Versailles, gas coke costs 29s. 6d. per ton; deodorised spirit (0.700 S.G.), 1s. 6d., per gallon; commercial spirit, 1s. 1½d. per gallon. The cost of fuel per net ton-mile was, therefore, at Versailles:—

0.91d.,	using steam from (coke-fired) boiler.
3.15d.,	" deodorised spirit.
1.40d.,	" commercial spirit.

These figures would evidently be altered in favour of coke in the neighbourhood of coal pits, and in favour of the explosion motor in the vicinity of petroleum wells. Hence, in France, if one does not take road maintenance into account, the explosion motor, even with the economy resulting from the employment of a single mechanic to drive and no stoker, is useless for the quick conveyance of goods, especially on hilly roads where a reduction of speed has to be resorted to in the absence of an increase of power.

In 1898, after its success in the trials for hackney vehicles at Paris, the electric motor, in spite of the weight of the accumulators and necessary *impedimenta*, was thought capable of doing its share in the rapid trans-

* Opening Address of Fifth Session of the Liverpool Self-Propelled Traffic Association, being the local centre of the Automobile Club of Great Britain and Ireland, December 3rd, 1900.

port of people or goods. At the Versailles trials of 1898 there was a delivery van of the Jenatzy type which carried a useful load of 1.67 tons, and was able to run twenty-five miles without re-charging, at a speed of seven miles an hour. The particulars of this vehicle are:—

Dead weight, 3.25 tons	Tare	2.04 tons.
	Driver and stoker ...	0.14 "
	Accumulators ...	1.07 "
	Useful load ...	1.67 "
Total ...		4.92 tons.

Several vehicles of this type have been used by the *Grands Magazins du Louvre*, but it has been clear for some time that it is an advantage to reduce the load to 12 cwt. The *Bon Marché* have some Krieger delivery vans which work with success under these conditions, but this being so they no longer come under the category of *Poids Lourds*.

The problem of weight appears to have been solved at the 1900 trials at Vincennes, by the Riker electric delivery van, of which the total weight was 2.82 tons, and the load 0.9 ton. The accumulators weighed 0.63 ton. It is true that it was only able to cover the 31 miles of a hilly road, without re-charging its accumulators, by acting as an actual delivery van; that is to say, by depositing portions of its load of pig-iron at different points of the route, and picking these up again in the evening before going back to be weighed. After a total course of 155 miles on very trying roads, this vehicle showed no signs of wear whatever.

Electrical energy can be so easily and economically produced in mountainous countries, which are frequented in summer by tourists, that several hotels have thought of making use of omnibuses with electrical motors in order to take their passengers to and from the station. M. Jeantaud, at their request, has studied carriages of this type, but so far as I know he has not made use of any of them.

Another class of vehicle, which made an excellent performance on the roads of the Vincennes Annexe, is the electric motor omnibus with an automotor trolley, and this seems to provide the solution of the light automobile for the carriage of passengers and goods by road in hilly countries, for no motor excels the electric motor for variable powers. This omnibus, for twenty-four people, weighs 3.5 tons empty, and, when fully laden, 5.2 tons.

It runs in the midst of other carriages as if it were independent of its electric overhead wire. It owes this seeming independence to the fact that its trolley is self-propelled.

Briefly, this is the principle of its automotor trolley: The small, grooved, metallic rollers, which run on the two conducting wires, are driven by a three-phase motor connected, through an induction coil, to an alternator driven by the motor of the vehicle. The trolley thus moves itself along, the connection between it and the vehicle being made by a flexible cable of two conducting wires—the first leading the current to the motor on the vehicle, and the second the alternating current from the vehicle to the two poles of the induction coil on the trolley.

The only difficulty is the meeting of two vehicles which, fed by the same wire, require to pass each other going in the same direction, or cross each other going in opposite directions. The very simple solution which has been adopted consists of exchanging the transmission cables of the two vehicles, which enables them to overtake or cross each other at any point on the line. The only weak point in this application of electrical energy to suburban traffic is the capital outlay on the overhead line. This solution at once strikes one as being specially applicable on long lengths of road where overhead wires already exist for the transmission of electrical power for industrial purposes.

Good Vehicles.—Let us pass now to the *Poids Lourds* employed for the transport of goods.

The powers of the motors and the weights of the motor-wagons which have successively figured in our meetings have been, for steam:—

Date.	Maker.	Type.	Fr'ght	Total Weight	I.H.P.	Com. Speed
			tons.	tons.		miles per hr.
1897	Scotte	Lorry, with single trailer	4.1	11.6	16	4.0
1898	De Dion and Bouton	Lorry	3.2	8.7	30	7.1
1899	Ditto	Ditto	3.9	9.7	30	9.2
1900	Ditto	Ditto	2.3	7.5	28	8.3

In the same way as for passenger vehicles, after having brought the total weight to nearly 10 tons, which the roads could not carry without damage, especially with a commercial speed of nine miles an hour, the constructors have come back to total weights which are less, but the speed is still very high. This tendency in construction is not only caused by what the public attach so much importance to, namely, the speed, but also and especially because in the calculation of the expense per net ton-mile interest and depreciation play a preponderating part, as can be seen from the excessive prime costs of to-day. Hence the constructors believe it necessary that their vehicles should be able to do a still greater number of miles per day.

On the other hand, they estimate maintenance and repairs at a fixed percentage, whatever the speed, which is a mistake, because these expenses are manifestly the result of shock and vibration, which increase enormously with the speed, as the considerable weight which the wheels of these vehicles have to support does not admit of the use of resilient tires. The curves in which Messrs. Bovaine and Julien have summed up

their calculations and researches on the powers necessary to impart a given speed to different loads on the roads (see *Road Locomotion*, by Professor H. S. Hele-Shaw, F.R.S., page 182—published by the Institution of Mechanical Engineers) show very clearly that the same power, 10 h.p., for example, will allow the conveyance of three tons at a speed of thirteen miles an hour, and three-quarters of a ton only at a speed of thirty miles an hour. That is to say, one obtains, for the same expense of fuel, thirty-nine net ton-miles per hour in the first case, and only twenty-two and a half in the second.

If one considers the lower powers, one sees that with 6 h.p., for instance, one can carry three tons at a speed of nine miles an hour, and half a ton at a speed of twenty-seven miles an hour. That is to say, in the first case one obtains twenty-seven net ton-miles an hour, and only half that number in the second.

Since, in the transport of goods, it is economy and not high speed which is the essential point, one must recognise the importance that attaches to the use of the motor-wagon with a proper load and at a moderate speed. We in France, therefore, believe that the future success of the transport of goods will be achieved by slower automobile vehicles. The difficulty of reducing a big deadweight, which is particularly difficult in automobile vehicles, appears to some to have been solved by road trains, where the total load is spread over a greater number of wheels. In order to understand the merit of this solution, one must consider the load which has to be borne by the driving wheels in order to give the necessary adhesion. In self-propelled vehicles one is obliged to place upon them about 60 per cent. of the total load. For example, in the De Dion and Bouton lorry of 1899, with a useful load of 3.9 tons, 5.8 tons, out of a total of 10.5 tons, was carried by the driving wheels; whilst in the Scotte lorry of 1897, with a useful load of 4.1 tons, the 5.6 tons on the driving wheels scarcely gave 0.48 of the total weight, which appears to be too little for all conditions of road haulage. The solution of the problem would be to make all the wheels drivers, when the load could be distributed equally.

As has been seen in the case of passenger vehicles, lorries with explosion motors offer, for the transport of goods, the advantage of a smaller deadweight. In this class the lorries of Messrs. De Dietrich and Co. have shown very good results, as the following table shows:—

Date.	Maker.	Type.	Freight	Total Weight	I.H.P.	Com. Speed
			tons.	tons.		miles per hour
1897	De Dietrich	Lorry	1.2	2.5	6.5	5.3
1898	Ditto	Ditto	1.5	3.3	9.0	6.7
1899	Ditto	Ditto	2.3	4.1	9.0	6.6
1900	Ditto	Ditto	3.0	4.8	9.0	7.6
1900	Panhard and Levassor	Ditto*	2.0	4.4	8.0	7.4
1900	Peugeot	Ditto†	1.2	2.4	8.0	8.3

* Solid rubber tires on steering wheels.

† Solid rubber tires on all wheels.

The title of *Poids Lourds* truly applies to the electrically-propelled lorry which the Say Sugar Refinery have had built in order to carry loads of refined sugar between their manufactory, 163, Boulevard de la Gare, Paris, and the different stations of the various railways of the capital. This lorry weighs 11.8 tons with the accumulators, and carries 10 tons of sugar. The motor is 20 h.p. In the runs which it made during the recent trials at Vincennes it reached a commercial speed of 3.3 miles an hour. It mounted the hill of Courbeaux, which has a gradient of 10 per cent., at a mean speed of 2 miles an hour, taking a current of 200 amperes at 155 volts. Experience alone can teach us the economic results of this attempt. In any case this lorry deserves to be made the object of detailed study, for its construction does honour to the engineers of the firm of Postal-Vinay, who designed it.

At the present time the Say refinery is experimenting with a lorry of German manufacture, which has a driving bogie in front. This fore-part, which is steered by a quadrant, carries an electric motor. The weight of the lorry when empty is 8 tons, of which 4.1 tons is carried on the fore part and 3.9 tons on the rear wheels. The accumulators are placed in a box below the platform. The useful load is only 3.4 tons, on account of the hills that have to be climbed. The motor, which is of 10 h.p., appears to be inadequate for a total weight of 11.4 tons in Paris, and the vehicle certainly cannot take a load of five tons, or a total weight of thirteen tons, for which it was designed.

Costs of Working.—We have now arrived at the essential part of this address, viz., the working costs for the transport of passengers and goods by automobile vehicles. In order to deduce the cost per net ton-mile, or per passenger-mile, from the consumptions found at our trials, we have decided that the expenses must be divided into two groups—

- (1) Those which remain practically constant whatever the volume of traffic and the useful load;
- (2) Those which vary with the load carried and the number of miles covered.

The first group includes interest, depreciation, the wages of the mechanic and stoker, fuel, grease, and lubricants. In practice, the consumption of lubricants varies slightly with the number of miles covered during the day. Again, to the fuel necessary for actual running you must add that which is burnt during the stoppages between two successive journeys, and in the course of delivery and collection of goods. Finally, for want of sufficient data for calculating the main-

tenance and repairs of the vehicle, engine, boiler, etc., which evidently depend upon the amount of work which is demanded of them, we have estimated them at from 10 to 15 per cent. of the prime cost of the vehicle.

This rate is manifestly too low, although the prime costs are so excessive at present. In vehicles whose wheels can be fitted with rubber tires, the tanks, the boiler, the motor, and the various parts of the transmission escape the worst shocks, but the cost of the tires reaches a high figure. The "*Poids Lourds*," both lorries and omnibuses, until the 1900 trials had no resilient tires, and accordingly the hammering action of the roads on the wheels, which, of course, are below the springs, caused excessive wear on this essential part and necessitated frequent repairs. In this respect the 1900 competition was one of the most instructive, for two of the oil-propelled lorries which appeared there had taken part in the grand manoeuvres of the French army and had not been repaired at all. Before the end of the trials their wheels had to be pressed, especially the driving wheels on the right. Experience with racing carriages seems to prove that the springs have to be changed after about 2,500 to 3,700 miles' running.

It is necessary, therefore, to increase the rate from 10 per cent. to 25 per cent. on the purchase price, in order to cover maintenance and repairs. If we take rent, rates, and taxes into account, it will increase the expenses of the first group by 10 per cent.

The second group of daily expenses comprises the consumption of fuel and water.

The following are the costs which have been drawn up, on these lines, from the data of the different trials:—

COSTS PER PASSENGER-MILE, INCLUDING LUGGAGE, OR PER TWO CWTs. OF PARCELS PER MILE.
(In decimals of One Penny.)

Peugeot lorry (1900) ...	6.98	3.95	2.93

You will remark that in these costs no figure appears for road maintenance. In France, at least on the National and Departmental roads, vehicles have only to pay a carriage tax and some indirect contributions payable by any public service. On the ordinary and parish roads the contractors for regular automobile services would probably have to pay taxes for the repair of roads subjected to exceptional wear and tear. It

is certain that in this case the contractors would have an interest in diminishing any load which would prejudice them in this respect by seeking to reduce the total weight, instead of favouring the opposite tendency. If one looks at the question of transport from the point of view of the community which maintains its roads out of such a tax, one will have to take into account this expense, and then, perhaps, a regular transport service, particularly of goods, by automobile vehicles, may prove to be more costly than by railway. However that may be, if one compares the costs of passenger carrying or parcels delivery by automobiles with the charges of the railways, one sees that, setting aside the question of speed, these road vehicles can perform the transport with profit to the contractor and benefit to the public. This is especially the case when one remembers that the points of departure and arrival can be in the actual business centres, whilst the stations are often on the outskirts of a town.

Of practical results we have not much to show. Many regular passenger services have been established, many more will soon follow, but none of them have lasted long enough to supply reliable particulars. We must not, however, conclude from the checks received that these services are not practical. The cause of the want of success appears to be the high price of the vehicles, which has forced the users to content themselves with inferior plant, which has not been properly repaired and maintained. Again, instead of establishing several services connecting an important centre with a number of neighbouring localities, which would allow of the establishment of one single repairing shop for all, and instead of commencing by conveying passengers without a fixed time-table, which would have provided for the inevitable hitches at the beginning of a new industry, the contractors have commenced by guaranteeing services between a railway station and a locality which has made them hope for important traffic. The break-down have discouraged the passengers, who have sometimes lost their trains, and the lack of a repairing shop, the establishment and maintenance of which would have made too big a hole in the general expenses of a single line, has forced the vehicles to go on running until they could go no longer.

(To be continued.)

To commemorate the King of Belgium becoming the *Haut Protecteur* of the Belgian Automobile Club, the club is organising a grand banquet for the 22nd inst.

OFFICIAL returns just issued show that during the nine months ending with September last, automobiles valued at £249,600 were exported from France, as compared with only £99,720 in the first nine months of 1899.

As a result of his recent visit to America, Mr. M. D. Rucker is reported to have secured control of the patents of a new heavy oil motor, of which great things are expected. Mr. Rucker is getting some of the engine and transmission gear parts from America, and hopes to have a car ready in about two months.

EX-BAILLIE BROWN, chairman of the directors of the Caledonian Motor-Car and Cycle Company, Limited, Aberdeen, and Mr. J. H. Paterson, managing director of the company, left that city for the Continent on Tuesday last. The chief object of their journey to the Continent is to visit the works of the Daimler Motoren Gesellschaft at Canstatt, Wurtemberg. The Caledonian Company some time ago completed arrangements for the purchase of about a dozen large motor-cars, each to carry sixteen passengers, according to the specifications supplied, and the object of the visit to Germany is to inspect the cars, which are now ready.

VERY few motorists have an accurate idea of the grade per cent. they can climb. If their vehicles go up easily they are apt to underrate the grade; while, on the other hand, if it is hard work to get up, they are apt to greatly overrate the grade. There has been no convenient instrument with which to measure grades. Pendulums with a graduated circle have been tried and answered fairly well when at rest, but besides being very bulky they were entirely unreliable when attached to a vehicle under motion. The vibration would cause the pendulum to swing back and forth so that readings could not be taken. An American concern, the Adams Company, Dubuque, Iowa, have just placed upon the market a simple but ingenious little instrument, that may be attached to the side of the seat of any vehicle, and the grade the vehicle is ascending or descending can be determined at a glance. Gradometer is the name given the instrument, which consists of a nickel-plated casing, 6 inches long, containing a curved glass tube filled with spirits, leaving a small bubble which acts the same as a spirit level. The casing has graduations on one side of the opening, and figures from 0 to 30 each way from the centre on the other side, so the per cent. of grade can be read from the level to 30 per cent., either ascending or descending.

ACTION OVER MOTOR-CAR STORAGE.

AT Brompton County Court, on Tuesday, before Deputy Judge Clement Lloyd, the Automobile Association, Limited, brought an action against Messrs. Weigel and Co., Limited, described as wine and biscuit merchants, Spring Vale Terrace, Hammersmith, W., for the recovery of certain motor-cars and motor-tricycles, with accessories, or £50 as their value. Mr. Canot, counsel, appeared for the plaintiffs, and Mr. J. Osborn, solicitor, for the defendants. Dr. E. Lehwess, managing director of the plaintiff company, stated that Mr. D. M. Weigel formerly held a similar position under the Automobile Association. In October, 1899, he sold to Mr. Weigel, who had recently severed his connection with the association, motor-cars and cycles to the value of £1,620. These motors included those which were the subject of the present claim. The terms of the sale were that £50 should be handed over in cash, and that the balance should be paid by instalments at the expiration of nine and twelve months. The £50 was duly paid. Subsequently the Automobile Association brought an action, in which they sought, and ultimately obtained, an interim injunction, setting aside the sale. On January 25 last an agreement was entered into by which the Automobile Association were to obtain the return of all the motors sold to Mr. Weigel, while he was to have his £50 returned to him. Some of the motors were brought away from the defendants' premises but others remained there. Mr. Osborn remarked that he was not going to dispute that his clients had possession of the motors as claimed, but he maintained that there was rent due to the defendants for storing the cars, etc., and this rent they counter-claimed.

Dr. Lehwess went on to say that his association did not leave the motors on the defendants' premises owing to want of room on their own. On September 12 last Mr. Weigel ceased to be manager to the Automobile Association, and on that day gave him (Dr. Lehwess) a note by which he might obtain delivery of the cars which were now claimed. In this delivery order there was no mention whatever of any charge being made for storage of the cars, etc., and nothing had been said to him about such a charge. When shortly afterwards application was made for the cars, the defendants sent in a claim for storage. This claim was at once repudiated, but up till the present time the Association had been unable to get possession of the cars, etc. Cross-examined: It was quite true that he was the largest shareholder in the Automobile Association, but he was not practically the only one, for several of his friends also had shares in the concern. Mr. Osborn: I find at Somerset House that the paid-up capital of the Association is £7. Is that correct? The witness: No, that is not so. Cross-examination continued: He, as manager to the Association, sold the goods to Mr. Weigel. It appeared that Mr. Weigel retained the cars, etc., in question as security for his £50, referred to above, which had never been refunded. Witness was not told that the goods were retained because rent for their storage was owing. It was not a fact that the Association had no room for the goods, for at that time they had ample space for them at the premises which they formerly occupied at 1, Prince's Road, Holland Park Avenue, Notting Hill, W., and also at their stables in Portland Road, Notting Hill. Demand had been made for the cars, etc., in question to Mr. Weigel personally and also to the defendant company. It was totally untrue to say that he had ever agreed to pay half-a-crown a week for each of the cars or tricycles stored by the defendant company. In answer to further questions, the witness admitted that his association charged 7s. 6d. a week for storing a motor-car, but this included the work of keeping it clean. It was not true that on January 25 he received a letter purporting to confirm a verbal agreement to pay storage money. Mr. Frederick Frentzel, manager to the plaintiff association, gave evidence to the effect that he had never heard of any agreement for his people to pay rent for storing the cars, etc., in question.

Mr. D. M. Weigel, of the defendant firm, agreed with the evidence given by Dr. Lehwess as to the purchase of the cars and cycles, etc., for £1,620, the interim injunction being executed setting aside the sale and the agreement for the return of the goods, and the refunding of the £50. Subsequently Dr. Lehwess asked him to store the motors in question, agreeing to pay half-a-crown a week each for their storage. This agreement was confirmed by the letter of January 25, which he handed to Dr. Lehwess. It was absurd to say that he retained the goods as a security for the £50, because, as a matter of fact, he then owed the Automobile Association about £250. Mr. Canot: I call for the letter-book in which this letter was copied. Mr. Osborn: We do not produce it. Mr. Canot insisted that as this book was in Court, and had been referred to, it should be put in. The learned counsel also made some most serious suggestions as to this letter and the alleged copy in the book, and the defendants' solicitor declined to put in the book. The judge said he thought that, after the suggestions made by the plaintiffs' counsel, the book should be put in. This having been done, Mr. Weigel, in answer to other questions, said that the letter in question was dictated by him to his sister, who wrote it, and that the letter was then handed to Dr. Lehwess. Frederick Studwick, a man in the defendants' employ, stated that he heard Dr. Lehwess agree with Mr. Weigel to pay for the storage of the motors in question. Mr. Harold John Orchard, formerly in the employ of the plaintiffs, stated that Dr. Lehwess consented to lend him one of the motor-tricycles, which were stored on the defendants' premises, and that when he went for the machine Mr. Weigel told him that he could not let the machine go because rent was owing for storage. Mr. Canot repeated his suggestions about the letter, and its alleged copy of January 25, and asked that the case might be adjourned so that Mr. Weigel's sister, who was supposed to have written the letter, might give evidence, and also in

order that other witnesses might attend. The Judge: I am not going to adjourn the case. I shall decide it upon the evidence before me. The claim is practically admitted, and I think that the defendants have succeeded in their counterclaim. There will be judgment for the plaintiffs on their claim, and for the defendants on their counterclaim, with taxed costs on both sides.

MOTOR-CAR LITIGATION.

BEFORE Mr. Justice Cozens-Hardy, last week, a motion in the action of La Société Panhard et Levassor, and the Panhard and Levassor Motor Company, and the Panhard Motor Company was mentioned by Mr. Vernon Smith, Q.C. The plaintiff asked for an injunction to restrain the defendants until the trial or further order from using the names of Panhard and Levassor, or any title or description which included those names, in connection with the manufacture or sale or use of motor-cars. The learned counsel stated that the defendant company had recently been formed in this country with the object of taking the trade of the plaintiffs—a French company—by using their name. The defendants had not yet commenced business. Mr. Eve, Q.C., thought the case was one for the trial of the action, and without prejudice the defendants would not commence business in connection with the sale, use, or manufacture of motor-cars until the trial of the action; but he asked that the trial should be expedited. Mr. Vernon Smith assented. Mr. Justice Cozens-Hardy thought that was a reasonable course, and he ordered that, the defendants undertaking in the terms of the notice of motion, the motion should stand over until the trial. It was arranged that the parties would agree to be bound by the judgment in the first action, and that the action against the second parties would be stayed. The action would be set down at once.

ACTION OVER MOTOR-CAR ACCESSORIES.

IN the Lord Mayor's Court, last week, Messrs. Friessell's, Limited sued Mr. Kitto to recover the sum of £9 for goods sold and delivered. The defendant raised a counterclaim for commission due. Mr. Jelf (instructed by Mr. Chaproniere) was counsel for the plaintiffs, and Mr. Young (instructed by Mr. Cheverton) for the defendant. Mr. Friessell said that the defendant purchased a motor-car of him. It was a second-hand car, and would have to be taken as it stood. Afterwards certain accessories were ordered by the defendant, and in respect of those goods the claim was now made. The defendant alleged that the accessories were included with the motor-car, and that he had paid for them in the price of the machine. Before the evidence was called for the defendant it was intimated that the agreement upon which the defendant relied in support of his counterclaim was lost, and could not be put in evidence. The Common Sergeant considered that that put an end to the counterclaim. Eventually, upon a suggestion from the Judge, the parties came to terms, a verdict being entered for the defendant on the claim, and for the plaintiffs on the counterclaim, except as to £5 13s. 6d., the defendant to have the costs on his counterclaim up to the time of the admission by the plaintiffs on the proceedings that that sum was due.

FURIOUS DRIVING CASE.

AT the Chertsey Petty Sessions last week, M. le Baro, a French engineer, of London, was summoned for driving a motor-car at an excessive speed at Egham Hill on November 25. William Whipp, engineer, of Egham, estimated the speed at which the defendant was driving his motor-car from Virginia Water to Egham at from twenty to twenty-five miles an hour. The car was going down hill, without the brake on. Subsequently, on turning a bend he saw the motor-car backing into the road, having evidently collided with some gates. The vehicle sustained some damage, as did the gates. Buckley Allen of Egham Hill, said he was astounded at the pace at which the car was travelling just before he saw it run into the gate. The pace must have been about twenty-five miles an hour. John Spencer said he was cycling down Egham Hill when he saw the motor-car; it was evidently out of control. His idea of the speed was similar to that of the other witnesses. Defendant, who pleaded that brake did not act, was fined £3 and costs.

THE Motor-Car Journal.

Vol. II.]

LONDON, SATURDAY, DECEMBER 22, 1900.

[No. 94.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE Automobile Club has shown," says the *Times*, "an admirable desire for compromise in the general interests of the community." Such is the verdict of the Press on the letter to which we made reference last week. Journalists have begun to recognise that fast speeds have only been indulged in by an insignificant minority of motorists,

and that owners of motor-vehicles are gentlemen and sportsmen, whose object is not to go on man-killing and children-frightening expeditions, but to get pleasure from a new pastime, the development of which means much for the future of British trade—both in engineering, road-making, and catering. There may not be much in common between engineering and catering, but there is a very tangible relationship between the encouragement of the automobile and the revival of the best class of hotels on all the main country roads.

Action Delayed.

ALREADY the letter sent by the Automobile Club to members of the County Council and other authorities is bearing fruit, and has been mentioned at several meetings of such bodies. Evidently some of the opponents of the motor-car do not

quite appreciate the efforts now being made to place the other side of the case before the public, and we are glad to recognise that in some cases it has been decided to postpone further action for awhile.

In Devon.

IN Devonshire, for example, several of the county councillors are opposed to automobiles. A Mr. Hurrell has declared that "they did not trouble about the person who was riding on the motor-car," and the Rev. Vowler Tanner, having

referred to those ancient and historical people the Medes and Persians, said it would "be better for the present to keep the limit down to a moderate pace." Why the present should be limited we know not; and apparently the reverend gentleman did not succeed in converting his brethren to a recognition of its importance. Anyhow, on the motion of Lord Elbrington the proposal of the committee with regard to speed is not to be acted upon. For which relief, many thanks.

Liverpool Self-Propelled Traffic Association.

THE report of the Liverpool Self-Propelled Traffic Association for the fourth session brings into concise form the activities of the organisation during recent years. The number of members has steadily risen until it now reaches

105. The draft report upon the working of the 3-ton limit of tare under Article I of the Locomotives on Highways Act, 1896, is given in full, and reference is made to the fact that the matter has been brought to the notice of the Associated Chambers of Commerce of the country. A full list of members

is published in the report, and the balance in hand amounts to £16 17s.

Annual Meeting.

THE fourth annual meeting of the Association was held on Monday at the Royal Institution, Colquitt Street, Liverpool, Professor H. S. Hele-Shaw presiding, in the absence of the chairman of the council, Mr. A. L. Jones. Mr. S. B.

Cottrell moved the adoption of the report and accounts, which was seconded by Mr. W. Beckett Hill, who referred to the 1901 Trials in Liverpool. He said that not only were railway charges excessive, but that the frequent handling and hooking of the Manchester bales so damaged them and so annoyed the merchants of that city that they would gladly pay a special price for efficient transport. Thus the way was opened for the motor-vehicle, which was expected to carry at approximately 6s. per ton for the entire transport between warehouse and quayside. So far only the high-pressure steam boiler had been tried on these vehicles, but other types might yet prove successful. It was notable, too, that heavy petrol-motors, which once carried a load equal only to half their weight, could now work up to 97 per cent. The motion having been carried, the chairman moved a vote of thanks to the Lord Mayor (Mr. Arthur Crosthwaite) for his assistance in receiving and entertaining Monsieur Georges Forestier on his recent visit to Liverpool. Mr. Anthony G. Lyster seconded the vote, which was accorded. On the motion of Mr. John H. Toulmin (Preston), seconded by Mr. H. H. West, a vote of thanks to the honorary officers of the association, the honorary solicitor (Mr. Lawrence Jones), the honorary treasurer (Mr. J. Walwyn White), the honorary secretary (Mr. E. Shrapnell Smith), and to the honorary auditors (Messrs. Lloyd and Walker) followed. In reply to a question, the honorary secretary stated that the proposal to dissolve the association after the third trials had been abandoned. The association would be continued in a form to be duly announced.

The Christmas Tour.

SEVERAL enthusiastic motorists have notified their intention of joining in the Christmas tour of the Automobile Club, and the fact that many ladies will participate should prove to the public that our pastime is as much for the fair

sex as for those of sterner mien. That the club should have undertaken a trip to Plymouth is evidence of the confidence that motorists have in their cars, and doubtless good educational work will be done during the course of the journey. At the time of writing, however, the climatic conditions are not of the most seasonable kind, and the outlook is rather dampening. But, hopeful for the best, we intend to enjoy a Motor-Christmas.

The Levassor Monument.

FRENCH officialism in common with that of other nations is only too prone to conduct business matters with a deliberation truly exasperating, and as a striking instance of the methods employed one might well cite the question of the proposed Levassor statue. Dating from the early part of last year,

posed Levassor statue.

the project eventually reached the fourth commission on December 15th, exactly twelve months ago, and yet in spite of the favour accorded to the scheme by all the members nothing definite would appear to have yet been decided. The selected spot is at the Porte Maillot entrance of the Bois de Boulogne, Paris, by the side of the tramway running to the Jardin d'Acclimation, and it doubtless is there that the statue of the founder of French automobilism will ultimately be placed, but when nobody seems to know. The statue itself is the work of the well-known sculptor, Dalou.

An Alcohol Motor-Car in England.

MR. W. T. PRETTY, of Ipswich, has lately received a new car from France, in which he intended using alcohol as fuel in place of petrol. Considerable attention has been devoted to the use of alcohol in motor-vehicles in France of late, and as this is the first car of the kind in England, so far as we know, the following particulars, kindly furnished by Mr. Pretty, will be of interest: "Living in an agricultural, or rather hostile, district, I decided to try an alcohol car—a 12-h.p. Gobron-Brillié, which had run in the recent French trials. The car reached Ipswich the day before the lecture on motor-cars by Mr. E. Shrapnell Smith, and I was anxious that some of the members of the Automobile Club who had come down to hear this lecture should participate in the first alcohol trial to take place in England. The instructions were to use 40 per cent. of alcohol and 60 per cent. benzoline, but as I found the first to cost 21s. per gallon I decided this would be a fuel for princes only, and therefore had recourse to methylated spirit at 2s. 2d. per gallon (65 per cent.), which was mixed with rectified benzol (2s. 6d. per gallon) in the proportion of five parts methylated to six parts benzoline. Having had no opportunity to test this mixture, it was therefore with some trepidation that I asked Messrs. Shrapnell Smith, C. Johnson, and E. Rosenheim to accompany me on a trial spin. The motor is of the two-cylinder four-piston type, working on the Otto cycle. The car carried the driver and four passengers from Ipswich to Colchester, eighteen miles, splendidly, and at a speed fully up to the legal limit, and the return journey was made on petrol without any alteration or adjustment. I cannot yet give definite figures as to consumption, but it is claimed that this is not more than petrol, while the power developed is from 5 to 10 per cent. more. With alcohol there is a total absence of any unpleasant smell, and if, therefore, the price can be reduced somewhat it should prove a very strong competitor to the oils we are now using." The car in question is the property of Mr. Henry Smith, of Regent's Park, and is expected to reach London to-day.

Naming Cars.

THE naming of cars is becoming popular among owners. It was the Antrona of Mr. Henry Edmunds that won Mr. Harmsworth's cup on the run to Southsea, and La Toujours Contente and La Presque Contente are associated with Mr. E. W. Hart's advocacy of electric vehicles. The idea is certainly a good one, and, as for ourselves, will have to be considered when our new cars arrive. These are now on order, and comprise a 9-h.p. Napier car and a four-cylindere M. M. Co.'s Panhard—of the latest type.

The Manchester Automobile Club.

THE first annual dinner of the Manchester Automobile Club was held on the 12th inst. The dinner was well attended, and was a success in every way, Mr. E. Shrapnell Smith being the guest of the evening. After the dinner Mr. W. E. Rowcliffe, Chairman, spoke a few words introducing Mr. Shrapnell Smith, and said that the Manchester Automobile Club was started a year ago; it had at present fifty-three members, and during the coming year there was every prospect of adding very considerably to the membership. Mr. E. Shrapnell Smith, in rising to propose the success of the Manchester Automobile

Club, said that he hoped the toast for another year would not be the success of the club, but the continued success. With respect to the speed at which motor-cars were allowed to run, he thought that the more electric tramcars that were laid down in our cities, the more would the public be educated to seeing large masses moving at what at present were called excessive speeds, and still under perfect control. He himself, in the city of Liverpool, had timed electric cars running at twenty miles an hour. He thought that the more general use of motor-cars was certain, and this general use would affect the question of the housing of the working classes.

Medical Men and Motor-Cars.

DR. W. W. HARDWICKE, of East Molesey, supplies the following useful contribution to the discussion on this subject: "I bought a 'Benz' car and started running it in October, 1899. My coachman soon dropped into its management. We have run it every day with, perhaps, two or three exceptions since. Our only troubles have consisted of a hot bearing on two occasions, due to our own fault in not properly looking after the grease boxes, and of short-circuiting of the electric current, generally at a point on the top of the battery under the seat, the result of imperfect insulation. This is remedied by enclosing the coil in an old piece of hose-pipe split down the middle and sprung upon the coil. The initial outlay on the purchase of the car was £230. The expenses for the twelve months have been: Repairs, painting, etc. (engineer and coach builder), £12 10s. 6d.; petrol, £10 17s.; carriage, etc., £1 10s. 2d.; pair of new chains, £3; re-charging cells five times, 7s. 6d.; total, £28 5s. 2d. I can quite understand a motor-car giving trouble to an owner who has no taste for, or much knowledge of, mechanics, for it wants learning, but when thoroughly understood a great deal of expenditure for repairs, etc., is saved, and in my experience there can seldom be any difficulty. Once only have I been 'hung up,' and had I only had the 'gumption' to lift up the seat and look at the battery I would have seen the spark flitting across from the coil into the battery again, and so saved myself much wasted time and some of the above expenditure, and have proceeded on my journey within the space of three minutes. A man is indispensable to look after a motor-car, and he is useful also in his spare time about the house and garden."

Another Convert.

OUR old friend Dr. Gordon Stables, who we remember in the *Tricycling Journal* days of two decades ago, writes a pleasant and inquiring letter which will doubtless cause a great many catalogues and much useful advice to enter his caravan during the next few days. We are glad to record the lessening of his aversion to motor-cars, and our readers will note with gladness his conversion to a form of locomotion which should increase the measure of his rural delights. Probably we shall be having a book, "The Story of the Caravan that Motored," by Dr. Gordon Stables, whose pen has delighted thousands of readers since he began to live his life among country scenes.

French Automobilists Honoured.

AMONG the recent recipients of the coveted red ribbon of the *Legion d'honneur* two names will at once attract the attention of the automobilist, two names which will always be inseparably connected with the new means of locomotion. The first is that of M. Amedée Bollée, father of MM. Leon and Amedée Bollée, and one of the founders of automobilism in France. We say founder, for the first of M. Bollée's cars was built in 1873, and the last of the famous four was constructed in 1880. The last-named vehicle was called the "Nouvelle," and it competed in the Paris-Bordeaux race of 1895. The big car, which was shown at Vincennes during this year's Exhibition, and which, steered by M. Bollée himself, led the procession at one of the *fetes*, is called the "Mancelle"—M. Bollée hails from Le Mans—and is the second in point of age, having been constructed in 1878. All these vehicles were successful,

and no one seeing the "Mancelle" careering gaily round the Lac Daumesnil at Vincennes would for a moment have thought that it was a car twenty-two years old. Since 1896 the sons have been more to the front in automobile affairs than has been the father, and one is therefore rather apt to overlook the part played by M. Bollée *pere* twenty-seven years ago. During the Exhibition, however, the famous constructor has performed a vast amount of work, for, in addition to serving upon a jury, he acted as president of the congress, and actively interested himself in connection with the show, both at Vincennes and Champ de Mars. The second name is that of M. Serpollet, another advocate of steam as the best motive power for automobiles. Born in 1858, M. Serpollet constructed his first car in 1887, and then a couple of years later began to devote all his energies to tramcar work. Up till last year this continued, but now the inventor has commenced to construct his automobiles in series, and at the moment no factory is busier than that belonging to MM. Gardner and Serpollet at Menilmontant. Congratulations to both of the new *chevaliers* will, we are sure, be the wish of every automobilist.

The Automobile Club of America.

At the last meeting of the Board of Governors of the Automobile Club of America, the question of a club-house was again taken up, and the board came to the conclusion that as there are about eighteen storage and repair shops in New York, it would be wise for the club not to go into the same business, and decided to leave this portion of the club-house plan to private enterprise. In connection with the proposal for the establishment of new club quarters, a committee of two members was appointed to negotiate with the New York Club, while the long endurance run, for some time in prospect, has been referred to the Committee on Runs and Tours, and will be probably held the same time as the Chicago Automobile Club holds its exhibition in Chicago, about May next.

Street Sweeping by Motor-Car.

THE latest proposal which is to come before the Grimsby Scavenging Committee is that the streets should be swept by motor-car. The car which is to be brought before the notice of the committee is an electric motor-car made by Messrs. Kruse Bros., of Hamburg. It sweeps the street by means of brushes in front of the car, collects the mud into a heap, throws it into a basin, and takes it away, instead of leaving it to be collected by a separate process. The first question which will naturally occur to the members of the committee will be, "How does the cost compare with that of the present method?" Herr Owert, the local agent, has prepared a mass of information on this point. The cost of six horses and carts for a year would be, he says, about £704 4s. Against this the cost of one motor-car, which would do an equal amount of work, would be £441 4s. The cost of the car itself would be £910, and an extra battery would cost £150. The electricity would be obtained from the Corporation works, but if it had to be paid for there would be the sum of £132 12s. per year for current. Of course, the stabling for one car would not be the same as that for six horses and carts. One man would work each motor-car, two or three of which would be required if electricity superseded the old method. A number of members of the Council are favourably inclined towards the proposal, which will doubtless be discussed at an early date. Messrs. Kruse Brothers have long been identified with carriage building in Germany, and have attained some distinction in connection with heavy motor-wagons and also electric vehicles.

Accidents in France.

In accordance with its custom, *Le Vélo* has issued a series of figures showing the accidents caused during the month of October by the principal means of locomotion, and, as is invariably the case, these statistics emphasise the increase of safety secured by the employment of mechanical traction. Whereas during the month in question horses have been

responsible for no fewer than 967 accidents, bringing death to 82 persons, and causing injuries to 885 others, the automobile can only be held guilty of 38 mishaps, in which but two lives were lost. In spite of the great difference in the number of horse-drawn and self-propelled vehicles, the record is all in favour of the automobile. Turning to the bicycle, one finds that the *petite reine* has given rise to 119 accidents, bringing in their train six fatalities. But the most astonishing item for the month is that of the railways. Generally very moderate, the return for the iron road has run up to 145 mishaps for October, giving rise to 8 deaths and 137 persons injured. This is altogether exceptional. The automobile, cycle, and train in all account for 302 accidents as against 967 occasioned by the horse. Our dear old friend the hay-motor should be ashamed of himself, but as he has been so long in the world he is probably quite hardened to the massacre.

The English Motor Club.

THE English Motor Club are not touring this Christmas, but the members will be on the road early in the new century, a run to Brighton on the first Saturday in January being contemplated, the Star and Garter being again the headquarters. It is probable that the club will hold a race meeting at the Crystal Palace on Easter Monday, and it has been definitely arranged that a control test shall be held on the first Saturday in April in the grounds of the Palace. This is likely to cause a great deal of interest, coming just as it will at the opening of the motor season, and will doubtless serve a useful purpose in once more exhibiting to doubters how easily and completely the modern motor-car is controlled.

A Junior Motorist.

WHEN the English Motor Club enjoyed Mr. Hart's hospitality at Luton the members were much interested in the motoring performances of young Oscar Hart, whose electric "Sherinette" was manœuvred through the crowd with ease and skill. He goes to school on the little car—probably the

only lad in the United Kingdom who is thus far advanced. In the accompanying illustration this enterprising young motorist is seen mounted on his favourite "steed" with his sister and a cousin as passengers. He is a keen motorist, and this little electric car is familiar in the streets of Luton, along which the mayor of the town has been driven by the young gentleman, whose love of motoring seems a natural trait.

French Medals for English Cars.

THE medals offered by the Automobile Club of France in connection with the English club's 1,000-mile Trial have been received this week, and are being dispatched to their winners. They are certainly well worthy the donors, and comprise the silver-gilt medal awarded to Mr. Edward Kennard's car, the silver medal which was won by the Wolseley voiturette, and the bronze medal awarded to the New Orleans voiturette.

The War Office and Automobiles.

BOTH the *Daily Chronicle* and the *Daily Graphic* have woke up this week with some particulars of Colonel Crompton's work in connection with automobilism in South Africa. Few of the facts are new to those who heard the gallant gentleman at the Automobile Club's dinner, but they doubtless proved of some interest to the general public. Had motor-vehicles been largely employed in the campaign there would certainly have been a lower death rate, for the spread of enteric fever was materially assisted by the carcasses of horses with which the veldt was bestrewn. Even the capture of De Wet, who seems to elude infantry and cavalry alike, might have been facilitated had motor-wagons been utilised for transport and commissariat purposes. Anyhow it is satisfactory that the War Office is abandoning its Bourbonism and has secured Colonel Crompton's assistance in practical reform.

Motor-'Buses in Lincoln.

SOME interest has lately been aroused in the shares of motor-car companies, particularly those concerned with the manufacture of vehicles. Lately at Lincoln something has been heard of the shares of the local Motor-'Bus and Parcel Delivery Company. These are £1 shares, upon which 12s. has been paid, and they sold at auction for 12s. 6d. In putting these shares up for sale the auctioneer took the opportunity of predicting that motor-cars had come to stay in Lincoln definitely and permanently. There were people who were ready to decry the trams when they were first placed on the streets, as there were now with respect to the motor-'buses. But in his opinion the time would come when motor-'bus shares would be very valuable.

A Busy Lecturer.

MR. E. SHRAPNELL SMITH is becoming well known as a popular exponent of automobilism, and since his recent lecture at Ipswich has been very busy in other parts of the country. On the 15th inst. he lectured at the Glasgow University Engineering Society, Professor Barr, M. Inst. C.E., being in the chair. Mr. Smith urged the use of motor-vehicles for three chief reasons: first, they would relieve horses of much hard drudgery, which in Liverpool meant an average of six or seven tons for two horses. Their use would not decrease the number of horses in use for light services; second, the horse being as long as a vehicle, removing the horse was equivalent to doubling the street area; third, the low cost, which was about 5s. per ton per day with a full load for 30 to 40 miles. There was a good muster of members of the society, and on the previous evening Mr. Smith was their guest at the annual dinner at the Grand Hotel, replying for the guests. Since then he has responded for the guests at the Liverpool University College dinner, and has opened the session of the Nottingham Automobile Club with a lecture.

An Automobile Handbook.

WITH a very effective cover, and printed in splendid style, the catalogue of the Automobile Manufacturing Company, Limited, rightly deserves the title given it by the firm in whose interests it is issued. In the early pages the instalment system of the company is described, by which it is possible to obtain any type of motor-vehicle, from a bicycle to a racing car, at a slight increase in the cash price. The first payment is made on ordering the car, the second when the car is delivered, and the remaining payments monthly. Section I. of the catalogue deals with petrol-cars, and illustrations of the Hille tricycle, the Carlton and Savoy voiturettes, the Georges Richard 7-h.p. truck, the Richard car, the Hille car, and the Delahaye high-speed cars are included among the other views. Steam cars are the subject of the second section of the book, and an illustration of the 10 h.p. A.M.C. steamer is given. This can be fitted with any design of body for two,

three, or four persons. In the section devoted to electric vehicles various types of the Cleveland car are shown, and the last few pages of the work are devoted to some of the accessories kept in stock at the showrooms, 48 and 49, Long Acre, W.C.

The Leecoll Battery.

SIX Leecoll cells, which had been four months in use on a motor-car, were recently submitted to Sir W. H. Preece for the purpose of testing. He subjected them to forty-two discharges and forty-one charges within six weeks, then left them standing idle for ten weeks, and afterwards submitted them to three more charges and discharges. He came to the following conclusions:—The normal voltage of each cell is 2.4 volts; the voltage of each cell remains above 2 volts for at least four-fifths of the discharge; the cells can be discharged to as low as .5 volt, without apparent injury to the electrodes; the cells may be left standing discharged for weeks without damage; they can be charged in two hours, and will stand discharges of 50 to 60 ampères—five times the normal rate. Sir W. H. Preece believes that the vibration to which the cells would be subjected on a motor-car would improve the cell capacity by assisting in the prevention of polarisation. This has been actually proved to be the case. The Leecoll cells on the "Powerful" car discharged 275 ampère hours, although only supposed to contain 270 ampère hours—a result which testifies to the value of the battery.

A New Company.

THE battery has been introduced by the Leecoll Electric Battery Company, Limited, a concern whose assets, together with one half share in the Leecoll patents in most European countries and the colonies of Victoria and New South Wales, are being acquired by the British and Foreign Electrical Vehicle Company, Limited. This company has been formed with a capital of £150,000 in £1 shares, 54,000 of which are now offered for subscription. The directors are Colonel J. F. Caldwell, J.P., Mr. Roger H. Fuller, of the De Dion-Bouton Company, Mr. T. G. Chambers, of the Leecoll Battery Company, Limited, and Mr. E. W. Hart, of Luton. These gentlemen are well known to automobilists, and their experience should prove a great factor in the development of the business. Through Mr. E. W. Hart the company has secured the English rights in the convertible electric brougham and victoria on the Lohner-Porsche system, and it is proposed to place a number of these vehicles under licence to ply for hire, in connection with which part of the business a splendid central depot and charging station has been taken in Lambeth. These premises are admirably adapted for the purpose with a superficial area of 14,000ft., and accommodation for 150 carriages on the ground floor. An expenditure of between £30,000 and £40,000 was entailed by their erection. The building is well suited to the special needs of the concern, and was the charging station of the old London Electrical Cab Co.

Extensive Operations.

THE sale of electric delivery cars and delivery tricycles is another branch of the business to be developed, and arrangements will be made with electric light companies throughout the country for the charging of cars, so as to encourage the sale and hire of cars for touring purposes. Mr. Hart has erected extensive works at Luton, and a contract on the part of this company has been entered into with him by which it has the option to purchase the whole of his stock, whether manufactured or imported. In addition to the Lambeth premises, depots have been acquired at Notting Hill Gate, South Kensington, and Shoreditch, so that the business may be able to carry on operations with equal facility in the West End, the City, and the suburbs. Although electromobiles will form the main part of the concern it should not be forgotten that the Leecoll battery, to be made by the British and Foreign Electrical Vehicle Company, Limited, is well adapted for launch work; that it has many advantages in connection with lighting, and can be used in connection with oil engines, and on petrol cars.

COUNTY COUNCILS v. AUTOMOBILISTS.

COUNTY councils are on their trial. Since their inauguration they have done much to bring system into the chaos of local government, and, although some have made conspicuous mistakes, they have, on the whole, justified their existence. Men of wide views and tolerant sympathies have directed their deliberations, and they have generally risen above prejudice and privilege and discussed matters of public importance on the high platform of public interest as opposed to private predilections.

But latterly they have revolted from the spirit of uniform fairness with which they were once characterised and have fallen into a state of mind reminiscent of the toll-keepers and turnpike-men of the pre-Victorian days. A minority has declined to run with the crowd; but a large number have fallen victims to the general outcry against mechanical traction on ordinary roads, with the result that they are now clamouring for the thwarting, if not the throttling, of the automobile industry. This they seek to do by a memorial to the Local Government Board to restrict the speed of motor-vehicles to ten miles an hour, and to have every car and carriage, propelled without the extraneous assistance of a quadruped, numbered in a prominent and impertinent fashion.

Basing these recommendations on the rash conduct of a few motorists—as to whom the Automobile Club has given chief constables good advice—they have declared that the motor-car is a dangerous vehicle and the motorist an enemy to the lives and limbs of the public. As is well known, the Automobile Club, regarding this in the nature of a challenge, is preparing to demonstrate to county councillors and others that the motor-vehicle is more manageable than the horse, and is a mechanical arrangement that need not be numbered. This demonstration will take place in May next, and should do even more for automobilism than the great Trial of 1900. Already invitations have been sent to county councillors throughout England and Wales, and in the office of the Automobile Club a huge pile of letters now testifies to the universal interest taken in the subject. When the idea was first mooted it was hinted that a meagre attendance of councillors would prove that the minds of the majority were made up; but the letters of acceptance that have been received show conclusively that the attendance will be large and thoroughly representative. Replies have come from every county between Northumberland and Cornwall, and we have reason to believe that there will not be an English or Welsh county unrepresented at the demonstrations. That fact alone warrants the enterprise of the Club and justifies the arguments of those who urged the adoption of the policy of “educating our masters.” Whatever county councillors may be in their collective capacities, they are, apparently, reasonable and rational persons as correspondents. The letters that have been received reveal a desire for information and practical experience, and not one breathes anything of the spirit of captious opposition. True, one councillor does not like the smell of petrol and another objects to the teuf-teuf of the motor-horn; but in spite of some such minor matters a more hopeful bundle of correspondence was never tied together by the secretary of the Club. One councillor, who bears a name honoured throughout Essex, regards the motor-car as connected with the revival of many a village industry; another sees in it a helpmate to the farmer who has been crippled by the expense of horse-hire; another recognises that it will help the engineering trade; and a fourth sees a bright future for many a small town with the popularisation of the automobile. And so on through a series of letters written by representative and influential men who, while writing for themselves, indicate an interest in the matter that will make for the conversion of others.

So keen is the interest taken in the matter that the Highways and Bridges Committee of the Worcester County Council is desirous to have such a demonstration of automobiles nearer home, and would like evidence of the reliability of the motor-car to be shown in or near the county; and Mr. J. Willis Bund, the chairman of the Council, has pointed out to the Club that the importance

of the Birmingham district may be sufficient to secure this education for the Council. The spirit in which Mr. Bund has replied is characteristic of the reception given to the Club's recent letters by many other broad-minded men. “I will give directions,” he says, “to the chief constable to report all cases of motorists failing to stop when required, and will, as far as I can, supply you with a list of such cases.” If similar steps will be taken by the chairman of every Council in the country and the chief constables will properly carry out the request, the insinuations as to the reckless and rash driving of automobilists without any consideration of other users of the road will soon fall to the ground. On the question of speed the remarks of Mr. Willis Bund (who, it must be remarked, only expresses his individual opinion, and does not in any way commit his council to the same view) are equally comforting to motorists. “I am opposed,” he continues, “to any limit of speed being fixed by law, as it is almost impossible for anyone to say with accuracy what rate of speed the vehicle was travelling at. I should much prefer to see it a question of fact in all cases: ‘Was the vehicle going at such a rate as to be dangerous to the public?’ This, I think, is the true rule for all kinds of traffic, and this I should be prepared to support. I feel more difficulty as to the compulsory numbering of motor-vehicles. On the one hand, placing the owners' name on carts or other vehicles has been law for years, and has, so far as I am aware, worked no hardship. I can quite understand the objections to it in the case of motors. I am rather inclined to give the justices in case of a conviction for furious driving, power to cause a distinctive mark to be fixed on the vehicle for a certain time. I am, however, strongly of opinion that the County Council should have power to see that any cars used in their county are fitted with proper appliances for stopping and guiding the motor. Subject to these conditions, I think that County Councils should give every facility to the drivers of motor traffic.”

Sympathetic as is the general tendency of Mr. Bund's letter, the suggestion that a number should be placed on offending cars for a stated period suggests conviction of the car rather than of the driver. The man with two cars will be at the advantage of being able to stable the offender while using the virtuous car that has not come under the eye of the law, although, perhaps, this might be avoided to some extent by causing the delinquent to make periodical journeys to the nearest police-station to report itself, as do men supplied with a “ticket of leave”—a system which is suggested by the proposal. However, that is a matter about which we do not expect to hear much in the course of discussion.

It would be well if county councillors who are thinking of coming to London next May would make inquiries in the direction of finding reasons why the motor-car should not be subject to the common law of the land, and why all traffic, whether horse or motor-drawn, should not be placed on an equality. We have thought over the subject from every point of view, and it does seem reasonable to suggest that whereas the man who drives in such a way as to imperil the life of a pedestrian should be severely dealt with, the man who spins along where there is no traffic and no obstruction should be allowed to be guided by his own common sense. To restrict the speed to ten miles an hour will not lessen the risk of accidents, and the man who is run over—and, by the way, the number of such does not go into two figures—by an automobile does not worry whether the vehicle is proceeding at four or forty miles an hour. The fact that does concern him is that he has been knocked down, and such an incident could happen at the lower speed just as easily as at the higher one. Hence we should say that to bring automobilists within the common law as to driving to the danger of the public would meet such an extreme case as the above; and every other case that is likely to crop up.

With regard to the numbering of vehicles, the consensus of opinion amongst owners of private vehicles—whether horse or motor-drawn—is against the proposal. Why should privately owned broughams be labelled as though they were on convict service at Dartmoor? Why should the Lord Mayor's coach be disfigured by a number, as if intended for an auction sale? Why should a motor carriage be similarly dealt with? Motor-car.

cannot be considered alone in this respect. There must be equity, and both the horse-drawn carriage and the much maligned motor-car must be dealt with on similar lines. Otherwise where is the fairness and justice of our much-vaunted system of Government?

THE DE DION LIGHT DELIVERY CAR.

THE accompanying illustration represents the light delivery van now being built by Messrs. De Dion-Bouton and Co., of Puteaux, near Paris. So far as the frame, motor, and transmission gear are concerned, these follow the lines of the firm's well-known voiturette. It is driven by a $4\frac{1}{2}$ h.p. water-cooled De Dion motor, located in the rear of the frame; two speeds forward and a reverse motion are available. The car, which complete weighs about 7 cwt., secured a gold medal in the recent *poids-legers* competition in France. The trials extended over five days, during which, states *La France Automobile*, the

DE DION LIGHT DELIVERY CAR.

vehicle travelled a total of 198 miles, carrying an average load of 5 cwt., the consumption of petrol during the whole test amounting to 7.57 gallons.

MR. T. G. LEWIN has joined Mr. H. Percival in the business of H. Percival and Co., Saracen's House, Snow Hill, E.C. The business will also be conducted from High Street, Kingston.

A VERACIOUS British contemporary says a large motor-van loaded up with coffins has been seen in London. A correspondent remarks it is but a short step from this to the motor hearse and coaches, and, we would add, to that correspondent.

THE LONDON AUTOCAR Co. informs us that they are now in a position to supply to motor-car builders voiturette fittings as used for building the Renault car. The set includes back axle and differential gear, complete with bevel wheel enclosed in aluminium case; strong wide hubs for metallic spoke wheels; two brake drums, 8in. diameter, and lubricator on gear-case; frame of voiturette complete, with the different attachments for fixing on motor, change speed-gear, springs, and foot step; ball steering head; front axle with hubs and steering joints; central shaft with universal joints for driving direct motor. The frame is made in three sizes, viz., for cars to seat two, three, or four persons. They are also now supplying a set of all motor parts for converting an ordinary bicycle into a motor-bicycle. The set comprises the motor, carburettor, silencer, accumulators in leather case, petrol tank (three quarts) in basket, special rim for driving belt, electric wires and handles, clips—in fact, everything for converting an ordinary roadster bicycle into a motor-bicycle. The bore of the motor is $2\frac{1}{8}$ in. by 2 $\frac{3}{4}$ in. stroke.

MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

Italian Public Services.

FOLLOWING the example set by the railway from Milan to Monza, the line Bologna-Modena has now commenced a regular service by electric traction. Each carrying two motors of fifty horse-power, the carriages can transport eighty passengers at a speed of fifty kilometres per hour; indeed, they can do better than this should necessity arise. The car with accumulators complete, weighs some four tons, and measures from end to end nearly sixty feet. The service so far has given most excellent results, and before long similar cars will be seen running between Bologna and Saint Félix. This class of work, together with that of the conveyance of the public over ordinary roads by means of self-propelled vehicles, would appear to be of great interest to Italians, for it is especially in these directions that automobilism is being made use of commercially. In this respect Italy is but doing like Spain, for there also new public services are frequently being inaugurated.

At Acheres.

So after all the keenly anticipated speed trials did not come off, and we must wait until to-morrow to see the champions go flying over the road in the Achères agricultural park. The cause of postponement was simply the bad weather, which had rendered the track quite unsafe for fast-speeded vehicles, and the action of the Moto Club in retarding the event for a week met with universal approval. Under ordinary circumstances every care should naturally be taken to minimise the possibility of a mishap, but now, when the position of automobile racing is distinctly critical, the precautions of the organisers of a course should be multiplied. An accident, and a regular hue and cry would be quickly raised, and I fear that all chance of next year's events would be entirely demolished. So let every care be taken, and I hope to be able to record to-morrow's meet as one perfectly organised and successful from every point of view.

A Big Lorry's Adventure.

WHEN reading in last week's *Motor-Car Journal* the report of M. Forestier's address at Liverpool that portion of it dealing with the experiments of the Say Refinery brought vividly to my mind a little incident which occurred to the big Postel-Vinay lorry one day, near to the Porte Ivry. On that particular morning this Hercules was steadily pursuing its way over a road the surface of which was somewhat greasy, when a sudden side-slip caused the rear of the vehicle to slue round. Crash it went into a road refuge, and the ponderous weight simply swept that refuge and all its belongings away as if it were but a pat of butter. One can judge of the driver's surprise when on looking back to see the extent of the damage he saw no refuge at all, but merely a distorted spot where it had once stood on the roadway. A 20-ton vehicle, even when travelling at only three miles per hour, is distinctly useful as an engine of destruction.

The A.C. du Var.

YET another club has to be added to the ever-increasing list of automobile societies, and once again it is in the South of France that birth has been given to the new organisation. This time it is at Draguignan, and the promoters have decided to call the new venture the Automobile and Vélo Club of the Var. Upon the occasion of the inauguration a banquet was held at the Bertin Hotel, at which some fifty automobilists participated, including several leading members of the Nice Club. Among those present was the Mayor of Draguignan, M. Gondoin, president of the A.C.N., and the Marquis de Villeneuve, to the latter of whom the new club already owes so

much. The Nice contingent left at four o'clock upon the return journey *via* the Esterel road, and duly reached home after an uneventful run. The new club will doubtless lend valuable aid to the A.C.N. in connection with the races in March, for the touring category will, as last spring, journey to Draguignan.

The Shah's Motor-Cars.

IN common with all motor men, I suppose my first thought was for the Serpollet cars when I read of the foundering of the steamer *Vera*, which was transporting a great quantity of goods purchased by the Shah of Persia during his recent European tour. The unfortunate vessel and her entire cargo, valued at many thousands of pounds sterling, went down in some 3,000 feet of water in the Caspian Sea, and as the first reports of the mishap cited the motor-cars as forming part of the shipment, I could only conclude that M. Serpollet's productions were already being examined with the greatest curiosity by the finny tribes. I had already heard that one of the Shah's automobiles had been safely delivered at Teheran, but I mourned to think of the other "teuf teufs" buried deep in the ocean's stormy bosom. But to relieve the feelings of automobilists, all of whom had taken much interest in the Persian monarch's motor experiences, M. Serpollet has made it publicly known that none of the cars formed part of the ill-fated *Vera's* cargo, and that the vehicles are safe in a spot fortunately less humid than the bed of the Caspian Sea. Motor men will rejoice at the news, for such a drowning would indeed have been an untimely fate for the noble "steamer."

Numbered Cars.

WHILE the question of numbering cars is causing so much excitement in England, it is interesting to note the system adopted by the authorities of Lyons in order to ensure the moderate pace of automobiles when passing through the town. Upon arriving at the "octroi" the automobilist, as usual, pulls up to permit of the officer's searching in the car for dutiable goods, and he is there handed a number, which he is required to place on his vehicle in a prominent position. This done, the motorist may proceed on his way, and upon reaching the other side of the town he hands over his number. A simple operation in itself, but one quite impossible in the case of a town entered by a hundred and one roads, unless an enormous staff of officials were retained. In France, where all the larger towns have their "octroi" stations, nothing is easier to carry out, and I should not be surprised to learn of other municipalities adopting the Lyons system. Big numbers, *caniveaux* and bad *pavé* combined should succeed in making even the wildest of motor men moderate his pace to a sedate crawl, and this combination is evidently favourably regarded by certain provincial authorities.

Three Accidents.

A VERY curious, and, unfortunately, a fatal, accident is reported from Apt, a small town upon the Avignon road. It would appear that a certain M. Sautel and his wife were proceeding in a cart to Apt, when they stopped to converse with a passing acquaintance. At this moment the sound of an approaching automobile was heard, and the party drew well to the side of the road to permit of its free passage. Just as the car had come almost up to M. Sautel his wife for some unaccountable reason suddenly descended from the cart and endeavoured to cross the road, with the result that she was knocked down and so badly injured that she expired a few hours later. Safely seated as she was in the cart with her husband standing at the horse's head, Mme. Sautel's unhappy idea to traverse the road is beyond comprehension, and from reports it would appear that the act was done so suddenly and unexpectedly that the driver of the automobile had no chance of pulling up his vehicle. Recently a couple of other accidents have occurred in the provinces, but happily in neither case have the results been serious. One mishap is reported from Valence,

where on the Tain road, almost at the entry of the town, a faulty bit of driving resulted in the upset of an 8-horse-power car and its occupants. One of these latter was thrown clear, but the other was imprisoned beneath the vehicle, and it is a matter of surprise that he received nothing worse than a few bruises. The case at Belfort was that of a cycle maker, who in driving a *voiturette* had occasion to turn sharply in order to avoid a pedestrian. In doing so he failed to observe an approaching tramcar, by which his little vehicle was struck and upset. Bruises to the driver only resulted, but he can congratulate himself on having escaped very lightly. What dangers one runs in driving an automobile some people may say on reading the above, but I would remind them that this is a record of ten days' motor accidents in France, a not very formidable list when the number of cars in use is taken into account, and as the papers seldom fail to record an automobile mishap, one can be fairly certain that the three above recorded are all that have occurred in France recently. Can the horse show an equally clean sheet?

The Paris Automobile Exhibition.

THE greatest activity now prevails in the works of French constructors, for in a month's time the Salon at the Grand Palais will open its doors to the public, and for the success of their next year's trade makers must be worthily represented there. This naturally entails a vast amount of work, rendered all the more difficult of accomplishment by reason of the disorganisation everywhere caused by this year's big show. Exhibitions are no doubt necessities, but unquestionably too many tend to upset both the clerical and engineering staffs of any manufacturing firm. The commercial men have, as it were, a second office to attend to, while the engineering people's attention is distracted from the construction of clients' cars to that of the firm's exhibits. Exhibitions give endless worry and anxiety, and when, as in the case of this year's big show, the result is microscopical, manufacturers are naturally far from content. With reference to the Salon, the organising committee has notified constructors that for the transport of machines and objects intended for exhibition the various French railway companies have, without exception, decided to apply a special tariff according to a total reduction of 50 per cent. This means that those machines and objects upon which the integral tax of the tariff applicable to them has been paid on entering, without reduction, will be transported free upon the return journey to the same destination from whence they came, excepting the cost of such minor charges as registration, receipt stamps, etc., etc. In order to secure the benefit of this important concession exhibitors should present—1. The receipt showing that they have paid upon the outward journey the price of the tariff allotted to their goods. 2. The certificate of admission to the exhibition of the objects to be returned. As for the customs, and this should be noted by foreign exhibitors, goods coming into France will be admitted subject to free temporary admission in accordance with the authorisation of the administration. These goods will be required to be re-despatched within one month from the date of closing the exhibition, so, exhibitors, make your arrangements accordingly.

As announced last week, a *Locomobile* is on its way from John O'Groats to Land's End. It arrived at Bristol on Wednesday.

CALLING on Hewetsons, Limited, Dean Street, Soho, the other day, we were able to inspect the latest type of Benz car—a spider phaeton fitted with a two-cylinder engine of 12 h.p. The transmission is effected by a single belt and spur gears, four speeds forward and a reverse motion being provided.

AT both the recent Stanley and National Shows, Grappler tires were exhibited on many of the stands, several motor-cars being shown fitted with these tires, which have acquired a reputation in connection with motor work upon which the New Grappler Tire Company, Ltd., is to be congratulated. The company has just issued a new price list of its motor-car tires.

THE LEMP IRREVERSIBLE STEERING DEVICE.

ONE of the important features in a motor-car is the steering mechanism. The divided axle pivotal steering (rigid front axle with the two front wheels pivoted on short vertical axles at either end) is almost exclusively used, as it produces a stable wheel-base under all conditions and reduces the leverage of the steering wheels upon the operating lever or hand-wheel. While this arrangement is safer than the old fifth wheel steering, it is open to objections in that it is only comparatively and not absolutely safe, and may for that reason lull the operator into a state of comparative security which really does not exist.

The requirements for a proper steering device are:—1. Ability to turn the wheels on heavy roads with little power. 2. All strains upon the wheels from obstacles in the road, and particularly the momentum of the carriage pressing against the steering wheels when the latter are at an angle, should be completely checked in the frame of the carriage and not allowed to reach the operating lever or wheel. 3. The steering gear must admit of turning the car instantly, to its full extent, if necessary, to run around an obstruction.

Several methods have been tried for obtaining these results. For example: the steering wheels have been pivoted in the centre of the hub; and the pivot of the steering wheels has been inclined so that a line drawn through its axle will strike the ground at the rim of the wheel or a few inches beyond. The latest device to come under our notice designed to fulfil these requirements is the Lemp steering check, illustrated herewith. It has been introduced by Mr. Fred M. Kimball, of 200, Summer Street, Boston, Mass., U.S.A., and its reliability is said to have been demonstrated by its use during the past two years on cars weighing from one thousand to four thousand pounds over rough roads and obstructions. It is claimed to prevent strains and shocks from obstructions in the roads from reaching the steering

FIG. 1—VIEW OF DEVICE FITTED TO AN ELECTRICAL CAR.

handle, and to relieve the operator not only of a feeling of insecurity but of all the physical strains experienced when riding in a car over rough roads without such a device.

Figures 2 and 3 illustrate the general construction of the device. Fig. 1 shows it fastened to the front axle of a motor-car connected by steering rods to the steering wheels, and by a vertical rod through a universal joint to the steering handle. The device consists of a circular receptacle having pivoted close

to its circumference a sleeve with a wing, which divides the receptacle into two compartments of variable size. The compartments are connected by a control passage which is normally closed by pivoted check valves. The wing with sleeve is connected rigidly to the quadrant, which in its turn is connected by rods to the steering wheels. The wing is concentric with a segmental oil tray, and can be moved in close contact with it

FIGS. 2 AND 3.—DETAILS OF DEVICE.

through an angle of 60 degrees, until it touches either side of the circular box. The whole receptacle is filled with a viscous fluid, such as glycerine or heavy mineral oil, which is not apt to clog or freeze. When both the check valves are closed, no communication exists between the two compartments on either side of the wing, and the quadrant is securely locked in that position. Through the central portion of the sleeve there is a shaft connected to the vertical steering rod through the universal joint. The latter carries a finger on the outside of the box and a short lever on the inside. This lever bears against the inner surface of the two valves of the wing, and the slightest motion in either direction will raise one of them. The valves are normally held closed by a light spring and the steering handle held in the central position by adjustable spring pistons having a limited motion just sufficient to allow the check valves to open slightly. Turning the steering handle to either side will open the valve on the opposite side and allow the liquid in that compartment to pass through and open the valve in the other side. When the valves have thus been opened the wing and steering wheels connected thereto are liberated so that they can be moved by the steering handle. As soon as the movement is stopped the valves close, and the wheels are held rigidly in their last position. It is evident that if the finger be moved in any direction the quadrant will move with it, but the quadrant cannot be moved without touching the finger. A special point to which attention is drawn is that the valves are unlocked by the motion of the steering handle required to steer. The makers claim that the device does not easily get out of order, and adds but little to the weight of the vehicle. It is equally well adapted for use with steam, petrol, or electrically-propelled vehicles.

THE three Panhard cars, respectively of 8, 12, and 20 h.p., of the late Count Cahen d'Anvers were put up for sale by auction in Paris on Tuesday.

THE Decauville Company gave a dinner in Paris, last week, to commemorate the recent 1,000-mile non-stop run on the Crystal Palace track. A number of well-known Parisian motorists sat down, and a pleasant evening was spent.

A GERMAN correspondent informs us that the Canello-Durkopp Company, of Bielefeld, is building a 50 h.p. racing car, with which Herr Canello intends to compete in the races at Nice next season. Is this the car that the company has entered for the Gordon-Bennett cup race?

AT Birmingham Assizes on Monday, before Mr. Justice Lawrence, Mr. Joseph Alfred Pember sued Mr. Vernon Pugh for damages to a horse and trap. The case for plaintiff was that his horse took fright at a motor-tricycle defendant was riding, but his lordship found there was no evidence of negligence, and therefore no case to go to the jury.

THE STARTING OF PETROLEUM-SPIRIT MOTORS.

IN a recent issue of *La France Automobile* M. H. Grosheintz, of Thann, Switzerland, describes a new and simple method of starting petroleum-spirit motors fitted with tube ignition. The inconvenience of doing this with an engine having high compression and the danger of personal damage from occasional back firing are too well known for me, says M. Grosheintz, to dwell upon here. Having in view the easy starting of motors fitted with electric ignition when the spark is retarded, I have endeavoured to apply this principle to motors provided with tube ignition, and have obtained excellent results by two methods. The first, which is more theoretical than practical, consists in moving the burners so that they will only heat the extreme ends of the platinum tubes, and so retard the firing.

The second method, which is much simpler and quite practical, is by closing the tap governing the supply of petroleum spirit to the burners to such an extent that the tubes are only brought to a dull red by the flame, which equally brings about late firing. With the tubes in this condition the motor will start at the first revolution of the starting handle without back firing. No variation of the carburation is required to start a motor under the last-mentioned conditions. The exact heat of the tubes under which the motor will start best is easily discovered after a few experiments, it varying with the compression.

MR. MARK MAYHEW has lately been seen driving a light steam car in and around the metropolis.

A SUCCESSFUL consumption test was held near Turin, Italy, on the 9th inst. The course was from Turin to Chieri and back, a distance of 38 kilometres.

MR. REGINALD TREVOR, a prominent member of the Bath Road Cycling Club, is lying at Esher in a precarious condition, as the result of an accident whilst riding a motor-tricycle on the Portsmouth road, near Horseshoe Clump, Esher. Mr. Trevor was proceeding towards London on Sunday night, and is reported to have collided with a vehicle which carried no lights. Mr. Trevor was extricated from under his wrecked machine in an unconscious state, his severe injuries including a fracture at the base of the skull.

A LIGHT two-seated car has just been put on the market by the Warwick Cycle Company, of Springfield, Mass. It is equipped with a $3\frac{1}{2}$ De Dion water-cooled motor, and has a tubular frame. In general appearance the vehicle much resembles the light steam carriage. A post for the steering and control levers rises right in front of the seat, the steering being effected with a very short lever. There are four little handles grouped around the steering post, which control the time of ignition, the ignition switch, the carburation and the gas admission, respectively. The speed gear is controlled by a lever just outside the seat. The weight of the car is about 5cwt.

THE Adams Express Company, of New York, has been experimenting for some time with a heavy steam wagon. The vehicle has lately completed a run from New York to Bridgeport, Conn. The object of the run on open country roads was to test the power and general strength of the vehicle, and to discover any defects that might exist in any of the parts. The wagon carried a load of 5,000 lbs., and the result of the test was, as a whole, satisfactory. The vehicle successfully negotiated several steep hills, and proved sufficiently powerful for all conditions of road encountered, although the latter were at times in a very bad condition. Portions of the road were covered with new road materials, to a depth of eight inches, and these were rendered very soft by continuous rains. Mr. Herschmann attributes the success of his wagon, in a great measure, to the large diameter of his wheels, and thinks that it is only a question of time when other makers will have to follow his example in this respect. No serious accident or breakdown of any sort occurred during the trip, but the test proved very instructive, and many minor improvements will be made as the result of the experience gained.

CORRESPONDENCE.

CARBURETTORS FOR MOTOR-TRICYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read Mr. A. E. S. Craig's article on "Motor-Tricycles: Some Defects and Remedies," and note he states the surface carburettor of the De Dion type is a source of danger, owing to the bulk of liquid and explosive vapour in communication with a chance of ignition. I am interested in reading these articles, and should much like to know in what way there is a chance of explosion occurring; also will he explain how the explosion in the carburettor happened that he refers to—was it by back flow, or how? I have heard of one tricycle being on fire in my neighbourhood, and riding a De Dion type of motor, I am anxious for information as to this danger.—Yours truly,

VERITAS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. A. E. S. Craig's article on "Motor-Tricycles, some Defects and Remedies," in your issue of the 1st inst., I notice he makes disparaging remarks about surface carburettors, and imagines they are a source of danger. This is the first time I have heard of an actual explosion taking place in the carburettor when the safety discs of gauze were properly fitted—a very simple matter. When this is done there is no more danger than with the Davy safety lamp; of course, if the gauze on the lamp gets damaged it is of no more use than a naked candle. It does not, however, always follow that an explosion would take place if the gauze were left out of a carburettor mixture chamber, as the valves would have to be out of order first. Perhaps Mr. Craig is not in a position to say whether the discs of gauze were out of place before the explosion he refers to occurred.

With regard to the unequal action on varying roads of the triangular surface carburettor as fitted to De Dion pattern tricycles, this was undoubtedly caused by the air space above the surface of the spirit being too confined, and over rough roads the spirit itself would sometimes splash into the mixture box. This may be the reason of the explosion, but the unequal action and source of danger is entirely eliminated in the "Ariel" carburettor, inasmuch as the carburation is never affected by unequal roads, owing to the distance between the mixture box and the surface of the spirit. The carburettor, which itself only holds a small quantity of spirit at a time, is replenished from a spare tank above, through a drip valve, and having the narrowest part at the bottom is less likely to waste the spirit than other types of surface carburettors. With it it is seldom necessary to run off more spirit than is required for cleaning spray carburettors. I see in your issue of the 8th inst. a letter signed "Alarmed" on the same subject, and my object in writing the above is to set his mind at ease.—Yours truly,

J. W. STOCKS.

TUBE VERSUS ELECTRICAL IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having in a country district met with ignominious failure and a lot of trouble with motors having electrical ignition, particularly in wet weather, I should be glad of advice from any of your readers as to the best type of tube ignition; any little hints as to the management of the lamps or burners, and how they are manipulated, also as to how they are likely to be understood by the average countryman, will be greatly appreciated by,—Yours truly,

TWENTY MILES FROM THE RAILWAY.

MOTOR PATENT MATTERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with considerable interest the letter of Mr. Edge which appeared in your issue of the 15th inst. This letter is, I venture to suggest, a most convincing proof how necessary it is that this association, which Mr. Edge is pleased to call "The Motor Protection Society," should receive every

support from all who are interested in motors, whether as agents, manufacturers, or as private owners. What are the objects of this society? Certainly not to support anyone in infringing any patents which the society, after proper advice, are advised are good and valid ones, but to see, if necessary, that no one shall be forced into paying royalties on patents which are, to say the least, extremely doubtful, and from which royalties foreign makers are free. I am sure not one of its members would object to pay a proper consideration to the proprietors of any patent on any article which they were using if, after proper advice, they were advised such patent was a good one. But is it reasonable to ask 5 per cent. on the cost of a car for using one article on it which can be bought for £2? Mr. Edge has quoted the names of several large French firms in his letter. Can he inform us if it is a fact that not one of them are paying a royalty on the carburettor, which is to-day the burning question between Mr. Edge's company and the public, and whether it is not a fact that the firm of Panhard and Levassor have refused to pay any royalty for using Daimler patents, including the one for the carburettor? Mr. Edge asks the industry to combine, I suppose by paying his company royalties, and so bring the manufacture of automobiles to the prestige it enjoys in France and Germany? I venture to assert it enjoys this prestige because, for one reason, it has not been hampered with threats of law actions against all who do not fall in with the views of certain patent speculators. As Mr. Edge assures us that he has so much the interest of the industry and sport at heart, might I suggest a course which would at once help the industry and be sportsmanlike, viz.: That the association which he is pleased to call "The Motor Trade Protection Society" should purchase a float-feed carburettor, which in the opinion of Mr. Edge's company, most infringes the patent under which they are acting, that an action be brought on this carburettor, that the gentlemen who compose the society agree to be bound by the result, which I am certain they would willingly do. This would at once be sport and serve the industry.

While on the question of sport, I would suggest it is not quite playing the game to insert week by week in the automobile journals the result of an action which has nothing to do with motor-cars at all. However, if it is the game, I am sure Mr. Edge will see that for several weeks the result of an action which was decided against his company the other day in the House of Lords appears, and if this advertisement is to assume the same proportion in respect to its importance as the action *v. Taylor*, the advertising columns of the *Motor-Car Journal* and other automobile journals will be full for months to come.—Yours truly,

W. D. ASTELL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with great interest Mr. Edge's letter on Motor Patents, which seems to me to be a most temperate and clear exposition of the situation from his point of view, but I think that there is another way of looking at the whole question which has entirely escaped Mr. Edge's observant mind.

In the first place Mr. Edge cites the success of the industry in France: now why, may I ask, has the industry been successful in France and why has it developed the large and thriving concerns mentioned by Mr. Edge? It seems to me the only answer to these questions lies in the fact that the industry has been unrestricted and untrammelled. Why, on the other hand, has the industry hung fire in England? For two reasons:—Firstly, because it was hindered by legislation; and secondly, because the large concerns promoted specially by the holders of the patents in question were saddled with huge purchase prices, which have ever since been an incubus to them, and because many of our great manufacturing concerns were kept out of the trade by the general threats contained in the advertisements and circulars of the proprietors of the said patents.

If the inventor himself had been profited by this or had even had a hand in fixing the value of his invention, some justification might have been held out even if the patents were sound and only over-valued, but in this case it is purely a speculator who assumed the value of the patents, and why should the British purchaser pay inordinate profits to this speculator in whom he

has no interest whatever? Mr. Edge calls in British and patriotic reasons to his aid, but he surely forgets that several of the concerns with which he is connected are the greatest importers of French made motor-cars.

In my opinion the whole question resolves itself into one of the validity of patents, and cannot be treated in any other way, but if the B.M.T. Company, Ltd., claimed a royalty on a carburettor I venture to think that whether the patent be good, bad or indifferent, most people would be satisfied to pay a reasonable royalty, but to demand 5 per cent. royalty on a £1,000 car, to which there is attached a £2 carburettor, is, in my humble opinion, unjustifiable, and I speak as a patentee of nearly twenty years standing.

With regard to the manufacturing interest, I feel convinced that the best way to promote a motor trade in England and to build up a large manufacturing business is just to do what the concerns in which Mr. Edge is interested do, that is to say, import the best cars and get them into use. Each of these cars will have educated a future purchaser for the British-made car when it is ready. I go a step further, and do not hesitate to say that if foreign cars were kept out now it would endanger the legal situation of motor users in this country, and open the way for further restrictive legislation, for the simple reason that the demand could not be filled by the British manufacturers, and that every new owner of a car, when he gets on the road, drives another nail into the coffin of prejudice.

I should see with great pleasure that Mr. Edge would weigh up these considerations, and put the energy he displays in everything on the side on which lies the real interest of the British manufacture and trade in automobiles.—Yours faithfully,

J. J. MANN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As one of "the unenlightened public who still use unlicensed motors," I was interested to read Mr. Edge's letter. I note that he would like me to pay "some consideration," and probably there are many who read his letter who wondered what that might amount to. The copy, which I give below, of a letter received from the company with which he associates himself will give a very good idea of his desires.

On investigation I find that the patent referred to is for a carburettor, similar to the one in my Panhard, the chief claims being the float and the jet through which the petrol is sucked. The idea that I should pay royalty on the whole car for the sake of the carburettor of the engine strikes me as rather comprehensive, apart from the question of validity of the patent. As well ask for a tenth of the value of a locomotive (less the cab) because somebody's patent packing was used in the pump glands. Perhaps it has not struck Mr. Edge that his friends who give such careful attention to other portions of their business may have already gone into these motor patent matters before combining for protection.—Yours truly,

T. B. BROWNE

[COPY].
THE BRITISH MOTOR TRACTION CO., LTD.
40, Holborn Viaduct, E.C.
December 12, 1900.

T. B. BROWNE, Esq.

DEAR SIR,—It has been brought to the notice of my Board that you are infringing Maybach's Patent No. 16072/93, of which my company are the registered owners, and I am instructed to ask you for an undertaking not to infringe again, and to send us the sum of 10 per cent. on the purchase price of the motor less the cost of the carriage body.

Yours faithfully,
(Signed) CHAS. OSBORN,
Secretary.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to the letter from Mr. Edge in your last, I think most people will agree that a patentee should have some consideration. But I cannot agree that the following instance shows reasonable consideration, and in my opinion such unreason-

able charges are doing more damage to the motor industry than the county councils. I will give two instances, both from companies with which Mr. Edge is connected.

In conjunction with Messrs. Brooks, of Lowestoft, we wished to know what the British Motor Traction Company would charge as royalty for permission to use one of Maybach's carburettors. In reply we received what I consider an impertinent letter to the effect that the royalty for the use of the carburettor was $7\frac{1}{2}$ per cent. on the value of the car, and a request that a cheque for that amount be sent on together with a letter undertaking not to infringe again. As a matter of fact I did not intend to use the carburettor on a car at all, but on a boat, the value of which is about £1,000. Do the British M.T.C. seriously think that we shall pay £75 to be allowed to use an article of the value of about £2, when there are other carburettors on the market? Or is it

THE 1,000-MILES NON-STOP RUN OF THE DECAUVILLE CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with interest "Amateur's" letter in your issue of the 8th inst. I do not doubt the truth of the statement that a piece of ice was found in the carburettor of the 8 h.p. car. What has the warmth of the engine to do with the carburettor? Is "Amateur" an ice-cream vendor, or in any way related to the trade? His letter is, in my opinion, the most absurd communication I have seen in your excellent paper. I have formed the following solution to the mystery: The 8 h.p. car had insufficient exhaust passing through its carburettor. Everybody knows, except probably "Amateur," that when evaporation or carbura-

A "BARDON" VOITURETTE IN THE RECENT FLORAL FETE IN PARIS.

Cliché de

[La France Automobile.

only when their patent carburettor is used on a motor-car that they try to throttle the industry by charging such absurd royalties. Please note, they not only charge a $7\frac{1}{2}$ percentage on their patents, but on all other patents that are used with theirs, as well as on all material and workmanship used a car that is blessed by one of their patents.

In the other case I ordered through Mr. Edge a pneumatic tire (cover only), and was surprised to receive invoice for £11 1s. 6d. I wrote asking if there was not some mistake, and was informed that there was not; that it was the usual price, and that I could not get as good a tire at a lower price. I found that the price for Michelin tires in France was about £8; the price of a better tire, in my opinion, from the North British Rubber Company was about £5, and from the Clipper Company about £8. In both cases the excuse for the high charges is that they have paid large sums of money for the patents.—Yours truly,

ERNEST ESTCOURT.

tion takes place, heat has to be taken from somewhere, in this case the petroleum spirit, which, as I contend, had insufficient heated exhaust passing through it. Therefore it was gradually reduced to freezing point, when ice began to form. I think this is the only way it could come about. I should also like to know other readers' opinions upon the matter.—Yours truly,

E. DE ST. G. TREGURTHA.

TO THE EDITOR OF *THE Motor-Car Journal*.

SIR,—Thanks for your correspondent's letter *re* Freezing of Carburettor. Mr. S. F. Edge being, I may say, a professional, must not imagine that quite every motist knows as much as himself. He says every user of a petrol engine knows the facts of the freezing of carburettors. I have had such an engine for over a year, and yet I didn't know this "fact" until now, and

probably I was not by myself. We all have to live and learn, and your capital journal is to teach us—and it has taught me a lot. Mr. Craig's articles in particular are most interesting, and I wish such as Mr. Edge would take a leaf out of his book and do likewise. No doubt that gentleman could teach us a lot if he would.—Yours truly,

AMATEUR.

MOTOR-CARS FOR MEDICAL MEN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The letters of "M.R.C.S." and "M.D." have interested me as indicating the growing necessity for a thoroughly reliable motor-car for the purposes of the medical man. The cars that appealed to me most at the recent shows, for appearance, sufficiency of power, and reasonable price, were the "Charette," "Mayfair Doctor's Car," "Progress," and "New Orleans Voiturette." With each of these cars the necessary hood is supplied, but as at present constructed all are defective in one detail, so far as the medical man is concerned, viz., in not having the starting arrangement from the seat. The object of this letter is really to emphasise the necessity of the seat starter. The doctor's car must remain silent at the patient's door, and the motor should be started afresh from the seat after each visit. To introduce a handle at the back or side of the car, or through the spokes of the wheel, is suggestive of "winding up the works," and excites ridicule.

As regards the tires, heavily-covered pneumatics appear to me to be the most suitable for town work, as less likely to cause trouble with the tram lines.—Yours truly,

"MEDICUS."

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—While fully approving the intention of your correspondent signing himself "M.D.," of taking in your journal and studying it, I think he need hardly postpone indefinitely the possession of a car. The mistake—unfortunately a terribly common one—is to suppose that the same car, or type of car, will suit different people of varying tastes, habits, and occupations. It is precisely on all fours with the idea that because a top hat suits one man it will equally well become all and sundry. As a matter of fact, there are several voiturettes that would prove, and have proved, entirely satisfactory to a doctor, just as there are others that answer every purpose for a commercial traveller.

In reading (I may add with pity) letters from malcontents in the *Lancet*, I have invariably come to the conclusion that the melancholy results therein chronicled have been due to the fact of the wrong car for the particular work in hand having been chosen. I have no doubt that if "M.D." consulted the secretary of the nearest automobile club he would receive some consolatory advice.—Yours truly,

CLAUDE A. P. TRUMAN,

Hon. Secretary Reading Automobile Club.

THE WERNER MOTOR-BICYCLE

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. A. L. Bennett seems to think that I have overstated the case when I say that the Wernerists claim that they can beat "any tricycle." To be more specific, then, Mr. Leonard, of the Motor Manufacturing Company, tells me he can beat "any 2½ h.p. tricycle." Mr. Pennell is reported to have said in his lecture before the Automobile Club that "he never saw during his whole trip a car or motor-tricycle that could hold its own with his 'little beast.'" Lastly, Mr. Bennett has stated that in the endurance competition at Vincennes, the Werner beat "the tricycle," though he now tells us he does not know in respect of what it beat them.

Mr. Bennett deprecates high speed on west country roads, but I can assure him that it would not have been necessary to travel faster than his normal average, when touring, of seventeen miles an hour, in order to defeat my 2½ h.p. roadster tricycle. My reason for troubling your readers with these two letters is that I think the Werner has been rather too highly spoken of lately, which might cause disappointment to intending purchasers. I do not think anything much better has been produced lately than the De Dion tricycle in point of speed and reliability; and if some riders have given the latter up and purchased voiturettes it is because they jolt—a defect which can be easily remedied.

Perhaps some may even be glad to return to the despised "trike" when they have charged a milestone at full speed, as I did recently on my voiturette through a side-slip.—Yours truly,

W. E. TESCHEMAKER.

DRIVERS' CERTIFICATES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We notice in your issue of the 8th inst. mention of drivers' certificates, and we, as an agency dealing with large numbers of men, especially drivers, are quite in accordance with the paragraph, as it is very necessary and apparent that drivers should have some official qualification beyond the every day references. If the Automobile Club would interest itself and take the matter up, it could be worked through on a sound basis, for the Automobile Club being the recognised authority on everything "motor," a certificate issued by them would of course spell "proficiency." There is no doubt that the granting of certificates would have to be done on very exclusive lines, for, to hold a certificate or qualification as driver, it is not necessary just to be able to drive a car along the road, but to do so in such a manner that neither the general public nor the police could find fault.

We have seen drivers who, when given a car to drive, seemed to have no idea except that of tearing along at a great speed without any consideration for the car or anything else, and when changing speeds make the most terrific bungle and noise, while the smell from dirty valves, badly adjusted lubrication and ignition, etc., made them a nuisance to the road. These men class themselves as drivers, much to the detriment of the good men—there are good men—and the trade generally. Bad driving is what has caused half the public service companies to close their concerns. All these things would have to be taken into consideration when granting certificates, as an official certificate carries such great weight in obtaining employment; and as the trade is young and growing fast, all motors should be seen to their best advantage by the general public. It is our personal belief that the granting of these qualifications by such an influential body as the Automobile Club would act as a "soother" to the police and stay or prevent some of their vexatious actions. Trusting this matter will be taken up and thoroughly discussed.—Yours truly,

H. E. WILKINSON,

The Motor Trades Employment Agency.

ELECTRIC IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I quite agree with Mr. Edge that the bulk of the trouble with electric ignition is experienced on motor-tricycles, and that less difficulties and troubles are found when the same system is applied on a motor-car proper; but Mr. Edge does not sufficiently clearly explain why this trouble exists. In my opinion it is due to the fact that one of the poles of the high-tension current is earthed. I am sure if both poles of the high-tension current were insulated, and if a double pole plug, instead of a single pole plug as at present, were used, there would be an entire absence from faults, misfires and other difficulties. I did not read the paragraph to which Mr. Edge refers in his letter, but I think before we can appreciate the enormous advantage of electric ignition over other methods that the other method or methods should be set forth.

I read in the *Engineer* recently a review on the gas engines exhibited at the Paris Exhibition, and it stated to the effect that out of all the American, French, German and English manufacturers who exhibited commercial stationary gas engines, the English firms were the only ones who stuck to the old tube ignition, and who did not fit electric ignition to their engines. Now, if electric ignition commends itself to the manufacturers of stationary gas engines as being advantageous and superior to the tube ignition, it must be ten times more so when applied to the engine on a motor, and for the following reasons: In the stationary gas engines there is always fitted an ignition valve which prevents any of the explosion charge from entering the incandescent tube or pocket until the exact moment is reached

when its explosion is desired. This valve is a most important safeguard, and prevents early explosions and other faults. With engines used on motor-cars no ignition valve is fitted, and therefore the open incandescent tube is free to the explosive charge from the commencement of the up-stroke of the piston to the time of its maximum compression, and an explosion may therefore occur at any time on the up-stroke of the piston, and not a few broken shafts and twisted connecting rods can be traced to this cause. The only safety lies in the fact that the gases are not liable to ignite until they are compressed to a certain degree of compression. From the first moment that the engine commences to work this compression never increases, but is liable from a variety of causes to commence decreasing. The wearing of the piston rings, wearing of valve faces, the increase of temperature in the walls of the cylinder, are all causes which tend to reduce the compression, and therefore cause constant misfires and loss of efficiency. When this happens it is possible to shorten the length of the ignition tube, and so increase the compression and cause the charge to fire a little earlier, but there is really little or no elasticity or adjustment; the system is crude, and I cannot see that it has one redeeming feature to recommend it, whereas with the electric ignition the most delicate adjustment can be obtained. The power of the engine can be increased or decreased within a very wide margin, and another very important point is that a weak mixture of petrol and air can be exploded by means of electric ignition that it would be absolutely impossible to explode by tube ignition, and therefore provides another means of economising fuel and reducing the power of the engine when necessary.

There are a large number of advantages which it would take up too much room to go into detail, but Mr. Edge will be able to criticise my remarks on this subject and perhaps furnish us with some additional reasons in favour of electric ignition. It seems to me a great pity that the press should be continually reporting the blowing up of a motor-car, and other silly reports of that character, which would be entirely eliminated from such reports if tube ignition were relegated to the place it deserves.

Yours truly,

R. F. WALL.

MOTOR MEN TO THE RESCUE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have hitherto looked upon motor men as a peculiar people, and I am not sure that I have always loved them. You see, I take my pleasure in summer in my caravan, "The Wanderer," and motor men have often scared my horses. I told a motor man so the other day. His reply was peculiar but pointed. He said, "Then, doctor dear, why the d—l do you have horses?" That set me a-thinking. When I drove into Lowestoft the summer before last, I met Mr. Estcourt. He scared both me and my horses, and I was sorry at the time I hadn't an egg handy. (N.B.—A stale one would have done.) I was relating my wild adventure to a Lowestoft journalist. His reply was also pointed. He said, "Oh, that was Mr. Estcourt. He's a motor-maniac!" But I found Mr. E. was a very good fellow, nevertheless. He drove his biggest car across Gunton Moor to my camp after that. I stared aghast! He didn't go round the road. Dear me, no! but came straight for the caravan. He rode his Daimler (I think he called it a Dammler) through the heather and furze, over the boulders, and across a moving bog, and came up smiling.

That set me a-thinking also. He said, "Doctor, will you come for a little spin?" I said, "Oh, yes. Certainly. Can my dog trot behind?" I added, "Not much," he answered, laughing. I ran into my caravan to add a codicil to my will, praying my executors to erect a headstone to my memory in each of the parishes in which pieces of me should be found. Then I mounted the motor-car. I can't say I didn't enjoy that little spin; but I was astonished to get safely back. We had driven thirty miles in twenty minutes, scared fifteen horses, and returned with a yard or two of a schoolgirl's red frock sticking to the Dammler.

Well, all this set me a-thinking, and I've been a-thinking ever since, and now I come, through the medium of your *Motor-*

Car Journal, to ask your readers for a bit of advice. To wit:—(1) My caravan weighs two tons, and I only want to do thirty miles a day. Could that be managed, and by what sort of a motor? (2) Could I have a safe one? (3) What manner of man should I have to *mote* me? (4) Could I *mote* myself without spending the next five years of life studying at an engineers' college? (5) What would the ex.'s run to?—Yours truly,

GORDON STABLES, M.D., R.N.

MOTOR TRADES' ASSOCIATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am requested by my committee to inform you that the object of the Association is the protection of those interested in the motor-vehicle industry, whether as manufacturers, agents, or vendors, and also the private users of motor-vehicles, as far as the trade is concerned. To this end this Association will work by enquiring into the cases of such members as are threatened with litigation, advising them as to their position, and, if thought advisable, supporting them in their actions. To enable this end to be achieved, the Association needs the support, not only of members of the trade, but also of the private users of motor-vehicles. The objects of the Association include the protection of private users who are members thereof.

It is intended to register the Association as a company, limited by guarantee; the annual subscription is £2 2s., and each member may then guarantee any further sum or sums to the funds of the Association, and his liability will be limited to the amount of such subscription and guarantee.—Yours truly,

GEORGE R. HELMORE, Secretary.

SEVERAL interesting letters have had to be held over, owing to the pressure on our space this week.

THE Galashiels Town Council has abandoned a proposal to acquire motor-waggons.

THERE are already thirteen incorporated automobile clubs in the United States.

THE Delahaye Company, of Paris, have lately completed a 14-h.p. phaeton to the order of the Marquis de la Ferté-Meun. They are also introducing a 4½ h.p. car, with *tonneau* body.

IN addition to air-cooled motors, Messrs. Buchet, of Paris, are now building a 6-h.p. water-cooled engine on their well-known system.

THE Hyde Park Cycle Company, 15-20, Parkside, Hyde Park, W., are prepared to undertake repairs to motor-cars. They have every convenience for the display of motor-cars.

A CORPORATION has been formed in New York for the purpose of organising automobile coaching parties from New York City to Long Island and other resorts in the neighbourhood.

THE Automobile Club de France has published its "Report on the Concours International D'Accumulateurs, Juin-Décembre, 1899." The Report consists of 109 pages, and includes illustrations and a number of charts.

A COMPANY under the name of the Massachusetts Steam Waggon Company has been formed at Pittsfield, Mass., for the purpose of manufacturing a steam waggon, known as the "Cunningham." The capital is fixed at £70,000.

PROPOSALS for the establishment of a number of motor-car services in the neighbourhood are at present being invited by the municipal authorities of the town of Romorantin, in the French Department of Loire et Cher.

AT the last meeting of the committee of the French Automobile Club, Baron de Zuylen announced that His Majesty the King of the Hellenes has been pleased to accept the title of high protector and honorary member of the club.

MR. LEWIS EARLE, of London, has, states the *Horseless Age*, been in New York for several days past in the interest of a London automobile company which has secured the right to run automobiles for public purposes in some of the principal thoroughfares of the metropolis, and is desirous of equipping the lines with American vehicles.

HERE AND THERE.

THANKS to the good policy of the Automobile Club in giving a complete answer to the case made out against automobiles, and also to the advocacy of Lord Clifford, the Devon County Council has gone against the recommendation of its Bridges and Main Roads Committee and declined to advocate the restriction of the maximum speed of motor-cars. Lord Clifford made the searching remark that he supposed there was not a member of the committee who had ever driven a motor-car and most of them would not, perhaps, dream of doing so. Under the circumstances he thought it was a little premature to say what was the proper pace for a motor-car—a suggestion with which no motorist will disagree.

IN last week's *Punch* Mr. Raven Hill depicted a poor wretch who had been laid low and flat by a motor-car. The driver is looking round, having evidently reversed his engine, while the victim, looking up and seeing the car apparently returning, exclaims, "What! Are you coming back?" The point of the joke is in the agonised expression of the mangled one.

THE automobile is becoming an object of delight to juveniles. A pupil in a Board School was asked for a definition of a horse, and replied, "A horse is a motor-car what neighs instead of puffs, and what runs by oats instead of oil."

MR. C. JARROTT suggests, with reference to the issue of certificates to motorists, that the certificates might be of three

ON THE ROAD TO TINTERN.

classes, namely, (1) Drivers who might travel at a maximum of ten miles an hour; (2) those who might go fifteen miles an hour; and (3) those who might be trusted to go at any speed. What would happen if those issuing certificates placed the holder of the forty-two mile an hour motor-tricycle record in the first category?

MOTORISTS have been very prominently to the fore in the eastern counties of late, and not only have magistrates been giving advice but several correspondents of the local papers have been airing their wisdom. Many suggestions for catching speedy motorists have been made, but unfortunately all the correspondents, save one, have shown undoubted bias—on one side or the other. The single exception is Walter Rye, who, in the columns of the *Eastern Daily Press*, declares: "There is only one way in which safety to the public from excessive speed and to the motorists from unjust convictions can be obtained."

His proposal is so delightful that I give it entirely in his own words:—"Let a short Act of Parliament," says Mr. Rye, "enact that every machine shall carry a meter-like contrivance which, whenever it travels more than twelve miles an hour, shall blow a horn or sound a gong, and at the same time register the fact that it has done so. The Act

should, of course, also enact heavy penalties for tampering with the register, but on the other hand make its evidence actual proof either against the scorching motorists or against the County Councilman or policeman who, foolish beyond the wont of his kind, is prepared to swear he sees bicyclists ride thirty miles an hour, and no doubt would equally boldly vouch for a motorist's hundred." Mr. Estcourt's speed indicator, recently illustrated in these columns, is ingenious, but where is the man prepared to come to the rescue of the public and the motorist—and, I would add, of Mr. Walter Rye—and devise the musical-box that will play tunes to gladden the weary motorist? It should also be arranged so that it could perform while passengers were waiting for repairs to be executed.

A NEW danger threatens those who have met with accidents in the streets of New York. Four of the city hospitals own motor-ambulances, the idea being that those who require hospital attention shall have the same at the earliest possible moment. It worked splendidly when there was only one such ambulance in the city, but now there is a quartette the advantage is somewhat ambiguous. For "ambulant rivalry" has grown so keen that every time the drivers of the vehicles meet a street race is sure to result. Up to the present the Presbyterian ambulance leads in wins, with Roosevelt a close second. What a glorious uncertainty for the man with a broken leg! Having escaped death in one form he runs towards it in another.

THE system of *garages* is common enough in Paris and is now developing fairly quickly in the Metropolis. The Automobile Manufacturing Company, Limited, have facilities for storing and cleaning cars. The Chelsea Electricity Supply Company, Ltd., is also prepared to store motor-cars and has special convenience for electric cars, the current being laid on at their premises for charging electric cars.

M. EDOUARD DETAILLE is a painter and M. Henri Lavedan is a litterateur. Like many other Bohemians in Paris they have interests other than those which form the staple fare of their daily task. Both are troubled with ideas as to the future of the horse and the advance of the automobile. Recognising that the latter may displace the horse as a beast of burden somewhere in the next century—we are still in the nineteenth—they are advocating the formation of a museum of the horse and carriage. This will testify to future generations the evolution of the horse from the Garden of Eden to, say, the Rue de Nations. This is only one of the senseless notions which some people suggest as the result of automobilism. If the two Parisians had confined the idea to asses it would possibly have excited more enthusiasm among their friends.

VERY amusing, and yet quite feasible, is the suggestion that automobile vans should be employed for the conveyance of race-horses to and from race meetings. At present the arrangements of railway companies for the conveyance of horses are most unsatisfactory. Animals frequently arrive at their destination too late to take part in races, or with their tempers so tried that they cannot be trusted on the course. Why not convey horses by road using the automobile for the purpose? Vans have before now been employed to transport racehorses, and the adoption of the latest idea would often prove a saving of time and invariably an advantage to the horses concerned; in addition to which the animals could be exercised on the roadway if desired.

LOLLIUS.

THE Serpollet-Gardner Company, of Paris, are building a 5 h.p. steam car for Dr. Yersin, of the Pasteur Institute, who intends to take the vehicle with him to Indo-China.

WE learn that the Thornycroft Steam Waggon Co. of America commenced by building standard 3-ton vehicles, with a 3-ton tare. It soon became manifest that the demand was for a considerably larger load to be carried, and they have therefore designed and are constructing 7-tonners to meet this want. These larger vehicles have a tare of about 5 tons and a gross of about 13½ tons.

HEAVY MOTOR TRAFFIC IN FRANCE.*

BY M. GEORGES FORESTIER, Inspector General of Roads and Bridges in France.

(Continued from page 703.)

Comparison with Railways.—For goods, the costs per net ton-mile, even when fully loaded, are decidedly greater than the corresponding charges of the French railways, and particularly for heavy goods which form a wagon load. On the other hand, if one takes into account the fact that goods sent by rail have to bear the expense of cartage both in collection and delivery, and of the terminal loading and unloading charges, which are usually about 6d. per ton at each end of the journey, one sees that for comparatively short journeys the advantage remains with the motor-wagon which takes the goods from the sender direct to the consignee.

In order to understand this better, let us consider the rates under the different tariffs and the terminals of the Cie. du Nord. The general tariff has five rates, varying from 1'25d. to 2'5d. per net ton-mile, and the special tariff four, varying from 0'64d. to 1'60d. per net ton-mile. Goods sent under the conditions of the general tariff pay 1s. 3d. per ton, for loading and unloading at the stations, which charge is reduced to 10d. for goods sent as a full wagon-load under the conditions of the special tariff. In addition to this, cartage has to be paid from the sender's warehouse to the departure station, and from the arrival station to the consignee's warehouse, and this is an expense that varies in each town according to the distance from the station. Let us take 1f.50, that is 75 centimes at each end for the terminal services, which is evidently a minimum. We are not going to take into account the loading and unloading at the warehouse, which are the same whatever the mode of transport. On the horizontal line we have the length of the journey in kilometres; on the vertical line the cost in francs (see diagram). The average cost by automotor transport being 18 centimes per ton-kilometre, the expenses for any number of kilometres will be represented by the ordinates on a straight line drawn from the lowest of the co-ordinates to the point 9f. at 50 kilometres. The cost of transport by railway, under the conditions of the general tariff, will be represented by the ordinates on the lines drawn from the point 3f. on the vertical scale to the points 3f. + 8f. and 3f. + 4f. on the vertical scale at 50 kilometres. The costs of transport by railway of a full wagon load, under the conditions of the special tariffs will be represented by the ordinates on the line drawn from the point, 2f.50 on the vertical scale to the points 2f.50 + 5f. and 2f.50 + 2f. on the vertical scale at 50 kilometres.

From the diagram one sees that transport by automobile is cheaper than that by railroad up to eleven and twenty miles for goods paying rates six and one respectively of the special tariffs; and up to nineteen and more than thirty-one miles for goods paying the rates one and six respectively, of the general tariff. These limits are the minima, as we have not taken stamp duties into account, which, on railways, are generally seventy five centimes, whatever is the expense of transport.

Comparison with Horses.—Let us compare, now, the cost of transport by automobile with that by means of horses. In France we reckon that a horse can go at a pace of from 2'25 to 2'5 miles an hour, giving a tractive pull of 0'13 of its weight, for a day of from eight to nine hours, and that on a well-paved or even a macadamised road on a fine day the rolling resistance is less than 44 lbs. per ton. A cart for two horses weighs 12 cwt., and the two horses, weighing together one ton, can thus give an effort of 291 lbs., corresponding to a load of 6'6 tons on the level. If one takes hills and the tare of the vehicle into account, the load must be reduced to 3 tons, which, for twenty miles per day, equals sixty net ton-miles. Besides, the driver of this team has to be paid, the team fed, repaired, and this equals 12s. 6d. per day, that is to say, 2s. 5d. per net ton-mile.

As horse haulage can take the goods from the sender to the consignee quite as well as automobile traction can in fine weather or on a paved road, it is not yet threatened by mechanical haulage for any traffic where a higher speed than 2'5 miles an hour is not required. In winter, master-carters can vary their teams according to the state of the roads, but in mechanical traction, one can only reduce the loads and speed. Accordingly, it is very desirable that our constructors should carefully study the conditions by which they can reduce their prices, still much too high in consequence of the unnecessary provision made for speed which is of no actual use to them commercially.

Road Maintenance.—I shall close my address by giving a few details of the effect of quick-speed motor wagons with small wheels on road materials.

The mutual action of roads and motor-vehicles ought to be studied for both paved and metalled roads, for it is not similar in the two cases. In pavements, each stone is of a shape individually to resist the weight of the wheels without any perceptible movement. This is owing to the mode of construction of the road and the depth of the sand foundation, by which the pressure is spread over a large enough surface of the sub-soil to prevent any getting out of shape. However wet the weather may be, heavy motor traffic is unaffected on pavements. If, however, the pavement is badly kept up so that its surface becomes irregular, while its paving stones become too rounded, in addition to the jolts and shocks which are so fatal to the preservation of the mechanism and of the vehicle, the surface then constitutes a serious obstacle to heavy

motor traffic. This trouble has often arisen at our trials, and in the attempts made in the various departments.

When the tangent plane common to the surfaces of the pavement and the tyre makes with the horizontal an angle equal to that which corresponds with the coefficient of friction, no matter what power is applied, the wheels slip round without being able to move the vehicle forward, unless enough sand is thrown down to increase momentarily the coefficient of friction. This unfortunate condition occurs all the more frequently as the diameter of the motor wheels is smaller, the pavement more badly kept up, and the gradient of the road more severe. I have also heard it said by an engineer of the plant belonging to M. Say, the sugar refiner, that it has been necessary in a five-mile journey of his large electric lorry to consume nearly two cwts. of sand.

The remedy for this unfortunate state of things depends on the public keeping up of the roads and on the constructor of the vehicle. In the first place, the worst pieces of road must be relaid or the holes filled up, especially on hills. In the second place, the constructor ought to try and increase the diameter of the wheels as far as the mode of construction and the mode of connection with the motor allows him to do without affecting the strength of the wheels or the balance of the

DIAGRAM SHOWING RELATION BETWEEN RAIL AND MOTOR COSTS.

vehicle. At the present moment, a French engineer—who two years ago started a regular service of goods transport by automobile, at Bougie, in Algeria, on loose stone roads—is on the point of founding a new concern for conveyances of this kind in the Département du Nord, where the roads are paved. He has decided to try and increase the diameter of the driving wheels of his Scotte vehicles from thirty-five to fifty-one inches.

Contrary to what we have said of the individual resistance of the sets which constitute a paved road, metalled roads are composed of materials of small dimensions which are only able to resist the weight of heavy motor traffic by mutually helping one another. Again, the foundation and top layers together form a thickness or depth which is oftener than not insufficient to prevent the subsoil from having to bear so heavy a pressure that it gets out of shape. In normal weather, metalled roads are almost as firm as paved roads, and the resistance to rolling is about equal on the two. Unfortunately, when rain has fallen for several days, the binding material loses all cohesion and the road becomes a mass of movable stones, which slip about more and more easily under the pressure of heavily-burdened wheels as the speed increases. At the same time the depth of the road, already too small and still further reduced by the displacement of some of the stones

* Opening Address of Fifth Session of the Liverpool Self-Propelled Traffic Association, being the local centre of the Automobile Club of Great Britain and Ireland. December 3rd, 1900.

transmits to the subsoil a pressure too great for its stability, and it gives way. When this is the case, the road continually presents an inclined plane in front of the driving wheels, and this largely increases the rolling resistance and, at the same time, adds considerable friction between the sides of the felloes and the depressions that are made. All engineers responsible for roads have agreed that during the rainy season the rolling resistance may be treble what it is during fine weather. This is one of the most unfavourable conditions for mechanical propulsion, for it necessitates the motors not only being capable of a single maximum effort but of a continual one, which may be three times greater in wet than in fine weather, unless one is content to diminish the speed.

The remedy for this state of things depends, as we have seen in the case of paved roads, on proper maintenance and on the motor-vehicle builder. In the first place, the depth of the road should be increased, it should be kept of all excess of detritus which might increase the state of mobility of the material, and the subsoil should be drained in order to prevent its giving way under the load. In the second place, the weight supported by the motor wheels should be diminished, and the latter should be given a width of tire in harmony with the compressibility of the road. I am going to make use of the experience acquired in a regular transport service, for both passengers and goods, which has been established since April, 1899, in the Department de la Mense, between Stenay and Montmédy, in order to arrive at the extra expenses which heavy motor traffic entails in the construction and maintenance of metalled roads.

This public service makes use of 11.2 miles of the National road (No. 47), where, before the establishment of the *Poids Lourds*, the traffic consisted of ordinary vehicles. Up to that time the roads were kept in repair by adding new ballast, well screened, under the following conditions:—

In order to maintain the 14 ft. road in good order, it was necessary to repair 1.7 miles, by laying 848 cubic yards of quartz from the Vosges, or of "trapp" from the Ardennes, both materials of excellent quality. This corresponds to 75 cubic yards per mile per annum, and to a wear of 0.33 inch per annum. The annual cost was £480.

(To be concluded.)

THE DAIMLER MOTOR COMPANY.

The following is the report of the Daimler Motor Company, Ltd., issued to the shareholders on the 12th inst.:—The directors beg to submit the balance-sheet and accounts for the year ending September 30, 1900. A gross profit is shown of £14,919 18s. 11d., and a net profit of £4,430 8s. 11d. It is satisfactory to note that as compared with the fifteen months covered by the previous year's report, the present report for twelve months shows about the same amount of gross profit, and more than four times the amount of net profit. The net profit is sufficient to pay a dividend of 4 per cent. and carry forward £146 4s. 11d. It will be observed, however, from the accounts, that in the permanent interest of the Company, the sum of £18,082 6s. 11d. has been expended on capital account as follows:—Additional buildings, £1,196 12s. 11d.; plant and machinery, £2,046 9s. 7d.; standard tools, £695 19s. 7d.; patterns, £522 4s. 7d.; drawings, £994 19s. 6d.; re-arrangement of office, etc., £283 2s. 4d.; stock, £12,342 18s. 5d.; total, £18,082 6s. 11d. Good value has been received for the whole of this expenditure. The sum expended upon stock may appear large, but experience has shown that for the securing of orders it is necessary that a sufficient number of completed cars should be in stock, as many intending customers decline to order when informed that a period of six months will be required for the building of cars. In view of the above expenditure the directors, after the fullest consideration, recommend the conservative policy of using the profit that has been earned for working capital for the present, instead of distributing it in dividends. The company's cars are giving the highest satisfaction, and satisfactory orders are being received. A proposal will be laid before you for converting the company's £10 shares into £1 shares by dividing each £10 share into ten shares of £1 each. Mr. J. H. Mace retires by rotation from the office of director, and, being eligible, offers himself for re-election. The auditors, Messrs. Monkhouse, Stoneham, and Co., also retire, and offer themselves for reappointment.

THE STARTING OF ENGINES.

JUDGMENT was given on Monday in the House of Lords in the case of Andrew and Co. v. The British Motor Company and the Great Horseless Carriage Company. The original action was brought by the respondents for an injunction to restrain the appellants, Andrew and Co., from infringing certain letters patent granted to Frederick W. Lanchester for improvements in gas motor-engines. Mr. Justice Kekewich expressed no opinion as to the validity of the patent, but held that the appellants had not infringed the same, and dismissed the action. The Court of Appeal decided that the patent was valid, and that the appellants had infringed it, and they discharged the judgment of the learned judge and granted an injunction. Hence the present appeal. Their lordships now delivered a reserved judgment, holding that the judgment of the Court of Appeal must be reversed, and the judgment of Mr. Justice Kekewich restored. The appeal was accordingly allowed.

ACTION OVER A MOTOR-CAR.

THE action at the instance of Messrs. Allard and Company, Ltd., Coventry, against Mr. James Todd, cycle dealer, Banchoy, for payment of £28 15s., being the unpaid balance of a motor-car, etc., obtained from the pursuers and in the action at instance of James Todd, against Allard and Company for repayment of £25 paid by Mr. Todd to Messrs. Allard and Company in part payment of the motor-car, was concluded last week. Sheriff Burnet has issued his judgment, discerning against James Todd for payment of £1 10s., sums admitted to be due by him, but granting him expenses, and in the second action discerning with expenses in his favour against Allard and Company.

THE Chief Inspector of Schools at Detroit, U.S.A., has been provided with a motor-car to facilitate the performance of his official duties.

THERE is some talk in America of arranging a regular inter-collegiate automobile meet, in which several of the universities where automobile clubs have been formed will take part.

THE Duryea Power Company, of Reading, Pa., U.S.A., have sent us a copy of their new catalogue, in which the latest types of Duryea three-wheel and four-wheel motor-cars are illustrated and described. The Duryea cars are fitted with a three-cylinder engine of 6 h.p.

THE Arvid Schuberts Fabriksund Handels Aktibolag, of Stockholm, who are going extensively into the motor industry in Sweden, send us a copy of their illustrated list of motor-cars and cycles, motors for cars and launches, pumps, etc. They have lately introduced a new carburettor, which is claimed to work without failing in the very coldest weather. It can be used on engines from 1 to 6 h.p., and up to 10 h.p. with a little alteration.

MR. ALEXANDER WINTON, of the Winton Motor Carriage Co., Cleveland, Ohio, and a companion, reached New York on the 4th. ult., after a running time of 38½ hours, from Cleveland, Ohio, a distance estimated at about 800 miles, over the roads he traversed. This was Mr. Winton's third journey over the route, but notwithstanding, in the storm and darkness, he mistook the road several times, and went out of his way some 60 miles, the journey occupying three days and 20 hours.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editor's hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. II.]

LONDON, SATURDAY, DECEMBER 29, 1900.

[No. 95.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

IN a special article last week we referred to the interest taken in the Automobile Club's Letter to County Councils, and quoted largely from the reply of the Chairman of the Worcester County Council. Another communication worthy of note is that of Mr. Tonman Mossley, the deputy chairman of the Bucks County Council. His sympathies are with motorists, and he does not see why automobilism should not be both useful and popular "if it is carried on in a reasonable and considerate manner." But he does object to road-racing, and blames the Club for "having arranged demonstrations upon public highways which would never have been allowed for costermongers' carts or racehorses." Mr. Mossley is an automobilist himself, being the owner of an electric car, and "would be proud to carry a distinguishing badge and number on my car." He declares emphatically for numbering vehicles, pointing out that the Thames launches are similarly distinguished, and that such a course is necessary owing to the easy evasion of police efforts by the average motorist. Although our readers will disagree with him on this point, they will probably welcome his suggestion that they should advocate the nationalisation of public highways by making their repair and maintenance a charge upon the National Exchequer instead of upon the local rates. "In this way," Mr. Mossley suggests, "you will conciliate the ratepayers."

A Lincolnshire Automobile Club.

A MEETING of Lincolnshire automobilists and others interested in the movement is being called for Friday afternoon next, January 4th, at the Saracen's Head Hotel, Lincoln, for the purpose of forming a Lincolnshire Automobile Club. Mr. G. J. Wilkinson, of 18, York Avenue, Lincoln, is acting as honorary secretary *pro tem.*, and will be pleased to hear from any Lincolnshire men interested in the proposal. We hear that the Club is likely to be very strong.

New Season's Racers.

As may be expected, the air is full of rumours relating to next year's racers in France, and certain is it in France that several exceptionally high-powered cars will be seen quite early in the spring. For one, the 100 h.p. Peugeot should run its maiden race with the opening of the season, for months ago the vehicle was practically ready, and we have little doubt that had last summer been as prolific in automobile events as in previous years, the big car would long ago have made its appearance. Many times have I seen this monster, writes our Paris correspondent, with its eight-cylinder vertical motor, and I only hope to witness it at work upon the road, for it ought to move along in a bit of a hurry. One peculiarity is the disposition of the cross-shaft, which is placed right at the rear of the frame, the motor itself being carried in front. Even the lattice work body in aluminium has long been ready. Surely we ought to see this flyer at Nice. Another big car will be the Canello-Dürkopp, for a 50 h.p. specimen of this type is entered for the

events of the Nice week, and it is also reported that a 100 h.p. vehicle is in course of construction at the Bielefeld factory. Then there will be the 40 h.p. Mercedes cars provided with all manner of new devices. And then, too, one may rest assured that neither Panhard nor Mors are doing nothing, and from both stalls there will certainly issue worthy representatives of the firm's past reputations.

Motoring in Algeria.

A CORRESPONDENT in Algiers writes us to the effect that it is surprising to see how many automobiles of every description are in that town at present. The foreign colony and visitors are going in strongly for motoring, the pioneer, as far as the English portion is concerned, being our friend Mr. S. E. Guy, who is generally to be seen in his De Dion voiturette or his Rochet car. The roads generally are good, and as soon as the hills around the town are passed long stretches of level country extend in every direction on the plain.

Count Zborowski's 26-h.p. German Daimler Car.

ON another page we reproduce an interesting photograph of Count Zborowski's 26-h.p. German Daimler with its new *tonneau* body, in which as many as six persons can be carried, in addition to the two accommodated on the front seat. The photograph was taken just prior to the embarkation of the car at Havre for England. At the wheel is Mr. E. M. C. Instone, who had driven the car through from Paris the previous afternoon, the journey, including stops, occupying five hours. Seated beside him is M. Delaville, one of the Count's *mécaniciens*, while M. Tourand, the proprietor of the well-known garage at Havre, is seen standing beside the car.

Good Prospects for Heavy Steam Wagons.

THE conveyance of heavy goods in cities or in other places where horse-transportation is expensive, or impossible for other reasons, is one of the most promising fields opened up by the advent of the heavy motor-wagon. The transportation on roads of heavy loads by means of mechanical power has so far received its greatest share of attention in England. Of late American firms have become aware of the possibilities of the motor-vehicle in this particular field, and there are now at least a half-dozen concerns in the United States devoting special attention to this line of work. If inquiries count for anything, there are also reassuring signs that those who have much heavy hauling to do are not slow to inform themselves of every advance made in this line, and are willing to do their best to hasten the advent of their emancipation from the thralldom of the horse. The interest manifested in the heavy motor-wagon is not, however, confined to large business houses in our chief cities. There are many mining and agricultural interests in our own country as well as in foreign lands where the transportation of raw materials is at present carried on by horses and mules in a very unsatisfactory manner. The owners of these enterprises are anxious to find a practical system of mechanical propulsion which they may substitute for their present costly means of transportation.

Licences for Drivers.

A MOTOR-CAR driver, plying for public hire at Merthyr Tydvil, has rendered himself liable to a fine of £4,500 for driving during the last ten months without a licence. Having confessed his inability to pay such a sum, he was doubtless glad to hear the magisterial decision as to a fine of 40s. and costs. The point is a small one, but it should not be overlooked by those promoting public vehicle services. Every driver must have a licence. Speaking of public-vehicle services, we hope the statement made in our report of the Motor Manufacturing Company's exhibit at the National Show the other week will not be overlooked, for the profitableness of such ventures when the motor-car is employed that was clearly shown.

A Run of 880 Miles.

ON Saturday the Locomobile upon which Mr. Hubert Egerton had travelled from John o' Groat's reached Land's End, and the journey of 880 miles was complete. The route taken was *via* Inverness, Perth, Edinburgh, Gretna Green, Carlisle, Preston, Worcester, Bristol, Exeter, and Penzance. There was apparently no trouble with the boiler throughout the trip, and no

MR. H. D. EGERTON LEAVING JOHN O' GROAT'S ON A LOCOMOBILE.

repairs to the engine had to be made. We have pleasure in giving a photograph of the driver leaving John o' Groat's on his long run, part of which was performed in very disagreeable weather.

Motor Cabs at Vienna.

FROM Vienna comes the news that a series of important tests have recently been made with a couple of electric automobile cabs, for the purpose of demonstrating the capabilities of this vehicle to the chief Commissioner of Police and the head of the fire brigade. The facility of manœuvre was clearly illustrated during the course of a run through thick traffic and narrow thoroughfares, and the officials were so favourably impressed that the question of adopting an electrically-driven fire engine is being considered. The cells will have a thirty mile range of action, which is considered sufficient for the work to be performed at Vienna. A number of these vehicles are to be placed upon the streets of the Austrian capital.

Mineral Oil for Cylinder Cooling.

M. E. LEGRAND, in a letter to our French contemporary, *La Locomotion Automobile*, suggests the substitution of mineral oil for water for cooling purposes in petrol motors. He says that mineral oils have a very high boiling point, and there would, therefore, be much less loss of cooling liquid, and with proper precautions the same oil could be used indefinitely. The oil will not freeze in winter, and another inconvenience would thus be removed. Finally, the oil will not corrode the walls of the jacket like water. Owing to the greater viscosity of the oil, the conveying pipes and circulating pump would have to be somewhat larger than with water. M. Legrand does not state whether he has given his suggestion a trial with practice.

The Automobile not a Nuisance.

THAT the ways of American justices are practical and sensible has been often shown, and in an automobile case heard in New Jersey the judge has had the motor-car in the courtyard for purposes of demonstration. A citizen of Hackensack had sued a doctor for the damages for the loss of his wife, who had died from the effects of injuries received in being thrown from a buggy. It was alleged that the horse drawing the vehicle was frightened by defendant's motor-car, although the latter was 275ft. away from the automobile. In his charge to the jury the judge said: "The first question you have to decide is whether this machine was a nuisance. You have seen how it was operated. The question rests with your judgment as to whether the machine, driving along the country roads without a horse in front and discharging steam behind, is likely to frighten a horse on the highway, and thus endanger the road as to constitute the machine a nuisance. The right to drive horses along the highway is an established right, and if a modern method of locomotion is used of such a nature that it commonly brings danger to those exercising the common right, then it is a nuisance and cannot be tolerated. If it occasionally or exceptionally frightens horses that would not make it a nuisance. In order to make it a nuisance its common effect must substantially interfere with the people who drive horses along the highway. After being absent a few minutes the jury returned to inform the Court that the automobile was not a nuisance."

A New Industry for Ireland.

THE recent trials of alcohol in connection with motor-cars in France have delighted some of our Irish readers, and the *Irish Times* devotes nearly a column to the subject under the heading which commences this paragraph. Having pointed out that alcohol has been proved to be cheaper than petrol our contemporary goes on to say that a great industry prevails in Germany, where, from potatoes, a cheap alcohol is made, which very often is used to adulterate the higher priced spirit produced from grain. The connoisseur who likes his "Irish" or "Scotch" pure would object to this; but the stomach of the motor-car is not so delicate, and cheap alcohol can be consumed by it without harm. Ireland possesses many distilleries at work, and the ruins of a great many more. It seems very probable that if a demand sprang up for cheap alcohol for motor-car purposes few countries should be better able to meet it than Ireland. The advantages are such as would recommend the new spirit to every motorist; the supply would be unfailing, it could be got in most towns, and the price would make it more economical to use than petrol.

Alcohol to Overcome Prejudice.

BUT unfortunately there are many Irish people who object to motor-cars because, they say, such vehicles do not benefit the country to the same extent as horses would. The cars are made in England or France, and the oil comes from America or Russia. Hence the *Irish Times* looks upon the utilisation of alcohol as likely to remove some of the prejudice now existing against the advance of automobiles. It may roughly be

computed, continues our contemporary, that a motor-car consumes a gallon of spirit for every twenty miles travelled, and an enthusiastic-driver will think nothing of doing at least 2,000 miles in a season. Hence he will consume about 100 gallons of spirit per annum. Work this out for the total number of actual and prospective automobilists in the United Kingdom and it will indicate a quantity of liquid well worth the efforts of Ireland to supply. They are able in Ireland to make whisky cheaper and better than England because they have most of the raw materials nearer at hand, though this country has the coal. They should also be able to produce the cheap tractive spirit profitably, for in all probability the potato would be found the best vegetable to get the raw spirit from. These reflections of an Irish authority are interesting.

Automobilism in Austria.

FROM Vienna comes the news that the Automobile Club of Austria has at length come to a definite decision with regard to the date of next year's automobile exhibition. The show, which will be held under the patronage of His Highness the Archduke Francis, will be formally inaugurated on May 23rd, and will remain open to the public during a fortnight, the exact date of the closure being June 6th. But the exhibition will not be by any means the sole feature of next year's automobilism in Austria, for on May 9th the annual Exelberg race will again be held. The Schottwein-Semering event, too, will be repeated, and very possibly a big race from Vienna to Budapest will be organised. The proposal to hold this latter event meets with universal favour, among motor-men at any rate, and it is not considered probable that the authorities will raise any objection to a race between the two capitals.

Danger to London Horses.

ON behalf of the horses of the metropolis an appeal is made by the London Master Carmen and Cartage Contractors' Association. They direct public attention to the serious danger to these animals arising from the carelessness of persons throwing nails in the roadways when unpacking cases outside warehouses. It is no exaggeration to say that there is scarcely a firm of carriers who are not sufferers from this cause. One firm at present have nearly ten per cent. of their horses incapacitated by injuries arising from nails, chiefly French nails. Apart from the serious loss to horse-owners, much suffering is caused to horses which might be prevented by the exercise of greater care on the part of persons using the roadways for unpacking. To such an appeal automobilists would give emphasis, and add the remark that this humanitarian view should be furthered by the greater utilisation of motor-vehicles in connection with the transport of goods.

The Daimler Meeting.

THE fourth annual general meeting of the Daimler Company passed off pleasantly enough, the full speech of Mr. E. H. Bayley, J.P., giving a very good account of the present position. Evidently the shareholders appreciated the caution of the directors in not declaring a dividend, and also in their diplomatic dealing with regard to the offer of purchase which has been made. The proposal to convert the £10 shares into shares of £1 each was unanimously sanctioned, and altogether the proceedings at the meeting were as smooth-running as the company's cars.

The late Comte d'Anvers' Cars.

THERE was a considerable gathering of motor men last week upon the occasion of the sale at Chéri's of the three Panhard cars belonging to the late Comte Cahen d'Anvers, and among those present we noticed the Comte Bozon de Périgord, MM. de Knyff, Charron, Gleizes, Girardot, etc. The first vehicle put up was an 8-h.p., which not only had seen considerable service, but was not of the authentic Paris-Amsterdam type. Still the car was worth considerably more than the

ridiculous sum of £140 for which it was knocked down to M. A. Mercier. Then came the turn of the 12-h.p. of the Paris-Bordeaux 1899 type, and in this instance the bidding was much more active. Finally, M. Hoquette secured the car for £668. This cleared the way for the big 24 h.p. vehicle in which the unfortunate count was killed. Damaged as it was the racer presented a somewhat woebegone appearance, and the general estimate was that £120 would barely cover the cost of the repairs necessary to put the car "*au point*." After some animated bidding the vehicle was knocked down to M. Charron for £1,088. It is only a few months ago that this self-same car was purchased by its late owner from Charron for £2,080, while Lord Carnarvon is said to have paid upwards of £3,000 for his vehicle of a similar type. But then an agent buying is quite a different person from an agent selling.

Mr. Cordingley's Car.

THE accompanying illustration depicts Mr. Cordingley on his well-known M.M.C. Panhard car. The photo from which it is reproduced was taken some months ago, on the occasion of the demonstration in connection with the summer meeting of the Institution of Mechanical Engineers. Since

Photo by Argent Archer.

that time the car has been driven thousands of miles, and, with a larger body, has taken part in the Christmas tour of the Automobile Club, an account of which is given on another page.

A Projected Service between Shrewsbury and Montgomery.

A MEETING of those interested in the projected motor-bus service between Montgomery and Shrewsbury was held on the 13th instant, at which the Mayor of Shrewsbury, Mr. Archibald Graham, presided. After examining estimates and specifications of the proposed vehicle, a committee was appointed to ascertain the amount of financial support likely to be accorded to the scheme in the district interested.

Toll for Six Horses.

THE "Tale of a Toll," told in a recent issue, finds a companion story in the adventure of a motorist in an out-of-the-way district in America. It is thus told in the *Motor World* of New York:—"In the course of his journey the motorist came upon a ramshackle toll bridge, the keeper of which was a thin, lantern-jawed, tobacco-eating mountaineer who looked as though he knew a great deal more about moonshine

whiskey than he did about collecting toll off the very few vehicles that might have occasion to risk themselves and their drivers by crossing his rickety allevation of a bridge. When the tourist stopped to ascertain how much he was indebted for the privilege of bridge crossing, the collector was evidently worried. The schedule of charges had upon it an enumeration of what a horse, a one, two, three, and even four-horse vehicle cost to pass over that bridge, but it was discreetly silent as to the tariff upon a vehicle which was minus any horse at all. Then followed a game of talk, in which the motorist was more bent on confusing the already perplexed tolltaker than in doing anything else. In the course of all this the fact escaped that the vehicle was a 6 h.p. one, and in the end the laugh wasn't with the man who owned it—that lantern-jawed mountaineer added the tariff for a four-horse vehicle to that for a two-horse one and made the chagrined tourist pay the six-horse tariff thus arrived at.

Toy Motor-Cars.

VISITORS to the bazaars this Christmas-tide have seen many automobiles in the form of toys for children, mostly propelled by clock-work. In the United States an electrical automobile has been a feature of the season, and has doubtless found its way to the shopping resorts of this country. It is 10 inches long and 7½ inches high. The battery is placed under the seat, where it can be easily got at. It will furnish power to drive the vehicle from half an hour to an hour without recharging. The motor is attached to the under side of the body, with a suitable gearing connecting with the wheels. The front axle is pivoted, and there is a steering lever by means of which the little car can be directed, the handle being placed in the usual manner in front of the seat.

An Enthusiastic Parisian "Chauffeuse."

ONE of the most prominent of the lady motorists in Paris is Madame Gobron, who during the past season has covered more than 6,000 miles on long tours, without reckoning ordinary runs. In March she went from Paris to Monte Carlo and back; in May she covered the course between Paris and Moulgouse; in June she visited Belgium; in July she toured along the sea coast, and in July returned to Belgium. Since then she has taken part in all the trials around Paris. Madame Gobron always drives the car herself, and in all of her travels has only been in danger of accident on one occasion, when the vehicle went over a tree that had been blown down across the road by a storm. Singularly enough the car was not damaged in any way, nor was its plucky owner.

Road Maintenance.

IN a paper read at a meeting of the National Traction Engine Owners and Users' Association, Mr. H. Howard Humphreys, M.Inst.M.E., has been criticising the authorities responsible for the maintenance of the roads. It appears to him that it will be necessary ere long for cyclists, automobilists, and users of traction engines to obtain Parliamentary powers to compel defaulting local authorities to do their duty in respect of maintaining their highways and bridges. The general tendency is to starve the roads in material or labour so that some more showy scheme may be carried through. Mr. Humphreys gave credit to one county that has appreciated the importance and economy of more centralised control in the matter. That is the Buckinghamshire County Council, which has a system by means of which they contribute a very large portion of the cost of maintaining every highway in the county on the condition that those highways are maintained to a certain standard of excellence.

Better Roads.

No apology need be given for again referring to the question of the roads, since they form a not inconsiderable factor in the success of automobilism. So often are people inclined to connect mere tire troubles with difficulties of the motor that the motor-vehicle has obtained a certain amount of prejudice

owing to no cause of its own. Smooth roads are, therefore essential if the public is to become thoroughly educated to the automobile. And the necessity of such being provided should be urged upon the ratepayer as well. As soon as a road becomes uneven and small depressions occur at frequent intervals, the wear of the surface goes on very rapidly indeed. Hence the necessity for surveyors to secure a firm surface that will admit of proper drainage, and to see that it is kept on an uniform level.

No Doctors for Horses.

A STATEMENT reaches us from America which, like many reports from the United States, seems hardly credible. It is to the effect that Harvard University has found it impracticable to continue its veterinary department, there being only seventeen students who care to devote themselves to the ailments of the horse. This is owing, it is said, to the fact that the young men of the country recognise the growing development of the automobile, and see in the study of mechanics a better living than in poulticing horses and doctoring mules. If it be so, it is very hard on the quadrupeds.

The Duke of Manchester an Automobilist.

THE Duke of Manchester having taken to matrimony by marrying Miss Helen Zimmerman has now taken to automobilism, and while in New York *en route* to Cincinnati to visit his father-in-law, has purchased a motor-carriage seating four persons. The principal amusement of the young couple in New York has been motoring, and they were seen out on Riverside Drive nearly every day, sometimes accompanied by the Misses Evans, aunts of the bride. The Duke and Duchess left New York a few days ago on a private car, which was attached to a fast goods train for a portion of the way. Their automobile will meet them when they reach Cincinnati, where Mr. Eugene Zimmerman, father of the bride, will entertain them. It is the Duke's intention to bring the automobile with him when he returns to Europe, in about a month.

The English Motor Club.

THE English Motor Club extend a hearty invitation to all automobilists to join them on the occasion of their run to Brighton on the first Saturday in the new century. The start will be at 1.30 sharp from the Westminster end of the Embankment, and the route and time table is as follows:— Mitcham Common, 2.15; Wallington; Coulsdon, 2.45; Crawley, arrive 4 p.m., depart 4.30; Hickstead; Brighton, Star and Garter, where dinner will be served at 8 p.m. All motorists desiring to have seats secured for the dinner should write not later than Wednesday morning to Mr. F. W. Baily, the hon. sec., 94, Oakfield Road, Anerley, S.E. The club is also arranging a race meeting at the Crystal Palace track for Easter Monday, when, in addition to motor-cycle events, there will be a voiturette handicap and an attempt at record for cars by a 70 h.p. Napier driven by Mr. S. F. Edge. A control contest will also be held in the Palace grounds on the last Saturday in April, when amongst the novel events will be a 200 yards starting handicap.

Motoring at Christmas.

NOT only have some members of the Automobile Club been enjoying a motoring Christmas, but Mr. A. J. Balfour had his motor-car dispatched to Whittingehame, his country seat, where he spent the vacation, and he has indulged in some lengthy trips in the vicinity. Not only has the Leader of the House been a-motoring, but we hear of a good many of his Parliamentary colleagues on both sides of the House having taken motor trips. Evidently their education can go on, even though the House is not sitting.

MR. T. BAYLEY, M.P., presided over Mr. E. Shrapnell-Smith's lecture at Nottingham last week. There was a capital attendance, and the proceeds should prove a very acceptable addition to the funds of the General Hospital.

PARIS TO LONDON.

THE Editor, with a fearlessness that characterises some motorists, has asked me to describe a flying visit to Paris to fetch a four-seated Darracq voiturette. We started on a recent Thursday *via* the Dover and Calais express, and although the passage was somewhat rough it luckily left no unpleasant recollections to mar our appreciation of the excellent appetites with which the short run provided us. Having heard so much about the French express trains, and the enormous speed they sometimes attain, it may be interesting to note the following figures: 1 kilomètre in 26 sec.; 1 kilomètre in 25 sec.; 1 kilomètre in 24 sec.; equal to 90 miles per hour. For considerable distances we made 70 miles per hour, and the car attendant informed us that in certain places the speed amounted to over 90 miles per hour.

On arrival at Paris I had the pleasure of dining at the charming French Automobile Clubhouse. The fine *garage* awakens feelings of covetousness undreamed of before; to say nothing of the fifty or more cars that were stabled. On Friday morning we started afresh for Suresnes, where the Darracq Works are situated. Stopping *en route* at the Palais Automobile, it was interesting to note the 12-h.p. Panhards and to watch the confidence with which the French *chauffeurs* rushed up and down the narrow road, regardless of greasy mud and skidding, which in England is looked upon by some motorists as one of the misfortunes attached to driving under these conditions. While lunching at a small restaurant at the bottom of the Suresnes hill, close to the bridge, it was astonishing to see the number of motors that passed, and we admired in particular the way in which a smart-looking lady, driving a four-seated car, took the sharp turning to the right on to the bridge (which, by the way, is crossed by tram lines) descending at the rate of about 30 miles per hour.

At Messieurs Darracq and Cie. the plant is practically all automatic, worked by electricity, and one cannot help remarking how few men (and sometimes women) work in this labyrinth of mechanism. I myself, no engineer, must not speak authoritatively of the perfection of their work, but think it no mean recommendation that a gentleman present, who is an engineer, stated his approval; and I believe seriously contemplated a purchase.

Having obtained the voiturette we started on our journey towards Dieppe at 4.15 p.m., expecting all sorts of strange things to happen, as the machine was new to both of us and the dusk coming on. But Mr. Maurice Farman, driving a similar car with two members of the A.C.G.B.I. and a friend on board, kindly volunteered to be our guiding star as far as St. Germain. As there were only two on our car we easily passed the others on the Suresnes hill, but they soon drew away from us on the flat, as it needed the confidence of an experienced driver and knowledge of the motor to disregard the bad grease which characterised the road; but our ascent into St. Germain was most satisfactory, as skidding up hill gives one the pleasurable excitement without the generally-accompanying danger. We stayed the night at the Henry IV. Hotel, where, by the way, they have an excellent *garage* with every convenience and up-to-date *mécaniciens*.

The following morning (Saturday) we left at 7.30, and though the air was cold the sky looked promising. After about an hour's run an unpleasant squeaking started, for which we could not account. At last we discovered that it was only the lubricating pump, which, with the usual inventive genius of this apparatus, had somehow got some air below the oil; this little matter delayed us one hour at the village of Fluis. The next stop was to fill up with petrol, and then we mounted Gaillon hill in grand style. During one long gentle ascent a 12-h.p. Panhard passed at a seemingly terrific pace; the faces of the two occupants, who were enveloped in furs, were scarlet with the wind. The "swish" as they passed reminded one of an express running under a bridge. We stopped at a village for a quarter of an hour at a small café, where they not only supplied comfort for the inner man, but also petrol for the motor—a convenience and luxury unknown in this country.

At Rouen we arrived at 1.20, and lunched at the Hotel d'Angleterre. Leaving there an hour later we followed the valley of the Seine for about five miles. The roads here were very trying, being thick with greasy mud, and in some places new "metal," which was almost preferable, as, on account of the traffic, one avoided skidding. We only stopped once between Rouen and Dieppe to fix the lubricating pump, and arrived at 4.30 p.m., driving straight to the Quay. Owing to the unfavourable elements the authorities would not ship our vehicle until Sunday afternoon, so there was nothing for it but to stay there for the night at the Chariot D'Or Hotel, where we found the usual conveniences for motorists. While on the quay a handsome 16 h.p. Cannstatt Daimler arrived, with M. Jeantaud at the wheel; it was Sir David Salomons' new car, and gave one the impression of being very comfortable.

Shipping a motor is an unpleasant experience for an owner, as the painting cannot escape a certain amount of scratching. That over, we crossed by the 1.15 boat, to find at Newhaven that the cargo would not be discharged until midnight, owing to another boat with perishable goods, such as poultry, eggs, and mistletoe, having to be unloaded. Rising at 5.30 on Monday, the officials kept us going until 8.30, when we at last thankfully dispensed with their services for the sum of £4 0s. 3d., to my mind an exorbitant charge for a machine weighing only about 9 cwt. and covering scarcely as much space as half a dozen crates

A REMINISCENCE OF THE SOUTHEAST RUN.

Photo by]

[R. W. Buttener.

of mistletoe. Motorists who intend coming by this route should avoid a night journey, as the drains that often cross the roads are quite enough to ensure ruined springs. It is also wise to telegraph beforehand to the London and Paris Hotel, Newhaven, for petrol, as the only agent in the town does not supply it after dark.

Starting at 9 a.m. (Monday) for London, *via* Lewes and Uckfield, at the latter place the lubricating plunger stuck fast, but by cutting the communicating pipe we managed to successfully lubricate direct, and got away again after an hour's delay. On nearing East Grinstead we pulled up for a restive horse, which retired precipitously backwards to watch our machine from a neighbouring ditch, causing a general muddle and another delay of three-quarters of an hour. Then we ran into Croydon, where the roads practically and emphatically beggared description, being regular "sloughs of despond." In spite of skids and mud baths we arrived at the A.C.G.B.I. at 2.30 p.m.

I would mention that through the whole run we had no trouble except with the lubricating pump, and as the motor was quite new we did not press at all, even up hill, but kept well up to the legal limit.

R. B. B. B.

BARON PIERRE DE CRAWHEZ, who is travelling on his 12 h.p. Panhard from Brussels to Algeria, has arrived at Marseilles. He journeyed by way of Troyes, Dijon, Maçon and Lyons; then came a pleasant zig-zag trip along the Rhône valley as far as Marseilles, where the *chauffeur* met his brother, Baron Joseph de Crawhez.

CORRESPONDENCE.

AN AMUSING EXPERIENCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—When horses have sustained from time immemorial a reputation for giddy behaviour, why don't people provide accordingly for little idiosyncrasies in their fickle characters? In the days gone by—when I drove a mere horse, instead of a motor—I never dreamt of leaving an engine-hating gee-gee, unguarded, in charge of the dogcart, in the vicinity of a railway station or such-like place. Why are shop boys allowed to leave rampageous horses with carts in solitary state whenever they choose to spoon at back-doors with various Bridgets and Harriets? If they took them along with them, or did the spooning at the front gate, it would be more sensible; but no, they leave the perhaps flighty animal at the mercy of all strange traffic—such as motors or steam rollers, fluttering papers, or brass bands—that may happen to pass that way. The butcher-boy seems to be the worst; he never by any chance takes a *compagnon de voyage* to mind his gig when on his rounds. Then, if a motor ogre appears, the sportive unfettered one—perhaps terror-stricken—is left to his own devices, and tableau! he sometimes “takes himself off”!

The other morning I started for town in my Benz dog-cart, as usual, and when about a mile away from my home in West Kirby, and nearly at the next village, Hoylake, I saw the local wine and spirit merchant's cart, with the horse's head facing me, standing at ease outside a gentleman's residence. The “boy” was nowhere to be seen. When I was afar off the horse espied

me—I hope my engine does not make enough noise for him to have heard me such a long way—and turning sharply round, made off at a war gallop in the direction of Hoylake. He arrived there long before I did, leaving a trail of intoxicating liquors, bottles, etc., behind him on the road. Someone stopped him after about three-quarters of a mile's career, and I met him being marched back to West Kirby to find his owner. What the boy looked like, or what the wine and spirit merchant said, I do not know—but unluckily the back of the cart happened to have been left down, and that caused all the fun. Oh, dear! I haven't laughed so much for ages. To see those things go jumping out—first a dozen of beer, then a syphon of soda water, next a flagon of burgundy, then a few bottles of stout, and so on—as the cart rattled along with the back-fall hanging flackety-flack after it!

It was a rare sight, but I don't think it was my fault. The boy must have known whether the horse loved motors or not; at any rate, there are enough motor-cars in our district, of one sort and another, for him to find out by now, and not leave the skittish animal alone to brave any possible ones passing by. Therein lies one of the beauties of the motor. You can leave it at the gate while you go in and have afternoon tea with your friends, and you come out and find it there, even if an army of steam rollers has passed; and no one is likely, as yet, to run off with it. Perhaps, some day, when everyone has a motor instead of a horse, we shall have to keep a private padlock on the wheel when we go visiting or shopping.

Yours truly,

WILLIAM LEA.

THE WERNER MOTOR-BICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Mr. Teschemaker's letters of December 8th and December 22nd, I may mention I did not care to put myself forward, as it might be suggested I was an expert on the Werner, but as Mr. Teschemaker mentions my name and statements I think I have a right to reply. I shall be most happy to match myself against Mr. Teschemaker with his 2½ h.p. tricycle (but will permit and should prefer him to ride a 2¾ h.p.) in a ride to Brighton from London. This, I think, is a fair give-and-take road. I would use an ordinary stock size machine, fitted with 1½ h.p. engine, 62 by 72, and a pedalling gear not greater than 63 inches. Mr. Teschemaker would be at liberty to use any pedalling gear he may think fit, either high or low.

Yours faithfully,

JOHN J. LEONARD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I hope I have not conveyed to anyone the idea that I desire to disparage the motor-bicycle. Though my Werner may have been my joy and despair, may have cudgelled my brains, and may not have carried me as many miles as its cost in pounds sterling, I still incline to the opinion that it can do all that has been claimed for it, especially if it fall into competent hands.

However, I have disposed of my machine, and have seen and tested another motor-bicycle, which seems to proffer all the enjoyment aspired to, without exacting proficiency in the sciences upon which it is constructed. Thanking correspondents who have kindly assisted. Yours truly,

J. A.

MOTOR PATENT MATTERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—My company have had their attention directed to a letter in your last issue signed “W. D. Astell,” in which this gentleman makes some statements in regard to British Traction Company patents which are not by any means accurate.

My company do not propose to enter into lengthy discussions in regard to the merits or demerits of various patents, as that is a matter which will be settled in the Law Courts, and cannot be settled anywhere else, but when incorrect statements are written to your paper they think it advisable to give publicity to the truth.

Mr. Astell suggests that no foreign manufacturers pay royalty for the use of this company's patents in England, and particularly mentions the great house of Messrs. Panhard and Levassor, of Paris. In regard to this statement we will merely give two extracts from letters written by Messrs. Panhard and Levassor to customers of theirs in this country. The first one is written to the Speedwell Electric Motor Car and Cycle Company, of 83, Oxford Street, Reading, and is dated March 4th, 1900:—

“We must at the same time inform you that as we are the owners only in France of the patent for the motor which drives our carriages we should not be able to deliver in England; you would have to agree with the owners of the English patents.

“For the Director,

“(Signed) A. DE FIENENVILLE.”

The second is one dated July 30th, 1900, and is addressed to Miss Willoughby Brown, of Epsom Road, Croydon, and reads as follows:—

“At the same time we must tell you that as we are only owners for France of the patents for the Daimler motors which drive our cars, it would be necessary in order to import one of our cars into England to obtain the authorisation of the Daimler Motor Company, Limited, of Coventry, by payment of a certain sum.”

We may say that these letters constitute part of an affidavit made by Messrs. Panhard and Levassor in an action of theirs in this country. We think that if a firm of the knowledge and standing of Panhard and Levassor themselves point out to customers of theirs that they have no right to use these carriages in this country without first getting the consent of the owners of the patents, it is fairly conclusive proof of their opinion of these particular patents. At the same time it will be as well at this point

for us to mention to motor users that we have a considerable number of patents covering the various well-known motor vehicles in use in this country, and that it would be advisable for them to satisfy themselves as to their right to use them here rather than complain when the aid of the law is invoked to stop their infringement. Yours faithfully,

For the British Motor Traction Company, Limited,
CHAS. OSBORN, Secretary.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In a letter in your last week's issue Mr. W. D. Astell makes a statement there that is likely to do us serious harm. He states that no large French manufacturing companies pay royalty on patents which are owned by other people in this country. As Messrs. De Dion and Bouton, who are, we think, the second largest, if not the largest, manufacturers of automobiles in the world, never allow us to sell a motor of their manufacture in this country without the royalty being first paid, and which royalty includes the use of the carburettor, we think it right to state this very definitely, as it would be most harmful to our business if our customers thought that in buying a motor-car from us they had also purchased a legal action. Every motor or motor-carriage bought from the De Dion-Bouton British and Colonial Syndicate, Limited, carries with it a full licence to use same freely in this country without any risk of legal action.—Yours truly,

The De Dion-Bouton British and Colonial Syndicate,
CHARLES JARROTT.

PETROL AT HARROGATE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—There has always been a difficulty in obtaining petrol or even benzoline in Harrogate, as the Corporation have refused to grant a licence for its sale and storage. However, I have always petrol on hand, and shall be very glad to supply in limited quantities any automobilists who are short. We get a large number of cars here all the year round, and I have often heard of them having to send for petrol from a distance.

Burleigh Villa, Harrogate. Yours truly,
JAS. EDW. LUKE.

MOTOR-TRICYCLES AND JOLTING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. W. E. Teschemaker mentions in your issue of December 22nd that the jolting of a tricycle can be easily remedied. Now, I think motorists will agree that this is the disadvantage most have unsuccessfully fought with. I for one would be much obliged to Mr. Teschemaker if he will tell me how it can be remedied, as I wish to do it to my tricycle, which slowly rattles itself to pieces on a long ride. Mounting the body on springs and driving from the engine by chains naturally suggests itself, but is rather involved, and any simpler way of solving the difficulty will be warmly welcomed by, Yours truly,
"MOTOR-MAD."

MOTOR MEN TO THE RESCUE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have great pleasure in answering Dr. Gordon Stables' queries to the best of my judgment and ability, and will, to save space, take them seriatim:—First, as to the kind of motor, this is largely a matter of choice, but, personally, for the weight Dr. Stables requires to move, I should prefer a steam motor with cylinders about 3in. by 6in. by 6in. stroke compound, and with a water-tube boiler burning coke, two speeds—a slow speed for heavy work of about three miles an hour and a fast speed of about six miles. With the engines set to run at a moderate speed, say three hundred revolutions per minute, Dr. Stables need be under no fear of being "held up" either for bad roads or steep hills, while the boiler will need no more attention than he can give from time to time. If, however, petrol's seductive charms succeed in alluring him from the older motor, let him

unquestionably invest in either a "Napier" or "Daimler" car, and he is sure to be pleased with his bargain; but here, as to details, I am not so well able to advise. In any case the car would probably have to be specially built. Perhaps the body of the "Wanderer" could be arranged to fit the frame, etc., supplied by the motor builders. Second, he may be quite at rest as to safety in either case. Third and fourth, he can "mote" easily and well without assistance if he does not mind occasionally dirty hands. Fifth, absolutely impossible to state off-hand, but not more than a horse, and, as he progresses, much less.

Yours faithfully,
"PRECURSOR."

TUBE v. ELECTRIC IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—After eight years' experience with motors I can unhesitatingly state that for heavy cars lamp ignition is the most reliable. I often find where the two methods of ignition are fitted to the same car that the lamp ignition is used generally. There is one fault users of lamp ignition often complain of, that is, the lamps blowing out. I can safely say that I have not had a lamp blow out for two years, although I drive in all weathers, a large part of my driving being done on the exposed sea coast. I should advise anyone that is troubled in this way to remove the lamp door entirely—leaving it open is not the same as removing it.

Yours truly,
ERNEST ESTCOURT.

THE 1,000-MILE NON-STOP RUN OF THE DECAUVILLE CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to the letter under the above heading in your issue of the 8th inst., I am inclined to think that the majority of your readers will join me in advising "Amateur" to give a little more time to the study of the petrol motor and its principles before favouring the public with further witticisms on the subject, unless, of course, you propose to add a comic section to your most interesting journal; in which case, perhaps, he will be careful to place his communications in that column, and not amongst the letters to which your readers look for interest and instruction.

If "Amateur" really wishes for information I think he would be much more likely to obtain it if he refrained from utterly ridiculing the idea of a frozen vaporizer, which he would know to be quite a frequent occurrence if his experience of motors in any way equalled his assurance in giving your readers the benefit of his wit.—Yours faithfully,
A. M. I. M. E.

THE Moto-Club of Lyons has challenged the Nice Automobile Club for the Coupe du Sud-Est, won by M. Chauchard. The race will take place on April 14th over the Salon, La Fare, Aix, Avignon, Arles, Salon route, a distance of 180 kilometres.

ALL motorists use Globe Polish, and it is useful to always carry a box on the car. A lady friend of ours found a box useful at Wilton on Christmas Eve, for, having nothing to do—her husband's car being "hung up"—she set to work and made all the bright parts beautiful, and on Boxing Day we saw her similarly employed at Plymouth, and our opinion is that no car is complete without a box of Globe Polish.

WITH regard to the Gobron-Brillié car on which Mr. W. T. Pretty recently made an experimental run, using methylated spirit and benzoline as fuel, we learn that Messrs. W. T. and S. E. Botwood, of Carr Street, Ipswich, have secured the sole rights to make and sell this type of vehicle in Great Britain and Ireland. Already several orders are pending, and Messrs. Botwood hope shortly to have cars ranging from 6 h.p. to 12 h.p. on the market. For the present the chassis, or frame, complete with motor and transmission gear, will be brought over from France, the firm building their own carriage bodies and fitting them to the frames. We may add that we published an illustrated description of the Gobron-Brillié cars in our issue of September 1st, 1899.

MOTORIZING IN THE MIST.

THE AUTOMOBILE CLUB'S CHRISTMAS TOUR.

WE have been motoring through the mist, and through the mud, and over the moors, and—to continue the alliteration—over the mountains as well. For although none of the hills we have surmounted this Christmas season have been more than 900 feet above the sea level, they have been mountains to venturesome motorists. The state of the roads over those hills was dreadful indeed, and in more than one instance we have had to invite our passengers to “pad the hoof,” and have had to do the same ourselves.

When the project of a Christmas tour was first mooted at the Automobile Club several members expressed delight at the idea, and declared themselves willing participants of the trip. So the tour was arranged and the route duly made public. The effect on the size of the party was remarkable, for when they saw the distances to be covered *per diem* enthusiastic motorists brought discretion to their aid and entered not upon the winter pilgrimage to the West Country. At all events, only two cars took part in the tour—one a Darracq voiturette, with Mr. and Mrs. Johnson aboard, and Mr. R. Bruce a passenger from Salisbury, and the other a M. M. Co.'s Panhard, with Mr. and Mrs. C. Cordingley and Miss Pursehouse. The journey was intended as a holiday trip; it developed into a holiday in which stiff work, and plenty of it, were conspicuous features, as Peyton, our trustworthy and hard-working *mechanicien*, could tell.

We gently remonstrated with the genial secretary of the Club upon the long distances set down for each day's journey, especially when the nature of the country—for we should imagine the road to have been the most difficult in the kingdom—and the shortness of the day are considered; but Mr. Johnson in his usual cheery manner endeavoured to reassure us, declaring that, at fourteen miles an hour, it only meant so many hours a day—quite a light and airy task to those who had been through the 1,000-mile Trial, and encountered the ups and downs of motor travel in hilly districts. Fourteen miles an hour was an optimistic calculation; we imagined our limit would be about a dozen, but towards the end of the tour we have been well pleased at an average of eight miles an hour. And upon this average we have based the time-table of the later days. In such a festive season as the last Christmas of the century we have known what it is to get up at what appeared the middle of the night to make a start at eight o'clock in the morning—with our lamps burning fitfully in the raw air and our marrow chilled with the grey mists from the moorland. Altogether the tour was remarkable—we might say is remarkable, for, as a matter of fact, at the time of going to press we hope to be still plodding along at our eight mile an hour average, for the tour does not end till the Friday of this present week. It has been, we repeat, a remarkable journey, not by reason of any *contretemps* to the motor-vehicles engaged, but for the variations of the atmosphere we have passed through. The nature of the road, too, has contributed to the experiences of the trip, for we believe that from Salisbury to Exeter—a distance of ninety miles—there is not a single inch of level road. At all events, it was only when going downhill that we used our fourth speed, and then only by “braking” on the clutch. Under such conditions the greasy nature of the road absolutely prevented anything like fast travelling. Stretches of freshly laid stones gave increased anxiety, and these were not only long, but numerous. They were specially interesting when discovered—and there was no fear of passing them unnoticed—half way up and over the crown of 1 in 9 hills. Under the best of circumstances, with the weather pleasant, agreeable, and smiling, and the road surface favourably inclined, such hills are difficult to surmount when our car has its heavy-hooded body, four passengers, and the necessary luggage; but when the atmosphere is unkindly severe and the roads have been drowned by deluge our car ploughs its way on the greasy roads with a sinking and a slipping not unlike the floundering of a small barque at sea. The experiences of motoring are never

monotonous; they are as varied as the British climate. Although we had previously motored in all weathers and on nearly all roads, we had a new experience in running short of petrol. No charge of carelessness can be laid against us, for the most careful calculation would be upset on a journey of sixty miles absorbing eight and a half gallons—about as thirsty a mood as our motor had ever been in. And not only did petrol flow freely, but although we had a radiator, and the pump was working well, we had to fill up twice with water in the same distance—an unusual proceeding.

It must not be thought, however, that our experiences have been unpleasant, troublesome and tedious though they undoubtedly were; for it must be remembered that our car is a very comfortable one, and, well laden with rugs, secured us against many biting winds. Moreover, just before starting on the journey we had purchased from Salisbury's a new foot-warmer which lasts sixteen hours upon a single charge of charcoal brick. This we have found as warm at the latter end of the day as at the beginning. Then, too, the hotels at which we have put up have compensated for inconveniences on the road. Like most of those to be found in the West Country they have been old-fashioned, cosy, and comfortable. Hosts and hostesses have uniformly, and kindly perhaps, concealed their private opinions of our enterprise. For they must have thought strange thoughts as we drew up, like shadows from the mist, before their hospitable doors. Their sympathetic regard for our comfort was great indeed, and we have found, with Shenstone, “our warmest welcome at a country inn.”

Then, too, the outside scenes at this season of the year are not all lonely and desolate. It was novel to see and pleasant to watch the gambolling lambs in the fields—not in isolated twos and threes, but in greater numbers. In one field alone, between Crewkerne and Shaftesbury, there were quite two hundred lambs frisking about, heedless of motors and their troubles. The countryside has been enlivened with holly bushes growing in greater profusion than ever we have seen before, myriads of red berries adding a colour that has been welcome to our eyes. And the mistletoe, too, has been equally luxuriant—remarkably so this season in a locality famous for such seasonable growths.

Would that we could write so glowingly of the roads. We had previously slipped along in silver frost, but never before had we had our car turn completely round on what was apparently a wet road, when, in reality, the rain had frozen as it had fallen. It is not wholly exhilarating to go through overflowed roads; but perhaps it seems colder and damper, and decidedly more awkward, to have to follow a couple of cows that will persist in keeping to the middle of the road in such a way as to prevent the passage of a vehicle behind. We came up with two such cows. They were in charge of a yokel mounted on horseback, and the three animals and the lad persisted in keeping in front of us for a long distance, until, at length, by shouting and “pipping” the horn, we drove them into a ditch where the water rose above their haunches. For the first time we learned that sheep do not take kindly to water. Nothing seemed likely to make them get out of the way of the car. They persisted in keeping to the highest part of the road, and would not turn aside where their feet would have got wet. So, alas! as a final resource in one case there was nothing left to do but get out of the car and assist in driving a flock into somebody's field that we might continue our journey at the average speed of eight miles an hour. An apple tree “in full bloom” at this time of the year was somewhat of a novelty to us, and although we have seen fields of violets in Cornwall in December, it is worth noting that between Exeter and Plymouth violets—sweet-smelling harbingers of spring—were plentiful on the banks and by the sides of the lanes; and violets were not the only fragrant flowers, for in the clusters of light-blue periwinkle the violet found a formidable rival. The cottage gardens, too, still showed roses in bloom, and hydrangea was profuse indeed, these bushy plants being almost treelike in abundance.

But this is the bright side of the picture, and there was, it must be truthfully confessed, another. Hitherto we have had the greatest faith in the Contour Road Book, but after our experience of the Exeter and Plymouth Road we are inclined to

the belief that there was a sarcastic man who wrote some portions. For instance, the book says the particular road which we have indicated "is very hilly throughout, but for Devonshire is a very fine road." The first portion of the description is correct, but to the latter part we give a direct contradiction, and the only explanation is, as we have said, it must have been "writ sarcastic." For of all the bad, atrocious roads over which we have travelled, the last twenty miles of the Exeter to Plymouth road is the very worst, without exception. We dare not trust our pen to give our opinion of this road. We had hoped to do the forty-three miles in four hours, but—alas for the uncertainty of mortal hopes!—it took us more than five hours. The highest points of the Great Western Railway, we have heard, are to be found round Ivy Bridge. The roads are certainly execrable. We found them sodden in mud and filth several inches deep. They were narrow and tortuous, turning about anyhow and in any direction,

himself the Holy Thorn of Glastonbury in full blossom. This has long been a cherished desire, but little we thought that ever its fulfilment would take place, as our visits to the West of England have hitherto been during an earlier period of the year. Yes, we are looking forward to seeing the Holy Thorn in blossom; we are also no less anxiously looking forward, at this dinner hour of Christmas day—amidst the sounds of revelry emerging from the servants' hall—to the arrival of our friend Mr. Johnson and party, who left Wilton—three miles from Salisbury—just after six this morning, and who telegraphed us from Exeter at three o'clock that "he hoped to arrive at seven or eight o'clock." We most devoutly and sincerely trust he will so arrive; but we are afraid he is a stranger in the wilderness. That, however, as Rudyard Kipling says, is another story.

Since writing the foregoing, we have seen Mr. Johnson and his party. They arrived at 8.20 p.m. in a deluge of rain. We

MR. E. M. C. INSTONE WITH COUNT ZBOROWSKI'S 26 H.P. GERMAN DAIMLER CAR AT HAVRE.
[Photo by] [C. Halkin, Havre.]

then doubling back upon themselves—apparently with no other reason than to show passengers by the railway how miserable they can make travellers who are independent of the railroad—and generally twisting and turning in a manner that is not straightforward or wise.

Another week we propose to deal with the tour in a more detailed way, and these general impressions of the last Christmas tour of the nineteenth century must now suffice. Most of the way from Salisbury to Plymouth the roads are very narrow, consequently the little traffic we met had to take to the soft grass tracks at the side. This placed the heavy carts coming our way in imminent danger of sinking in. Fortunately the courtesy of those in charge of carts and vans was universal, and they always turned aside to give us a straight and clear passage. Had we had to turn aside the result would have been lamentable, for on the soft grass track we should have certainly stuck, and might have been still there.

At the time of writing we are anticipating the pleasure of the return journey. There is one pleasing thought to the doubting Thomas wielding this pen—he will be able to see for

had all arranged to resume the trip early on Boxing Day, but the weather was so fine and bright that it was decided to postpone the departure till Thursday. We left Plymouth in good weather and early in the afternoon reached Exeter, having met with good roads most of the way. After the deluge of the earlier days the roads were delightful and the weather almost summerlike.

A NOVEL and useful form of steering wheel has been devised by Mr. L. Brooke, of Messrs. J. W. Brooke and Co., Limited, Adrian Ironworks, Lowestoft. The new feature is the incorporation with the wheel, by means of a hollow enlarged boss, of a receptacle in which maps, matches, gloves, goggles, and any other oddments can be placed and instantly got at when required. A rubber cover is supplied with each wheel, which completely protects the receptacle from wet or dust, though, of course, it is only in damp weather that it would usually be necessary or advisable to use the cover. The wheels, which are made of aluminium and polished mahogany, are being made in two sizes—for cars and voiturettes.

MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

The Acheres Disappointment.

DISAPPOINTED once by the postponement of the meet at Achères, our regret at learning the promoters' decision to entirely abandon the trials was intensified. These December days are very dreary, and we had been anticipating the event with an anticipation whetted by the postponement. And then to be disappointed, and for the most trivial of reasons. As explained by the *Vélo*, the Moto Club, who were promoting the meet, found themselves in the impossibility of securing the services of three officially appointed time-keepers as required by the A.C.F.'s racing rules. Of the six qualified men, the promoters were apparently only aware of three, MM. Tampier, Rousseau, and Gaudichard, and the latter of these being unable to assist, the Moto Club had no option but to abandon the trials. I may mention that the three other time-keepers living in Paris and holding A.C.F. appointments are MM. Huet, Giraud, and Riguelle, and it is certainly somewhat curious that this was not known to the organisers of the Achères meet. However, there it is, and the feeling of motor men is rather one of regret at the loss of some exciting racing than one of curiosity as to the real why and wherefore of the cancellation of the fixture.

The New Record at Gaillon.

WHEN at Gaillon upon the occasion of the recent speed trials up the famous hill of Sainte Barbe, I heard upon every side regrets at the non-appearance of the Caillois-Renault vehicle, for many present had regarded the little car as a certain winner, while others were anxious to see what it really could do. Last week its capabilities were demonstrated in a truly remarkable fashion, for, timed by MM. Gaudichard and Tampier, of the French Automobile Club, this wonderful vehicle raced up the recognised kilometre of hill at Gaillon in 1 min. 10½ secs., so beating the present best, made by M. Brasier on a Mors, by no less than 15½ secs. Just think of it! To start actually on the hill, which in places shows a 10 per cent. grade, and yet make a speed representing 51 kilometres per hour. It is really astounding, and the performance will certainly direct very considerable attention to the Caillois-Renault vehicle. What would the car have done on the level at Achères? is the question everyone is asking, and there are those who say that Jenatzy's famous record would have been buried had the weather conditions and track been favourable. That is as it may be, but evidently the two Siamese twins of the automobile world, as Caillois and Renault are often styled, have got hold of a veritable flyer. Doubtless we shall see the car again at the Pau and Nice meets in the spring.

The Lemaitre-Flotte Affair.

So, after all, M. Albert Lemaitre decided to abandon his appeal against the Versailles judges' award of £800 damages to the unfortunate engineer, Flotte, who, it will be remembered, was injured in the Paris-Bordeaux race of May 24th, 1899. This decision, however, was only arrived at very late in the day, for the Appeal Court was actually engaged upon the case when M. Lemaitre's solicitor formally notified the judges of his client's wish to withdraw the appeal. The affair is so well known that to repeat the details is quite superfluous, but I may mention that Flotte originally claimed £2,400, and that the Versailles court, after granting him a provisional £200 and appointing a couple of doctors to examine and report upon the extent of his injuries, finally assessed the damages at £800, against which verdict M. Lemaitre was appealing. From the doctors' report the sum awarded would certainly not appear to be excessive, for the unfortunate man is suffering from severe and permanent injuries to his left eye, tongue, and left arm, added to which his nervous system is seriously affected. Incapacitated from following

his employment, Flotte, who is only thirty-nine years of age, cannot be said to have made extravagant claims, and M. Lemaitre has done wisely in not pursuing the matter further.

The Automobile Club of Cognac.

FRENCH automobilists, who have no local club, evidently intend that such a condition of affairs shall no longer continue, for every week one hears of the formation of new societies. It is only a fortnight ago since I gave a list of clubs actually existing, and already two additional societies have been promoted. The creation of the first, that of Var, I have duly chronicled in these columns, and now it is the Automobile Club of Cognac whose formation I must note. Promoted by the most influential men of the district, the future of the new club is particularly bright, and in course of time the A.C.C. will assuredly attain to a high position among French automobile societies.

The A.C.F. Fete.

WHEN I entered the club-house on the evening of the 20th inst. a great number of members and guests had already arrived, and the beautiful theatre and salons presented a truly brilliant scene. The theatre in particular was thronged, for although a quarter of an hour before the time appointed for the commencement of the programme, everyone was eager to make a tour of the "house" before the entertainment commenced, and their trouble was well rewarded. Of exquisite proportions, the *salle* is most tastefully decorated, and the lighting in particular is the work of an artist. It was this latter feature which specially appealed to the visitors of last week, for although many of them had been present at the two *fetes* given during the summer, the electricity was then not in good humour, and played the audience some scurvy tricks. This time, however, all went well, and the wonderfully subdued light issuing from the lamps hidden behind the cornices was voted beautiful. The change of shade too was very effective, and as the light went from a golden tint to a rosy red the club's guests warmly expressed their admiration. By half-past nine there was not a *fauteuil* to be found, and ranged down the side gangways and along the back of the pit, shall I say? were rows of members unable to secure a seat. And what a wonderful gathering it was too. Almost everyone of note in the automobile world of Paris was there, all anxious to do honour to their fellow-members who have been decorated recently, and in whose honour the *fete* was given. No fewer than seventy-four club members have this year either been nominated to the *Legion d'Honneur* or received promotion in its ranks, a record affording a striking proof of the position held by the Club. It would be interesting to ascertain exactly how many of the Club's two thousand odd members are decorated. On Thursday the highly-prized red button or ribbon was to be seen in dozens of button-holes. But to the programme. After the usual orchestral selections, Mlle Odette Dulac, of the Boite à Furey, gave a couple of famous comic songs. Then followed M. Baldelli, of the Royal Opera at Madrid, and another well-known operatic singer in the person of M. Lasalle also claimed us. A series of dances were executed by Mlle. Blanche and Louis Mante, of the Opera, and a couple of one scene plays were performed respectively by artists from the Comédie Française and the Gymnase. The success of the evening was undoubtedly scored by Mlle. Lina Cavalieri, a new singer, who has caused quite a sensation in Paris. The other items of the programme were all enjoyable, and it was not until a late hour that the audience dispersed.

After the Berlin-Vienna Race.

WHILE chatting with some club members during the recent *soirée* I learnt of the proposed tour after the conclusion of the Berlin-Vienna race, and as I take it that probably some Englishmen will be racing in this event, particulars of the subsequent tours may be of interest. To begin at the beginning,

it will be remembered that first of all we are promised Paris-Berlin, to be followed immediately by Berlin-Vienna. Now upon arriving at the Austrian capital automobilists would probably be looking about for the most agreeable route over which to make the return journey to Paris, so it has occurred to certain members of the A. C. F. to organise a tour, leading the participants back to France by way of some of the most delightful scenery in central Europe. What a splendid run could be made via Klagenfurt, Villach, Tarvis, Udine, Venice, Padua, Verona, Milan and Switzerland. And as there will be no lack of automobilists going to Vienna, whether as racers or as tourists, quite a caravan should be formed for this tour. The idea is certain to appeal to motor-men visiting Vienna, and the subsequent details of the scheme will be awaited with considerable interest.

Paris Automobile Show.

THOSE English firms who intend to exhibit at the Paris automobile and cycle show of next month should note that no applications for space made after January 3rd will be considered by the organisers. A tremendous number of entries have actually been received, and as the committee of management are determined that the opening day shall see the exhibition ready, the allotment of space will be made immediately after the 3rd proximo, and the tardy applicants will be simply ignored. So English intending exhibitors must post their applications not later than Wednesday next, the 2nd proximo, and these should be addressed to the Commissaire Général du Salon d'Automobile et du Cycle de 1901, 6, Place de la Concorde, Paris. For those who do not know the Grand Palais, in which the exhibition will be held, let me say that it is situated on the river side of the Champs-Élysées, and that its main entrance gives on to the Avenue Nicholas II. Utilised during this year's big show for the exhibition of fine arts, the palace is still encumbered with a great number of statues, and an enormous amount of work must be got through before the Salon will be ready to open its doors. As at present arranged the automobile section will be placed on the right of the great hall, as one enters the palace, and will be known as Class 1. Here the heavy vehicles will be arranged nearest to the entrance. In the left-hand portion of the great hall will be shown the cycles, while at either side the accessories, tires, and tools will find place. No sparing allotments of space need here be feared, for the hall rejoices in magnificent proportions, and every exhibitor should be amply provided for. In the enormous rotunda, which so much excited the admiration of visitors to this year's exhibition, will be placed the retrospective section, together with the stationary engines, the carriage bodies and the products of various industries akin to that of the cycle and automobile. On the first floor the space will be given over to the exhibitors of costumes, and here also will be found the "fun of the fair." Naturally, this programme is subject to amendments, but the changes, if any, are hardly likely to materially affect the original scheme. The bulk of the organising work is being carried on by M. Rives personally, and the most cursory examination of the palace to-day gives ample proof of the enormity of his task. Outside the building itself there is also much to be done, from the testing of the cars intended for exhibition to the thousand and one details of clerical work. No wonder, then, that the exhibition staff are to be found working far into the night, and that the first floor of the club-house in the Place de la Concorde presents a scene of bustling energy, which is in marked contrast to its usual state of tranquillity. With regard to the trial runs, these are performed over the Versailles road, a duly appointed commissioner accompanying each vehicle. Constructors are required to give to the organisers four days' notice of their intention to make the trial, and the *rendezvous* is invariably before the entrance of No. 6, at half-past nine in the morning. Passing to another matter concerning the Salon I would like to draw particular attention to the retrospective section, which promises to be the most interesting and comprehensive collection ever shown. Numerous cycles which have figured in historic races, together with several examples of early efforts in automobile construction, have already

been promised by their owners, and in place of the hitherto somewhat scattered displays made at previous shows the retrospective section of the Salon of 1901 will be wonderfully complete. Indeed, everything points to success, so I strongly recommend all English automobilists to set aside a few days in January in which to visit the show.

Another "Culasse."

POSSIBLY the water-cooled cylinder head which is the easiest of adaptation to the De Dion and Bouton and Aster air-cooled motors is that manufactured by MM. Brissard et Fils, Paris, and for which a steady demand is springing up in France. Its employment on either of the two types of engine mentioned gives rise to no complications, for it is by means of the existing columns that the attachment is effected. Both the inlet and exhaust valves of this cylinder head are large, and are perfectly cooled by a steady stream of water which, coming direct from a reservoir placed some ten centimetres above them, passes around the head of the cylinder to return subsequently to the tank. This circulation of water is effected by the thermo-siphon system, and generally a five-metre radiator is carried. By the use of the radiator five or six litres of water is all that is required, but if dispensed with, the water supply must be raised to ten or even twelve litres. The cooler is placed below the level of the cylinder head, for the difference in height ensures an active circulation of the water. A number of 1½ and 2½ h.p. De Dion motors have been successfully converted into engines developing 3 h.p. by simply changing the cylinder and piston and attaching the Brissard "culasse," without in any way altering the length of stroke or weight of fly-wheels. The question of efficiently cooling ribbed motors is undoubtedly a most interesting one, for this type of engine has many advantages over the water-jacketed motor. Less expensive to build, it is much lighter than the water-cooled engine, and, in the smaller sizes, it is but during the ascent of hills, or while the car or cycle is running slowly, that its tendency to overheat is at all pronounced. It is, therefore, but a slight modification, which should render the smaller sizes, at any rate, ideal in respect of cooling efficiency, and it is more than possible that the improvement would, at the same time, make possible the construction of powerful ribbed motors. I do not think that the Brissard system has yet been tried upon large air-cooled motors, but upon the smaller sizes it is undoubtedly very efficient.

Aluminium.

WITH the ever-increasing demand for aluminium suppliers are busily engaged upon seeking an alloy which, while retaining to a great extent the qualities of the pure metal, can be delivered at a very moderate price. Whereas in 1889 the price per kilogramme (2.2 lbs) was 56 francs, to-day the cost of 98 to 99½ per cent. metal is only 3 francs 25 centimes, a truly extraordinary diminution in price. Now we are to have an aluminium of 90 per cent. supplied at 2 francs per kilogramme—such, at least, is the announcement made relative to one of the leading firms of French suppliers. A visit to one of these Parisian coach-builders, who make a speciality of aluminium bodies, affords an interesting lesson on the manner of working up the metal, for there one sees a hundred and one parts and dozens of different types of carriages all constructed of an aluminium alloy. For the more complicated and stronger classes of vehicles wood is, however, always given the preference.

THE quarterly 100-mile trial organised by the Automobile Club will be held on Tuesday next, January 1st.

THE local depôt of the Dunlop Pneumatic Tire Company, Limited, at Nottingham, has been removed to new premises at 3A, Lower Talbot Street.

MR. H. EDMUNDS was one of the many motorists in the London district out enjoying the mild weather of Boxing Day; we saw him driving a merry party on board his well-known "Antrona" through Wandsworth.

NEW STIRLING MOTOR-CARS.

THE name of Messrs. Stirling, of Hamilton, is one which was very early identified with the motor industry in this country, and for nearly half a century has been known throughout Scotland as one of the leading coach-building houses in the kingdom. Considering the well-known conservatism

on new and specially attractive cars which he had determined to produce and place on the market in the first year of the twentieth century, and some of which we are now able to describe and illustrate.

The first is the Stirling voiturette, Figs. 1 and 2, an elegant little carriage to seat three or four persons, and propelled by a 5-h.p. water-cooled De Dion Motor.

It is built on a strong tubular frame carried on tangent wheels and pneumatic tires. The motion of the engine shaft is transmitted through silent chains to the counter-shaft, from which it is communicated to the front driving axle by spur wheels, giving two changes of speed and a reverse motion. On the counter-shaft is also placed a friction-clutch, operated by pedal in the same way as on the well-known Panhard carriages. By this means the motor can be released instantly, making the handling of the vehicle in traffic an easy and comfortable matter. Two powerful band brakes are fitted, and for emergencies the reverse motion can also be brought into action. This little carriage has been designed to go into the hands of ordinary people who may not have previously had any mechanical experience. It is simple in construction, and all the parts are most accessible. What is, perhaps, the most startling thing about the car is its price, viz., 125 guineas, Mr. Stirling having decided to list it at the price named in order to command a popular market. We may add that the weight of the Stirling voiturette is only $4\frac{1}{2}$ cwt.

FIG. 1.—GENERAL VIEW OF THE STIRLING VOITURETTE.

of that very ancient craft, it was surprising to find a firm of coach-builders of such standing so early embracing the motor-carriage industry. As a matter of fact, scarcely two months had elapsed from the date of the coming into operation of the new Act when the first Stirling-Daimler Stanhope was running on the streets of Glasgow. This was in January, 1897. It was natural that such enterprise should meet with conspicuous success. Within twelve months from the introduction of their motor-vehicles it was found necessary to greatly extend the producing capacity of the firm. In December, 1897, therefore, Stirling's Motor Carriages, Limited, was incorporated with a capital of £100,000. Since then the company has regularly paid 5 per cent. to its shareholders, and enjoys the distinction of being the first motor-carriage manufacturing company to pay dividends. When the difficulties surrounding the introduction of a new industry are remembered these results must be considered most satisfactory. During the past twelve months Mr. John Stirling, the founder and managing director of the company, has been at work

FIG. 2.—SIDE VIEW OF THE STIRLING VOITURETTE.

The Stirling Victoria de Luxe, Figs. 3 and 4, is fitted with a new 7-h.p. four cylinder motor, and is claimed to be practically vibrationless. The motor is suspended transversely midway between the fore and hind wheels directly under the driving seat. The engine shaft is extended to the off side of the frame, and carries two easy-working friction clutches, by which two changes of speed are obtained. A third, or hill-climbing gear of five miles an hour is also provided for use on specially steep gradients. On a recent 100-mile run over comparatively hilly country with this car the third speed was, we understand, never used. The motion on this car is also transmitted by silent chains to the counter-shaft, which carries the differential gear, and from thence to the driving sprockets and the rear wheels by chains in the usual manner. A reverse motion is, of course, provided, while there are two powerful brakes. The road wheels of both this car and the "Stirling voiturette" are of equal size. A special feature in the "De Luxe" car is the increased width of the wheel gauge or track. This has been made to correspond exactly to the English standard gauge for ordinary carriages, a feature which has advantages on many country roads, and must give greatly increased stability to the carriage when running at high speeds. The design of the body and the entire carriage work is handsome and luxurious, the car being most comfortable to ride in, and is very silent in running. The

weight of the car with its 7 h.p. motor is only $10\frac{1}{2}$ cwt., and maximum speeds of twenty-five miles an hour and over are easily obtainable.

A third pattern which Messrs. Stirling are putting on the market for the coming year is a light Parisian phaeton to seat

FIG. 3.—MR. STIRLING ON HIS VICTORIA DE LUXE.

FIG. 4.—THE STIRLING VICTORIA DE LUXE, WITH HOOD UP.

three persons, got up somewhat similarly to the "De Luxe" except that it is lighter in construction and capable of higher speeds. They are also building a light van to carry 4 cwts. and driver, and another for a load of 8 cwts. and driver. We believe it is Mr. Stirling's intention to run two of the new Stirling cars in the 1901 Big Event of the Automobile Club, which has its chief destination at Glasgow.

THE Northern Carriage and Motor Company, Limited, has been formed in Aberdeen to acquire an old-established carriage works, with which is to be combined the motor business at present carried on at 414, Union-street, Aberdeen, as the M'Rae Northern Motor Company. The capital is £20,000.

AN ingenious exhaust valve lifter and current breaker for motor-tricycles has recently been brought out by Mr. Milbrow Smith, of Handsworth, Birmingham. By twisting the right handle a quarter turn the current is switched off, whilst half a turn raises the valve and keeps it up until the handle is turned back again.

THE VALKYRIE VOITURETTE.

THE latest cycle concern to take up the manufacture of motor-cars is the Springfield Cycle Company, Limited, of Sandiacre, Nottingham, whose Valkyrie voiturette is illustrated herewith. The little car is propelled by a $3\frac{1}{2}$ -h.p. water-cooled De Dion motor, located in the fore part of the frame. The water circulation is on the thermo-syphon system, no pump being employed. Three speeds forward—six, twelve, and eighteen miles per hour—are provided, the transmission mechanism being very much on the lines of that adopted in the Renault cars. The engine drives the variable speed gear through a friction clutch; from the gear-box the power is transmitted by a longitudinal shaft, terminating in a bevel pinion meshing with a corresponding bevel wheel on the rear live axle. Three powerful band brakes are fitted, while steering is controlled by a

horizontal hand wheel. The cycle-type wheels are 24 in. diameter at the front and 28 in. at the rear, they being shod with Dunlop $2\frac{1}{2}$ in. pneumatic tyres.

AN American couple, Mr. and Mrs. Van Alen, intend to spend their honeymoon in touring through France and Italy in an automobile.

MR. ZACHARIAS sailed on Saturday for the Malay Peninsula, taking with him a Roots and Venables' car. A Thornycroft steam car is to follow.

AT Spilsby County Court last week M. W. Whirram and Co., brewers, Burgh, sued Mr. George Godson, of Asgarby, near Sleaford, for £25, depreciation in the value of a horse, and other expenses incurred through an accident owing to defendant's motor-car not being under proper control. The jury found defendant was not guilty of any negligence, and they returned a verdict in his favour.

WE regret to learn that while out with the Duke of Beaufort's hounds near Malmesbury on Saturday last Mrs. Ernest Pitman, of Bath, the wife of the owner of the 6-h.p. Daimler car No. A21, which took part in the 1,000 mile trial, collided with a gentleman rider in a dense fog, and was thrown severely, sustaining concussion of the brain. Mrs. Pitman was removed to Malmesbury, and up to Monday evening had not regained consciousness. We extend our sympathy to Mr. Ernest Pitman, who was in the field at the time, and trust that the hopeful view of the case taken by the doctors will be confirmed.

ISSUES have been ordered in the First Division of the Court of Session for the trial of an action by Sarah Renicks, residing in Broxburn, Linlithgowshire, against the Edinburgh Autocar Company, Limited, for £150 for personal injuries. The pursuer states that on the 22nd September last, while stepping off a cable car in Prince's Street, Edinburgh, she was knocked down by a motor-car belonging to the defendants. She avers that the motor-car was being driven furiously and recklessly, but the defendants deny the averment, and state that the pursuer jumped off the car right in front of the motor-car.

HEAVY MOTOR TRAFFIC IN FRANCE.*

By M. GEORGES FORESTIER, Inspector-General of Roads and Bridges in France.

(Concluded from page 720.)

SINCE the establishment of the *Poids Lourds* service, consisting of two De Dion and Bouton omnibuses for twenty-two people, and one five-ton lorry for goods, we have weights of at least eight tons, going at speeds of at least nine miles an hour. It was found that, for a distance of about three miles, where the ground was damp, ruts had been formed in the road which it was impossible to get rid of. It was necessary to carry out the drainage of the subsoil, which cost £600. It was afterwards found necessary to increase the width of the road by two feet. This additional width was indispensable in order to obviate all the inconveniences which were produced when the wheels of the lorry, having a total weight of eleven tons, passed over soil at the sides, which was not metalled. Again, while waiting for the drainage work to be carried out, it was necessary to put down fresh stones, and this cost £2160. Finally, from the estimates made up to the present, the engineers of the *Département de la Meuse* consider that the normal maintenance of the roads will now have to allow of the mending each year of 2.9 miles with 1,830 cubic yards of material. This corresponds to 163 cubic yards per year per mile, and to a wear of 0.60 inch per annum. The annual cost will be £1,040, which is an increase of £560 per annum for the whole road, or of £50 per mile. Briefly, then, in order to provide for this traffic on 11.2 miles of the National road (No. 47), it has been necessary to spend £246 per mile in widening and drainage, and to increase the annual expenses for repairs by £50 per mile.

As the number of trips per day is six, or 2,190 per annum, the extra cost of maintenance is 5.2d. per vehicle-mile.

Now the owner estimates his working costs at about £130 per mile per annum, these being arrived at as follows—

Personnel (Foreman)	£ 80
(Drivers, Stokers, and Mechanics 372)	£452
Fuel	340
Oil and Grease	48
Water	16
Maintenance of Rolling Stock	124
General Expenses of Office and Dépôts	76
Government tax on transport (3 per cent.)	16
	£1,072
Interest and Depreciation (8 per cent. per annum on buildings, 13 per cent. on rolling stock)	420

Total per annum £1,492

For the 11.2 miles of road in question, this works out, therefore, at about £130 per mile, or say 14d. per vehicle mile. Hence, the extra wear and tear on the roads, which we have seen to be £50 per mile, is about two-fifths of the actual working costs of the service.

You will have noticed the high proportion which the *personnel*, interest and depreciation form. This melancholy fact arises from the unsuitable nature of the districts worked, and the necessity of guaranteeing the connection between two railway stations, in consequence of which the service, instead of being performed by a single omnibus, doing 71 miles daily, is carried on by two omnibuses, which only do 30.5 miles per day; that is to say, only half the work which the vehicles and the staff are capable of discharging. On the other hand, the maintenance charges are very low.

Width of Tires.—A moment ago I spoke in passing of the width of tire that should be adopted if one wishes to diminish the destructive effects upon the roads. Although this very long address has already put your patience to a rude test, I think I ought to ask your attention for a minute longer in order to treat briefly this question of the width of tire, as it is a most important one in heavy motor traffic. One certainly must not forget that at a competition at Versailles, one of the engineers on the jury said, with the consent of all—"Without good roads, heavy motor traffic is impossible."

The width of tires which, according to the load, was to be put on the wheels of various road vehicles, and the effect of this width on the life of the roads, occupied the minds of the greater number of French engineers during the whole of the first part of the nineteenth century. Up to 1851 the following regulations were in force:—

Width of tire.	Waggons (in winter).	Public Service vehicles.
3.1 inches. ...	1.8 tons. ...	2.6 tons.
4.3 " ...	3.2 " ...	3.5 "
5.5 " ...	4.7 " ...	4.5 "
6.7 " ...	6.3 " ...	— "
9.8 " ...	9.6 " ...	— "

Dupuit then observed that a very wide tire soon got rounded by wearing on the edges, and that the load then rested on a much smaller area than that which would have been obtained with a narrower tire which did not change its shape under the load. He showed that the roads suffered chiefly for this reason, which was contrary to what the partisans of these exaggerated regulations had thought.

The law of 1851, regarding the rules for vehicles, confirmed this

* Opening Address of Fifth Session of the Liverpool Self-Propelled Traffic Association, being the local centre of the Automobile Club of Great Britain and Ireland. December 3rd, 1900.

view of Dupuit's. It did not insist upon any particular width of tire. It left to the people themselves the responsibility of adopting that width which experience had proved to require the least traction, which meant, of course, the least wear and tear on the road. Thus to day, in Paris, omnibuses weighing 3.5 tons have tires only 2.24 inches wide, and the heavy Delannoy lorries, weighing 12 tons, have front tires only 5.1 inches and back tires only 6.4 inches, in width.

Very wide tires should be used on soft ground, as experience has proved in the cause of steam ploughing engines. It is only under these conditions that the soft earth will stand the engine's combined driving action and weight when going round curves. On the contrary, if the soil is as resisting and hard as a stone road in good weather, curves make no difference and the tires obtain their full adhesion. For the motor-wagons with which we have to deal, it is necessary, then, to have two sets of wheels—one with very wide tires for winter, during which the road material is easily disturbed, the other with narrower tires for summer when the material is very coherent.

In order to avoid this inconvenience, some of our builders have tried to divide the total weight between a greater number of wheels. This question also has the attention of English constructors, for on page 200 of the paper on "Road Locomotion" by one of your eminent Vice-Presidents, Professor Hele-Shaw, F.R.S., we read—"It may be found economical to support a motor-vehicle upon a much greater number of wheels than at present." The following attempts have been made in France:—

As long ago as 1835, Dietz designed a traction engine with six wheels, but we have no information regarding the arrangement of this engine. Towards 1886, M. A. Bollée, a builder at Mans, had a six-wheeled traction engine at work, four of the wheels being driven. Messrs. De Dion and Bouton have, for a long time, made a speciality of a steam tractor in which the driving wheels bore part of the weight that was pulled behind it. A tractor of this kind, running alone, arrived first in the race from Paris to Rouen in 1894. Another, hauling a brake for thirty-four people, took part in the *Poids Lourds* meeting of 1897. The total weight on the driving wheels on this occasion was 4.4 tons for a useful load of 2.5 tons.

M. Le Blant has proposed to add to the number of driving wheels by keying two or four more upon an extension of the ordinary driving axle. This arrangement, which might necessitate a very small diameter, does not offer complete solution of the problem.

Driving on all four wheels has also been tried. The advantage obtained is that the total moving weight is used for adhesion, which is very useful on hilly journeys, but one cannot lessen the weight on the driving wheels without giving the steering wheels the same diameter and dividing the load uniformly. One cannot, therefore, approve the arrangements for front driving, such as those of Doré or Gandon, which move around a central bolt, and which have the same drawback as the arrangement of the multiple driving wheels of Le Blant. If combined front and rear steering is adopted, it is possible to turn in so short a radius that the wheels need not be below the platform. I should prefer, however, the arrangement of Jeantaud, where the front wheels are mounted on a forked axle and can have as great a diameter as is required if the axle is lengthened.

I have now concluded my account of "Heavy Motor Traffic in France." May I cherish the hope that your Council will not regret having entrusted the reading of this Address to a Frenchman who understands so little of your language, especially when it had such an *embarras du choix* among the many eminent members of the Automobile Club of France who are capable of dealing with this subject in English, and, in addition, with more competence and authority than myself. In any case, allow me to assure you that I shall retain all my life an agreeable recollection of the very great honour which has been done me, as well as of your kindly welcome and your gracious attention.

THE DAIMLER MOTOR COMPANY.

THE fourth annual meeting of the Daimler Motor Company, Limited, was held on the 21st inst., at the Holborn Restaurant, Holborn, under the presidency of Mr. E. H. Bayley, J.P. (the chairman of the company).

Mr. G. Foster Pedley (secretary pro tem.) having read the notice convening the meeting, the chairman in the course of his speech said: I have the pleasure to move the adoption of the report. The balance, as shown in the accounts, is considerably on the right side. The accounts before you show for the past twelve months a profit of £4,430. This is four times the amount made in the preceding fifteen months, so that at this rate of progression we ought, at the expiration of the current year, to have made a profit sufficient to justify a dividend of 16 per cent. The profit now shown would have been greater but for the fact that many cars, nearly completed, have had to be taken into account at the cost instead of the selling price. It may be reasonably asked why, if a profit has been earned, a dividend is not declared. Nothing would have been easier than to have adopted the popular course of paying a dividend, but the directors prefer to act for the permanent welfare of the company rather than for their own immediate popularity. Since the removal of the legislation which thwarted automobilism four years ago, the automobile movement has spread rapidly in this country. The engineering talent of the country has applied itself to the subject, with the result that motor-carriages can now be built here equal in every respect to the best

foreign machines, and lower in price. No finer carriages as to design, materials, and workmanship have been produced, either abroad or in England, than the latest carriages built at our works at Coventry. During the present year remarkable improvements have been worked out in our factory. The speed will be attained of one mile per minute, roller bearings are fitted, electric ignition is used, the gearing has been greatly improved, automatic lubrication has been introduced, a reversible band brake has been added, a better arrangement of the controlling and governing gears has been made, the water-cooling arrangement has been improved, the motor frame has been lightened and considerably stiffened, better forms of axles and springs has been adopted, an improved form of cylinder head and joint is used, and many minor modifications have been made which considerably improve the machine. Most important of all, by means of a simple contrivance the power of the company's standard motors has been increased about 50 per cent. This startling result is obtained without any material outlay in plant. The company's 5½ h.p. motors are altered to develop 7, 8, or even 9 h.p. on the brake, and the old 12 h.p. engines are made to develop 18 h.p. The Prince of Wales is highly pleased with the carriages supplied to him, and the Royal Warrant will be conferred on the company. In view of this Royal patronage, the fact that we have over £25,000 worth of orders in hand, and that further orders are coming in satisfactorily, I submit that the directors would have been lacking in foresight if they had not prepared for the approaching boom by incurring the outlay referred to in the report, which was absolutely necessary for improving the factory, so as to increase the output and provide extra stock. We have obtained the increased horse-power to which I referred; the Critchley car, which in its original shape had many defects, has been re-designed, and is now a practical and saleable machine; and we have obtained four new types, a one-ton and two-ton delivery van, a 12-h.p. car, and a 20-h.p. racing car. In the great 1,000-mile competition twelve Daimler cars took part, and carried off three first prizes, five silver medals, three bronze medals, and three *Daily Mail* prizes of £10 each. It is desirable that the working capital which has been used on capital account should be replaced. Two years ago the shareholders' committee suggested an issue of about £40,000 debentures, which would no doubt have been subscribed for. We have been able to carry on without this extra capital, thus saving the company £2,000 per annum. An issue may be offered of a much smaller sum than this, and as the company's assets are £20,000 more in value than they were two years ago, and its prospects are brighter, splendid security can be given for a very safe investment. I must now mention that a well-known firm of City solicitors has made an offer to purchase the Daimler Company, and have sent £250 to cover any preliminary expenses that may be incurred. The board have replied that, as a board, they can take no part in either accepting or declining such proposal, which is a matter for the shareholders. They have undertaken, however, that, provided the solicitors in question put their offer into the definite form of a draft agreement, and forward £1,000 as a guarantee of good faith—to be forfeited if the arrangement is not carried through—they will submit the proposal to the shareholders. They can do no more in the matter than act as a conduit to place the matter before you for your consideration. This is how the matter stands at the present moment. It might be useful if a small committee were appointed of the largest shareholders to confer and advise with the directors on this and other matters which cannot conveniently be discussed at a public meeting. The board would gladly welcome the appointment of such a committee.

Mr. Thomas Bayley, M.P. (director), seconded the motion. Sir Edward Jenkinson said he had been delighted to hear so good an account of the character of their motors and improvements that had been made during the year; but he regretted very much that no dividend was given, as, in his opinion, there might have been a distribution if there had been a little foresight displayed. It seemed clear that there was need for further funds, as, in a business of this sort, it was necessary to have considerable working capital. As to the general conduct of the business it seemed to him that a strong man was wanted at the head, one with a thoroughly practical knowledge who would be given large powers in the direction of the works. With regard to the negotiations for the sale of the property, to which the chairman had referred, he was glad to hear that the shareholders were to be consulted in the matter before anything was done. For his part he considered the business an excellent one, and if the capital were increased they need not think of selling it—unless, of course, they got a very tempting offer. Mr. Thomas Bayley, M.P., said that this business was just emerging from the experimental stage into a practical commercial undertaking. He had every confidence in it, and was a considerable shareholder at the present time. Mr. F. L. Rawson dealt with various points in the accounts, and in regard to the question of fresh capital expressed a hope that if any were raised it would be by means of five per cent. or even six per cent. preference shares, rather than by an issue of debentures. Mr. H. J. Lawson urged the necessity of having a strong man who had a thorough understanding of the Daimler motors to conduct the works. He had recently been to America, and inspected the works of the great motor companies there, and although there was formerly a great difficulty in obtaining men of thorough expert knowledge, he considered that was not the case now.

The Chairman replied on the points raised. As to the offer to purchase, he submitted that the directors had taken the only course open to them as practical and honourable men, and that if they had acted otherwise they might have been open to just complaint from shareholders afterwards. He repeated his assurance that the business was now

making rapid strides, and had turned the corner. The motion was then put and agreed to. The Chairman proposed the re-election of Mr. J. H. Mace (the retiring director), which was unanimously agreed to.

An extraordinary general meeting was then held, in accordance with notice, when the Chairman submitted a resolution for the conversion of the £10 shares into shares of £1 each. He pointed out that this was proposed with a view to meeting the wishes of the shareholders, who considered that the shares would be more marketable at the lower amount, and it was a matter which the board left with the shareholders. The proposal was unanimously sanctioned. The proceedings closed with a vote of thanks to the chairman and directors.

ACTION FOR THE PRICE OF A MOTOR-CAR.

AN action came before Sheriff Lee in Forfar Sheriff Court last month at the instance of James Macfarlane, cycle and motor-car dealer, Perth, against Alexander Ross French, dentist, Forfar, for the sum of £135, being the price of a motor-car. Parties were heard on the preliminary pleas, when Sheriff Lee gave judgment in favour of the pursuer. Defender appealed to Sheriff Johnston, and the latter has issued an interlocutor sustaining the appeal and allowing parties a proof of their respective averments. In a note Sheriff Johnston says that he agrees with the Sheriff-Substitute in thinking that no good purpose was served by allowing a proof in this case. But in so thinking they were not judging of the relevancy of the record, but were judging from the general complexion of the case, and from the letters Nos. 10 and 13 of process. But proof has not been led or renounced, and it is not a legitimate course to give judgment partly on a record and partly on matters learned outside the record—in fact, on a partial and *ex parte* proof. He saw very little, if any, prospect of the defender gaining anything by a proof except a heavier award of expenses against him. But so long as the defence stated is relevant he was entitled in his own discretion to ask a proof of it. He might not think the defence in *bona-fide*, but he could not proceed on that idea, which might be quite without foundation. He had therefore allowed a proof. If the parties were prepared to take a judgment on a record and productions they might obtain it, but a minute renouncing probation is necessary. His opinion was that the defence, though in the circumstances improbable, is relevant.

ACTION OVER A MOTOR-CAR.

IN the Nisi Prius Court No. 2, on the 21st inst., before Mr. Justice Madden and a special jury, the case of Mayne v. M'Taggart, which had occupied the court for several days, was concluded. It was an action by Mr. R. F. Mayne against Mr. W. R. M'Taggart, cycle and motor-car dealer, Dublin, to recover damages for alleged breach of warranty in respect of a motor-car which plaintiff purchased from the defendant, and which he averred was not of the quality which defendant guaranteed. The defence was that the defendant had not given the guarantee alleged, that the car was in good condition, and that anything that had happened to it was owing to the plaintiff's ignorance and want of skill. Mr. Blood, Q.C., having spoken to the evidence for the plaintiff, and the learned judge delivered his charge, the jury retired, and after an absence of more than an hour came out, the foreman stating they had not agreed on all the questions which his lordship had left them. They had not agreed as to whether the defendant gave a guarantee or not. Mr. Justice Madden told them that if they believed the evidence which the plaintiff had given, there was no escaping from the conclusion that the defendant gave a guarantee. But there was the evidence of Mr. M'Taggart the other way, for he said he was asked for a guarantee, and refused it. The jury retired again, and after a short absence brought out findings to the effect that the defendant did guarantee that the car was in proper working order, and capable of maintaining an average speed of twelve or fourteen miles an hour, and that it would take any hill or ordinary Irish roads; that the plaintiff bought on the faith of the guarantee; that the car was not in accordance with the guarantee; and they gave £30 damages and costs.

COLLISION WITH A MOTOR-CAR.

AT the Bradford County Court last week an action was brought by Rhodes Crabtree, butcher, of Bradford, against the Yorkshire Motor-Vehicle Company, Limited, of Bradford, to recover damages for injuries sustained to the plaintiff's horse and cart. It appeared that on September 26th the plaintiff's horse and cart, in charge of George Greenwood, an apprentice, was proceeding along Manningham Lane for the purpose of delivering meat. When the cart was opposite Blenheim Mount, between the near tram line and the causeway kerb, a motor-car belonging to the defendants came up behind. The motor-car was running on the tram lines, and when passing the cart the driver of the motor-car turned slightly to the right. The fore wheels of the car left the tram lines safely, but the hind wheels skidded on the lines, and the back part of the car struck the plaintiff's cart. The spring at the back was broken, the shafts were snapped, and the horse ran away, sustaining considerable injuries. The defence set up was to the effect that what the driver of the motor-car did was done with the intention of avoiding an accident, and could not, therefore, be negligence on his part. On the other hand, he contended that the driver of the cart was guilty of contributory negligence in suddenly swerving to the right just as the motor-car was passing. Thus

the rear of the cart and the rear of the motor-car came into collision. His Honour Judge Bompas, in summing up, explained the law of negligence to the jury. He said that if the motor-car skidded on the tram lines, and the skidding could not have been avoided by reasonable care, the occurrence would be an accident, and no one would be liable. His Honour asked the jury to consider whether they thought the driver of the motor-car tried to pass the cart too closely. If he did so that would be negligence. There was plenty of room for the motor-car driver to pass the cart at a much greater distance. The jury, after five minutes' consultation, found a verdict for the plaintiff, and assessed the damages at £12. Judgment was given accordingly.

THE stock, assets, goodwill, and contracts of the Automobile Association have been purchased by Friswell, Ltd., and will shortly be sold by auction.

THE Motor Power Company, Ltd., are putting an 8-h.p. Gladiator car on the market. The vehicle takes the form of a four-seated phaeton.

THE Hackney Carriages Committee of the Northfleet District Council has examined and passed a motor-wagonette which was submitted for their inspection by Mr. W. H. Smith, of New Road, Gravesend, and granted an application for a licence to ply for hire within the district.

MR. CHAS. T. CROWDEN, of the Motor Works, Leamington, has lately devised and patented a new instrument, which is useful in adjusting mechanical motions, such as between piston and valves, or where one motion has relation to another. The apparatus can be fitted to an ordinary steam engine indicator or it can be complete in itself. The purpose of the "Crowden" gear is to give in the shape of a diagram the exact relation between the slide valve and piston at all points of the stroke, from the engine under load, and without the use of models. The results obtained by the apparatus are not only accurate and beyond dispute, but enable the engineer to keep diagrammatic records of the relation between the slide valves and pistons of the engines. The gear can also be used for gas, hot air engines, pumps, etc., when the valves are mechanically operated, or if by vacuum or pressure if such is sufficient to actuate the pencil movement. The curves drawn would show the duration or periods of the inlet and outlet valves opening and shutting during the piston stroke. The apparatus is being put on the market by Messrs. T. S. McInnes and Co., Clyde Place, Glasgow.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editor's hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. II.]

LONDON, SATURDAY, JANUARY 5, 1901.

[No. 96.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE continuation of our story of the Christmas trip of the Automobile Club is unavoidably postponed this week, but we may mention that from Exeter our car woke up and travelled splendidly. It failed, however, to pick up the Darracq, and we imagined that that car was safely stabled for the night. But no! while stretching our legs up a rise of one in eight we heard the well-known sounds of a car behind us, and looking back saw Mr. Johnson waving his hand. The hill was mounted in good style, and at the top a halt was made for explanations. Then we learned that the Darracq was missing fire. An effort was made to remedy this, but as we could not help we proceeded on our way, promising to wait at Wellington. This we did for an hour, but, time getting on, we were compelled to make our way to Taunton, enjoying the short ride by moonlight. The crossing of the borders from Devon to Somerset was easily recognisable, the roads of the latter county being hard and wide, and enabling an easy sixteen miles an hour to be made. The Darracq arrived at Taunton just before eight o'clock, the party on board not regretting stoppages for tea, etc., for they had seen a rainbow caused by the reflection of the moon—surely, a novel sight.

The Storm.

ALL Thursday night our rest was disturbed by the sound of what seemed like falling houses, tiles, etc. It was the night of the great storm, and in the morning there was a deluge. Meeting, as usual, by artificial light at the breakfast table it was unanimously decided that no start should be made that day. And in Taunton town we found much to occupy our time. Saturday opened clear and bright, the keen air making us long to be on the move, and an early start was made. The roads were capital, and our car pulled as it had never pulled before. Glastonbury was easily reached by making a detour through Langport and Somerton. Everything being so favourable the journey was continued to Reading, making a distance of over 120 miles for the day. London was duly reached early on Sunday. Mr. Johnson made a long stay at Wells, and then journeyed to Devizes, coming up to London on the following day.

Our M. M. Co.'s Panhard.

AT the last Automobile Club's exhibition at the Agricultural Hall our new car—a M. M. Co.'s Panhard—was on view and attracted considerable notice. As our readers are aware, the vehicle was entered for the 1,000-mile Trial, in the course of which it certainly did not do credit to either ourselves or the makers. Since that interesting and trying tour it has been back to the works to be properly adjusted, with the result that

its subsequent behaviour has been all that could be expected of a good car. It has been driven thousands of miles up great hills and down steep ascents, on all kinds of roads and so-called roads, and in all weathers. Only once have we been delayed, and that was owing to a spring breaking when we were touring in the New Forest. Of course, as usual, we had with us every spring but the one required, and so there was nothing to do but to improvise one. This was done, and, after half-an-hour's delay, we resumed our journey. The recent Christmas tour proved the power of the motor, for with four passengers, and in such bad weather, it was able to make an average of over eight miles an hour on the notoriously bad roads of Devonshire—a speed which, having regard to all the adverse circumstances, was, we think, highly commendable.

The Darracq Car.

THE Darracq driven by Mr. Johnson was a new car, having only recently been brought from Paris. The first day its going was somewhat intermittent through the clutch slipping—and this was the cause of the long delay at Wilton, to allow of the clutch being relined. When this was done, an early start was made from Wilton, and the journey right through to Plymouth, a distance of over 130 miles, was completed in a total time of less than fourteen hours. On the return journey the voiturette gave occasional trouble through misfiring but otherwise ran well and proved itself a thoroughly reliable and powerful vehicle, its speed up hill being especially noticeable.

Petrol Talk.

ALTHOUGH it seems incredible, it is nevertheless a fact that between Salisbury and Exeter—a distance of ninety miles—there is not a single agent stocking any kind of motor-spirit. During the recent Christmas tour this fact cost us nearly two pounds in cash, any amount of inconvenience and annoyance, and a three hours' railway journey. It was also the cause of the writer catching a chill while "kicking his heels" at the various railway stations where changes had to be made between Chard and Exeter. This want of petrol arose not from carelessness, but from the extreme heaviness and hilly state of the roads. It does seem surprising that towns like Shaftesbury, Sherborne, Crewkerne, Chard, Honiton, etc., have no petrol supplies. Where are the cycle agents who are reputed as being so anxious to cater for the wants of automobilists? It was suggested that before the end of the nineteenth century there would be stores of petrol in every village. Where are these facilities? Echo answers, Where?

More Petrol Talk.

A CORRESPONDENT with a statistical turn of mind, and having, perhaps, some basis upon which to found his conclusions, estimates that the amount of petrol used the during last year represented a total mileage of over one million was made by motor-cars in this country. This, again we are assured, represents a thousand motor-cars doing a thousand miles each per

annum. Surely our correspondent must be altogether at sea in his calculations, for one firm alone has sold over one thousand cars in Great Britain, and a man cannot much appreciate his motor unless he does over one thousand miles per annum. We have now before us a new list of the agents stocking Pratt's motor-spirit, and we are assured that over one hundred agents have been added since the last edition was issued. This, of course, is welcome news; but the list should be trebled at least, and we trust our enterprising friends, both Messrs. Carless, Capel and Co. and the Anglo-American Oil Co., will use still greater energy in adding to their lists of agents. Any readers finding a difficulty in obtaining motor-spirit are invited to send the name of the town without its agent for publicity in our columns, so that the attention thus drawn to the matter may lead to a remedy.

Numbering Cars.

THE proposal to number cars continues to arouse indignation among automobilists. Mr. E. P. Reynolds suggests that, should the numbering of vehicles be pressed for, the alternative of each car carrying a name on the engine apron, or an apron on the back of the car, be submitted. Mr. T. G. Tulloch offers the idea that members of the Automobile Club should have the badge carried on their cars, and that that should be sufficient for purposes of identification. Mr. A. P. Sennett's proposal is that, if the numbering be made compulsory, it shall be deemed a sufficient compliance with the regulations to have the number engraved on a plate covered by a flap provided with a railway carriage square hole catch, such as could be opened by a constable's key. Further suggestions from members will be considered by the Club committee.

A Marquis on Motors.

THE Marquis of Granby has been writing in the *Field* on the use and misuse of motor-cars, and in the course of half a column of print has committed himself to several glaring inaccuracies. He says there is no reasonable safety for the public in any part of the country wherein are motor-cars, and that "as for a motor-car being stopped because of a nervous, frightened horse, such an event has, I fancy, never happened yet, whatever may be the case in the future. At any rate, I have never heard of or seen such a kindly action on the part of a motor-carist." The Committee of the Automobile Club decided to reply to the letter of the Marquis, and in the course of their answer Mr. C. Johnson says:—"The Committee of the Club are in a position to offer evidence of the fact that scores of motor drivers are in the habit of stopping several times on each of their journeys on account of restive horses, in spite of the fact that the regulation which compels them to stop on the driver of a restive horse holding up his hand is frequently misused for the purpose of their annoyance by drivers of horses which are in no way restive. The rules of this Club provide for the expulsion of a member who may be guilty of failing to stop when properly called upon to do so." The Club also controverts the assertion of the Marquis of Granby that motor-cars are simply useful "to gratify the pleasure of a select number of wealthy persons and rich trading firms," and declares that automobiles will do something, as was pointed out by Mr. Balfour in the House of Commons, to solve the problem of the housing of the working classes.

The Bardon Voiturette.

ONE of our visitors this week was M. H. Ramoisy, who has just come over to England in the interest of the Société des Automobiles et de Traction (Système Bardon, of Puteaux, near Paris). M. Ramoisy, whose visit has for its object the opening up of agencies in this country, had with him a Bardon 5 h.p. car, with four-seated phaeton body, on which we had the pleasure of a short run. A prominent feature of the car is the petroleum-spirit motor employed, this having a single cylinder, there being, however, two pistons with a single central explosion chamber. As we hope to publish an illustrated description of

the car in a later issue, we will content ourselves by remarking that it has apparently been well thought out and rides very easily. In France it is already a popular type of vehicle, being used by a number of prominent *chauffeurs*.

Another Case in East Anglia.

A CASE heard at the Samford Petty Sessions, in which the driver of a motor-car was fined for refusing to stop at the request of the driver of a restive horse illustrates the difficulties which are thrown in the way of the development of automobilism. In the particular case before the Bench, there was no independent corroborative evidence, and the occupants of each vehicle stated their own version of the facts, which, it is needless to say, did not harmonise in every respect. There is nothing unusual in this, as the same incident, viewed from different standpoints, may well present a different aspect to the actors engaged. Having heard both stories, the Bench was of the opinion that the driver of the motor-car was to blame, and he was fined 10s. with 19s. 2d. costs. Even according to the complainant's story the motor driver slackened his speed—and it was not alleged that he was going at an undue rate—as soon as it was signalled to him to do so, and the whole gist of the charge was that the motor driver did not stop altogether. Upon the facts the Bench might well, says the *East Anglian Daily Times*, have taken a lenient view of the case, and dismissed the charge, but the motor-car is a new comer on our roads, and it can hardly be expected that a Bench of County Magistrates should have much sympathy with what they seem to regard as an unpleasant novelty. We recognise the fairness of our contemporary in dealing with the case as being quite refreshing after the many prejudiced comments we have read in daily papers.

Comparative Cost of Motors and Horses.

ON the question of the economy of motor-vehicles as compared with horse-drawn carriages, Dr. Hardwicke, whose general conclusions were given in a recent issue, supplies some definite data to the *Lancet* which very clearly demonstrates the saving that the former effects. The cost of fodder, farrier, and saddler for one horse is given as £44 8s., and for two horses £84 16s. The initial cost of a hooded gig, horse, and harness was £119, of a Victoria, horse, and harness, £189, and of a hooded Benz motor-car £200. The interest on each at 5 per cent. per annum is £5 19s., £9 9s., and £10. The expenses of the motor-car during the year was—petrol £10 17s., lubricant £1, accumulators 7s. 6d., pair new chains £3, pair new belts 6s.—total, £15 10s. 6d. The comparative cost of each per annum, with the interest on the initial outlay added, is therefore as follows:—

	£	s.	d.
One horse and gig	50	7	0
Two horses and gig	90	15	0
One horse and victoria	53	17	0
Two horses and victoria	94	5	0
Motor-car	25	10	6

The actual saving in cash is easily apparent, while as a coach-house is required the rent of the stable is avoided as well as the man's time in feeding horses at regular and specified times. These figures, which are taken from Dr. Hardwicke's books, may be accepted as authoritative on the matter.

A Motor-Car at Drury Lane.

IN the pantomime at Drury Lane Theatre the motor-car plays a part. The Prince is turned into a beast and his kingdom is converted into a republic, with a plausible president, who appropriates the revenue and then sends it out of the country. At this point there is a comic scene for Messrs. Leno and Campbell, who, as the King and Queen, now in very reduced circumstances, plot to get their own back again by breaking into the National Museum and seizing the Crown jewels. They arrive on a motor-car, and to get rid of a boy attendant

play golf in order that he may search for the ball. After sundry mishaps, the Queen enters by the balcony, while the King waits below. The reputed "jewels" turn out to be mere imitations, and the motor-car comes hopelessly to grief.

Motor-Vehicles for Public Services.

AMONG the guests to be invited to the Automobile Club's house dinner on Wednesday next, January 9th, are Mr. J. W. Benn, chairman of the Highways Committee of the London County Council, and Sir Alexander Binnie, the engineer to that body. Following the dinner will be a paper by Mr. Outhwaite, the secretary and manager of the Edinburgh Autocar Company, on the "Use of Autocars for Public Service Purposes." It is hoped that firms which have supplied vehicles to ply for hire in cities and towns will endeavour to arrange that the managers of such services will be present, so that their experience may be elicited in the course of the discussion. There is no doubt the provision of motor-car services will do much to ease the strain of passenger traffic in the great cities; hence the special value of the forthcoming paper and discussion. We are informed that the reading of the paper will commence at 8.45 p.m.

An Automobile Meeting at Pau.

So much attention is devoted to Nice and its automobile week that one is apt to overlook the fact that the Pau meeting precedes it in the list of this year's fixtures. The Nice races are set down for decision in March, while those at Pau will take place between February 14th and 18th. The big event, in which last year M. René de Knyff gained so brilliant a victory, will be decided on Sunday, February 17th, and the route followed will be from Pau by way of Tarbes, Riscle, Aire-sur-Adour, Saint-Saver, Dax, Bayonne and Peyrehorade back to Pau. We wonder whether the president of the Pau Club, Mr. Thorn, will be running his new 40-h.p. Daimler? When last I saw him, writes our Paris correspondent, he was in Paris, having just returned from Cannstatt, where he had been seeing after his big car. As his 26-h.p. car was then doing the kilometre well inside fifty seconds he had great hopes for the capabilities of the new 40-h.p.; and, if rumours be true, his anticipations will be realised, for the 1901 racer is likely to prove a veritable flyer.

Encouraging Industry.

WHEN it is being freely proclaimed in the press that, despite the activity now apparent in our workshops, British trade is being menaced by foreign rivals, the folly of those who would throttle a growing industry seems impossible. But it is none the less existent, and the county councils—or, at least, some of them—are not acting in the interest of the whole community in trying to prevent the progress of automobilism. This is a fact that cannot too often be insisted on, nor can it be too often urged.

Motor Coaching in America.

THE idea of motor-coaching parties from the leading London hotels to southern resorts has frequently been mooted, but has not yet been acted upon. In New York, however, the matter has gone a step further, and a number of Society people there have joined in an effort to run an automobile coach on these lines. The vehicle to be used has accommodation for nine passengers. Its motive power is electricity, and it can run about twenty-five miles without recharging. While it is proposed to put this coach on the road for a short run to begin with, probably to one of the country clubs out on Long Island, it is quite within the bounds of possibility that it will ultimately be operated to Philadelphia, covering the route of the former New York and Philadelphia public coach, which left the Waldorf-Astoria at eight o'clock daily, reaching the Stratford in Philadelphia at eight o'clock in the evening. There were many changes of horses, and several galloping stages, with a brief rest at Princeton of a half-hour for luncheon. It is thought that the

automobile could make much better time and show the coaching men of the old days the possibilities of more modern means of transportation. It would be necessary to provide fresh batteries three or four times, and the trip would be one which many people would be anxious to try.

A Public Motor-Car Service in Mexico.

THE electric wagonette shown in the accompanying illustration forms part of the service recently organised in the city of Mexico by the Compañia Mexicana de Vehiculos Electricos, a sub-company of the Electric Vehicle Company of New York. The new service runs between the National Palace and the statue of Carlos IV., and was subjected to a severe test when the streets of the city, on the occasion of a recent fête, were crowded to their utmost capacity with people on foot and vehicles of all kinds. The new service made regular and frequent trips during all that portion of the day when vehicles were permitted on the streets named. Every omnibus was filled to its utmost capacity, and, in spite of the immense crowd, thousands of people were transported from one end of the route to the other, not only pleasure seekers who were viewing the illuminations, but people who wished to go to and from their homes. The vehicles themselves presented, remarks *Automobile Topics*, a gay appear-

ance, draped with the national colours, and at night they were illuminated by red, white, and green electric lamps, which added to the festive appearance of the streets.

Foolish Litigation in Ireland.

IF ever the folly of rushing into law was clearly demonstrated it was in the case of *Mayne v. McTaggart*, which we reported last week. Plaintiff bought a second-hand motor-car from defendant, who was the Dublin agent for the vehicle in question. The plaintiff, not being satisfied with the car, sued for damages, and the defendant offered to settle the case out of court for £17 10s. The former refused to cancel the bargain for less than £25. Accordingly the case went to the courts and lasted four days. The total costs of the action are estimated at over £300. The plaintiff, though he won the case with £30 damages, will probably be out of pocket also, and he still has the car on his hands. The case has an important bearing on the buying and selling of motor-cars, and should teach makers and agents to be careful in the guarantees they give outside the ordinary implied guarantees under the Sales of Goods Acts. If any other specific guarantees are given they may be used by claimants. Curiously enough the case in question took the turn it did from the favourable evidence given by one of the witnesses of the plaintiff. This gentleman averred that he got a De Dion voiturette last April, and in his evidence swore that he had driven it over 5,000 miles on Irish roads without any trouble. He also stated that he accomplished one run of 200 miles, and

only stopped once to oil up. His evidence impressed the judge and jury very much, and they seemed to hold the opinion that a good motor-car never went wrong. Therefore, when the plaintiff told of his wails and woes, they were naturally the cause of a comparison between the two vehicles. The fact that the plaintiff was quite a novice, whilst the owner of the De Dion was an expert did not apparently receive the attention it deserved when judging if plaintiff's car was defective in itself.

Avoiding Sheep.

A CORRESPONDENT of *Madame* has seen a young lady attempting to guide a voiturette on the Bath road, a young man, who was sitting beside her, meanwhile looking on with admiration. A flock of sheep appeared on the scene, and to avoid these the fair driver steered on to the path and finally upset her car in the ditch. This was fortunately not a deep one, and the machine appeared to be much more damaged than the passengers. Ladies must remember that motor driving requires practice, and also that sheep are not very dangerous animals. In fact, they are taking kindly to the automobile, if the following paragraph be true.

An Automobile Sheepfold.

ANOTHER application of the automobile to pastoral affairs is suggested from the United States. In fact, it is said to be in actual operation at the Agricultural Experiment Station of Michigan. A pen is provided fifteen feet square built of wire, and mounted on broad flat wheels. Wires connect it with a small motor stationed at one side of the pasture, this being connected with the electric wires from which power is derived. A turn of the button and the pen slowly creeps across the field. The field in which the machine has been tried is planted with lucerne, growing thick and heavy. The pen is so arranged that it crawls the full length of the pasture in one month, travelling about two feet an hour; at the end of this time it is switched around and travels back again. As it moves the sheep eat every bit of the fodder, eagerly cropping next the forward side of the pen as it runs over new ground. A bit of canvas duck is hung over the corner of the pen so that the sheep may be well sheltered, and, when the pen has passed, the lucerne that has been cropped by the sheep immediately grows up again, and by the time the pen has made its monthly circuit the pasture is again in good condition. The advantages of this electrical pen lie in the fact that the sheep are kept from running over, half eating and tramping down a large amount of pasture, and it keeps the sheep quiet, so that they lay on flesh rapidly. This sounds very captivating, and should be utilised by some M.P. interested in agricultural depression and anxious to make a mark in the House, or among the sheep.

Motor-Cars at Bournemouth.

IN a review of the past year the *Bournemouth Guardian* says: "The motor-car service began on January 1st, and has, without doubt, proved a decided success. It began amid considerable doubts and had to face a lot of ridicule, but now the value of this quick communication between the east and west, in so extended a town as Bournemouth, is generally appreciated. There have been no accidents worth recording, and it has been proved that motor-car traffic can be as easily controlled as any other. The police action in toning down the speeds on one or two occasions, though disagreeable to the owners, has, without doubt, had a salutary effect, but it is the proprietors of private vehicles that are the chief sinners, and called from the Recorder recently a powerful lecture on their iniquity generally. While all will not agree with the sinfulness of speedy motoring where the roads are clear, reckless driving calls for general disapproval." One of the Bournemouth motor-buses, built by the Motor Manufacturing Company, was on view at the recent cycle show at the Crystal Palace.

Horse-Breeding as Affected by Motor Traction.

IN the course of an article in the "Agricultural Annual and Mark Lane Express Almanac, 1901," Mr. E. G. F. Walker, of Chew Stoke, discusses the question of motor traction in its relation to horse-breeding, and asks, "Will this affect horse-breeding as much as some persons imagine? Will the motor be more disastrous to the horse trade than the steam engine of the railway? In some respects this most certainly must be answered in the affirmative. Prominent amongst these causes must be set down the conversion of horse tramways to electric tramways. By this means a consumptive demand of comparatively recent introduction has been removed from our midst. In times gone by the city cab horse ran on as long as it had a leg to stand on, and this leg was a long time wearing out. Then came the horse cars in our streets; the frequent stoppages and restarting soon tore the horse to pieces, and worn-out 'trammers' were only good for the knacker or else to return to the land." After considering various other features of this interesting problem, Mr. Walker remarks:—"In my opinion, despite the introduction of motor traction, there still remains a prospect of remunerative horse-breeding for the British farmer. The probability is that motors will increase slowly; low powers are not in favour, and increased power means heavier motors, and consequently, much greater initial expense. At present, the cost of motors places them out of reach of the middle classes. A decent cob and trap can be secured for £70, but it is not the very best motor-car that can be secured under £170, and high-class ones are much higher priced still; and very few care to invest in a second-hand motor-car with its attendant expensive upkeep. Whereas many can purchase and own a horse, it is confined to the few to be owners of mechanical motor power, and usually in the long run the majority wins, especially as the horse can do most of the things a motor can and several things that the motor cannot do. Therefore I believe in the horse for the future."

Horse v. Motor-Car.

OUR friend, who cannot disavow a partiality for the horse, says "the horse can do most of the things that a motor can." This is hardly fair, seeing that the motor-car can make journeys of over a hundred miles a day continuously and maintain a steady pace hour after hour, whereas the natural horse would soon tire. This difference alone is sufficiently great to secure for the motor-car the public favour which, if rather long in coming, is none the less sure.

Mr. Edge Interviewed.

MR. S. F. EDGE has been interviewed on the subject of the motor-car industry, and points out that in France there have been periodical long-distance trials since 1894, with the result that great establishments have been built up like that of Panhard and Levassor, who employ 1,800 workmen, and De Dion et Bouton, who have 1,400 men. Altogether there are 200 makers in France. Mr. Edge regards with pleasure the increase of price of English cars, for with that has come about an increased quality. In some types, he says, our productions are as good as the best of the French; in a few they are better. Every year the motor-vehicle improves in quality, and Mr. Edge suggests three ways in which England can be helped forward with regard to her position in connection with automobilism. Firstly, there must be an increased demand; secondly, an alteration of the law in regard to permissible speed, and thirdly, a fuller support by the public of companies formed for the manufacture of properly-accredited types of motor-carriages. In the course of the interview it transpired that the Napier cars to compete in the Gordon-Bennett race will be geared to travel at seventy-three miles an hour at normal speed, and 103 miles an hour at the top accelerated speed.

FROM END TO END.

AT the recent National Show I chanced to be talking to a visitor who seemed to think a steam car fit only for town work, and in trying to dispel this impression, I laughingly said that there should be no hesitation in undertaking a journey thereon from John o' Groat's to Land's End. Mr. Letts, who with Mr. Halsey is managing the business of the Locomobile Company in this country, and who had overheard this conversation, took the matter up, and in less than six hours from that moment it was definitely arranged that the journey should be made on a Locomobile. I left King's Cross by the night mail on Saturday, December 9th, and reached Wick safely on Sunday night. Next day, after some trouble in getting the car out of the truck, I steamed away to John o' Groat's. It was rather amusing, by the way, to see the driver of an enormous Caledonian express engine getting up steam for the sole purpose of shunting the truck containing my car into the siding. Arrived at John o' Groat's the car was housed for the night, and after poring over the visitors' book, in which I found the signatures of those who in years past had made the "End-to-End" journey on bicycles, I turned in. The weather was then quite fine, and I was very much disappointed to hear in the morning the wind whistling noisily.

We started out, but met with difficulty owing to the persistent "blowing back" of the fire, caused by the high wind. Not having had much experience with the steam car previously, and fearing damage to the fire-box, I decided to put back into shelter. Towards evening, the wind having lessened a good deal, I tried again, and though our progress was not fast, we continued on our way till we arrived at Latheronwheel, a distance of about forty miles, where we stopped the night. The next day we set out and encountered a wind of considerably stronger character than that of the day before, and as the road lay for the most part close to the sea we got the full benefit of it. We crawled on the best way we could, and presently reached the famous and much-dreaded Berriedale Hill. So much had I heard concerning the terrors of this descent that I maintained a very slow rate of speed whilst coming down it. Then came the ascent. I started with 180lbs. of steam showing on the gauge, but anticipating a sort of precipice I thought it wise to get Perkins, who was with me, out of the car. In fact, I armed him with a "sprag," consisting of a block of wood nailed on to the end of a short stick. The road winds in and out among the cliffs, and therein lies its chief danger, for it enjoys a somewhat undeserved reputation on the score of its steepness. After I had climbed about half a mile of the hill I took compassion on Perkins, who, from sheer fatigue, had fallen to the rear, and seeing a big stone at the side of the road, I partly closed the throttle and gently backed down until the driving wheel rested against it, when I waited for my companion to catch me up. He climbed into the car, and away we went again, finishing the ascent without any difficulty and at a very fair speed. We reached the two danger-boards at the top of the hill with 140lbs. of steam to our credit. The sheltered nature of the road had made the ascent much easier since the fire had full play, but once on the high ground our troubles came on again, until we began the long descent of the Ord of Caithness, where the cliffs offered some slight protection. Half-way down the hill we came across a small cairn of stones, above which was a solitary tombstone bearing the terse inscription, "Here perished Mr. Welsh; be ye also ready." History does not say whether he met his fate going "up" or "down" the hill, and its steepness warrants nothing but a guess upon the point. Our destination that night was Invergordon.

Next morning we set out early, and had by no means a pleasant drive along the coast towards Inverness. The heavy roads and the strong head wind had upset calculations with regard to the distance our store of petrol would carry us, and it finally gave out about a dozen miles from Inverness. The car was, fortunately, just opposite a small hotel in the village of Muir of Ord when this happened, so we ran it into the yard, and after telegraphing to Inverness spent the time very pleasantly until a couple of hours later, when a trap arrived bringing a fresh case

of petrol. We soon reached Inverness, and after purchasing a strong pail to facilitate the filling of our water tank from the wayside troughs which abound in that neighbourhood, we started out once more. By this time it was quite dark. The high wind was accompanied by heavy rain, and the roads were in a frightful condition. To make it worse, the next twenty-five miles were all up-hill, the road rising from practically sea-level to an altitude of a little over 1,300 feet. We took the wrong road at Moy, and found ourselves in the station yard, but were soon set right by the signalman, who came out to direct us on our way. Close to the summit we noticed a very curious crackling sound, which puzzled us a good deal, and it was not until we got down to fill our water tank that we discovered it was caused by the passage of the tires over a snow and ice covered road. It was a little difficult to get the water, as it only consisted of a very small stream a few inches wide and of no depth at all. We managed to scoop out a hole of sufficient size to allow us to get half a pailful at a time. When the tank was full and we got under way again, I soon noticed that the descent had begun. It was very pleasant to find that the car would run with the throttle shut at quite a brisk speed after the painful climb we had just completed. After about three miles

AT JOHN O'GROAT'S.—ON THE FRINGE.

of downhill, on rounding a corner we beheld, much to our joy, the Carrbridge Hotel, where we had bespoken rooms. The landlord was waiting for us and had begun to get a little anxious, as we were a good deal later than he had been advised we should be. He soon showed us where to stow the car, and then led us into as cosy a room as any weary traveller could wish to see. After supper he entertained us with many yarns concerning the famous riders who in years gone by had snatched what rest they could at his hospitable house on their way North. Next morning we were off at daylight only to find that the wind had increased, and the rain, though not quite incessant, was even more drenching than on the previous day. By the time we neared Kingussie it was blowing a regular gale. As we proceeded anxiety increased with regard to the petrol, which again seemed likely to fail. By the time we had made Dalwhinnie it became quite evident that we must get a fresh supply of petrol somewhere if we were to reach Perth. Perkins went on by rail from Kingussie to Perth, to bring back a sufficient quantity to carry us from Pitlochry, which place I hoped to be able to reach alone with what was left in the running tank. From Dalwhinnie to Blair Athol, a distance of twenty-four miles, there are practically no houses at all and nothing approaching a village. The road presents a good many

dangers at night. It is cut out in the side of the mountains and follows the course of the river, sometimes close to it, sometimes a hundred feet above it. There is no parapet to prevent one's running off the road, and there are many very sharp corners, in the rounding of which a good deal of caution has to be exercised. While travelling over this stage I met with a disaster which came near to ending my trip. Rounding a bend in the road, I saw in front of me a dark streak stretching right across the road, and a second later, by the light shed by my head lamp, I was able to make out a gap in the road. The only effect of the brake which I instinctively applied was to make the car give an angry swerve towards the edge of the cliff, and realising that I could not possibly pull up in time (I was travelling down hill at full speed), I devoted my attention to steering the best course I could. On reaching the gap the front wheels seemed to drop from under me as they went down. There was a momentary pause, followed by a frantic jerk, and the next instant the front of the car shot high into the air, balanced a moment, and then came down with a crash that nearly unseated me. Amazed to find myself safely past the danger I got the car under control, and then walked back to have a look at the cause of it. By the aid of the lamp I soon made out that a stream caused by the prevailing incessant rains had made a channel for itself right across the road, through which it was pouring. The next step was to carefully examine the car. Not much damage seemed to have been done by the violent shock it had suffered. All that was really apparent was that the frame tubes had become slightly buckled. Having set my mind at rest on this score I was soon under way again, and ran right through Blair Athole and out the other side before stopping to replenish my water tanks. I had done twenty-six miles and had still about half an inch of water left in the tank. From Blair Athole to Pitlochry is only a few miles, and it was not long before I drew up outside the post-office. Ascertaining that I could get benzoline sufficient to carry me on to Dunkeld, even if the petrol in my running tank should fail to carry me through, and knowing that there was a "motor man" in Dunkeld, I telegraphed asking Perkins to remain at Perth, instead of coming on with the petrol. On reaching Dunkeld a little later I found that Dr. Taylor was out, but I made bold to beg some petrol all the same, afterwards setting out for Perth, where I arrived at the Station Hotel earlier than I had expected, but had a good deal of trouble in getting the car stowed for the night. One rather amusing incident occurred outside the town. I had run short of water, and in exploring the private premises of the nearest house I was suddenly scared by hearing close at hand a deep growl. I carried out some very interesting experiments, which were very much facilitated by the possession of a ham sandwich. The result of these experiments was to prove that the dog's chain prevented it from reaching me provided I kept close to the hedge in passing it. I had to pass that dog a good many times, but fortunately the sandwich held out, and its successful application turned the growl with which I was at first greeted into a contented munching sound.

On leaving Perth (where I rejoined Perkins) in the morning, we had to face the roughest weather we experienced all through the trip. The rain came down in sheets, and I had occasion to bless my kind friend, Mr. E. W. Hart, of Luton, who, when he came to say good-bye to me at King's Cross, had insisted on lending me his wondrous waterproof cape. Verily, without it, I had been lost. We reached Burntisland about mid-day, and some hours afterwards arrived in Edinburgh, only stopping in the Scottish capital sufficiently long to fill up our petrol tank and stow creature comforts. That night we stayed at Carllops, and our host turned us out next morning at daybreak. We had not gone far on our road to Carlisle when we discovered that the balls of the back axle had escaped from the ball race, and were wandering about between it and the hub of the wheel. At the next inn we came to we propped the car up on a box, and while they were preparing lunch for us indoors we set about renovation. Finding that the cone was damaged past repair, I fished out a new one from the basket at the back of the car, and not thinking what I was doing slipped it on to the axle and pushed it into its

place without having first stuck the new set of balls into the ball-race. When I discovered my mistake and tried to get the new cone off I found that it would not move, and after spending a good deal of time in a fruitless attempt to dislodge it from the axle I gave it up and flung the balls over the hedge. We then filled the axle tube and ball-race with grease from injector, screwed the wheel on, and in this way travelled the remaining 600 miles on a plain bearing without any further trouble. At Gretna Green we filled our tanks at the last pump in Scotland, and a few moments later crossed the border, reaching Carlisle about nine o'clock in the evening. Next night found us at Preston, and the day following we journeyed without adventure to Bridgnorth. It was late when we got to this town, and not a soul was abroad. However, after shouting ourselves nearly hoarse we at last saw a man emerge from a house hard by. He said that the people in his house were ill and like to die if we continued our pandemonium. I told him that if he did not wish us to share their fate he had better direct us to the Crown and Anchor, and a little later we arrived there just in time to catch the Boots, who was on the point of starting for home. He turned back on seeing us and let us in. The next stage of the journey was to Bristol. One rather exciting adventure occurred on the way. We were about to pass a brougham, when, without the slightest warning, the horse, which had not shown the least fright at first, took it into its mind, probably, that our boiler was about to explode. Putting its head down and stretching out its legs, it sped past us like a flash, missing a telegraph post by about one-sixteenth of an inch. It was going at considerable speed, though apparently under some control, when we saw the last of it. At Bristol it was not easy to find a stable for the car, and it was late before we turned in that night. The next day, December 20, was one of the most boisterous days I have ever had the luck to experience.

The blowing back of the fire at last caused one of the fire-tubes to leak, of which fact we were warned by a popping sound emanating therefrom. I had much hope that, notwithstanding the bad weather, we could have got through the journey without changing the burner, and it was disappointing to have to replace it so near the end. Fitting the new fire-box took about an hour, and then we went forward again and did not draw rein till we had reached Exeter, where we stayed the night. We made up our minds to run from Exeter to Land's End without further rest anywhere, a distance of 120 miles, but the unfavourable conditions of the roads, the wind, and the hills, made it equal to twice the distance. We did our best, though our speed was by no means brilliant. When night came down we were just entering upon a very desolate stretch of road between Launceston and Bodmin. The car had been running very badly for the last few miles, and I had thought it due to tightness of the driving chain, and it was some time before we discovered that the real cause was the empty condition of the cylinder lubricators. When these had been replenished and properly adjusted, we had no further trouble and it ran its very best. That night we were compelled to wake up a good many sleepy householders in order to inquire our way, and were surprised on each of these occasions by the good nature displayed on the part of our victims. During the small hours I felt a terrible sleepiness creeping over me and at last, after several fruitless attempts to overcome it, and fearing lest I should go to sleep and allow the boiler to become scorched (a thing which would have been a terrible pity on the last lap), I decided to stop. So, the fire having been damped to give me ten minutes' rest, I fell fast asleep. Started once more, we reached Penzance about breakfast time. After a hearty meal at the Western Hotel we set about making arrangements for the shipping of the car to London, and then, when the photographer had been given sufficient start, we followed him out to the End, where we arrived about noon, thus ending a twelve days' journey through the worst and most persistent bad weather which it has been my lot to experience. No repair or adjustment was made to the engine proper from start to finish, and a plentiful supply of lubricating oil was the only attention it received from End to End. Doubtless I shall possess many another oil car, but there will always be a warm corner in my heart for the little steam

car that carried me so bravely and against such odds on this eventful trip.

N.B.—I have omitted to mention one trouble. I refer to the inability of the cross-head pump to keep pace with its work owing to the abnormally heavy load and the frightful conditions of road and weather prevailing. We had recourse on a great many occasions to the auxiliary pump, but this should never occur on fair roads and with an ordinary load.

HUBERT EGERTON.

THE RESULT OF THE FRENCH ALCOHOL COMPETITION.

IT was on October 28th last that the *Crétérium de l'Alcool* organised by the Moto Club of France, was decided over the Paris-Rouen route, a distance of 127 kilomètrés, and so laborious have been the succeeding analyses of the various alcohols employed by the forty competitors who succeeded in completing the course, and so intricate have been the calculations necessary for the classification, that the Club's technical committee only completed their labours last week. In the course of a very detailed and interesting report the committee remind the public of the elements on which they base their appreciations and the principal conditions under which the event was decided. These were—

Article 3. The competition will bear upon—(a) the consumption of alcohol for production of driving power; (b) the consumption of alcohol employed for other purposes, such as for burners, etc.; (c) the chemical composition of the alcohol employed; (d) the working of the motor and the regularity of the running. Speeds exceeding 30 kilomètrés per hour and 20 kilomètrés per hour in towns and villages will not be considered.

Article 4.—All self-propelled vehicles (carriages, voiturettes, and cycles carrying two people) will be permitted to compete.

Article 5.—The vehicles should have at least two seats, of which one will be reserved for the commissioner. They will be weighed at the finish and their reservoirs will be gauged at the start in such a manner that the commissioners will be able to control the consumption of fuel.

After dealing with the subscriptions and prizes received, the committee exposes its plan for their distribution to the successful competitors, and then proceeds to explain the system upon which the classification was arrived at. There is, first of all, the question of consumption. This was judged by the proportion borne by the total gross weight of the vehicle, when fully laden with passengers, fuel, etc., to the consumption of fuel. The number of *tonnes-kilomètre* obtained by a litre of fuel was calculated, and to the results ten points were awarded for every *tonne-kilomètre*. Then the formula applied was

$$10 \times \frac{W \times 127 \text{ kilomètrés}}{C}$$

W representing the weight and C the consumption.

As to the chemical composition of the fuel employed, the committee, bearing in mind that the essential object of the competition was to promote the use of alcohol in motors, adopted the following scale:—One point per one cent. of alcohol contained in the mixture employed; and the system has answered most satisfactorily. In connection with this point it is somewhat amusing to note that one of the forty competitors who finished the course does not figure at all in the official return, as analysis revealed the fact that the "composition secrète," as he styled the fuel upon which he made the trial, only contained four per cent. of alcohol. Perhaps, however, his motor had temperance principles. In making the classification for regularity of running the committee have disregarded all speeds exceeding 23 kilomètrés 225 mètrés per hour, and have awarded to each competitor attaining this speed 116.12 points, the calculation being based upon five points per kilomètre per hour. A penalty of one point for every minute of breakdown caused by motor or carburettor has been enforced, but, on the other hand, allowances have been made for time lost through causes other than these.

It is interesting to note that thirty-three competitors secured the maximum number of points awarded under this heading, and that, of the remaining six, four sustained long delays *en route*. I do not propose to quote the entire records made under the several headings by each of the thirty-nine competitors, but will merely give the leading cars in each class, previous to showing the final classification. In the matter of consumption the best records were as follows:—

Car.	Weight. Tons.	Fuel consumed. Litres.	Tonnes- kilomètrés.	Points.
Gobron-Brillié (No. 18) ...	1.279	15.00	10.826	108.26
Dietrich (No. 28) (carburettor Martha) ...	1.540	19.40	10.080	100.80
Gobron-Brillié (No. 11) ...	1.289	16.80	9.744	97.44

The leading Panhard representative's record was 9.562 tonnes-kilomètrés, entitling the car to fourth place. Under the heading "Composition of Fuel" four cars receive the maximum number of points, viz., 100, each vehicle having employed pure alcohol as fuel. These four cars are the No. 20, Bardon; the No. 3, Gobron-Brillié; the No. 37, Battaiellie tricycle; and No. 25, Impetus. The large majority of competitors used about 50 per cent. of alcohol to 50 per cent. of petrol.

Coming to the regularity of running, the wonderful speed made by the No. 55, 24 h.p. Panhard, at once attracts attention. All who know the route followed will appreciate the time of two and a quarter hours made by M. Giraud's car, for an average of 58 kilomètrés per hour over such a course takes a lot of doing. Following this performance there comes that of M. Girardot's Panhard, which averaged 45 kilomètrés per hour for the distance. The big Henriod and M. Schaeffer's Panhard tie for third place, their record being 41 kilomètrés per hour. And now, having given the leaders of each section, I have but to chronicle the general classification, which is as follows:—

	Prize.
1. Bardon ...	£40
2. Gobron-Brillié ...	20
3. Panhard and Levassor ...	12
4. Gobron-Brillié ...	8
5. Battaiellie ...	4
6. Vilain ...	4
7. Dietrich (carburettor Martha) ...	4

£90

This competition has undoubtedly opened the eyes of those interested in the automobile movement to the possibilities of the employment of alcohol in light-oil motors, and since the date of the trial the question has received the very serious attention of buyers and constructors alike. Here in France, where alcohol is a national product, the agricultural districts are showing considerable interest in the question, for the adoption of alcohol as the fuel of light-oil motors would open up for the farmer a new market for his produce. Little wonder, then, that this is the question of the day, and that the rural districts are manifesting an altogether unaccustomed interest in motor matters.

THE Dumbarton County Council has agreed to support the Fife County Council in its effort to secure the registration of motorists and cyclists.

THE Wheel Within Wheel Company is the name of a company which has been formed at Paterson, N.J., with a capital of £25,000, to manufacture carriages and automobiles.

LA FABRIQUE NATIONALE D'ARMES DE GUERRE, of Herstal, near Liège, inform us that they have entrusted Messrs. Cheswright and Cottam, 73, Queen Victoria Street, London, E.C., with the sale of their motor-cars in the United Kingdom.

THE Reyrol Motor Car Company, Limited, has been registered with a capital of £120,000, to acquire the business, goodwill, machinery, plant, cars, stock-in-trade, works, and assets of the Société des Automobiles, Hermes, Système Reyrol, Paris, and of the Yorkshire Motor-Vehicle Company, Vaughan Motor Works, Bradford; The North of England Motor Company, Aire Street, Leeds, and Manchester Motor Car Corporation Works, Victoria Bridge, Manchester.

CORRESPONDENCE.

CARBURETTORS FOR MOTOR-TRICYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I regret delay in replying to several letters *re* my "disparaging remarks" on the triangular box form of combined petrol reservoir and surface carburettor. I have no desire to retract anything I have put in my article on the subject, but I strongly object to having my sentences twisted and their meaning exaggerated. As regards the risk of an explosion, I merely said that such a danger "exists," I did *not* suggest a probability or frequency of occurrence, merely a *possibility*. Two of your correspondents admit hearing or knowing of one or two cases; I have experienced another; therefore, it is somewhat unnecessary for me to further contest this point.

That there are one or, perhaps, two advantages in a surface carburettor properly constructed I freely admit, and I quite agree with Mr. Stocks that such a form as the "Ariel," in which there is a separate container in which the carburation takes place, is safe and superior in other respects to one in which the bulk of the liquid and vapour are in one box. Regarding his query as to whether the gauge discs were in their place at the time of the explosion to which I referred, I do not think they could have been properly so, otherwise I do not see how it could have occurred. My idea is that vibration had loosened the nut which held the clamping rings, and that owing to a leaky induction valve, small explosions, hardly noticeable, first took place frequently in the pipe between it and the discs until they became displaced, and then occurred an explosion which was decidedly and unpleasantly noticeable. It is obvious that, contrary to the statement of Mr. Charles Jarrott, electric ignition in this respect did not mitigate the chance of an explosion. Electric ignition is safe in as far as it prevents risk of a flare-up in the event of an upset or the spilling of petrol near the motor.—Yours truly, A. E. S. CRAIG.

MOTOR-CARS FOR MEDICAL MEN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With all due deference to the opinion expressed by Mr. Truman, in the *Journal* of December 22nd, the motor wanted by a medical man is identical with that required by a commercial traveller (with the exception of a few minor details); both want a car that will go in all weathers, and all the time; that will stand wear and tear, and that is offered at a reasonable price. These requirements are what the trade has not been able yet to give us. It is not speed that is wanted, but lasting power, which is only to be obtained from good sound and honest work. Voiturettes are all very well to play with in dry weather, but are not fit to rough an English winter season. The car that is wanted is one possessing the following characteristics:—

(1) A good well-made 5 or 6-h.p. engine, water-cooled, carrying sufficient spirit and water to last 50 miles, without belts, which are affected by the weather, and if possible without chains. (2) Starting handle sufficiently near the seat, so as not to necessitate getting out of the car. (3) Good large solid rubber tires, artillery wheels, and easy springs (pneumatic tires are productive of unnecessary anxiety, which far outweighs the little extra comfort experienced). (4) Tonneau body, with movable brougham top or leather hood, cloth lined. (5) Levers so arranged as not to interfere materially with a good leather apron made to fit. (6) Tube and electric ignition, with wires thoroughly insulated, and lamps so fitted with electric lights to show red lights behind. (7) Three speeds forward and reversing gear. (8) Body sufficiently high from the ground to avoid catching dust in dry weather and mud in wet weather, and all machinery likely to be affected by the weather, dust, or mud, covered in; all parts easily accessible, and central lubrication.—Yours truly,

W. W. HARDWICKE, M.D.

THE WERNER MOTOR-BICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If Mr. Leonard will kindly refer to my letter of December 8th, he will see that I offered to ride thirty miles over

hilly Devonshire roads against a Werner without the assistance of pedals.

If he, or any other "expert," likes to take up this offer, I shall be pleased to meet him; but this appears to me to be a somewhat slender peg on which to hang a challenge to ride a pedalling race on the Brighton road. Apart from the fact that this road is not to be named in the same category with our west-country gradients, we all know that a pedalling road race never yet did more than show the strongest rider; and we also know the comparative results produced by pedalling a Werner bicycle and a roadster tricycle.

If, however, Mr. Leonard really desires a fair and square trial between a 2½ h.p. De Dion and a Werner of 1900 model (the latest model, the capabilities of which I do not know, is barred), he has only to accept the following conditions and I think I shall be able to oblige him very shortly when I am in town:—1. Chains off; 2. Route to be selected by me; distance not more than twenty miles; start not more than ten miles from London.—Yours truly, W. E. TESCHMAKER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having purchased an up-to-date Werner motor-bicycle three months ago I have found the machine everything it should be, with the exception of belt troubles. Could your recent correspondents give me a wrinkle as to what strap they use, and also where to get one? The V-shaped strap seems a failure, as it continually breaks at the joints. I should also be glad to know of any contrivance to reduce the noise that could be easily attached to the exhaust.—Yours truly, SIDNEY E. SILVERTHORN.

TUBE v. ELECTRIC IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In thanking Mr. Estcourt for his kind information *re* above, I want to ask what kind of burner he uses, the kind of oil it burns, the material of which his tubes are made, and also the makers' addresses. Would he kindly say if he uses a timing valve in conjunction with tube ignition? Coming from such an experienced source, I am satisfied that the above information will be very acceptable to a large number of motorists.—Yours truly, TWENTY MILES FROM THE RAILWAY.

QUERIES RE BELT-DRIVEN CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad to know if lacing a belt would be more advantageous as a fastener than the usual iron clips, which have repeatedly come loose, the belt being left on the road unknown to the driver of the car. I should also be obliged if any reader could inform me where to obtain belting suitable for a 3½ h.p. Benz car.—Yours truly, PERPLEXED.

THE 1,000-MILES NON-STOP RUN OF THE DECAUVILLE CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Mr. Tregurtha allow me to say I have owned a motor for more than a year, and never found any frost about it. My carburettor is evidently sufficiently heated from the exhaust, but on large cars, as noted by Mr. Edge, it is necessary that it should be heat jacketed; and I have never heard of this before, nor seen anything of it in any specifications. I am exceedingly obliged to Mr. Edge for pointing it out.—Yours truly, AMATEUR.

MOTOR PATENT MATTERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The advertisement itself of the British Motor Traction Company would lead most of people to believe that the Motor Protection Society was a useful combination, and the correspondence in your issue of the 22nd ult. confirms that view. Mr. Ernest Estcourt will find that a carburettor patented some fifteen years ago by Mr. Ed. Delamare Deboutville, the inventor

of the "Simplex" gas engine that figured so largely in the Paris Exhibition of last year, cannot be beaten for the work that he requires one. Mr. Delamare Deboutville is a charming man and would, I feel sure, if he could not furnish a carburettor, give Mr. Estcourt the necessary information to get one made here.

Yours truly, CUSH.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was surprised to note in your last issue that my simple letter on motor patent matters seemed to be of such burning interest to the various gentlemen who have written to your paper on the subject. I have no doubt that a great deal they say on the subject is true, particularly when looked at from their own point of view, but really they have in many cases entirely misunderstood my remarks. My reason for writing the letter was in the first place to explain my personal position in the matter and not in any way to lead others to do anything against their judgment or inclination. Personally, from every point of view I believe in supporting good patents, or at any rate not indulging in the somewhat unsatisfactory pastime of breaking one's head against a wall.

The suggestions of some of your correspondents as to the amount of royalty that should be charged is interesting no doubt, and will, I suppose, have due consideration from the owners of the patents, but I venture to think the royalty value of the patents will be settled by the owners and not by the users. I hardly imagine it is the usual commercial arrangement for the buyer to settle the price he will pay for an article, but it is usual for a would-be buyer to refuse to purchase if he considers an article is far too dear, as seems to be inferred in this case. Surely under these circumstances they should discontinue to use patents the property of other people, or if they do use them in an illegal manner they should not complain if the proprietors of the patents issue legal proceedings against them. Mr. Estcourt's letter is interesting reading, and coming from him I must take it that all he states are facts; but, at the same time, I must say if this is so, his arrangement of these facts, no doubt unintentional, is somewhat misleading to the ordinary reader.—Yours truly,

S. F. EDGE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have noticed a great deal of correspondence in your paper in the last two or three weeks in reference to the British Motor Traction Company's patents; it seems to me that this looks very much like the case of the Dunlop tire over again. The Dunlop tire patents were disbelieved by everybody who thought they knew anything on the subject, and yet to-day they stand in an absolutely unassailable position. Looking at the value of the shares of the British Motor Traction Company, it seems to me that it would be cheaper for the trade to combine to buy these shares and run the company themselves for whatever it is worth, thus protecting themselves against foreign invasions, and at the same time reaping the benefits from the royalties of new companies.

I think if someone, who has been connected with the electrical business for the past few years, would speak, they would very quickly throw a new light on this question of patents that would probably be a surprise to some of the firms at present in the motor-car business. A rather well-known member of the Automobile Club, whose car recently won a prize for cleanliness, could give some information on patent matters that would be somewhat interesting to many of your correspondents.—Yours truly,

P. BRADSTOCK.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the various correspondence which appears in your issue of December 29th, Mr. Jarrott and Mr. Charles Osborne must think the motor-buying public are a set of greenhorns if they cannot see through their very poor proofs (if they may be termed such a name) of the honest, royalty-paying concerns. To take them in group as per the advertisement of

the British Motor Traction Company, will the secretary of that company kindly inform me through your columns if the following statement is not correct—that the Daimler Motor Company and the Motor Manufacturing Company are the offsprings of the owners of the said patents, and that all the others, the Napier, De Dion Syndicate, Motor Power Company, the Ariel Motor Company, and Panhard and Levassor for England are not all partly owned and directed by Mr. Du Cros, who is also part and principal owner of the British motor traction patents.

Without further going into details, Mr. Jarrott or Mr. Osborne would greatly oblige me and your readers, I am sure, if he would give the name of any individual manufacturing concern that is paying royalties in which Mr. Du Cros or the offspring of the Lawsonian group are not interested.—Yours faithfully,

C. FRISWELL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read the letters in your last week's number signed by Messrs. C. Jarrott and Chas. Osborne on behalf of their respective companies. Evidently, my letter, which appeared in your issue of the 22nd ult., has been misread. Your readers will recollect that my letter was in reply to one from Mr. Edge in which he quoted the names of several large French firms. What I wrote was "Mr. Edge has quoted the names of several large French firms in his letter. Can he inform us if it is a fact that not one of these is paying a royalty on the carburettor which is to-day the burning question between Mr. Edge's company and the public, and whether it is not a fact that the firm of Panhard and Levassor have refused to pay any royalty for using Daimler's patents, including the carburettor?" My question applied to France, this must have been obvious to everyone. I never for a moment thought of who was or who was not paying in England. It may, however, be of interest to state that for all practical purposes our own and the French patent laws are the same, that there is a Maybach patent in France and that 95 per cent. of French cars use carburettors, which are obvious infringements of this patent (that is, if the patent is a good and novel one), and that so far no one has attempted to stop them.

Yours faithfully,

W. D. ASTELL

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—My board have noticed a great deal of correspondence from motor-car users in the last issue of your paper which has arisen in answer to a letter written by one of our directors, in which he has set out his personal position in regard to this company and the patents owned by this company. My board venture to think that the idea of these various correspondents as to what constitutes a reasonable royalty for the use of the Maybach carburettor and other patents which my company control is one that must be left entirely to the owners of the patents to settle.

If these patents are of so little value as some of these correspondents seem to suggest, surely the common-sense view of the matter will be for them, after they have paid us the necessary damages, if we obtain the judgment of the law courts against them, to use some other type of carburettor, or some other method of doing these various things in connection with motor-carriages which my company's patents cover. My board hardly think that the infringer of the patents should become the assessor of the damages, and that seems to be the position that your various correspondents seem to wish to assume.

In regard to the Motor Trades Protection Association, Mr. W. D. Astell suggests, with what authority my board are unaware, that this society should agree to be bound by a verdict taken against the society on some infringement. Providing this society is sufficiently financially strong to bear the burden of a patent action my company will have great pleasure in falling in with Mr. Astell's suggestion, and my company are now waiting to hear from this society and the names of their solicitors, so that an action may be commenced.

In regard to Mr. Friswell's letter, surely his experience in patent litigation should make him aware that the proposition as

to the settlement of infringements must come from the person who has infringed, unless they are prepared to accept the terms laid down by the owners of the patents. It would, perhaps, be as well for me to remind your readers that Mr. Friswell at present has no manufacturing interest, but his chief business is the importation of unlicensed foreign cars, and moreover his judgment in regard to patent matters has not been a singularly correct one.

There is another very important point in regard to my company that seems to have been overlooked by every one of your correspondents, and that is, through their agreements with the original owners of the patents, such as Daimler, de Dion, Bollée, etc., they are entitled to all improvements which these firms bring out from time to time. This point has a greater bearing on the question of infringement than many people at present seem to realise. They must not imagine that my company only have one or two patents. If they do think this they will be very rudely disillusioned.—Yours faithfully,

FOR THE BRITISH MOTOR TRACTION CO., LTD.,
CHAS. OSBORNE, Secretary.

A MEETING is to be held in Birmingham on the 11th inst. to arrange for the formation of a Midland Centre of the Automobile Club of Great Britain and Ireland, and at this meeting an executive will be elected.

AT Aberdeen, last week, James Reid, motor-car driver, was charged with having, in Market Street, driven a motor-car recklessly and carelessly. Accused pleaded not guilty, but was found guilty, and fined 20s., the option being ten days in gaol.

THE International Motor-Car Company, Limited, has been registered with a capital of £1,000 to take over the business carried on by Mr. F. O. Seyd as the International Motor-Car Company. The registered office is at 116, Great Portland-street, London, W.

MR. J. H. PATERSON, of the Caledonian Motor-Car and Cycle Company, Limited, Aberdeen, has received his appointment from the De Dion-Bouton Foreign and Colonial Syndicate, Limited, London, as official repairer for Aberdeen and the north of Scotland.

THE MIDDLESEX MOTOR-CARRIAGE COMPANY, LIMITED, has been registered with a capital of £3,000 to acquire the business carried on by W. J. Colville at Station-parade, Willesden-green, N.W., and to carry on the business of cycle and motor-car manufacturers, &c.

"HECNUM," the non-corrosive metal invented some years ago, has been found to be a remarkable substitute for nickel, and several tests have proved that exhaust valves made from it answer exceptionally well, while their price being considerably lower is a factor which should make them very popular. Messrs. Brown Brothers, Limited, of Great Eastern Street, London, are sole agents for these exhaust valves.

THE Steam-Car Company (House's System), Limited, has been registered with a capital of £10,000, to carry on the business of engineers, steam and other motor-car and accessory manufacturers, carriage builders, carpenters, joiners, rubber manufacturers, &c., and to acquire the option for the exclusive use of certain patents of H. A. House. The registered office is at 84, Chancery-lane, W.C.

THE Westchester Automobile Club is the name of a new organisation which has been formed by a number of well-known motorists in New York, many of whom own country seats in the northern part of Westchester and along the northern shore of Long Island Sound. The club purposes to establish supply stations for motor-vehicles on the country roads leading to the Ardsley Casino, the Knollwood Country Club and the Westchester Country Club.

THE Cambridge and Newmarket Autocar Company, Limited, has been registered with a capital of £2,000, to acquire the business carried on by H. A. Bedwell, G. C. Bedwell, E. C. Crisswell, and F. W. H. Hitchinson, at Cambridge, as the New Town and Newmarket Motor Company, and to build and deal in motor-cars, cycles, flying machines, launches, &c., whether worked by electricity or other power.

THE CREST EXHAUST-VALVE OPENER.

THE Crest Manufacturing Company, of Cambridgeport, Mass., a concern which is devoting considerable attention to the construction of small motors for motor-cycles and voiturettes, have lately introduced a new device for opening the exhaust valve on starting, so as to relieve the compression on machines that are started by pedals. An illustration of the device, for which we are indebted to the *Horseless Age*, is given herewith. The arrangement consists of a stud on the commutator box of the motor, and is so arranged that when the lever controlling the speed is operated to retard the spark, by moving the commutator box in a direction contrary to the direction of the motor, this stud passes under a foot on the exhaust valve stem and thus holds the exhaust valve open and relieves the com-

pression. An exhaust-valve opener is useful not only in starting but also when running down hill, for the exhaust valve can then be held open, so relieving and cooling the motor.

AMONG the papers announced for reading at the Society of Arts is one on "Some Experiences of Motor Bicycles," by Mr. Joseph Pennell, which is set down for the 6th February.

UNDER the title of Die Sudddeutsche Benzinwerke Gesellschaft, a company has been formed in Ludwigshafen on Rhein, Germany, for the purpose of making petrol for motor use. It is intended to produce it on a very large scale, and on a new system, which will, it is claimed, enable the makers to sell it cheaper than hitherto.

CALLING in at the London Autocar Company's dépôt the other day, Mr. Rush showed us a useful and interesting device of French manufacture he has lately put on the market in this country, in the shape of a water-circulation indicator. It consists of a glass tube, inside which is a white enamelled disc; the glass tube is arranged to be introduced in the water-circulating system between the pump and the engine in such a position on the dashboard that at a glance the driver can discern whether the pump is performing its appointed task or not. So long as the water is circulating properly the small disc, which works around a central spindle, will remain about the centre of the glass tube, but so soon as the circulation lessens in velocity it will begin to descend, and when the pump fails will fall directly to the bottom of the glass tube. In view of the trouble so frequently experienced by the owners of cars driven by water-cooled motors by reason of the obstinacy or failure of the water-circulating pump, the little fitting should meet with a large adoption.

HERE AND THERE.

WITH regard to the Automobile Club's offer to arrange for demonstrations of the reliability of motor-cars, it is probable that the first will take place next month at the invitation of the East Suffolk County Council. Another is in contemplation for Worcestershire, and others will be provided in any county where a month's notice is given. By the way, in connection with the forthcoming conference in London, it is probable that the Marquis de Chasseloup Laubat will read a paper on the speed question in France, where thirty kilomètres, or nearly nineteen miles, an hour has been fixed for the open country road, and twenty kilomètres, or twelve and a half miles, for towns.

WHAT the bicycle has done for the "press-the-button-and-send-your-negatives-to-be-developed" photographer, the motor-car will do for the photographer who prefers a stand camera with the necessary accessories. One of my friends is a keen photographer, whose paraphernalia weighs about twice the weight of a couple of St. Bernards. He regards the automobile as a splendid assistant in the pursuit of his art and his victims. There is no doubt a close connection with automobilism and photography, and the devotee of the motor-car already regards the camera as indispensable to the full enjoyment of a holiday. With its help scenes of ever-recurrent pleasure can be made permanent, while its effect on the industry is another point of importance, for by the aid of the photograph the public can be familiarised, and those automobilists who have sent out seasonable greetings made picturesque by photos of themselves and their cars have, in some way, contributed to the popularisation of the sport.

To describe the language of the man who has something go wrong with his motor-vehicle when about ten miles from everywhere, and who is unable to locate the cause of his trouble, is really impossible. But probably the following is about the most succinct account of his utterances on such an occasion:—
 "_____! * * * * _ _ _ _ _!! * * * * * _ _ _ _ _!!
 _ _ _ _ _!! * * * * _ _ _ _ _!!!! _ _ _ _ _ _ _ _ _ _!! _ _ _ _ _!! *
 _ _ _ _ _! _ _ _ _ _!! * * *"

Probably readers can supply their own keys to the foregoing.

It is impossible to ignore the close association existing between good roads and good vehicles. As the former are perfected the running of the latter will be improved and Macadam's axiom should not be forgotten by carriage and motor-car constructors. Road surveyors should also bear it in mind. "The making of good roads," said the great road engineer, "should be considered before carriages fit for them can be considered." In view of this the efforts of makers of vehicles—both mechanical and horse-drawn—deserve all the more praise.

WHEN a man gets a new car his friends consider it quite the thing to investigate every part and become inquisitive unto the most infinitesimal decimal or sparking plug. It is curious how the bicycle and motor fraternity feel a common interest in the other fellow's concern—a concern that is not always well appreciated, and a Boston motorist is said to have revived an old idea with a view to discourage those individuals who persist in fingering the various portions of the mechanism of his automobile when he leaves it standing by the curb. He has added a galvanic battery, which he has attached to the various levers. When he leaves his vehicle he turns on the current. The result is obvious.

A COMBINATION of goods transport with effective advertisement is now threading its way in and out of the London traffic. This is a motor-van, beautifully painted with panels in each side, upon which are reproduced the specialities of the H. J. Heintz Company on their packages, bottles, etc. On the top of the van is a large model of a gherkin illuminated by an electric lamp at night. This van is the second motor-vehicle owned by the

firm, the first having proved satisfactory after a trial of eighteen months. Both vehicles have been supplied by the Motor Manufacturing Company, Ltd., and the second van is capable of carrying a load of from 15 cwt. to one ton. Although motor-vehicles are becoming fairly familiar sights in our public thoroughfares, they are still sufficiently a novelty to cause their utilisation to prove exceedingly attractive advertisements, especially when designed in the form for which the Motor Manufacturing Company, Ltd., are responsible.

MR. F. S. WEROTTE has taken over the premises and plant of the Times Cycle and Engineering Works, in Upper St. James' Street, Brighton, and has re-started them as the Grafton Engineering Works. He has a good plant for motor-car work, and has facilities for the storage of vehicles. Keeping petrol, etc., in stock, Mr. Werotte is a man whom motorists visiting the southern resort may find it well to know.

THE Christmas mails of 1899 between Lincoln and the village of New York were carried by motor-car—as duly recorded in the *Motor-Car Journal* of exactly a year ago. The vehicle did the work well within the scheduled time, and was able to do what in the ordinary way would have required five mail carts with horses and drivers. The success of the experiment warranted the postal people continuing the motor-service as a regular thing, but that was not done. Recognising, however, the abnormal traffic of Christmas time, the Lincoln authorities again requisitioned a motor-vehicle from Messrs. Gilbert and Son, Ltd., during the recent Christmas season. Previous success was repeated; everything was got through in record time, and there was not the slightest hitch. Seeing that on both occasions the authorities were well satisfied, the wonder is that motor-vehicles are not allowed to become a recognised feature of the regular postal service.

ACCORDING to the *Financial News*, "faith in the ultimate usefulness of the motor-car is demonstrated by the many more or less important registrations in that particular industry." Certainly there have been a good many motor-car companies registered during the past month or two, and, seeing the hostile attitude of the financial press in the past, we must be grateful for even this halting recognition.

DR. GORDON STABLES, who recently wrote asking for advice with regard to motor-cars, may be interested in the fact that Messrs. Marshall and Company have just completed a motor touring caravan which will probably be on the road by the time these lines appear in print.

AT an automobile auction sale in Paris, an electric "run-away" has been put up for sale. The motor-car that proves obstinate at times, the vehicle that won't go, and the American "runabout" I know, but the "runaway"—what is that?

EVER watchful and wakeful, it would seem that the United States is before this country with regard to an automobile racing track—a matter that has been frequently advocated in these columns. From Newport comes tidings that before the summer season arrives an automobile track will have been built there for the use of racing and other motor-vehicles which will be used by the millionaire owners in Newport during the summer. Colonel John Jacob Astor has gone in for racing, and will have three machines there ready for track work. When the season opens there will be several attempts made to break the automobile records between Newport and New York, and in various other ways activity is promised. It is to be feared, however, that the intended track will be a rather exclusive affair, and that it will not be on the broad lines that would be a necessary condition of success in this country.

LOLLIUS.

MESSRS. R. M. WRIGHT AND CO., of Lincoln, the makers of the "Stonebow" car, are, we learn, at work on a new type of motor-bicycle. They have also been appointed sole district agents for the De Dion and Progress voituresses.

MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

Passing an Examination.

THE method adopted by M. de Lorme of Orléans, in the course of his examination as *chauffeur* on the 23rd ultimo, cannot be recommended to aspirants of drivers' honours; indeed, I will go so far as to say that its adoption would in every case be detrimental to the success of the candidate. When on the dreaded day the examiner takes his seat beside you it is but politic to show yourself solicitous of his welfare, and not to project him violently from the car, as did M. de Lorme. The Orléans candidate must have had somewhat confused ideas of what was expected of him, for not content with the roadway he directed his car on to the footpath with so rude a shock that the examiner was simply bumped out of the vehicle. Has any aspiring automobile driver ever done the like? I fancy not, but if one exists, his motor aspirations doubtless came to an end with the achievement. As for M. de Lorme, he probably awaits the recovery of his victim before submitting himself for a further examination. Do you think that he will receive his *brevet*?

A Municipality's Neglect.

As the result of the December rains a sort of fissure made its appearance on the main road at Antibes, in the south of France, and unmarked by the local authorities, it brought about a nasty accident to M. Mrozwicki, a well known automobilist of Nice. Mounted on a 3 h.p. tricycle and travelling fast, it was not until within close proximity to this fissure extending right across the route that the *chauffeur* perceived the danger. Quickly springing from the saddle M. Mrozwicki escaped scatheless, but his machine came hopelessly to grief in the hole, which measured nine feet in width by three in depth. It seems incredible that such a danger to the public was left unrepaired and even unmarked, and that, too, after many complaints had been addressed to the authorities. It is the intention of M. Mrozwicki to claim damages, and I wish him luck in his endeavour.

The Union Automobile.

So the new Moto Club of France no longer exists! That is, so far as its name is concerned, for the committee have not failed to impress upon members that if the original name disappears the original programme remains, and that under the new title of "Union Automobile de France" the society will carry on its work of promoting the welfare of the industry in exactly the same manner as it has done since the day of the famous scission from the A.C.F. But why the change, you will ask. Well, the committee say because the term "club" does not correctly represent the society, because Moto Club too closely resembles "Auto Club," the telegraphic address of the big society, and because there are too many Moto Clubs. To these another reason may be added, and that is the too English-like style of the title. All sound reasons, I think you will agree, but the best of all, and one not given prominence, is the fact that a Moto Club already existing in Paris the new society has no right whatever to the name. When one learns of this, the other reasons sink into insignificance, and one is tempted to ask why they should be mentioned when there exists another so powerful. But there it is, and since Wednesday, December 17th, the Union Automobile has commenced an existence which will, it is to be hoped, do much to advance the prosperity of automobilism. Let the Union work conscientiously for the whole movement, and nowhere will it find heartier approbation than at the A.C.F., but if its existence is simply to be devoted to antagonism with the older organisation then it will receive but scanty consideration. I am bound to admit that as the Moto Club it kept studiously aloof from any such proceedings and worked energetically in the interests of the industry. May it always continue to do so!

Petrol Cabs in Paris.

I NOTICED in an English paper the other day an article dealing with the recent strike of the drivers of the small red cars which are familiar to every visitor to Paris, and it surprised me to learn that during the exhibition the men earned from 120 to 150 francs per day. Even under the depressing conditions now existing it would appear that these fortunate *chauffeurs* clear about a pound a day, and yet they actually strike for a reduction of five francs per day on the hire of their car. That is, they wish to pay daily ten instead of fifteen francs. As the profits quoted seemed to me considerably exaggerated I questioned one of the men, whom I know, and from him had a somewhat different version. To-day with the prevailing weather the open cab, such as the little red Peugeot, cannot be hired out, and those *chauffeurs* courageous enough to take their cabs return to the *garage* in the evening usually without having gained a sou. With the covered vehicle, such as the company is actually preparing, business can be done, but with the present car it is out of the question. During the Exhibition there were days when £6 and £7 were earned, but these were counterbalanced by the time lost on repairs. The driver paid the full day to the company if he took out a car, no matter whether he was struggling with repairs all day long. These *pannes* were frequent, for the cars are lightly built and the treatment meted out to them is not always of the most careful nature. My informant charged sixty francs per day for the hire of his car, or ten francs the first hour, eight francs the second, and as he paid the company only twenty francs, he could, with luck, make a big sum for his day's work. But the *pannes* were the difficulty, and by the end of the Exhibition the men's net gains were nothing out of the common. Such at least is the men's version, and I think that it about represents the actual state of affairs.

The New Tax in Paris.

PARISIAN automobilists resent strongly the action of the Municipal Council, who, at a recent meeting, definitely decided to impose upon all self-propelled vehicles *de luxe* a tax equal to that already imposed by the State. Thus at one fell swoop the total sum payable on an automobile is doubled, and instead of the following tariff

Motor-cycles: One place, 12 fr.; two places, 24 fr.
Carriages: Two places, 60fr.; exceeding two places, 110 fr.
this one is in force as from January 1st—
Motor-cycles: One place, 24 fr.; two places, 48 fr.
Carriages: Two places, 120 fr.; exceeding two places, 220 fr.

The reason of this augmentation is that the *octroi*, or city dues, upon certain goods entering into Paris has been suppressed, and the councillors are therefore busily engaged upon finding new channels through which to make good the deficit. Of course, one of the very first things they stumble across is the unfortunate automobile, and as all motor men are rich, and the self-propelled vehicle is an *article de luxe*, the council quickly decide to make the new industry carry a portion of the burden. But what those interested in automobilism are enquiring is, how are the authorities going to define the vehicles *de luxe*. I am strongly of opinion that with but very few exceptions all owners of cars will be required to pay the new tax, for the collector will be hard to convince of any motorist's right to exemption. It is said that the carriages of commercial travellers, doctors, and solicitors, in addition to those used by commercial firms for business purposes, will not be taxed, but it is obvious that it will be no easy matter to draw the dividing line, and that if the collector errs in judgment it will not be on the side of the automobilist. No, the question as to what constitutes a carriage *de luxe* and a carriage of utility is a very nice one, and to my mind the distinction is an impossible one. When the good, kind councillors talk of it their idea is merely to sooth motor-men in their first outburst of indignation, but in actual practice all private owners will feel the effects of the new tax. Moreover, the official text of the council's resolu-

tion makes no mention of *de luxe* in relation to motor-vehicles, the words only appearing in connection with horses, and the collector can best act upon this. Obviously the verbal declarations of councillors are valueless under such circumstances, so Parisian motorists one and all can resign themselves to bear their portion of this new infliction. Oh, the poor motorist! What inflictions he has to submit to. Will they never end?

List of Mechanics.

WITH the advent of the season in France the demand for capable mechanics will greatly increase, and as in previous years the *garages* will be besieged with inquiries for suitable men. But these establishments are seldom anxious to furnish the owner with a thoroughly competent man, generally preferring to retain him for their own use, and the automobilist finds it necessary to search high and low for his *chauffeur*. It is in order to facilitate this search that the new sporting daily, *L'Auto-Velo*, proposes to publish a weekly list of drivers seeking employment, and of owners desirous of engaging men. It is a happy idea, and one sure of a cordial welcome from master and man alike. Oh, those long wearisome searches for a driver, which I, in common with hundreds of other automobilists, have made, and which might have been diminished by half, had the proposed list then been even in existence. Nothing is more worrying than a protracted search of this kind, but now a glance at the list will acquaint one with the names, addresses, and qualifications of the men at liberty, and simplify the work enormously. If the *Auto-Velo* could at the same time hit upon a practicable plan of augmenting the number of competent men, motorists would be doubly grateful. This is the great difficulty, for the supply of good drivers is extremely limited, and, aware of the fact, the men are exorbitant in their demands. With an increase in their ranks the mechanics would find it necessary to moderate their conditions, and the result would be that many people who find the extravagant cost of a man the great drawback to the use of an automobile, would purchase a car. Then strenuous efforts should be made to ameliorate this condition of affairs, which is so prejudicial to the industry.

MESSRS. PANHARD AND LEVASSOR, of Paris, are reported to have a new type of petroleum-spirit motor on the stocks.

To the last number of the *Journal* of the Camera Club Mr. J. H. Knight, of Farnham, contributes an article on "A Three Days Run on a Motor-Car."

At the Otley Police-court last week, Mr. Graham White, of Bradford, was fined 2s. 6d. and costs for driving a motor-car without lights at Baildon, on December 13th.

THE Automobile Club de Nice have sent us a copy of the programme and regulations of the "Nice week," which will extend from the 24th to the 29th March. The programme is quite a bulky book, extending as it does to over eighty pages.

THE Walters Motor Syndicate, Limited, is the name of a concern which has been registered with a capital of £5,000, to manufacture, let on hire, and deal in motors, cycles, carriages, and launches, and to carry on the business of mechanical engineers. In a recent issue we made a brief reference to the Walters motor, and illustrated a launch to which it has been fitted.

PASSING along Long Acre the other day we called at 48 and 49, where the Automobile Manufacturing Company, Ltd., is making a good display of motor-vehicles. The premises seem admirably adapted for the purposes of the business, and in addition to a splendid basement and a lofty ground floor comprise two upper stories—all well lighted for show-room purposes. The premises have a good depth, giving accommodation for about thirty cars on each floor. In addition to the large assortment of motor-vehicles—Darracq and Savoy voitures, Cleveland cars, Delahaye and Richard cars with various bodies, etc.—the company have a complete collection of accessories. We understand a new steam car is almost ready, and that business has been exceedingly active.

AN IMPROVED PANHARD VARIABLE SPEED-GEAR.

USERS of Daimlers and other cars fitted with Panhard type of gearing will be interested to know that the third speed can now be renewed on the sleeve, and that the sleeve need not be thrown on the scrap heap when the first and second speed are in good condition, as hitherto. The accompanying illustration shows a method of renewing this speed which has been devised by Mr. C. H. Gilbert, of Messrs. Gilbert and Son, Limited, of Lindum Works, Lincoln, and which this firm has adopted for the past twelvemonths with great success. It will be seen from the illustration that when once the sleeve has been altered the third-speed ring can be replaced as easily as its fellow on the top shaft. The system is well worth the attention of managers of public service companies and all large users of cars, as a great saving in cost of running is claimed to be

effected. We understand that some sleeves which have been treated in this way have been in use twelve months on hire and public-service vehicles, and have given entire satisfaction. The new wheel is made from a mild steel forging and is case-hardened.

THE Automobile Patents Exploitation Company has acquired the American rights, under the "Lifu" steam vehicle patents, of Mr. Henry A. House, of Bridgeport, Conn.

WE learn that the United Motor Industries, Limited, 40, Holborn Viaduct, E.C., have opened a free registry of motor drivers. Any drivers seeking engagement can send their names and qualifications, with rate of wages required, to the company, and they will keep a record of these particulars free of charge. This register is placed at the service of any automobilist on the look out for a driver, and whether he secures a driver or not there is no fee of any description to be paid.

READERS are reminded that the English Motor Club's run to Brighton starts to-day (Saturday) at 1.30 p.m. from the Westminster Bridge end of the Embankment, and that the route is via Mitcham Common, Wallington, Coulsdon, Crawley and Hickstead. All automobilists are cordially invited to join in the run. The headquarters at Brighton will be the Star and Garter, where dinner will be served at 8 p.m. The return is on Sunday, but there is no fixed programme as to the time of starting.

MOTOR-TRICYCLES.—SOME DEFECTS AND REMEDIES.

By A. E. S. CRAIG.

(Concluded from page 693.)

THE radiating ribs in air-cooled motors—which are well worth discussing, at all events, for tricycles and voiturettes—if not looked after soon become very rusty and choked with mud and grease in places. This is very detrimental to the cooling, and consequently the efficiency of the motor, and should be guarded against by well brushing the interstices with a stiff brush until clean, and then if blacklead is applied it will not only improve the appearance of the motor, but will considerably assist radiation. The coating of blacklead should not be polished; merely worked on with a painter's "sash tool" or similar brush, after being made into a thin paste.

The interruption of current through breaking of wires carrying it, or terminals shaking loose, is often more frequent than pleasant, especially in tricycles that have been run some time, and in which the vibration has rendered the wires brittle at sharp turns and near terminals. The best remedy is a new set of wires, but a method I have adopted for connecting them up has, I think, one or two advantages. To the ends of the wires I solder split pins, through the eyes of which the ends of the wires pass, and are turned back and twisted before soldering. The split pins are then sprung open a little and are electro-coppered. The terminals I drill with holes, which the split pins can be forced tightly through. I find joints made in this way never shake out, are quickly fastened and undone, prevent wires breaking near terminals, and do away with all clamping screws which might shake loose or break in tightening. Accumulators should have their terminals greased; this will not interfere with contact, but will prevent corrosion. Small accumulators are easily spoiled by having too large a current put through them in charging. The correct rate should be ascertained from the makers, and a label stating it attached to the cells when sent to be re-charged at a new place.

The excessive vibration and jolting of motor tricycles over rough roads militates against their adoption by people who desire a certain amount of comfort on their travels. To reduce this by means of enormous pneumatic tires would give a tricycle an undesirable appearance, and unless, even then, they are only partially inflated the result would not be attained, and in no case are worth the weight and cost. The only remedy that will have the desired effect is the insulation of the frame from the rear axle by means of springs. This, of course, involves a certain amount of initial expense, and, it may also be objected, complication. These would, however, in time be repaid by the longer life of the tricycle and the reduction of the repair accounts.

The saddles at present fitted are too much like those used for cycling. What is required is a light, springy seat, with little or no peak, and a back-rest at least 15in. high, so that one can lean against it when required. This combination need not be by any means heavy if properly designed. In conjunction with this I advocate the abolition of the ordinary bicycle handle-bars and the substitution of tiller steering brought conveniently near the rider, and on which all the necessary control levers can be mounted. Some

people may say, "Why not have a voiturette instead of making a tricycle more comfortable?" My reason is that a tricycle is the motor-vehicle reduced to its simplest practical form, the most convenient as regards size and weight, and capable of being produced at a little over half the cost of a four-wheeled voiturette. For although undoubtedly prices of these latter will eventually be considerably reduced, the same remark applies to the tricycle in proportion.

To prevent the constant shedding of bolts and nuts through vibration, sometimes with serious results, all screws should be provided with either a lock nut, split pin, or other efficient preventive, according to the position and nature of the joint; this is done on first class motor-cars where the vibration is comparatively slight; why not on tricycles? Sometimes a lot of noise is occasioned by the aluminium box covering the gear wheels, but it is a great mistake to remove this and run the pinions exposed to mud and grit. The casing is of necessity made a close fit to the wheels sideways, and therefore the slightest warp in the casting or side motion of the large pinion causes considerable noise. The only remedy is to take the case off, find out exactly where the point of contact is, and ease the case at that point. I think it would be an advantage in at least two respects if the sides of this casing were made of celluloid. Another cause of noise is the fitting of a fresh small pinion; this is

often very "talkative," and can only be cured by careful adjustment of the mesh, usually by lessening the depth of contact.

Holding open the exhaust valve going down hills is better in theory than in practice. The object sought is, of course, to relieve the compression, and at the same time cool the motor. The compression is effectually relieved, but the air drawn into and expelled from the cylinder alternates between it and the heated exhaust box, often charged with a certain amount of dust and loose char. Of course a certain portion of fresh air is drawn in, but the cooling effect is retarded, and is nothing

like so rapid as it would be if the motor were made to draw in cold air direct, filtered through fine gauze.

Free motors for tricycles are undoubtedly a step in the right direction, and will, I think, dispose ladies and others who cannot stand the strain of starting the fixed motors to try to manipulate them. When, nearly two years ago, I suggested the desirability of free motors for tricycles, I was told that they were an "unnecessary complication." The band is playing a different tune now.

THE Locomobile Company of Great Britain, Limited, has been registered with a capital of £100 to manufacture and deal in vehicles (whether worked by animal traction or by steam, oil, electricity, or other mechanical power), motors, motor-cars, cycles, etc. Registered without articles of association.

For young engineers and amateur mechanics Mr. Percival Marshall has prepared, and Messrs. Dawbarn and Ward, Limited, have published, a useful little work entitled "Practical Lessons in Metal Turning." Some idea of its scope may be gleaned from the headings of the various chapters which deal with tools and tool-holders, measuring appliances, chucks and mandrels, how to centre work for the lathe, driving work between lathe centres, turning work between centres, chuck and face plate work, drilling and boring in the lathe, and screw-cutting.

FIG. 1.—GENERAL VIEW OF THE SIMPLEX VOITURETTE. (See opposite page.)

THE SIMPLEX VOITURETTE.

HEREWITH we publish an illustration of the Simplex voiturette, which, after many experiments, has lately been put on the market by Messrs. Ernest Hutton and Co., Limited, of Ohm Works, Northallerton. The frame of the car, which is built up of steel tubing, carries the whole of the motor and transmission gear; the body, being thus entirely independent, can take any desired form, the makers offering a choice between two, three, or four seated designs, while it can also be fitted with a parcels-van body for light delivery purposes.

The motive power is supplied by an M.M.C. De Dion 5 h.p. engine; this is, of course, of the water-cooled type, the circulation being maintained by a pump. A large radiating coil is fitted below the motor in the fore part of the frame. The engine parts are of ready access, the bonnet being so arranged that it can be quickly detached when necessary. A De Dion float-feed carburettor is employed, while the handle controlling the electrical ignition is conveniently located on the steering column. Another usual feature is the provision of an arrangement whereby the engine may be started from the driver's seat; this consists of a handle attached to the side of the dashboard and connected by a free-wheel clutch and chain gearing to the engine.

FIG. 2.—PLAN OF REAR PORTION OF FRAME OF SIMPLEX VOITURETTE.

As regards the transmission, two speeds are, it may be mentioned, provided. The engine shaft carries at one side a wide belt pulley, which is connected by a single belt to a small countershaft at the rear (Fig. 2). This shaft carries three equal-sized light wood pulleys, the two outer ones being fast and the central one loose. The inside fast pulley is not mounted direct on the countershaft, but on a hollow shaft surrounding the same. On the inner end of this hollow shaft is fixed a small pinion. The outer fast pulley is keyed on the countershaft proper, at the inner end of which is fixed another small pinion. The pinion on the countershaft is of a different size to that on the hollow shaft; they are located, however, side by side, and each meshes with a corresponding spur wheel fixed around the differential gear on the rear live axle. Thus, by shifting the belt on one or other of the two outer pulleys the high or low speed can be readily obtained, while, when the belt is placed on the central loose pulley, the engine is cut out from the driving gear. The pinions and spur wheels on the countershaft rear axle are enclosed in an aluminium grease-containing case, while provision is made for taking up any slack of the belt from the driver's seat.

Inclined hand-wheel steering is provided, while a small press-the-button switch is fitted on the same, by means of which the electrical circuit can be instantly broken when riding through traffic, etc. The road wheels are of the cycle type, and these are fitted with Dunlop pneumatic tires, while two foot brakes acting on the back axle are provided. The car complete weighs between five and six cwt. Although it has only been on the market a few weeks it has attracted considerable attention, probably by reason of its excellent performance in the Hindhead Climb in the recent run to Southsea, when, with two persons up, an average speed of 15.2 miles per hour was attained. Among those who have already ordered Simplex cars are Mr. J. Hargreaves, of Norwich, a gentleman well known in automobile circles, and Major Bower, Chief Constable of the North Riding. We trust that the example thus set by the latter gentleman in becoming a *chauffeur* will be followed at no distant date by many of his *compères* in other parts of the country.

FURIOUS DRIVING CASES.

AT Wilmslow Police Court, last week, Mr. Percy Prestwich, of Pendleton, was charged with driving a motor-car at a furious rate at Wilmslow on the 18th December. He pleaded not guilty. Inspector Robinson deposed that shortly before four he was in the Wilmslow Police Station, when he saw the defendant on a motor-car. He was coming down Grove-street at a great speed, and when opposite the Police Station there was a smash. He was going at the rate of 16 or 17 miles an hour. Witness was looking through the window, and before he had time to get out the car ran against the kerbstone, and the two wheels on the footpath side, after grinding against the kerb for about ten yards, collapsed and became quite a wreck. If defendant had gone a few yards further he would have run over a child in a bassinette. Witness spoke to the defendant, and he replied that the machine had skidded. Witness, however, pointed out that there was no sign of skidding on the road. Clerk: You have no doubt as to the speed?—I never saw any machine go so fast before. Mr. Levi Brown, builder, Wilmslow, said he was in Swan-street when the car came round from the direction of Grove-street. He never saw any conveyance go so fast except that it was a runaway. Clerk: Can you judge as to the speed?—No. But you say it was going faster than any carriage?—Yes. Defendant denied that he was travelling at the speed mentioned. He sounded the horn, and he was not going more than 8 or 10 miles. The chairman (Mr. E. H. Greg) said the point where the accident happened was a dangerous one, and drivers should have the good sense not to travel at a high rate of speed there. The Bench looked upon the case as a bad one, and defendant would be fined 40s. and costs.

AT the Lambeth Police Court, on January 1st, William James Twigg, of Denmark Hill, answered to a summons for furiously driving a motor-car in Norwood Road. Police-constable Grayling, 301 P, said the defendant shot past him "like a flash of lightning," and when near Thurlow Park Road, applied his brake so suddenly that the motor-car swerved round and very nearly knocked down a lady who was alighting from a tramcar. He estimated the defendant's speed at fifteen miles an hour. The defendant said the statement was ridiculous, his pace was not more than six miles an hour. Mr. Hopkins: Which is probably slower than the tramcar. The defendant: The tramcar runs at five miles an hour. Mr. Hopkins: But a man can walk at that pace. There is a good deal of reckless driving of motor-cars, but I should be sorry to convict the defendant merely because one is prejudiced through this. The summons was dismissed.

LONDON ELECTRIC OMNIBUS COMPANY.

THE report for the period of November 30th states that the efforts of the present board have been entirely devoted to the object of placing the company in such a position so that a definite and feasible working scheme could be submitted to the shareholders. The future existence of the company now depends upon the response received to the circular dated December 18th. This circular states that in the opinion of the directors electricity as applied to street traction (except as regards tramways) has not been developed sufficiently to warrant their advising the shareholders to experiment further with it, but they consider that a system of street cars capable of carrying fourteen passengers could be made a success. If a sufficient number of shareholders agree it is proposed to reconstruct the company, the shareholders receiving one £1 share in the new company for every share held in the old company, the new shares having a liability of 5s. per share.

The fourth ordinary general meeting was held on Tuesday. Lieut.-Colonel Thomas Turnbull, managing director, presided, and, in the absence of a quorum of shareholders, moved the adjournment of the meeting till that day week, at the same place, at 2 p.m. Colonel Lewis seconded the motion, which was carried. The chairman subsequently referred to the circular which the board had issued suggesting a scheme of reconstruction. He said that although electricity, as applied to heavy

omnibuses, had not yet been sufficiently developed to warrant the company undertaking further experiments, the board believed that a type of street car to carry fourteen passengers, suitable for London streets, could be procured for about £450 each. The directors had devoted a great deal of attention to the matter and felt sure that such cars could be run on a commercial basis. He reminded the meeting that the company's financial resources were practically exhausted before he joined the board, and said that, if the proposals with regard to reconstruction were supported by a sufficient number of shareholders, he and his colleagues would take the necessary steps to carry them into effect.

EDINBURGH AUTOCAR COMPANY.

A MEETING of the directors and shareholders of the Edinburgh Autocar Company, Limited, was held on Friday, the 28th ult., in Dowell's Hall, Edinburgh. There was a large attendance. Mr. John Macdonald presided, and read the first annual report, which stated that the profit and loss account showed a debit balance of £2,542 9s. 8d. Some discussion took place over the auditor's report, which referred to some clerical errors. The chairman admitted that it was very bad book-keeping, and further pointed out that they were a pioneer company, and had to pay for their experience. He also referred to the training of men and said that till lately they had always been training men. They had never been able to have the twenty cars they aimed at running at the same time; in fact, the average number was never more than eleven or twelve. It was not a very satisfactory account. As to the future, the directors had been considering the matter, and had been able to give a better service and to gradually reduce the working expenses. The report was seconded by Mr. Edwin Adam, advocate, who said as a retiring director he had no wish to return to the Board, as it seemed to be a very thankless job. They had tried to reduce the expenditure, and had only a clerk and an office boy. A shareholder asked what was the salary of the manager, and the chairman replied that, to tell the truth, the manager had drawn no salary for the past nine months.

A shareholder said that there was a general feeling of dissatisfaction with the management of the company, and he thought that, as the directors had proposed, there should be a committee of investigation appointed. If they accepted this report they could not go back on it again, so he thought that the investigation committee should be appointed. A great amount of discussion took place over the alleged neglect of the car drivers to supply tickets, some alleging that the conductors only supplied a ticket when they were asked for it. Others, however, said they had travelled every morning and had always received tickets. The Chairman replied to the several questions, and said that they would have had boy conductors, but the magistrates would licence no one under eighteen years of age. They had tried to overcome the difficulty by altering the shape of the car, and having the passenger entrance by the drivers' seats. The manager explained his absence from the office, stating that he had been out acting as inspector. The chairman said the public were too ready to act in collusion with the driver in the matter of not getting a ticket for the fare. It was moved and seconded that a committee of investigation, consisting of six, be appointed. The mover of the resolution said they did not wish to cast a slur on the directors; all they wanted was an explanation. On being put to a vote, it was agreed to appoint a committee of six. Only three were nominated, however, and Messrs. Hay, Milne, and White were appointed. After some discussion the report was adopted, and it was agreed to hold a meeting after March and hear the report of the directors and the committee of investigation for the six months beginning October 1st and ending March 30th. Mr. Edwin Adam was re-elected a director, and the auditors were also re-elected.

REFUSING TO STOP.

AT the Samford Petty Sessions, held at Ipswich, on Tuesday, Harry Bennett, Ipswich, was charged with being the driver of a light locomotive and refusing to stop when requested by the driver of a restive horse, at Chelmondiston, on December 8th. Mr. E. P. Ridley defended. Frederick Patridge, coachman to Rev. Fredk. R. Wood, Erwarton Rectory, said he was driving Mrs. Wood in a carriage on the Ipswich Road, Chelmondiston. They met a motor car driven by defendant. The horse witness was driving was a light cob, and became restive on seeing the motor-car, so he held his hand up for defendant to stop. The latter slackened his speed and then cried out, "Come on." Witness replied that he dare not unless the car was altogether stopped. Defendant continued to approach, and the horse began to rise on its hind legs. Defendant was again asked to stop the car, but he said that he had no time to stop about the roads all day. When the car was quite close, the cob made a plunge, and attempted to turn round and bolt. The car was obliged to stop then, the road being blocked. The horse eventually became quiet, and the car proceeded on its way. Defendant, on oath, said he saw the coachman hold up his hand at a distance of about ten yards. He stopped as soon as he could put the levers on. The coachman got down to the horse's head. Witness called to him to come past, but he said he could not, having to stop. Witness thereupon replied that he had important business to do, and must go on. This he did. Ernest Dallaston, Luther Road, Ipswich, corroborated. The Bench inflicted a fine of 10s. and 19s. 2d. costs.

A WARNING TO DRUNKEN WAGGONERS.

AT Brentford Police Court, last week, Robert Woolridge, thirty-four, of Twickenham, a carman, was charged with being found drunk whilst in charge of two horses and a waggon at London Road, Twickenham. P.C. Sangster said that in consequence of a complaint made to him he went towards Isleworth, where he met the prisoner driving a pair of horses attached to a wagon. He seemed to be dazed, and witness found him to be drunk. Mr. Montgomery Napier, of Whitton, said that on Saturday he was driving a motor-car through Whitton, when he saw two vans coming towards him at a place where half the road was up. As they were on the same side as himself, he pulled up to allow them to pass. The first van passed all right, but the second one, which the prisoner was driving, came straight on, and, despite witness' cries, the prisoner did not pull off to the right as he ought to have done. The result was that the van came full into the motor-car, completely smashing it, and throwing witness and a lady he had with him out into the road. The motor, which he valued at £175, was completely ruined. P.S. Gordon said he took the charge against the prisoner. There was no doubt that he was drunk. The prisoner denied the offence, and said that the driver of the motor did not pull up as he said he did, but came on full tilt. The Bench sent the accused to prison for fourteen days' hard labour without the option of a fine.

THE Chief Constable of Derbyshire is an automobilist.

ONE of the new knights—Sir Hiram S. Maxim—is a member of the Committee of the Automobile Club.

MORE than four thousand county councillors have received the Automobile Club's recent letter.

A HUNGARIAN automobile club has been organised in Budapest. The members of the club had a meeting the other day and elected Count Paul Szapary as president.

A PROPOSAL is being discussed that the English Automobile Club should present to the A.C.F. an International Cup for a race of commercial carriages over a portion of the Gordon-Bennett course.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editor's hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

Vol. II.]

LONDON, SATURDAY, JANUARY 12, 1901.

[No. 97.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

PEDESTRIAN CYCLIST—1818

AN automobile club for the Midlands is in contemplation at Birmingham, and such an institution for Wolverhampton and district was inaugurated on Friday last week at a meeting over which Mr. S. R. Rhodes presided. There are about thirty owners of motor-cars in the town and suburbs, and about half of them have promised to join the club, the annual subscription to which will be one guinea. Alderman Marston is to be asked to become president, with Alderman L. Johnson as vice-president, Mr. S. R. Rhodes as hon. secretary, and Mr. A. E. Jenks as hon. treasurer. The rules are largely based on those of the Nottingham club. Mr. Rhodes is to be congratulated on the result of his efforts to form the club, which should be a useful association, as well as a centre of friendship among automobilists.

Lincolnshire Automobile Club.

LINCOLNSHIRE also has its automobile club, a very successful meeting having been held on Friday last week at the Saracen's Head Hotel, Lincoln. The Mayor of Lincoln, Mr. Councillor C. W. Pennell, an ardent motorist, was in the chair, and there was a very representative attendance. Mr. G. J. Wilkinson, who convened the meeting, explained the scope of a county club and what it could do, and urged the desirability of affiliating with the A.C.G.B.I. He suggested that the club should carry out the following objects:—To popularise, assist, and encourage the use of motors throughout the county; to provide a centre of information and advice; to support or oppose alterations in the law affecting automobilism, and to take such steps as may be necessary; to defend, or take proceedings on behalf of members; to organise lectures, with discussions and demonstrations, on matters of interest to the members; to arrange meets and tours and inter-club meets and generally to further the movement. Mr. C. Johnson, secretary of the A.C.G.B.I., also spoke, going over the formation of the Automobile Club and its growth, and the opposition that had to be fought, especially that of the County Councils, just now. He congratulated Lincolnshire that one of its county councils—Kesteven—had refused to assist in the agitation. He would like to see the county the pioneer of a movement which should be exactly opposite in its effect to the present agitation. He thought that these local centres of the big club—for he hoped they would become centres—could very effectively carry out the local work, and in larger matters stand shoulder to shoulder with the other automobilists in the land, and under one banner present a solid front to prejudice and opposition. Mr. Johnson suggested that before long agriculturists would throw away their prejudice, and be engaged in producing alcohol for the purpose of running motors. On being put to the meeting the decision to form the club was unanimous, and by the close of the meeting over thirty members had given in their names, so that the club starts well. A committee with a

small sub-committee was formed to draw up rules and objects and to do other work, and Mr. G. J. Wilkinson, of 18, York Avenue, Lincoln, was elected as hon. sec. *pro tem*.

The Gordon-Bennett Cup.

THE Automobile Club of France has selected the first week in May as the date, and the Paris-Bordeaux route as the course of the 1901 race for the Gordon-Bennett Cup. Nothing definite is known as to who will comprise the French team to defend the cup, but the *Auto-Vélo* gives publicity to a rumour that Charron and Levegh will form two of the three starters. Our contemporary adds that the German Daimler car entered for the race will probably be driven by M. Lemaitre. As regards Belgium, it is said that M. Jenatzy has a "dark horse," in the shape of a combination electrical and petrol car, of which great things in the way of speed are expected.

Motor-Vans for Municipalities.

WHY will the borough surveyors persist in asking for electric motors for cartage purposes? The City authorities some time ago invited tenders for the supply of electric motor dust vans, and the borough surveyor of Fulham has been similarly courting refusal. He reports that the price quoted for an electric motor capable of moving one ton at the rate of eight miles an hour is £750, and he therefore opposes the purchase of electric motor-carts for borough purposes. It is believed that the borough council will decide to continue the use of horses, although in Chelsea and other places steam motor-carts are proving more expeditious and economical. Perhaps the Automobile Club could render useful service in calling the attention of the borough councils of London to the fact that steam motor-waggons are being profitably employed in many districts, and asking the surveyors, when inviting tenders, to be less insistent upon the electric motor.

The Carriage Tax.

WE advise automobilists to pay the tax on their motor-cars without delay—even if they do not pay it with a good grace. For should they get into the hands of the police—and no motorist can be assured that such an eventuality will not arise—it may go hard with them when the discovery is made that no tax has been paid. We know the law, and in the present state of public opinion the smallest breakage of the same should be avoided.

The Durability and Wearing Power of Cars.

AUTOMOBILISM is so recent an innovation that little data is yet to hand with regard to the life of cars. Hence the value of such particulars as those given by "Teuf-Teuf" in the *Daily Express* of Tuesday. It appears that the Hon. C. S. Rolls has travelled about 4,000 miles on his 12 h.p. Panhard, and has never been stopped for anything more serious

than choked burners or a nut slipping. The Hon. J. Scott Montagu's 12 h.p. Daimler has done well over 16,000 miles, the chief item of trouble being the blowing out of the lamps on windy days—a fault that appears to be remedying itself. During the time that Mr. J. A. Holder owned a 12 h.p. Daimler his total mileage run was 4,000, and a defective pump and a broken governor hammer constituted his only drawbacks. Supplementing this information we may mention that Mr. S. F. Edge has driven 9,000 miles on his Napier without inconvenience, and that, as mentioned last week, our own experience has been equally satisfactory, the breaking of a spring being the only mishap in connection with the machinery. We shall be pleased to receive from readers monthly returns of the miles they run so as to keep a record that will be of interest and value.

Facilitating Renewals.

So long as motor-cars are used, the working parts of the same, as in all pieces of machinery, will, in course of time, become worn and require renewal. One of the features of the present time is the attention which is being paid to the question of facilitating these renewals when they become necessary. It should be the object of motor-car designers and builders to so arrange the various parts that each and any one of them can be taken out and replaced with a minimum of interference with the other parts, thus not only saving a large amount of time, but also obviating needless expense in the unnecessary renewal of parts still in good condition. A case in point is the renewal of the gear wheels in the Panhard type of variable-speed gear, and last week we illustrated the method introduced by Messrs. Gilbert, of Lincoln, for renewing the third speed without it being necessary to have a new sleeve. Since then we learn that Mr. Crowden, of Leamington, has also devised a simple method of renewing the wheels in Panhard gearing, in which arrangement screwing is entirely obviated. Mr. Crowden tells us that he has applied the arrangement to a car of his own, on which it has proved very successful.

Horseless Carriages.

THE accompanying group of horseless carriages is from a photograph by Mr. Howard Edmunds, and represents a merry party who spent Christmas with Mr. Henry Edmunds at Antron, Upper Tulse Hill, S.W. Here we have the evolution of the motor-vehicle from the locomotive upon which the young gentleman in the foreground of the picture is

disporting himself. The perambulator supplies the next link, and then the motor-tricycle leads the way to a Marshall car. A Daimler is succeeded by another vehicle of the same type—the famous Antrona, which made such a clean journey into Southsea that it won recognition by the judges who awaited the arrival of the cars.

Motor-Cars and Health.

IF we are to accept the conclusions arrived at by Dr. Waldo, medical officer of health to the parish of St. George the Martyr, a considerable proportion of the mortality from diarrhoea, one of the most fatal of diseases among town children, is due to the pollution of milk and other articles of food with street dust, in other words with dried horse dung highly charged with deleterious micro-organisms. Filthy street dust we must always have with us, unless we have streets that we can wash. It is probably to the facility with which asphalt can be washed that we must look for the explanation of the largely diminished death-rates which have been noted in certain towns after the introduction of this material as a paving. It is claimed that in New York the death-rate has gone down from 38.37 per 1,000 in 1892, to 26 per 1,000 in 1896, when the cleaner streets due to the large extension of asphalt pavement had begun to show their influence on the health of the population; and although we can hardly doubt that the introduction of asphalt was, in this case, only one item in a general improvement in sanitary conditions, the benefits which have already resulted in London, in Paris, and in many other large towns, from the use of asphalt in courts and alleys have been such as to show how great would be the advantage of its more extended use. Not until all our streets are provided with a hard smooth surface which can be thoroughly cleansed shall we even begin to see what town life might be made. It is to the motor-car that our contemporary, the *Hospital*, looks to bring this much-needed reform within the range of practical politics.

Notes in the "Mail."

IN a very different style to that in which they commenced, the "Automobile Notes" in the *Daily Mail* have been resumed. They are not meant "for the inner circle of motor men but for the general public." Among the items of news chronicled is the fact that "the cab-owners of Naples are taking the bull by the horns," which apparently is the *Mail's* way of saying that they are starting some motor-cabs. We are also told that the ship, which did not contain the Shah's motor-cars, did not sink, and that Mr. Still can drive his electromobile through more than 2 ft. of snow. These items and a reply to the Marquis of Granby constitute a beginning which, as the writer says, "takes very little for granted."

Tricycle and Trailer.

SIX miles an hour is not a furious speed, but when this is exceeded by a "light locomotive" to which a "carriage" is attached, it is done in contravention of the regulations of the Local Government Board. Such is not the view of the Weston (Bath) Petty Sessions, where Mr. William Whiting appeared on Saturday in consequence of having driven a motor-tricycle with a trailer attached, at a speed estimated by the police at twenty miles an hour. Mr. Whiting declared he could not possibly exceed fourteen miles, that being his limit of speed. It has previously been held at Grimsby that a motor-tricycle and a trailer is one vehicle; and after hearing the evidence the Weston magistrates dismissed the case, so that we are to recognise the motor and its trailer as one vehicle, which is a wise and reasonable decision.

The Motor-Car on the Stage.

AN organisation of young American society men, known as "The Strollers," who have been presenting their new play, "The Cruise of the Summer Girl," at the Waldorf-Astoria, New York, recognised the hold which the automobile has upon society by introducing a motor-car on the stage. It is in the third act of the play, the scene representing the grounds about the Casino at Newport. One of the characters in the play, represented by Miss Elizabeth Donaldson, is a well-known society woman, who, to get ahead of her deadly rival,

comes into view on an automobile. It is a ladies' Marie XII. Victoria, provided by the New York Electric Vehicle Transportation Company, with a professional *chauffeur* in attendance. She certainly wins, for the chagrin of her rival, who has nothing but an ordinary coach and four, is unmistakable. The automobile, with Miss Donaldson in a black and white gown, comes rolling merrily on the stage, and stops in the centre long enough for Miss Donaldson to sing a song. Then it goes away, off the side entrance, and there Miss Donaldson leaves it. The scene was, according to *Automobile Topics*, an undoubted success.

Motor-Car Repairers.

ENGINEERS in country towns will do well to watch the progress of the automobile industry, and to take something more than academic interest in its development. For there is no doubt that, as motor-vehicles become the recognised means of travel in the country, there will be a large amount of overhauling and general repair work required from time to time. Already the supply of good repairing firms with the requisite knowledge of motor-cars is hardly so universal as it should be, and we hope in a year or two to be able to chronicle that every small town and large village has its motor expert capable of setting motor-cars on their way after mishap. The shoeing forge was a feature of our countryside which has suffered from the competition of towns from whence firms have endeavoured to secure trade for miles around. In its place, with extended prestige and greater possibilities, the motor-car repair shop will soon be seen up and down the land.

The Recent Trials of Electrical Vehicles.

IN the course of an article on the recent Automobile Club trials of electrical vehicles, a writer in the *Electrical Review* remarks:—The tests do not seem to have been scientific in their nature; apparently they only roughly indicate that one car as a whole is better than another, but wherein, or to what, the superiority is due cannot readily be ascertained from the results. A poor battery may serve a very finely-constructed car, and, on the other hand, a good battery may waste its energy working a badly-constructed vehicle, and even the personal factor in the shape of the driver may come in. Motors are so well made now that there is no reason why all cars cannot get them equally efficient. But the traction battery is in a transition stage from the stationary form to the traction type, and there is reason to believe that some of these later forms are much superior to others, but no information is forthcoming of a reliable nature from road tests as recently carried out. For the purposes to which electric cars are most suitable and desirable, long runs with one charge are not necessary. These light small pleasant vehicles admirably fill the want for medical and business men making daily trips not exceeding twenty miles, often less than ten. It seems, therefore, absurd to drag about a battery heavy enough to go fifty miles when one able to do twenty-five would be ample. The fifty and hundred-mile charge may have some advantages, but most people who want to do business would go on long journeys by rail. There is, however, a great field for a light car for city and town travelling with short daily trips never exceeding twenty miles per day, which, at a pinch, could do its twenty-five miles. At any rate, it is a fact that many cars making runs of fifty or more miles on one charge as a display of power, are, when taken over by a customer, in most cases condemned to carry about a battery far too heavy for their actual requirements. The lighter battery will go as fast with the same weight, but for a shorter time, and if we deduct the weight saved in the battery, it will be found that we can nearly reduce the battery by one half, by reducing the time over which the charge is to last by one half. There is room for an enterprising movement in this direction. We have had plenty of attempts on the pattern of a steam road roller; we want something on the style of a light gig smartly drawn by a pony.

Where the Motor-Car Scores.

THE foregoing remarks may be commended to the consideration of builders of electrical vehicles. In concluding his article, the writer referred to points out that it is not necessary to try automobiles as we try horses, that is, as a whole. Although the comparison is interesting it is not of much profit, for, as he aptly points out, a horse must run as a whole, and if he has good legs he may have bad lungs; we cannot replace the lungs with a better set, but in a motor-car we are able to remove a faulty organ and put in a good one. Hence the necessity on the part of automobile engineers to locate the good features and the faulty parts, and to remedy the latter.

Hidden Defects in Automobiles.

LAST week there came before the Paris courts an appeal by a M. Caplain against a judgment of the lower court, whereby the sale of an automobile made by him to a M. Bertrand-Taillet, was declared null and void upon the ground that the vehicle sold had a hidden defect, or *vice caché* as it is called in the French civil code. This car, of 6-h.p., changed hands for £760, and no trial trip having been accorded to the purchaser, he only discovered the vehicle's insufficiency of hill climbing power some time after the completion of the transaction. Claiming cancellation of the bargain, he won his case, and M. Caplain, dissatisfied with the judgment, appealed, but without the result hoped for. The court held the former finding to be perfectly just, inasmuch that the vehicle's defect was a hidden one, the expert appointed to make an examination having only ascertained the fault after a very careful inspection. It is interesting to note that the defect was localised in the carriage work, the expert holding that it was much too heavy and very badly arranged.

SIR HIRAM S. MAXIM AND HIS FLYING MACHINE.

[August, 1894.

The Automobile Club of America.

NOTWITHSTANDING extremely cold weather eight cars conveying members of the Automobile Club of America and friends participated in a run from New York to Bridgeport the other week. The trip was one of the club's regular runs, and was in acceptance of an invitation received from the newly organised Bridgeport Automobile Club. The roads were in fine condition, and the members and their guests were in the best of spirits when they arrived. Mr. Albert C. Bostwick was the first to appear in Bridgeport. With his twenty-four horsepower Panhard he had made the run in less than three hours and twenty minutes, including all stops. In the evening the Bridgeport automobilists entertained the visitors at dinner. The return journey was made the following day

over snow-covered roads, snow having fallen during the night. The club has at last taken definite quarters on the second floor of the Plaza Bank Building, Fifth Avenue and Fifty-eighth Street, New York, to which the headquarters will be removed from the Waldorf-Astoria about February 1st. The new quarters, while they will give more commodious and comfortable rooms than at present enjoyed, are in all other respects than, perhaps, location, hardly, remarks the *Motor World*, what one would expect an organisation seeking to be the premier of its class in America to occupy. In fact, for a vehicular club to choose second storey accommodations seems even worse than it would be for any other kind of a club. The rooms are now being renovated and furnished, and a housewarming will mark the formal possession by the club early in February.

Accidents in France.

DURING the month of November last there were only ten automobile accidents throughout the length and breadth of sunny France, but, strangely enough, the percentage of fatalities was higher than usual. Upon consulting the *Velo's* return for the month we find that these ten accidents gave rise to three deaths, two occurring at Paris and one at Saint-Germain-en-Laye, but in no instance would it appear that the driver of the self-propelled vehicle was to blame. The number of motor-men prone to indulge in reckless driving has been wonderfully diminished, and last summer's war against *chauffeurs* has undoubtedly had a salutary effect. Compare this record with those of the other means of locomotion, and one can the more readily appreciate the safety of the automobile. The train gave rise to 117 mishaps, in which forty persons lost their lives, and 151 suffered more or less serious injuries. The bicycle's record stands at thirty-two accidents, bringing in their train a couple of deaths. As for the horse, he can show for his month's work no fewer than 274 mishaps, and sixty-three deaths must be laid to his charge.

The Snap of Cold Weather.

THE snap of cold weather experienced during the past week has forcibly impressed itself on the minds of numerous motorists who have been suffering from frozen carburettors and other troubles. On the occasion of the English Motor Club's run to Brighton on Saturday last, we noticed that one motor-cyclist had swathed his float-feed carburettor in flannel with the view of preventing it from freezing, a precaution which other motorists might follow with advantage. With the temperature at freezing point users of petrol vehicles would do well to see that all the water is emptied out of the tank cylinder, jacket, radiator, and piping when leaving the vehicle to stand for any great length of time. A failure to do this may result in such unpleasant things as a cracked cylinder, burst pipes, or damaged tanks.

Useful Discussions.

Now that so many local automobile clubs are in existence in various parts of the country we shall doubtless have many useful papers prepared for discussion, and some of the societies on this side might take a hint from the Long Island Automobile Club of Brooklyn, which has arranged a course of lectures with the following subjects:—"Automobile Propulsion by Electricity," "Experiences with Different Types of Automobiles," "Operating Automobiles," and "The Transmission of Motive Power." Practical points such as these can be usefully discussed and be made to afford very valuable information.

THE Riker Motor-Vehicle Company, Limited, has been registered with a capital of £1,000 in £1 shares, to manufacture, sell, let on hire, and deal in electric motors, cycles, launches, cycle and motor parts and accessories, etc. The registered office is at 31, Walbrook, E.C.

A GLANCE BACKWARD.

THE past year was one of steady advance for automobilism, and the last days of the century found the public less prejudiced and the industry more flourishing than at any time since the memorable year 1896. Elsewhere we commence a brief summary of the leading events and incidents in connection with the motor-car world during the twelvemonth, and a glance thereat will reveal considerable activity, as well as several events of passing interest. Our summary does not profess to be complete; but as a synopsis of what has been done will be useful for future reference.

Standing out prominently in the history of the period is the great 1,000-Mile Trial—an event which testified to the fact that the motor-car was a practical and reliable vehicle. Sixty thousand miles were travelled by the various cars taking part in the tour and no accidents occurred. So successful as a means of public education was the Trial that its repetition on a large scale this year is being eagerly anticipated by motorists. During the latter part of the year the interest of county councils in the automobile movement was shown in many ways, notably by the threatened restriction of the speed limit to ten miles an hour, and also in the compulsory numbering of cars. These attacks roused the Automobile Club to action, with the result that a vigorous propaganda was commenced with a view to reassure councillors and educate the public. Already the fruits of that work have been seen in the chastened attitude of several important councils and the general acceptance of the invitation to attend the forthcoming conference and demonstration in London. In connection with this we are glad to observe the formation of local associations and clubs in various towns to further the interests of motorists.

Several new English-built vehicles have been introduced, and some have done exceptionally well. In voiturettes advance has been made and in larger vehicles, too, the formation of public services have given great encouragement. Municipalities have done something to help makers of vehicles for heavy traffic, and steam, dust, and water carts have proved that there is a future for heavy automobiles in that direction, while the adherence of the Prince of Wales to our ranks was further evidence of the popularity of the motor-car in another direction. Altogether British manufacturers have cause for satisfaction with the year that has gone, since it augurs so well for the future.

Among notable developments was the increased attention given to motor-cars by the military authorities of Europe. Early in the year the German authorities placed orders for cars with the Daimler Company of Cannstatt, and in February Major Crompton sailed for South Africa, where he was able to so demonstrate the value of traction engines that the War Office was impressed, and he is now engaged in advising the permanent department on the subject. In the spring, too, trials of motor-carriages for field guns were made by the French military authorities, and at the autumn manoeuvres automobiles were freely employed. Italy has realised the possibilities of the motor-car in warfare, and a commission of officers was appointed to inquire into the application of the automobile to modern warfare.

Space prevents anything like a complete reference to the events of the year, but sufficient has been said to indicate some of the directions in which progress has been made. Everything points to an early development in many ways, and the forthcoming exhibition at the Agricultural Hall will give evidence of the enterprise and intelligence which are being employed on modern motor-cars. In extending the popularity and influence of automobilism the *Motor-Car Journal* may claim to play its part, as a glance at its subscribers' book reveals. Hardly a post fails to bring inquiries from every part of the world, and one of the most pleasing features is the frequent budget from Australia and from other colonies. In the distant parts of the Empire our manufacturers will have a faithful market ere long, and the long list of subscribers we have already obtained in Canada, Australia, and the great Dependency of India demonstrates how usefully this *Journal* can serve the trade—both home and Imperial.

BY MOTOR EXPRESS TO BRIGHTON.

BY PHANOMEN.

LIKE many more motorists I have often longed for a run on the much-talked-of 16 h.p. Napier car, and at last my longing has been satisfied, for on Saturday I received a telegram to the effect that a seat on Mr. S. F. Edge's vehicle was at my disposal in connection with the English Motor Club's new century run to Brighton. It was a case of touch and go, however, for the telegram did not reach my domicile in the suburbs until just about the hour fixed for the start on the Embankment. For a few minutes it seemed as if I was not, after all, to enjoy the experience of a run on a fast car, but soon a brilliant idea struck me. I remembered that the route decided upon lay over Mitcham Common—this being doubtless chosen in order to miss the stiff climb up Brixton Hill and the crowded Croydon High Street. Cogitating with myself, as it were, I argued that the direct way to Mitcham Common was *via* Clapham and Tooting, and the latter being my nearest point, I quickly hied myself thither behind a hay motor. A wait of a quarter of an hour at Tooting corner, with no sound or sign of a motor-car, ensued. Cold and disappointed, I was just making up my mind to return home when, lo, in the distance, a motor-car hove in sight, and as it quickly approached I saw it was the very one I was looking for. Not only so, but there was my seat still vacant. Putting up my hands, as a policeman did later, but with more success than the man in blue, I was soon comfortably ensconced in one of the rear seats of the *tonneau* body, with which Mr. Edge's car is now fitted.

And now what shall I say of our trip to Brighton? Really there is very little to write about. When I got accustomed to my new surroundings I noticed that the houses and fields were flying past us at an unusually quick rate, and yet we did not appear to be travelling at an excessive pace, so smoothly and free from vibration did the car run. Across Mitcham Common we went, overtaking Mr. Schlentheim on a 6 h.p. M.M.C. phaeton, and soon afterwards had to pull up to allow a mounted policeman, whose horse was inclined to be stupid, to go by. Troublesome horses were one of the features of last Saturday's run; they were dancing and prancing all over the place, a noticeable feature being that it was not those between shafts that gave the trouble, but the high-spirited animals ridden by ladies and gentlemen. The mounted policeman safely by, on we went again, quickly reaching Wallington, where I had a demonstration of the capacity of a high-powered car as regards hill-climbing, the long hill at this point being taken with no apparent diminution in speed. At the top of the gradient Mr. Edge stopped a couple of minutes to examine the clutch, a country waggoner the while likening the low row of lubricators in the front of the dashboard to a refreshment bar! Soon we were on the Downs and on a long drop, with the clutch out, into Stoa's Nest, the vehicle making its way so quietly down the hill that we came as a surprise on a party of female lunatics who were being taken out for a constitutional in the keen frosty air. And it was keen too, on Saturday, especially when travelling at the speed the Napier car is capable of. So well were we all wrapped up that there was only a small portion of our faces visible, this, however, not being of its usual colour! At Coulsdon, a foolish guinea fowl, which probably thought itself capable of blocking our path, came very near to losing its life, but at the last moment, and just in the nick of time, decided to discontinue its attack. Through Merstham we went, but ere Redhill was reached another stop on account of troublesome horses was necessitated. A lady and gentleman were both riding towards us; the former signalled to us to stop, which Mr. Edge did immediately. The animals had a strong objection to passing our car, but the lady, who was an accomplished rider, did not mean to be beaten, and turning the horse back for twenty yards, brought it quickly round again, and with a little coaxing, yet with a firm hand, got it safely past, thanking us as she went by. The gentleman rider was, however, not so successful in his efforts, or rather not so happy in his methods, for, despite continuous kicking of his heels into the horse's sides, the animal was not to be thus got by, and

it was only by a little coaxing from our party that it eventually galloped past.

The town hall clock at Redhill was striking three as we went through that town, and once on Earlswood Common we again began to travel at an exhilarating rate. Only for a few minutes, however, for in the distance we saw a party of horsemen returning from the hunt, a red-coated gentleman having his hand up. If I remember rightly it was the Marquis of Granby, who wrote the other week to the *Field* saying that no motorist ever pulled up because of a nervous, frightened horse. That such a statement is untrue on the face of it need hardly be remarked; but if his lordship had been with us on Saturday he would have seen sufficient to cause him for ever to hold his peace on this score. For no sooner did Mr. Edge see the uplifted hand than he pulled to the roadside and came to a standstill. And once again were we regaled with an exhibition of expert (?) horsemanship. These troubles over, no further incident barred our way, and soon we ran into Crawley, where tea and a large fire allured us to desert the car for close upon two hours.

Not having been able to get to the Embankment, I cannot give a list of those hardy motorists who put in an appearance at the starting point of the run of the English Motor Club, but our car being the first to arrive at Crawley, I was able to note the names of those who turned up at the latter place. Half an hour after us came Mr. Schlentheim and friends on the 6-h.p.

MR. EDGE ON THE 16 H.P. NAPIER CAR.

M.M.C. car, followed by Mr. G. D. Barnes on a Renault voiturette, with Mrs. Cheel as passenger. Seven minutes later Mr. C. Jarrott (who in his Arctic costume was taken for a lady!) put in an appearance on the De Dion skeleton racing machine which attracted so much attention on the run to Southsea in November last. Subsequent arrivals, in the order given below, included a Locomobile driven by Mr. Ginder, of the Locomobile Company, Messrs. Cecil Edge, Maltby, Moyle and Parton on motor-tricycles, and Mr. Cheel and another gentleman on a New Orleans voiturette. All beat a hasty retreat to the tea room, and as the big fire once more brought life into the voyagers, the incidents of the journey began to be recounted. Mr. Cecil Edge, who was riding a 5 h.p. trike, had been delayed by reason of trouble with his carburettor, the exterior of which, at the time I examined it, was thickly coated with snow. News was also brought that Mr. G. H. Smith, on a Gladiator car, was *en panne* at Redhill, his troubles being connected with the tires.

It was not till close on five o'clock that a move was made from Crawley, and when the roll was called it was found that only Mr. Edge's party, which, by the way, consisted of Mr. and Mrs. Edge, Mr. A. J. Wilson and self, Messrs. Jarrott, Barnes,

Cecil Edge, Malthy, and Moyle were going on to Brighton. The lamps being lighted and all of us again aboard, the Napier car soon got into its paces once more, Jarrott, on his 10 h.p. skeleton, being on our heels. A few minutes' ride brought us to the top of the well-known Handcross Hill, down which we travelled at a speed greater than I have before experienced, but which I cannot give in figures, seeing that it was too dark to time the miles by the watch. Quick, however, as we went, I was pleased at the way Mr. Edge handled the car; never did he go past a crossing without a sound of the fog horn—I mean the hooter—and without slackening speed. At Bolney we found Jarrott, who had gone on in front of us, his little machine going strongly—stopped at the roadside. As we passed him by he informed us that it was merely his lamp that had gone out, and that he would soon be after us. It was not long ere he was, but we kept on his heels, and passing through Hickstead, Patcham, and Withdean, were quickly at Preston Park, a few minutes later seeing us pulled up at the door of the Star and Garter Hotel, where the worthy host gave us a hearty welcome. I have heard much of the Napier car, now I know what it can do. Although I hope and trust that it will not be the last, I shall long remember my first ride on a fast car in the early days of the new century.

Little remains to be said of Saturday's event. One by one the other motorists who had carried through the programme began to arrive, and shortly before eight we sat down to an informal but welcome dinner. We were only a small party of thirteen, and although this number is frequently said to be an unlucky one, it did not interfere with our pleasure. In addition to those whose names I have given as having left Crawley there were present at the dinner Mr. F. W. Baily, who said he had come down by steam-car, which steam-car, however, proved, to be a railway train, and Messrs. Bradstock, Duck, and Harris. The last train on Saturday brought me up to town, the others returning by road on Sunday, there being, however, no fixed programme.

MESSRS. R. SCAIFE and Co., engineers and motor experts, Reliance Motor Works, Armley Road, Leeds, have been appointed official repairers to the De Dion-Bouton British and Colonial Syndicate, Limited.

A MEETING of gentlemen interested in motoring is to be held at the Alexandra Hotel, Bath Street, Glasgow, on Friday next, the 18th inst., for the purpose of forming a motor club for Glasgow and the West of Scotland.

MR. WM. LEA, of the Liver Motor-Car Works, Birkenhead, has sent us a copy of his new price list. It consists of a number of leaflets clipped together, giving clear illustrations and particulars of the new English model Benz cars which Mr. Lea is turning out.

MR. F. C. BLAKE, of the Ravenscourt Works, Dalling Road, Hammersmith, W., has issued his catalogue of motor-cars, motor-cycles, and accessories. It is well arranged, and should be extremely useful to those who at any time may require motor parts. On the first page is an illustration of Mr. Blake's heavy machine shop, and among the special features is a full account of the Blake ignition coils, accumulators, etc. It contains, in addition to illustrations of a number of cars complete—including Mr. Blake's own—particulars of parts, both finished and in the rough, suitable for repairs to most of the standard cars now sold. This is particularly handy for reference.

THE fifth edition of Messrs. Brown Bros.' motor catalogue has been issued, and they will be pleased to send a copy to all inquirers writing to 24-30, Great Eastern Street, E.C. Prominence is given to the Brown-Whitney steam-car, which is said to have been greatly improved. De Dion motors and De Dion motor parts occupy several pages, and the Brown motor tricycles and quadricycles are illustrated and described, as well as some trailing cars of good design and an excellent fore carriage for a tricycle. Petrol reservoirs, lubricators, dry batteries, volt, ampère, and densimeters, chains and chain wheels, automobile bells, horns, bags, tool carriers, lamps, pumps, tires, etc., also find a place in this new catalogue.

MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

From Paris to Toulouse.

GIVEN fine weather there should be a goodly crowd at the Porte Maillot, Paris, on Monday morning next, when at eight o'clock the well-known *chauffeur* Bertin sets out upon his self-imposed task of endeavouring to beat the existing *voiturette* record between the capital and Toulouse. Mounting a light car constructed on an entirely new system, Bertin hopes to cover the distance of 831 kilometres in less than thirty-three hours, which, if accomplished, would give him the respectable average of 25 kilometres per hour. The itinerary selected is by way of Chartres, Vendôme, Tours, Châtellerault, Poitiers, Ruffec, Angoulême, Bordeaux, Marmaude, Agen, and Moissac. One would hardly select January as an ideal month for attempts on records, but doubtless the approaching automobile exhibition is the cause of Bertin's trip, for constructors are now especially eager to bring their productions before the notice of the public, and are looking round for means of advertisement. And certainly no better means exists than that of a practical demonstration.

The Police and Speed.

IN common with all automobilists I have always regarded Béconnais' record of 39½ sec. for the kilometre with flying start, which he accomplished at Nice on March 31st last, as being a truly wonderful performance, and utterly beyond the scope of the ordinary touring motor-cyclist. But, dear reader, this has been quite a mistaken idea, for upon the highest authority—that of a Parisian policeman—at least one motor-man is capable of doing much better than this. What do you think of the kilometre being made in 34 sec., or at the rate of 106 kilometres per hour? And achieved quite recently, too, in the Bois de Boulogne, the roads of which were then heavy with continuous rain. Something to be proud of, I think, and yet the performer had the bad taste—or modesty, which?—to question the agent's veracity. It is extraordinary how some men insist upon hiding their powers from the public's gaze; and Béconnais at least has cause for self-congratulation, for his position as the *roi des motor-cyclists* would assuredly be doomed were the hero of this performance in the Bois to commence to race. Considering the pace I do not think that the fine of two francs, to which the *chauffeur* was condemned, can be considered as excessive. What say you?

The Tax at Roubaix.

LAST week in these columns I referred at some length to the new tax on automobiles in Paris, and I have now to mention the name of a provincial town, which has determined to follow the example of the capital and establish a municipal tax upon the self-propelled vehicles registered within its boundaries. As in the case of Paris, the *octroi* upon certain goods has been abolished at Roubaix, and the mayor of that northern city considers it impossible to make good a portion of the deficit by better means than taxing the automobile. Now hitherto the local motorists have paid to the State twelve francs on their motor-cycles and fifty francs on their two-seated cars, but the mayor having broad, expansive views, proposes to make but a single category of these two types of automobiles and advises the municipal council to impose an annual tax of 50 fr. upon each machine. If, then, his proposition be carried out, owners of motor-cycles will be required to pay in all an annual sum of 62 fr., which really is a little too stiff. Needless to say, the local *chauffeurs* strongly resent the proposal, and the newly-formed Northern Automobile Club has already lodged a formal letter of protest with the authorities. In this it is very properly pointed out that in any case the motor-cycle cannot be regarded as a *voiture de luxe*. If any councillor desired conclusive proof of this statement just let him try a machine over a stretch of that *pavé* so frequently found in

Northern France, and I feel sure that he will be convinced. For the sake of the automobile industry at Roubaix it is to be sincerely hoped that the club's appeal will have the desired effect.

The Driving School Question.

I have from time to time in these columns insisted upon the importance of founding schools in the various countries where automobilism is at all extensively practised, for the purpose of instructing would-be drivers in the management and construction of different types of self-propelled vehicles. It has been left to Belgium to take the initial step in this direction, for a new society has just been formed at Brussels with the special object of affording both amateurs and mechanics opportunities of becoming thoroughly acquainted with different systems. Presided over by Monsieur Bertrand, the society has its headquarters in the Rue d'Arlon, and it already musters nearly forty members. If the need of such institutions is felt in Belgium, Germany, and England, one can well believe that in France the question is of vital importance. Here, in the home of automobilism, there exist numbers of industrial concerns and commercial men who would gladly make use of the motor-vehicle for business purposes, but for the difficulty, or, indeed, one may say impossibility, of obtaining competent drivers at reasonable rates. The demand is so great and the supply so small that the really qualified men are pretentious to the highest degree in their conditions, and many a private owner lives in fear and trembling of his imperious engineer. The slightest disagreement, and off goes the *chauffeur mecanicien*, confident in his ability to secure another billet in forty-eight hours. On the other hand, there exist any number of men with but the slightest knowledge of automobiles, and who hope to extend that knowledge at the expense of the unfortunate owners. If this class of man admits at all to his prospective employer that he is ignorant of the particular type of car in question, he invariably qualifies the confession with the assurance that every other existing system is well known to him, and that consequently no trouble may be apprehended. But the trouble comes all the same, and an unskilful diagnosis by the engineer (?) leads to the doctoring of one part when another is actually at fault. And so it goes on until the miserable proprietor is driven desperate, and finally gives automobilism up in disgust. With a school conducted by thoroughly capable instructors much of this would be avoided, and the institution of regular examination and the granting of certificates would enable the owner to estimate the capabilities of any applicant for the post of driver.

THE first of the 50 h.p. Napier racing cars is expected to be completed early next month.

MR. OPPERMAN'S new electric Victoria was outside the Automobile Club on Wednesday and attracted considerable attention.

THE Discount Motor-Car Company, Ltd., has been registered with a capital of £5,000, to take over the business of a motor-car, cycle, and vehicle manufacturer, repairer, and agent carried on by A. Dunhill at 51, Clock Terrace, High Road, Cricklewood, as the Discount Motor-Car Company, and the monthly publication called the *Motor Mart*.

SEVERAL weeks ago we chronicled the fact that Mr. Tousey, who will be remembered as having assisted Mr. Johnson in the organising work entailed by the 1,000-mile Trial, had been appointed secretary to the American Automobile Club. That gentleman has nominated Roper, who has been assistant-steward at the A.C.G.B. for some time past, to the position of steward to the American Club. Roper, whose quiet, gentlemanly manner has commended itself favourably to the members of the English Club, sails next Wednesday.

THE New Century Motor Syndicate, Limited, has been registered with a capital of £3,000 to adopt an agreement between Susie Adams and W. L. Adams of the first part, R. O. White of the second part, and E. M. Davey, for the company, of the other part, and to manufacture and deal in motors, vehicles, cycles, etc. The registered office is at 93-94, Chancery Lane, W.C.

THE BARDON MOTOR-CAR.

AS mentioned in our last issue we had a brief run recently on one of the cars of the Société d'Automobiles et de Traction (Système Bardon), of Puteaux, near Paris, in company with M. H. Ramoisy, the representative of the company. Through the courtesy of this gentleman we are now able to give illustrations of the vehicle, together with a brief description of its leading features.

FIG. 1.—THE BARDON 7 H.P. TONNEAU.

To deal first with the engine, this is located under a bonnet in the fore part of the frame. It is of the horizontal petroleum-spirit type, and while having only one cylinder there are two pistons, with a common explosion chamber centrally between them. Only one inlet and one exhaust valve are provided, the lift of the latter being controlled by a centrifugal governor connected with one of the fly-wheels. The engine is made in four sizes, 5 h.p., 7 h.p., 8 h.p., and 12 h.p.; the 5 h.p. engine has a cylinder 88 mm. diameter, by 100 mm. stroke, the 7 h.p. motor measuring 100 mm. by 100 mm. The normal speed is 1,000 revolutions per minute; by means of a foot-controlled "accelerator" this can be increased up to 1,200

FIG. 2.—PLAN OF BARDON CAR.

revolutions. The cylinder is cast in one piece with the water-jacket, the latter also extending round the valve chamber. Each of the piston rods is connected up to a separate crank shaft, each of which in turn carries two small fly-wheels. Electrical ignition is, of course, adopted; while the cylinder is water-jacketed. The circulation is maintained by a pump driven by frictional contact with one of the fly-wheels. A large quantity of water is carried, and this, coupled with the well-exposed radiating coil located in

front of the dash, not only keeps the engine cool, but the water never gets too hot, so that little is lost by evaporation.

Coming now to the transmission mechanism, the 5 h.p. cars are fitted with three speeds forward—the maximum being twenty miles per hour—and a reverse motion, the higher-powered cars having four speeds ranging up to twenty-six miles per hour. In all, the system of transmission, which is on novel lines, is the same. As already mentioned the engine is located transversely in the fore part of the frame. The rear end of each crankshaft terminates in a bevel wheel, meshing with corresponding bevel pinions on the ends of a cross variable-gear shaft running at the same speed as the crankshafts. Mounted loosely on the cross shaft is a sleeve which can at will be connected with or disconnected from the shaft by a special double friction clutch. On the sleeve are mounted a train of spur wheels, any one of which can be brought into engagement with corresponding pinions on the differential shaft. The reverse motion is controlled by means of a foot-pedal, the depression of which causes a small pinion to be interposed between the two gears giving the first speed. From the differential shaft the power is conveyed to the rear wheels by the usual duplicate set of chains and chain wheels.

The petrol tank, which is located behind the dash, has a capacity sufficient for a run of eighty miles; the water tank is at the rear, and holds thirty-five litres. Special attention has been devoted to the lubrication of the working parts, lubricators in the dash, in full view of the driver, conveying oil, as will be seen from the plan (Fig. 2), to the crank chambers and main bearings. Steering is controlled by an inclined hand-wheel, around which the various control levers are grouped. A foot-pedal operates a hand brake on the differential shaft, while there are band brakes, operated by a hand lever, acting on drums attached to the hubs of each of the rear road wheels. The frame of the car is built up of channel steel, and carries the whole of the motor and transmission gear. It is suspended on the axles by plate springs; artillery-type wooden wheels are fitted, and these are shod with pneumatic tires. The frame being entirely independent, any type of carriage body—spider phaeton, phaeton, *tonneau*, etc.—can be fitted, according to the desires of the customer, the Bardon Company also supplying complete frames minus body to coachbuilders and motor-car dealers. Fig. 1 shows a 7 h.p. car fitted with the popular four-seated *tonneau* body.

As mentioned last week, we had recently an opportunity of a trial run on one of the Bardon cars, and were struck with its smooth running. That the engine and the various parts are well balanced was indicated by the absence of vibration when, with the car standing still, the motor was put in operation.

THE last issue of the *Electrical Review* contains an interesting article from the pen of Mr. H. F. Joel on "Electric Automobiles—a Retrospect and Forecast."

MULLINER'S Carriage-Building and Motor Company, Ltd., has been registered with a capital of £12,000 to acquire and carry on the business of coach and carriage builders, harness makers, motor-car manufacturers, etc., carried on by A. F. Mulliner at Northampton.

ALTHOUGH the U.S. Post Office Department at Washington in its recent advertisement for proposals for carrying the mails through cities, between post offices and railway stations, incorporated a special invitation to builders of motor-vehicles to compete, not a tender for motor-cars was sent in. The *Motor World* remarks that if for no other purpose than the moral effect thereof, it does seem as though at least one manufacturer might have put in a bid for a contract of this kind.

THE Sussex Automobile Company is the style of a new concern which is being established at 163, Western Road, Brighton, by Messrs. Duck and Harris. In addition to having secured the local agency for, among others, the Ariel motorcycles, the Progress and Pieper voitures, and the Locomobile, the firm are putting down plant to undertake repairs, while a stock of petroleum spirit and motor-car accessories of all kinds will be carried. There is undoubtedly an opening in Brighton for an enterprising concern, and we wish the new firm every success.

HERE AND THERE.

ALTHOUGH the War Office does not consider the time ripe for the creation of an Automobile Volunteer Corps, it is willing to consider how to utilise the services of available cars. The secretary of the Automobile Club will be glad to hear from automobilists willing to join such a corps as to the horse-power and speed of their vehicles.

VARIOUS have been the devices suggested to the police for ascertaining the speed of motor-cars when travelling at a seemingly rapid rate. One of the easiest has just been adopted by a policeman at Widford, near Chelmsford, who noted the time a motor-car passed through, and then telephoned to Ingatestone, where the driver was stopped. The distance between the two points is four miles and three furlongs, and the journey was performed in 12½ min.—well over the legal limit. Surely the telephone is not to be added to other annoyances.

MOTORISTS have a sturdy champion in Mr. J. T. Hereford, J.P., of the Garlands, Mordiford, near Hereford, who has arranged to take a committee of his county council on his car with a view to smoothing down any delusions they may be labouring under. "Should any motorists be arrested by the police in the Hereford Petty Sessional Division I would on receipt of notice attend on the bench and do what I could to ensure justice." Will readers take a note of Mr. Hereford's address.

I HEAR that Dr. Frost, of Bournemouth, has become a motorist being the owner of a De Dion voiturette. Automobilism is becoming increasingly popular with the medical profession, and as a rule doctors are enthusiastic with regard to the subject. Besides being a medical man, Dr. Frost is a member of the Bournemouth Town Council, so that his accession to our ranks is to be welcomed on more grounds than one.

MR. F. C. GRIMSLEY, of Belgrave Road, Leicester, will be pleased to render assistance to any motorists who may need it when passing through that busy town. He has good storage room for motor-cars, as well as a good plant for repairs and an inspection pit. Mr. Grimsley is on the De Dion repair list and also among the firms stocking petroleum spirit.

THE Duke of Manchester has been refused a licence to drive a steam car in New York. It appears he has not been naturalised, and that only native engineers can obtain a certificate of competence in that very exclusive city of New York.

PROBABLY the most important event of the week has been the weather. Whether it has been enjoyed by everybody we know not; but we do know that it has enabled motorists in many places to give further evidence of the value of the motor-car. For while it has been excessively difficult for horses to plough their way through the snow and slush, motor-vehicles have been out and about in goodly numbers. The omnibus traffic at Bournemouth was partially suspended during the height of the storm, but the motor-car service was maintained fairly regularly throughout the day, although once or twice the cars were blocked by the snow, a fact which, of course, caused immense delight to the cabmen. Despite the fall of snow, the buses of the Lincoln Motor 'Bus Company were serenely pursuing the even tenour of their way. At the same time the trams were compelled to run two horses in place of one to each vehicle. The opening out of the High Street route by this company has been greatly appreciated. Such facts as these should be reassuring to those interested in the future of automobilism.

MR. E. A. ROSENHEIM, of Chelmsford, is endeavouring to get some of the leading automobilists to drive down to Chelmsford on the 13th prox., when Mr. E. Shrapnell Smith will give his illustrated lecture on motor-cars. Colonel R. E. Crompton will preside.

LOLLIUS,

CORRESPONDENCE.

THE WERNER MOTOR-BICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Mr. Teschemaker's letter of the 5th, I fail to see how he can consider my offer of a match against his tricycle as a pedalling contest. To avoid this question arising, I distinctly stated I would ride an ordinary stock motorcycle with a gear not higher than sixty-three, knowing full well when saying this, that I should be unable to follow the pedals when the machine was running at its average speed of twenty-five miles an hour. However, I shall be most happy to reduce my gear to anything Mr. Teschemaker desires, but I must certainly decline to ride without a chain for starting, or any other modification, as I wish to demonstrate the capabilities of the Werner as it is sold to the public.

Mr. Teschemaker wants to ride 20 miles only; why not London to Brighton? Is Mr. Teschemaker afraid that after 20 miles his motor would be overheated and practically out of the running? I think the Brighton road is a good test, and if Mr. Teschemaker really wants a ride, I don't see what objection he can make, as it would necessitate only four or five hours' absence from town.

If Mr. Silverthorn will send his address to me at 47, Holborn Viaduct, E.C., I shall be most happy to forward a portion of belt joined in a manner that I think will give him but a very little trouble.—Yours faithfully, JOHN J. LEONARD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent, Mr. Silverthorn, finds two difficulties in connection with his Werner which I have overcome. First, the strap. I have this long enough to turn up the two ends thus—, then through these ends I pass a bolt with a stout washer on each side. I find this stands well; to take up stretch cut one end off and make fresh hole. The washers should be rounded off so as not to cut the strap. Secondly, the silencer. Inside the present box I have fixed a brass tube, closed at the bottom, and drilled with holes on one side of rather larger area than the holes in the present box. This tube is tapped into the exhaust pipe, and hangs down inside the outer box; when fixed the holes of the inner silencer should be on the opposite side to the holes in the outer silencer. Even when working up hill only a dull thud is perceptible.—Yours truly, T. FREDK. HUNT.

MOTOR-CARS FOR MEDICAL MEN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am afraid I scarcely feel sufficiently "crushed" at Dr. Hardwicke's criticism of my remarks. Without wishing to obtrude my opinion unduly, I think I may venture to express my belief that the requirements of a commercial traveller and of a doctor, in "matters motorial," would hardly, I think, be identical. Surely the traveller would want more space for his "samples," etc., than the medical man, whose chief anxiety would be easy starting.

The presence of six inches of snow on the ground suggests the advisability of a certain amount of reserve power for those who want to use their cars in all weathers, and a momentary glimpse of Mr. Mark Mayhew speeding by, as I write, on his 16-h.p. Napier as easily, despite the raging blizzard, as a butterfly in summer, is a very fair answer to a dismal question, put by an unbelieving friend of mine this morning: "Where are the motors now?"—Yours faithfully,

CLAUDE A. P. TRUMAN,
Hon. Sec. Reading Automobile Club.

QUERIES RE BELT-DRIVEN CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—"Perplexed" should obtain a belt of best orange tan from any engineering shop. This ought to be used for top speed. It is best to put it on fairly tight over night, and pull a

block of wood, say 2in. square, between the belt and pulley. Leave it all night. Then take off, shorten, and repeat till all the stretch is taken out. Finally, the belt should be secured with Harris's belt clasps; there is nothing better or more handy for taking apart should the belt require shortening.

For the low speed, use Dicks' canvas belt, which does not stretch or slip. Avoid resin, or any sticky material. Put a little castor-oil on the *outside* of the leather belt—not on the canvas belt—to keep it soft and pliable.—Yours truly,

A. J. ALDRED.

ELECTRIC IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been waiting for some weeks to see if any of your numerous subscribers would reply to the letter of Mr. Henry Edmunds in your issue of December 15th on the above subject. As no one seems to have done so, however, I feel bound myself to write, if only to express my thanks to him, for, in my opinion, he has solved one of the greatest problems in this ignition difficulty. I bought an Ariel tricycle six months ago, and never had the slightest trouble until, one damp misty day in November, I started on a 50 miles' run. The firing was erratic when I started, but gradually became worse, and progress was only maintained by vigorous use of the pedals. Then came the stop, 5 miles from home, where I spent three mortal hours testing the machine at every point where trouble was supposed to arise, but all to no purpose. Now for the mystery (the cause of which has been explained by your correspondent). The machine would fire easily enough with the compression tap open, but cease instantly when closed. Had I seen the letter of Mr. Henry Edmunds before starting on that journey I should not have said half as many wicked things as I actually did. I may say that a later similar experience was remedied in five minutes by closing the platinum points as suggested.—Yours truly,

JOHN BREESE.

CAR CONTROLLING CAPACITY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The agitation that is being propagated by some legislative bodies for the reduction of maximum speed for motor-vehicles, and thereby restricting the latter's usefulness, is out of all keeping with the times. Experience shows that it is not so much the matter of speed wherein danger sometimes lies, but in the capability and adaptability of braking power. Those persons who are so kind as to look after the man in the street should make brake power and application their study. Incidents have occurred to the writer where, had he been driving his motor slower, serious mishaps would have arisen. The idea of limiting speed to 10 miles per hour is absurd to all automobilists, and would be laughable did it not mean a serious repulse to motor industries.—Yours truly,

F. J. HORTOP.

MOTOR-TRICYCLES AND JOLTING.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Motor-Mad," I enclose a rough sketch showing how I have overcome the jolting difficulty in my tricycle. The vibration is of three different kinds:—(1) The tremor caused by the engagement of the pinion and gear wheel; (2) The vertical jolt, where both driving wheels meet an obstacle simultaneously; (3) The lateral jolt, when one driving wheel is lifted and not the other. The pulsation of the piston at very high speeds and the jarring of the handle bar are minor matters.

After trying many saddles, including the "Multispiral" mentioned by Mr. Jarrott, I came to the conclusion that a pneumatic would absorb No. 1, but that none of them would remedy Nos. 2 and 3. I then tried various saddles of my own design, including spiral springs up to four inches diameter, but none of them answered the requirement of allowing considerable rise and fall and yet be rigid in a fore and aft direction. I then designed the following, which, after several months' trial,

appears to me to be a distinct success. It is a "Guthrie-Hall" pneumatic saddle attached by two plates and three nuts to a steel spring made of one piece of finely tempered steel 4ft. 6in. long. For a rider not exceeding 10 stones the diameter should be $\frac{3}{8}$ in., and for one over 12 stones $\frac{1}{2}$ in.

The rise and fall of this saddle is about 4 in., but it is as well to strap it down a little at first until one is accustomed to the peculiar motion; also to sit well down and bring the weight low when rounding corners; also to be considerate for one's machine on rough ground, for, as the rider feels no vibration himself on this saddle, he is apt to forget the strains his machine is undergoing.

Of course, this is only a remedy for vibration as applied to the rider, not to the machine, and I notice that "Motor-Mad"

d—d	2 in.	e—e	2½ in.	b—f	3½ in.

complains that his tricycle "rattles itself to pieces." Perhaps he would tell us what goes wrong in particular! My machine is all right after two years' hard work.—Yours truly,

W. E. TESCHEMAKER.

MOTOR-CARS ON THE HIRE SYSTEM.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With the commencement of the new century I consider that it is high time that financiers, capitalists, and manufacturers turned their serious business attention to developing the motor-car industries. English visitors to France and to the Paris Exhibition cannot but be impressed with the fact that we are a very long way behind the times with this remarkable invention, and that the time has arrived when prejudice, ridicule, and doubt were placed on one side, and earnest, thorough, and extensive business established.

To my way of thinking one of the greatest mistakes made by manufacturers is the arbitrary terms they all seem to make as regards the "cash with order," or "cash on delivery" payments. How many sewing machines are sold for cash?—about thirteen per cent. How many pianos?—roughly speaking, only ten per cent.; and so on with carriage builders. If the hire system has been so very successful in the aforesaid articles, and which deal with much smaller amounts, why should it not be immediately extended to this particular industry? Not all professional or business men have hundreds of pounds by them ready to invest in a car, or have the confidence to part with ready money to the require 1 cash amount.

There is immense business in the future and success assured to any company which has a large capital and a good commercial board of directors, that can place on the market reliable, up-to-

date cars on the three years' system, and having, in connection with the business, a school of instruction and an exchange bazaar. It is thus that a better feeling of confidence would germinate in buyer and seller.—Yours truly,

DANDO HARPER.

A SUBSTITUTE FOR PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will Mr. Pretty kindly inform me, through the medium of your columns, if a mixture of methylated spirit and benzoline (in the proportion of 4 and 6) can be used, instead of motor-car spirit, in any car now driven by the latter, as, for instance, the Benz or Daimler? Or is it necessary to have a specially constructed engine? It would undoubtedly be a great boon, even at 50 per cent. more cost, to be able to get rid of the unpleasant smell attending the former means of driving.

Yours truly, W. W. H.

TUBE v. ELECTRIC IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Twenty Miles from the Railway," the lamp I was speaking of is the usual pressure-feed lamp as supplied by the Daimler Company; there is no timing valve and the tubes are of the usual type.

I also take this opportunity of thanking "Cush" for the information regarding carburettors; should I require one I will make inquiries. I presume M. Delamare Deboutteville lives in Paris; his address may be useful to others besides myself if "Cush" would oblige with it.—Yours truly,

E. ESTCOURT.

MOTOR PATENT MATTERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. Friswell's letter in last week's issue of the *Motor-Car Journal*, I have to say he is incorrect in stating that the Ariel Motor Company, Limited, is partly owned and directed by Mr. Du Cros. Mr. Du Cros does not hold a single share in the Ariel Motor Company, Limited, and never has done. He is not a member of the board and never has been; neither is he connected, either directly or indirectly, with the Company.

Yours faithfully,

H. R. ELDERFIELD, Secretary.

PORTABLE BUILDINGS FOR CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can you inform me whether there are any portable (i.e. "tenant's fixtures") motor-car houses to be obtained, which shall be as damp and weather-proof as good brick-built ones, and if so, let me know the firm or firms who make them, and the approximate price for such a one measuring about 13ft. deep and 15ft. wide, to accommodate two motor quads or a quad and a voiturette, etc., with room to get round one at a time for cleaning, adjusting, etc.; also attached, and communicating, a room the same depth (13ft.), and about 8ft. wide, for workbench, vice, shelves, cupboards, etc., as workshop and store in connection with the motors? I desire to take a permanent house in Southport, but cannot come to terms in respect of any which has accommodation for my quad, and unless I buy a house, I do not see how I can continue to keep my quad except I can get a thoroughly good portable building at a moderate price. At my late home, in another town, where my quad now remains, I had any amount of accommodation in a permanent building, but have no experience of the portable ones.—Yours truly,

THERMO.

AN American contemporary defines a patent as a sort of thing that gives one person the exclusive right to all the litigation in connection with some sort of a thing for a certain number of years.

AUTOMOBILE NOTES FROM PARIS.

THERE is an enormous difference between this time and last year with regard to the number of automobiles in circulation in Paris. Then, they were frequently to be seen; now, they are constantly in sight. Hardly a second passes during which the eye fails to see a motor-vehicle, should one be walking almost anywhere in Paris. Even in side streets they are to be constantly met with, whereas processions of them follow each other down the main thoroughfares. At all times of the day does one hear the singing hum of motor-cars, except when a cab or other horse-drawn vehicle passes by with a rattle and a clatter which drowns all other sounds; and how inspiring it is to hear the cheerful toot-toot of the horns answering one another in the distance.

In the Champs Elysées and the Avenue de la Gare are to be seen most of the motor-cars, while a fine morning will bring them in swarms, like bees in a hive, to the Bois de Boulogne. I am glad to see that a sober rate of speed is the fashion by general adoption. No scorching or showing off of any kind have I noticed. Motor-cars now take their place sensibly in the traffic, and are accepted as units of the same. No one pays any attention to them beyond bestowing possibly a casual glance. The astonishing number of motor-cars one sees in the Bois de Boulogne, at this time of the year, too, is most gratifying to the bosom of the ardent motorist.

There is a marked improvement in quality. By far the greater number of motor-cars seen are of the very best and most expensive type. This time last year the cheaper ones were more common. I have only seen one solitary car have a "break-down." That, however, was a bad one. I mean both the car and the "break-down." It was of a make which, I should say, has done more damage to the cause of automobilism than any restrictive regulation. A friend of mine had a similar one not very long ago, and the story of his adventures with it was very funny. He assured me its normal condition was that of being *en panne*. It was not from lack of knowledge how to work it on his part. Once, he told me, he wished to impress some friends, and thinking—not without reason—that his car was perhaps a bad one, he went to the agency, and borrowed the best car they had for the occasion. It was supposed to be extremely good, this car, it being the one on which all prospective buyers were taken out for a trial run. The car was brought round to his house by a mechanic and arrived an hour late. He had promised to take his friends out for a grand run in the country, outside Paris, and they all started in high spirits. The car went beautifully for 100 yards and then something went wrong; halt and hard work. To cut a long story short, I may as well say at once that although he got it going again, oh dear yes, many a time, they never got beyond the length of the street. They had fourteen "breakdowns" in as many hundred yards, and after spending an afternoon going the length of that avenue, they thought it wiser to push it into a stable which happened to be handy. There it was left to be called for, and my friend having packed off his party on a "hippomobile," returned home, where he proceeded to pen an indignant and sarcastic letter to the company.

There are plenty of fine Panhards to be seen, of 8, 12, and 16 h.p. The three branches of motor-vehicles, cars, voiturettes, and motor-cycles seem fairly equally divided. The Rochet-Schneider Company are now turning out an excellent car similar to the Panhard. As I was examining their motor the other day, I thought to myself patents are valueless, or else Panhard sleeps. Of the voiturettes, the Renault is much to the fore, and so is the Darracq. I think they divide the honours in number. Gladiator voiturettes come next. De Dion voiturettes are often seen, but are by no means so common as might be expected.

There are lots of other good voiturettes rarely seen, owing to the limited output of the firms concerned, among which must be mentioned the Soncin and the Vinet. One or two firms are turning out very successful voiturettes, fitted with the Buchet engine. This motor has won several races lately, among which was the Cote de Gaillon, in the voiturette class. One firm in Paris is making a voiturette to be fitted with a two-cylinder

water-cooled Buchet engine, which gives 14 h.p. on the brake. Quite a graceful voiturette is the Renault latest model. I am, however, greatly taken with the small light Renault coupé or brougham, which I have several times seen. This little car has a brougham body, and is steered and worked from within. The engine remains under a bonnet outside with the radiator as usual. There is a small seat at the rear on which a mechanic can be taken. I have seen these little vehicles scudding along at a great pace, and they seem to be admirable. I should imagine it is the *beau idéal* of a light car for a doctor or anyone with professional duties necessitating much going to and fro in all weathers. As for the motor-cycles, every other one seems fitted with an Aster engine, which shows how greatly this motor is growing in the public estimation. I remember the time when this engine was as rare as the proverbial plum in the schoolboy's cake, compared to the number of De Dions going about. There are quite a number of motor-vans to be seen, and the electric cabs appear to be doing well.

The weather is not at all pleasant for motoring, owing to the piercing cold. However, the streets are full of motor-cars as it is. Judging from the present, the number of motor-vehicles in Paris next summer will be a sight for the gods.

Paris, December 25th, 1900.

LEOPOLD CANNING.

MOTOR-CARS FOR PUBLIC SERVICES.

At the Automobile Club on Wednesday there was a large gathering of members and visitors to hear a paper by Mr. T. R. Outhwaite, the secretary and manager of the Edinburgh Auto-Car Company, on "Motor-Cars for Public Services." Mr. Shrapnell Smith presided, and referred to the greater prominence which the subject had attained in England, as compared with France. He also quoted from the experience of Dr. Haley, who had done much to further the motor passenger system between Olney and Newport Pagnell, and who had absolute faith in the future of such services. The following is Mr. Outhwaite's paper:—

In July of 1897 I first entered upon my motor-car career, buying from Stirling's, of Hamilton, a four-seated Daimler wagonette. In this car I covered in the following eighteen months over 20,000 miles—in fact, having little else to do at that time, and being anxious to gain experience, under all conditions of weather and roads, in an industry I felt sure was bound before long to be a large and important one, I left no stone unturned to attain my object. I merely state this, by way of preface, to show what led me to associate myself with the company which came before the public in May of 1899 to run motor-cars on the same lines as trams. I do not want to trouble you, however, with the history of this individual company, but showing as we do, after eighteen months' business, a loss, I would like to point out, so far as possible, the reasons for it, and make a few suggestions for the future. One point I would ask you to remember, and that is that I am dealing solely with the one type of car—that driven by oil.

To come back to the point again, viz., "the causes of failure," firstly, the cars as at present built for public service work are, as regards strength, out of all proportion to the work they are called upon to do. To put it a little more graphically, it is like going into action with a gun mounted on a "Victoria" and drawn by a pony. The labours of Hercules were nothing compared to those of anyone running twenty or thirty cars for public service, unless, of course, it was done absolutely regardless of cost. We are to-day attempting to run at a profit cars originally designed for four passengers, with loads of eleven and twelve persons, to say nothing of a hood in bad weather. The same engine, the same gearing, the same sized bearings, the same section of rubber tire, the same chains, are to-day fitted to my largest public service car as are fitted to my own two-seated car. It is obvious, then, one of them is wrong, and it is obvious which it is when I say that the former costs me nearly as many pounds to keep up in one month as my car costs me shillings in a year.

Secondly, even though the existing type of public service oil car was built heavier throughout, and a more powerful engine substituted, I find from experience the design in many vital points is not suitable for this particular class of work, owing to (1) constant variations in load, (2) incessant starting and stopping, (3) lack of really competent drivers. Take point No. 1. A driver adjusts his brakes and chains before leaving the depot. He procures a full complement of passengers—ten, with what result? chains go out of adjustment, and the brakes rub on the tires. Point No. 2. Except with careful drivers, the continual starting and stopping, compulsory in street traffic, is a severe strain on nearly the whole of the car, and I believe this factor has almost more to do with the rapid deterioration of the cars than anything else. Very often, too, it is absolutely necessary to pull up suddenly to prevent accident. Lastly, drivers. I have given this question most careful thought and attention. Not being able to alter the defects in the cars, I tried the only other remedy, to improve the drivers. In this I was partially frustrated, for I

found that after carefully training men and giving them every possible encouragement to make themselves efficient, not only as drivers, but as mechanics, other small companies started up with three cars here and three cars there, and by reason of an extra shilling a week and the promise of a new car, I found my best men leaving, and I had to start at the bottom of the hill again. I firmly believe the motor industry and motor public service have suffered more through bad drivers than anything, and I would take the liberty of urging you not to certify a man to be an efficient driver when he is far from it. I have had many men come to me with excellent characters who, when asked the simplest question, were absolutely at sea. After a driver has been with me a considerable time, and, besides being a good driver, is capable of doing his own repairs, a printed certificate is given him, which, so far as his efficiency goes, is his character. There is one other important point which must not be omitted—tires. I have tried almost every make at every price. The tire which to-day gives me by far the best results is the "Castle" vulcanised tire, supplied by the North British Rubber Company. If the ordinary "Clincher" section is used, I should most certainly advise nothing under a 3in. section on the driving wheels—and would even prefer 3½in. or 3¾in. section.

I will now make a few suggestions for a future car suitable for public service work—and with which I am confident it would be more than possible to compete with any existing tramway company in the country. The carrying capacity of the car should not be under fourteen passengers, so as to admit of a conductor being carried. To carry this number of passengers nothing under a 12 h.p. motor should be used, yet the engine should only have two cylinders. All working parts should be encased, and while electric ignition might be used to advantage, tube should be fitted as well. It should be made impossible for the driver to increase the speed of the engine above normal. All wearing parts must be accessible, adjustable, and easily and cheaply replaced. One of the greatest drawbacks of the present public service car is the time lost in gaining access to the various parts. A good many of the present-day evils could be got over by laying the existing driving shaft stationary horizontally, and instead of sliding the shaft and friction clutch together, slide the clutch itself along the shaft. The connection to the road wheels would, I think, be better with gearing in place of chains. As regards lubrication, this should be done from one oil reservoir with pipes leading to all the journals. While I have always found the Stauffer lubricator very efficient, the time taken to grease twenty cars is very considerable.

A car on these lines being built, let us consider the advantages of the motor-car for street traffic, which are obvious. It possesses all the advantages of the 'bus, in that the cars can run on any route according to the requirements of the traffic, and, moreover, the passengers can be taken direct from the pavement. It is not necessary to upheave the streets and spend hundreds of thousands laying rails, building power stations, etc. With the finest mechanical tramway system yet produced one accident at once disorganises the whole system. The cost per mile of running a good car is about 3d. for petrol, which compares quite favourably with any tramway system. For suburban traffic motor-cars seem particularly suitable, as passengers can be conveyed with safety at a greater speed than would be possible or safe with any other vehicle. For three months last winter I ran such a service to a small village three miles from Edinburgh, with a time-table, and as people were brought into town in twenty minutes, as against forty by 'bus, an extra 3d. over the bus fare was charged. This the people resented, so the cars were withdrawn for another service.

Coming now to the means adopted by my company to overtake and check repairs and fix responsibility. When each car comes in at night, the driver is given a "report" sheet, with a list of all the main parts of the car printed. Opposite any part which needs attention he makes any necessary remarks. The foreman makes an extract of these, and allocates the work among the night engineers. The head engineer hands report to the foreman in the morning, stating all the work done and by whom each respective job has been carried out. When the driver takes over his car in the morning, he is given back his previous night's report sheet. On the bottom of this is a place for him to fill in any items which he had reported, but to which effect had not been given, so that he is thus cleared from responsibility in case of accident. My company have carried over 5,000 passengers in one day, and over 1,000 in one car in one day. We had cars last year as far north as Inverness, and as far south as London, and, without a single exception, we have never injured in the slightest degree any passenger—which is a tribute to the men employed by our company.

Mr. Bell (Bournemouth) opened the discussion. His cars were running on the main road in competition with three omnibus companies the shareholders in which were directly represented on the Town Council. He charged 3d. as against the 'bus fares of 2d., and people would wait for the cars because they did the journey in 11min. compared with the 25min. occupied by the 'buses. The cars carried eight passengers, and those eight-seated cars had practically the same capacity as the 26-seated omnibuses drawn by three horses, because of the quicker journeys made, and the time saved in changing horses, etc. On the previous day there had been snow at Bournemouth, and at three o'clock there were three omnibuses left on the road. They all gave up at five o'clock, but the motors kept on. He had not made any financial loss. With regard to drivers he had found experienced men a nuisance. They knew too much. He had engaged an old milk carman, who had done better than the skilled mechanic. All they should be expected to do

was to drive; the mechanic and fitters would see to the machinery. His service had carried nearly a million passengers and had not been held up once. At the present time he was in negotiation with a town in the south of England which had started a line of trams to institute a motor-car service as a feeder to outlying districts.

Mr. Parker Thomas, of the Aberdare Valley Motor-car Service, Limited, was assured there was a tremendous opening for manufacturers who could turn out a satisfactory car. It was impossible to run to time tables. His service had seven cars, and it might occur that five happened to want attention at the same time. The present motors were too complicated for public service vehicles, and the bearings were too large. As to tires, he had found the A.B.C. very satisfactory. It had run 1,400 miles on one of his cars and was without a scratch.

The Chairman then read a letter received from Mr. A. W. Goodall of Lincoln, in which he referred to some of the difficulties that had to be encountered. As a rule services were started by men who were unaware of the practical working of the cars. They erected unsuitable buildings, did not obtain the proper plant and tools, and had a dread of laying out money on the duplication of the various parts. Tires had proved his great trouble. When useless he could not obtain more than 2½d. per lb. Some of the tires ran out in a few months; he had lately had one done for in ten days. Owing to the sudden starting and stoppages chains were another trouble. The introduction of hardened gears had proved helpful. He had a gear which had only been taken out once for examination and was now as sound as it was twelve months ago, and that after running seventy miles a day. The heavy charges for renewals were an important factor in the working of a motor-car service, and he had known a difference of 75 per cent. in makers' quotations. The difficulty of getting drivers had increased during the last four years.

Mr. Sidney Straker said that many of the cars now running were not built for public service. The Daimler Company were bringing out a public service vehicle to carry fourteen passengers. It was of 12 h.p., and there were no chains. It was a direct geared machine, and the tires were of a special make. Since the 1,000-mile trial the company had thoroughly revised the engine, and had constructed a motor with a head. The total weight of the car, which had an open top, was 30 cwt. The London Steam Omnibus Company put two petrol 'buses on the road in June of last year. They had made journeys of 350 miles per week, running six and seven weeks without any repairs being necessary. The public patronage had not been very great. Oil and fuel had cost 3d. per car mile, the drivers 2½d., and the repairs 1½d., making a total of 7d. per car mile—an estimate based on the result of the first three months' running. The average weekly cost per vehicle of the London General Omnibus Company was £15; of the motor-'bus only £9 10s. With all heavy vehicles direct gearing was the only solution of one of the great difficulties. He advised the employment of drivers accustomed to 'bus driving, and who would not interfere with the machinery. A weight beyond 30 cwt. was outside rubber-coated tires; inside that they had evolved a tire that was successful owing to the system of vulcanising the tire on to the rim. Electric ignition was quite unsuited for public service vehicles, and the tube system was more reliable. In connection with lubrication they had a pump with four independent deliveries that forced the oil between the piston and the cylinder, whether it required it or not. The ideal car was a 30cwt. machine with solid rubber tires to carry fourteen passengers. The addition of a hood would make it weigh 34cwt. It should have a minimum speed of six miles an hour and a maximum of 10½, to cost £450 or £500 if without the hood, £50 more if that was provided.

Colonel Crompton said chains were the only satisfactory plan where springs were used. The last three years had seen a revolution in chains. Chain transmission was not so liable to a sudden break-down as gear. In connection with tires some sort of hollow tire must be adopted. They should not have skilled mechanics as drivers, but nerry men who could obey orders. The next three or four years would show great advance. When they commenced electric traction they had the same difficulties with repairs that were being experienced with cars, and these occurred until they got many of the parts standardised.

Mr. George Iden said the endeavour of makers had been to introduce improvements which would give a better result on the road. The cars so far supplied in connection with public service vehicles had been feelers. Those in service had been overloaded, and reserves had not been kept, as was the case with omnibuses. Drivers did not pay enough attention to lubrication, and to remove some of the difficulties connected with that he had introduced a self-adjusting lubricator, in which the movement of one lever opened all the pipes. As to old tires, he was able to obtain 8d. per pound for them. Considerable improvements had been made in chains, and he now fitted roller chains in all cases. He did not recommend mechanics as drivers. They wanted men who could accommodate themselves to circumstances. Every part should be as nearly as possible interchangeable. In a short time a new 12-h.p. motor-service vehicle would be run, weighing 34½ cwt., with a good omnibus top, and carrying sixteen passengers. His company was also making an intermediate size with 8-h.p.

Mr. S. F. Edge knew something about the difficulties of obtaining drivers. He had sent coachmen to France to become acquainted with mechanical details, and they returned useless as drivers. The best plan was to get ordinary drivers. He did not think much of the way cars had been served in public service. A little thing built for four people had been loaded with fourteen. The improvement in chains had been most extraordinary. Up to fourteen months ago he renewed his block chains every 1,500

miles. Since then he had used Brampton roller chains on a carriage developing 24 h.p., and after riding 9,000 miles he could say it had proved very satisfactory. For the first 3,000 miles he took them off every 250 miles and put them on hard Russian tallow. Now it was necessary only to pour oil on them. The best manufacturers in France had to come to this country to buy chains for their vehicles. In the Cannstatt coupé carriages the gear method was employed, but after a little while the gear wheels got extremely noisy. In keeping a reserve of cars the cost had to be considered, and he should like to have some idea as to what the managers of public services were prepared to pay.

Mr. Percy Richardson referred to the causes which had forced some of the earlier motor-car service companies to the wall. The first was the vehicles themselves. Upon cars constructed to carry four people bodies to carry ten had been placed. The question of management had also been a factor in the position, and men had been appointed who knew nothing about motors. He had found in one case that the cars always developed difficulties on wet days—and when he made an investigation he found it was solely because the drivers would not go out on wet days. The present vehicles were not perfect, and they could not arrive at a perfect vehicle until they had sufficient experience. With careful management, however, there need not be a loss with the present cars. People starting motor-car services often had curious ideas of price.

Mr. Hutchens, Bournemouth, said the attitude of the public towards motor-cars was becoming more favourable. They were really introduced into Bournemouth in March, 1899. Before establishing his service he took the Horse Committee of the Town Council and the local Press for trips, thus accustoming the local people to the innovation. They had a time-table, and for six months they had kept to it. The service only consisted of three cars, one of which was kept in reserve. He did not think a driver ought to know absolutely nothing about mechanics, and the best man was one occupying a position between the two extremes to which reference had been made. He hoped an effort would be made to give the chain some kind of gear case similar to that on cycles, arranged so as to slide in some way and be easily taken in part, so that the chain could be got at. The couplings on the intermediate shaft, he found, wore out in a small space of time. The strength of the tanks required attention, and, if possible, he should like to see copper tanks. Owing to the action of the springs the tire brakes in some positions did not act, and that ought to be remedied. Something, too, should be done to protect the burners from draughts. With regard to hoods he had tried three different kinds. The small hotel 'bus shape was not popular, and the most satisfactory was one with a glass behind the driver and curtains at the side which could be pulled up in fine weather. Judging from the results of the 1,000-mile Trial, the vulcanising of tires did not seem to be satisfactory, but he recognised the advantage of the system if it could be made a success. He advised that the Clincher tires should be given a more rounded shape.

Mr. F. Morris (King's Lynn) had had three years' experience with motor-cars. They wanted a car not geared up too high, as most of them were. Three speeds might well be substituted for the four generally provided. He had had difficulties with the gear sleeve, which had to be thrown away when the first and second speeds were little worn, because of the third speed. He had got over the trouble by cutting the sleeve in two and making a third and fourth speed of it. With regard to the tires, he could never get more than 2d. a lb. for old rubber. He had had an omnibus running for twelve months from end to end of the town. Nothing was so satisfactory as the ordinary Clincher tires. A heavy section of Glew's tire had also given satisfaction. On the subject of drivers, he had just got an agricultural labourer to drive a car at 10s. a week. Should anything go wrong with the car when on the road he could telephone to the works.

The Hon. C. S. Rolls spoke of the advantages possessed by electric trams. Side slip had not been mentioned; that was a difficulty to be recognised. A day or two before he had gone with a friend to Rugby to fetch a Leyland steam waggon. They got under way and the wheels skidded round. They coiled ropes round the rim, but these were soon cut through. Then they used steel wire cable, which lasted till they got to a hill which they could not surmount. Eventually they returned by train, having previously attained a speed of 127 miles an hour. Motor-cars would undoubtedly be useful as feeders to tramcar systems. Some of the present vehicles in use for public service were of an antediluvian type, carrying fifteen people with 4 h.p. For the heavy vehicle the most satisfactory power would be steam. Lately he had had no trouble with chains. Brampton's had apparently got a chain out which gave no trouble. The Renold chain ran more like a belt than any other chain, and was noiseless. In France he had seen the Compound tire working on heavy vehicles. It was a semi-pneumatic tire, very thick, but the difficulty was its expense.

Mr. J. H. Gretton said it was not a fact that public service vehicles had not been successful. One manufacturing company that he knew had supplied cars to fifty different services in this country. Motor vehicles had not been all that one could expect. It was similar with the locomotive, the steam engine, and, in fact, every form of carriage. At the beginning people did not keep enough vehicles in reserve, and sufficient attention was not paid by manufacturers to standardising the parts. All that had been got over. It was not sufficient to run public vehicles on electric ignition.

Mr. French, who proposed to start a motor vehicle service in London, asked for information with regard to the collection of fares.

Mr. R. Outhwaite replied to various points in the discussion, saying the ticket system was adopted to collect fares. Even with that there was a leakage of 15 to 25 per cent. With regard to the cost of cars, he

thought a profit could be made on a car costing about £450 or £500 if it ran properly.

A vote of thanks to the writer of the paper having been carried by acclamation, a similar compliment to the chairman closed the proceedings.

DIARY OF 1900.

AN INTERESTING AUTOMOBILE RECORD.

JANUARY.

Formation of a Yorkshire branch of the Automobile Club.
Motor-wagon trials arranged at Bradford.
Paper by Mr. T. H. Parker on "Electricity on Common Roads," at the Automobile Club.
Inauguration of Motor-Car Services at Bournemouth and King's Lynn.
The Motor Trades Association formed in London.
Thirteen new English built motor vehicles—the Balmoral char-a-banc, the New Orleans voiturette and the Wolseley car—attracted attention.
Special interest attached to the visits paid by English motorists to the United States.
New tariff of taxes on automobiles came into operation in Antwerp.
German military authorities placed orders for Cannstatt-Daimler wagons.
Records attained on motor-bicycles by MM. Fossier and Béconnais, the former making an average of 71 kilomètres per hour in a 21 kilomètres race, and the latter covering one kilomètre in 42½ seconds with a flying start—at the rate of 84 kilomètres (52½ miles) per hour.
Motor-car exhibition at New York.

FEBRUARY.

The Prince of Wales ordered his first motor car.
Difficulties experienced with the railway companies in connection with the carriage of petrol.
Formation of the Manchester Automobile Club.
Inauguration of the Motor Vehicle Users' Defence Association.
Hon. J. Scott Montagu's paper on "British Automobile Manufacture," at the Automobile Club.
Major Crompton sailed with the Electrical Engineers for South Africa.
Annual Meeting of the Automobile Club.
The Chelsea Vestry adopted motor dust vans.
Licences granted for public motor-cars at Hastings.
New voiturettes introduced by Mr. J. Burns and Messrs. Monk and Lonsdale.
Formation of the Lincoln Motor 'Bus and Parcels Delivery Company, Ltd.
The Yorkshire Motor-Car Manufacturing Company, Ltd., and Accles-Turrell Autocars, Limited, registered; meeting of the Motor Manufacturing Company, and a scheme proposed for the re-organisation of the London Motor-Van and Wagon Company, Ltd. The name of the Motor-Vehicle Company, Ltd., was changed to Motor Power Company, Ltd.
The Pau week took place at the end of the month.
M. De Knyff maintained a speed of 43½ miles per hour for 5 hours.

MARCH.

Death of Herr Daimler—a pioneer in automobilism.
Mr. H. Sturme's paper on "The Motor-Car in Europe and America," at the Automobile Club.
Reconstruction of the Motor Manufacturing Company effected.
Annual meeting of the Motor-Car Club.
Mr. E. J. Coles gave the first automobile performance on an English stage.
Gasté broke Beconnais' record, covering a kilometre from a stationary start in 53½ secs.
The Nice week commenced.
Exhibition at Amsterdam.
Trials of motor-carriages for field guns made by the French military authorities.

APRIL.

Ladies' dinner at the Sheen House Club.
The Automobile Club's Exhibition of Motor-Cars, held at the Agricultural Hall, Islington, under the direction of Mr. Charles Cordingley.
Hon. C. S. Rolls read a paper on the 1,000-mile Trial at a dinner in connection with the Exhibition.
The Automobile Club's 100-mile hill-climbing Trial.
Motor-cycle racing at the Crystal Palace and other metropolitan centres, and at Birmingham.
The Automobile Club's 1,000-mile Trial began.
Paper by the Rt. Hon. J. H. A. Macdonald, C.B., on "War and Power Traction," before the Automobile Club.
Paper by Professor Hele-Shaw before the Institution of Mechanical Engineers on "Road Locomotion."
New char-a-banc for public services introduced by the Daimler Company.
First automobile race in America took place on Long Island.
Commission appointed by the French Government to inquire into the existing law with regard to automobiles.
Paris-Roubaix race.
Bill adopted for licensing all drivers of automobiles in New York State.
Commission of Italian officers appointed to inquire into the application of the automobile to modern warfare.
Motor-car exhibition at Brussels.

MAY.

The 1,000-mile Trial came to a successful conclusion.
Exhibition of the cars at the Crystal Palace.

The Hudliss petroleum spirit motor-car placed on the market.
 Licenses for motor-cars at Eastbourne renewed.
 Conference at the Home Office on the carriage of petrol by the railway companies, and issue of new regulations.
 New Joel electric carriage made good trial tests.
 Paper by Messrs. Rush and Joy on "The Motor-Car Industry," before the Institution of Junior Engineers.
 The Manchester Automobile Club held its first run—to Knutsford.
 Sir David Salomons read a paper on "Modern Locomotion" before the Anglo-French Association in London.
 Paris Exhibition—with important automobile section—opened.
 The new clubhouse of the German Automobile Club opened.
 Automobile *fete* at Vincennes.
 Split occurred in the Automobile Club of France.

JUNE.

Whitsuntide tour of the Automobile Club to the Eastern Counties.
 The suggestion for a motor racing track made in the *Motor-Car Journal*.
 Motor-car meet at Southport.
 Mr. J. S. Critchley appointed manager of the British Electrical Traction Company.
 Rigal covered 38 miles 1,372 yards in the hour on a motor-tricycle at the Crystal Palace.
 Rules of the 1901 Liverpool trials of motor-vehicles for heavy traffic published.
 The English Motor Club formed.
 The Blake four-seated petrol car attracted notice.
 First automobile auction in England held by Mr. E. Owers.
 Second quarterly 100-mile trial of the Automobile Club held.
 Automobile Club's motor racing meet at the Crystal Palace, and hill-climbing contest at Westerham.
 Motor-car exhibition in Vienna.
 Speed trials for Belgian vehicles on the Dieghem road at Brussels.
 The Gordon-Bennett Cup race won by M. Charron.
 The Bordeaux-Perigueux race.

(To be continued.)

FURIOUS DRIVING.

AT Chelmsford Petty Sessions, last week, Henri Berrue, described as a motor-car driver, of 30, Charlotte Street, Fitzroy Square, London, was charged that on the 22nd day of December, at the parishes of Widford, Margaretting, and Ingatstone and Fryerning, he did drive a light locomotive at a greater speed than twelve miles an hour, contrary to "the Light Locomotives on Highways Order, 1896." Mr. Eldridge, instructed by Messrs. William Tanner and Co., prosecuted on behalf of the police, and Mr. T. W. Staples Firth defended. Mr. Firth objected to the presence of county councillors on the Bench, and three gentlemen retired. Police evidence showed that between 3.46 p.m. and 3.58½ p.m. the defendant had travelled 4 miles 3 furlongs 100 yards—at a speed of twenty to twenty-one miles an hour. A surveyor and a publican having given evidence, Berrue said his speed was but ten or eleven miles an hour. Mr. F. F. Wellington corroborated. The justices imposed a fine of £5, and £12 13s. costs.

THE LONDON ELECTRIC OMNIBUS COMPANY.

AT the adjourned meeting of this company, held on Monday at the offices, 11, Queen Victoria Street, E.C., Lieutenant-Colonel T. T. Turnbull, who presided, said that the main point that had occupied the attention of the board was how to secure an omnibus which could be run not experimentally, but on a commercial basis. The board believed that a suitable vehicle, guaranteed by the manufacturers in every way, could now be obtained at a reasonable cost. They had laid before the shareholders a scheme for reconstructing the company with a view of raising further money for the purpose of purchasing omnibuses of the type referred to. Turning to the accounts, he pointed out that the unpaid calls amounted to £5,068. The omnibuses at present owned by the company might be expected to realise a certain sum, although he was not able to say how much. In reply to questions, the chairman said that the new omnibuses would carry fourteen passengers. The motive power to be used was now being considered by the manufacturers. Before anything definite was done, however, in the way of buying new vehicles, the directors would have to be perfectly satisfied with them by a trial run of thirty consecutive days. It was proposed to run the new omnibuses all over London. Eventually the adoption of the report was carried, and a resolution was passed to the effect that it was desirable to reconstruct the company on the lines of the suggested scheme. The chairman said that the board would do the best they could to carry out the scheme, but if sufficient support were not forthcoming the company must be wound up.

MOTOR-CYCLES AND TRAILERS.

MUCH interest will be shown in the case heard at Weston Petty Sessions, near Bath, on Saturday. William Whiting, of Bath, was summoned for driving a light locomotive, to which a light carriage was attached, at a greater speed than six miles an hour, contrary to the Local Government Board regulations.

Police evidence was to the effect that the defendant was driving a motor-cycle, with a car attached, at a pace between eighteen and twenty miles an hour. For the defence it was contended that the pace did not

exceed fourteen miles an hour, for it was impossible to drive the motor at a greater speed than that. The question which arose, however, and which Mr. B. A. Dyer, the solicitor for the defence, described as one of great importance to motor cyclists, was whether they came within the charge of drawing a vehicle. The car attached to the tricycle was what was called a trailer. It could be taken apart and the tricycle driven alone, but the trailer was entirely useless without the motor, as it could not be pulled by a horse or anything else. He submitted that it was not a vehicle which, if taken in a broad, common-sense view, could be called separate, and therefore it did not come within the meaning of the regulation. The importance of the case was that if it was once held that the trailer was a separate vehicle it would follow that the motor could not be driven more than six miles per hour. The regulation, if it was not a separate vehicle, was that it could go a maximum speed of twelve miles an hour, and if it was held that the carriage was separate, motor-cycling would be done away with. The question as to its being a separate vehicle had been raised by the Inland Revenue authorities, and they summoned a gentleman for not paying the tax on one vehicle. The defendant contended that it was two vehicles, and the taxes would therefore be different, but the Grimsby Bench, before whom the case was tried, held that it was one carriage, and so they convicted the defendant because he had not paid the taxes on one carriage, although he had paid them for two. He (Mr. Dyer) just cited that case to show the view the Inland Revenue took, because they had to collect the taxes according to whether it was one carriage or two carriages. After hearing the evidence for the defence, the Bench decided that the motor and car formed one vehicle, and therefore dismissed the case, with a warning that a pace of twelve miles an hour must not be exceeded.

DRIVING WITHOUT A LIGHT.

BEFORE the Richmond County Bench, last week, Mr. John Strange, of the Swan Hotel, Hammersmith, was summoned for driving a motor-car without a light, the regulation being that the vehicle should have carried a white light in front and a red light behind. Defendant was the owner of the car, and was riding on a tricycle beside it. The lamps, he asserted, were on the car but were not lighted. There had been an accident, and this accounted for the lamps being out.—Defendant was fined 5s.

THE Automobile Club of America, whose head-quarters are in New York, now comprises 225 members.

THE old town bridge at Guildford, which was destroyed by floods last year, is to be replaced by a steel structure at an estimated cost of £6,000.

THE South-Western Motor-Car Company, Limited, has been registered with a capital of £10,000, to carry on the business of jobmasters, electrical, steam, gas, and other motor-car manufacturers and merchants, etc. The registered office is at 314, High-road, Balham, S.W.

MR. CHARLES FRISWELL as an agent is well known. His "go" and "push" are proverbial. Therefore the news that he has taken out an auctioneer's licence, and will shortly be seen in the rostrum, will interest many. Probably his friends will be curious to "see the novelty in the box."

THE Creese Motor-Car Starter Company, Limited, has been registered with a capital of £1,500, to acquire certain inventions for improvements in explosion engines and gear for the same, to adopt an agreement with E. A. Merkel, and to manufacture and deal in motor-cars, cycles, and their component parts.

MR. H. W. VAN RADEN, of Ellys Road, Coventry, has lately introduced a small stationary dynamo to be used for the charging of accumulators. The machine has a capacity, at 1,720 revolutions per minute, of 10 ampères at 15 volts. Another useful article is a small dynamo intended to keep up the charge in the ignition accumulators on motor-cars. The capacity of the machine is 2 ampères at 5 to 6 volts, at a speed of 2,000 revolutions per minute; it is arranged to be driven by a small rubber friction pulley off the fly-wheel of the engine, or from one of the driving pulleys. Mr. Van Raden has also designed a handy volt and ampère-meter for use on electrical cars. It is fitted in a light aluminium case, and is both watertight and dust-proof. The instrument enables the driver to see at all times what current is consumed, and in what state his accumulator batteries are, so that he can prevent complete exhaustion of the store of electrical energy which is not very beneficial to the life of his accumulator. The dial is covered by ground glass, and marked for any desired voltage, the standard pattern being 60 to 120 volts, and 60 ampères. The ampère-meter is arranged to read during charging and discharging.

COMMENTS.

DAIMLER MOTOR BUS, 1897.

THE other day a concert was held in aid of the Soldiers and Sailors' Fund at Castle Rising, four miles from Sandringham. The Princess of Wales, the Princess Victoria, Princess Charles of Denmark, and the Duchess of York attended, having been driven over on the Prince's car. The Royal ladies were evidently delighted with the trip, the Duchess of York having the good opinion formed of automobiles, when at Monmouth recently, amply confirmed. Both the motor-cars used at Sandringham are behaving admirably, and, since the temporary failure of the burners lately reported, there has been no mishap—or it would have been chronicled in every paper throughout the country.

Motoring in January.

JANUARY has not so far proved a motoring month, the enjoyable days for driving having been few. Therefore, when one of the fine days happens to fall on a Sunday, Sabbatarians must forgive us for taking advantage of the opportunity for a run. On Sunday the air was keen but the roads were hard and dry in the direction we went, save in Richmond Park, where they were soft and heavy. At the Sheen Gate entrance three cycling members of the Automobile Club were seen looking askance at the mud. A debate was evidently in progress as to the advisability of choosing some other road. Fortunately, our car was travelling well; in fact, after its Devonshire trip it seems rather to like the heavy going than otherwise, and we had a pleasant morning's run of about thirty-five miles to Esher and back. We only saw two other motor-cars and both were Darracq voituresses—the one being driven by Mr. C. Johnson, and Mr. Northey being at the wheel of the other.

Educating Councillors.

AUTOMOBILISTS now have the opportunity of assisting in the movement that is in progress for the education of county councillors, and there should be no lack of vehicles at the disposal of the Automobile Club for the purpose of giving rides to our local governors. On the 19th prox. the Roads and Bridges Committee of the East Suffolk County Council will consider the speed and numbering of motor-cars, and on the three or four days preceding that meeting motor-vehicles will be sent to Lowestoft, Beccles, and Ipswich for the convenience of county councillors desirous of obtaining "by practical experience, a thorough knowledge of the control which a driver of a motor-vehicle has over his machine both as regards speed and control." In March, demonstrations will take place at Worcester and Birmingham for the enlightenment of the Highways Committees of Worcester, Warwick, Stafford, Gloucester, Hertford, and Shropshire. Invitations have been sent to the highway authorities of other councils to consent

to similar demonstrations in their localities. Among those who have already promised vehicles are Mr. S. F. Edge, the Motor Manufacturing Company, Messrs. Deacon and Son, of Llandudno, and, for the Midland demonstration, Messrs. Alfred Bird, Siddeley, Broughton Dugdale and Lanchester.

Numbering in Norfolk.

NORFOLK is a capital county for advancing motoring, seeing that so many parties for shooting, golfing, doing the Broads, etc., visit the district every year. Hence the prejudice that exists therein—despite the presence of the Royal automobiles in the Sandringham district—is to be regretted. The County Council has, by twenty-one votes to eighteen, just decided in favour of the numbering of motor-vehicles, the resolution that was adopted being as follows:—"That the Local Government Board be requested to make regulations or to promote legislation to the following effect:—All light locomotives shall be registered by the County Council, and upon registration shall be provided with a plate bearing the registered number, which plate shall be fixed in a conspicuous position to the light locomotive in respect of which it is provided. The fee payable on registration shall be £1 1s. for each light locomotive, or, if the locomotive is to be let out on hire, shall be £5 5s."

"Pay, Pay, Pay."

If such a regulation did become law the motorist's position would require a Rudyard Kipling to compose a charitable appeal on behalf of the Poor Numbered Motor. We have to pay a carriage tax of two guineas; then another guinea for registration; and probably another for a nice number. These fees, with the privileges of high terms at hotels, excessive charges for housing the car when away from home, and the exorbitant cost of petrol in some districts, open up a delightful vista of expense without end. Why does not the Norfolk County Council suggest that the Prince of Wales should carry a number on his dogcart as well as his motor-car, and that no motorists shall be allowed within fifty yards of a fully licensed hostel? If they cannot get rid of the driver of a motor-car any other way, why not starve him out?

Mileages Wanted.

IN response to our request for particulars of the mileage run by motorists during recent months, we have received an interesting letter from Mr. P. Brown, of West Kirby, Cheshire. That gentleman has run a 6 h.p. Daimler 4,427 miles during the last six months, an average of 170 miles per week. The car has been out in all weathers and on some very bad roads, and, with the exception of a few punctures, the owner has had no trouble. The cost for the petrol, lubricating oil, grease, and methylated spirits has been 3d. per mile. Such experience as this is interesting, and we shall be glad to hear from other gentlemen on the same point.

Alcohol Tests.

WE understand that a committee of gentlemen specially qualified for the purpose, has been appointed by the Automobile Club to investigate the value of alcohol in connection with motor-cars. The report will be awaited with considerable interest, not only by motorists, but also by agriculturists. The use of alcohol as a motor-fuel has already received considerable attention in France.

Mr. Peall's "Breaks."

During the last eight months Mr. W. J. Peall has driven his 6 h.p. Daimler 5,035 miles, and only on one occasion has he been compelled to stop. That was owing to a broken valve. Fortunately, he had a spare one with him, so that only a delay of a third of an hour occurred. The gear is apparently as good as ever, and only £2 has been spent in repairs. Mr. Peall can drive a car as well as he can play billiards—and that is saying much.

The Late Mr. Andrew W. Barr.

It is with great regret that we have to record the death, at the early age of thirty-five, of Mr. Andrew W. Barr, which took place at Montreux, Switzerland, a few days ago. Mr. Barr, who was a member of the Automobile Club Committee and head of the firm of Messrs. Andrew W. Barr and Co., of Moorgate Street, E.C., the auditors to the Club, took an active

THE LATE MR. BARR.

part in the revival of the automobile movement in this country five or six years ago, he being the secretary of the original Self-Propelled Traffic Association. As secretary, too, of the Institute of British Carriage Manufacturers and a member of the Coach-makers Company he was able to do much to assist the motor cars movement by bringing it directly under the notice of carriage builders. The deceased was a native of Glasgow; he came to London in 1886, where his Scotch training in accountancy stood him in good stead, and he quickly rose to prominence in his profession. In May 1898 he was elected President of the Society of Accountants and Auditors, and was returned to the same position the following year, while in May last he was elected President for the third time in succession. Mr. Barr had been suffering for some time from a pulmonary complaint, and for twelve months or more had taken no active part in the business of the firm. He left England at the end of 1899 and went to Madeira in the hope that the salubrious air of that island would strengthen his constitution. On his return he visited several seaside health resorts in this country, but at the end of last year he was advised to go to Switzerland, where he succumbed on the 12th inst. We are indebted to the *Automotor* for the photograph of the late Mr. Barr.

Mr. A. C. Harmsworth in America.

APPARENTLY Mr. A. C. Harmsworth is doing something to popularise the motor-car in the United States. He has joined the American Automobile Club, and has been taking drives about New York in Mr. Whitney Lyon's electric-trap. On the last day of the old century the *World* gave a report of a conversation between Mr. Harmsworth and Mr. Lyon. in the course of which they exchanged some interesting views, Mr. Harmsworth taking occasion to show how much ahead of the rest of the world French makers had gone in the matter. He had intended taking one of his eleven vehicles with him to America, but the duty of 45 per cent. was hardly worth the experiment. So he has borrowed a petrol-car from a member of the American Automobile Club, and has gone on a trip to Florida.

Motor Street-Cleaners.

THE suggestion has often been made that the streets might be cleaned more efficiently by machinery than by the present antiquated method of shovel and broom. According to a correspondent, there ought to be no great difficulty in devising a powerful motor brush, worked by steam or oil, which should sweep the streets clear of snow at a speed of four miles an hour, starting within an hour of the fall of the first flake and never ceasing until the roads are clean. Machinery does not tire out, and four or six men working in relays could probably keep one of these engines going for twenty-four or forty-eight hours at a stretch. The device he has in mind would be not unlike the steam vans already doing cartage for the Strand district, and for several large firms. Carry the idea a little further. In Germany there are said to be dust vans with a hopper arrangement which lifts refuse from the road level, delivering it into the cart, and so saves hours in the course of a day. Why should not some such device be attached to the motor-broom in such a way as to load a van coupled up to the cleaning engine? When the van is full it could be uncoupled, and taken off, with others, to a suitable dumping-ground by a traction engine. Mechanical methods would save horse-flesh, which suffers much in carting snow, would be always on the spot, would require less supervision, and would probably cost no more in the long run than the present system.

The Strand Experiment.

IN connection with the foregoing the report of Mr. Arthur Ventris, surveyor to the borough of Westminster, on the cost of the Thornycroft steam motor-van used for street watering and dust removal in the Strand since February last, is of interest. The car has a body giving a capacity of six cubic yards for the reception of dust, and is capable of conversion into a street-watering body of 700 gallons capacity—double that of the ordinary watering-van. At first the steam cart was only employed in collecting street refuse and depositing it at the depot on the south side of the Thames near the Shot Tower, but later on, about the middle of June, it was felt that the vehicle was capable of further use. Therefore, from June 19th to August 4th, the motor was used in dust collecting from six o'clock in the morning till eleven o'clock in the forenoon. Then it was converted into a street watering-can, and carried on its work until six o'clock in the evening, and, after five hours' idleness, was again brought into requisition from eleven o'clock at night till five in the morning for the purpose of flooding the streets and loosening the debris in the roadway preparatory to the nightly flushing by means of the fire-hose. For several weeks the motor was more or less in actual practical use for eighteen hours out of the twenty-four. Mr. Ventris, in his report, differentiates the work of the motor-van into three periods. The first covers eight weeks when it was on hire, and the weekly average of refuse collected was about 35½ tons. The second period is one of seven weeks, prior to the time when the van was converted into a street-waterer. During this space the weekly average of dust removed was fifty-two tons. Then came the third term, when the tonnage declined to

twenty-seven, but, in compensation, 225 loads were distributed in watering, and 777 loads were used in flooding the thoroughfares. The report points out that, on the one hand, by partially discarding horse labour, there is a reduced expenditure of £772 per annum, and on the other, by the employment of motor-power, there is, basing the estimate on the experience of three months' working, an expense of £598—roughly, £600 a year. The difference between the two totals gives the relative advantage obtainable by the employment of steam motors.

A Young Motorist.

SUED at the Northampton County-court for damages caused to a trap through the negligent driving of a motor-car, Allan Hickman, of Billing Road, Northampton, admitted—although he was not yet seventeen years of age—that he had driven motors for three years, and had covered many thousands of miles on them without accident. He had several times driven through London, and understood thoroughly the mechanism of the car he was driving on the day of the accident. He had had three motor-cars. This youthful motorist obtained the verdict, his Honour Judge Snagge being of opinion that he was not furiously driving at the time, and that there was a conflict of opinion as to whether he gave sufficient warning of his approach.

"Atmospheric Gas," a new Motor Fuel.

ON Monday last, at the invitation of Mr. S. Leuchters, of Leeds, we inspected a Benz car at Messrs. Hewetsons' dépôt, in Dean Street, Soho, in which a new motor fuel has for some time been employed. It is styled "atmospheric gas," and is being introduced by the Atmospheric Gas Company, Ltd., of Leeds. A crude oil, said to be ordinary benzoline, is the base of the new atmospheric self-burning gas, and this is vaporised in a special carburettor. It is claimed that the use in motor-cars of atmospheric gas, being a self-burning mixture, does away with the usual air lever, leaving only one lever instead of two to be worked, the great trouble of the correct mixing of gas and air, especially at starting, being done away with. Another great advantage in favour of the new gas is that it is made in a sense automatically, the current of air necessary for the manufacture of the gas being drawn through the carburettor by the engine itself. The gas is stated not to smell or to give off any smoke. Atmospheric gas is not claimed to develop any more power than the explosive vapour obtained from petrol, but the company state that it shows a considerable economy over petrol. The combustion is described as being perfect and to leave no deposit in the valves. Mr. Leuchters demonstrated to us the ease with which the engine using atmospheric gas can be started. He also informed us that he had driven the Benz car exhibited for some time, using the new fuel, as a result of which he was able to assert that on a gallon of petrol, at 1s. 3d. per gallon, he could only cover twenty-five miles while using crude benzoline at 1s. per gallon and the Atmospheric Gas Company's apparatus he had been able to travel fifty miles.

The Motor's Triumph.

OUR Paris correspondent writes:—For a few days recently the Parisian motorist was sick at heart. Drizzling rain gave rise to greasy streets, and, frankly, the "auto" does not create a favourable impression under these conditions, for as often as not it sidles along with a crab-like movement far from reassuring. So during those few days the *chauffeur* had to submit meekly to many a rude remark from the scoffing *cocher* and the cheeky *gamin*. But suddenly there came a change; a cold "snap" arrived, and then, without the slightest warning, down came the snow. The effect was wonderful. From end to end of the great Boulevards one saw horse-drawn vehicles helplessly *en panne*, while dodging in and out among the sliding, staggering, tumbling gee-gees there glided rapidly and smoothly the derided automobile. It was a glorious sight for the motor man to see his beloved vehicle sailing gaily over the white surface of the

Boulevard while the noble steed could not move an inch, horizontally at any rate. A truly great triumph! The culminating point, was reached when a gentleman, driving a comfortable omnibus pulled up alongside one of the Gare Saint-Lazare buses, which was stranded in the Rue Auber, and took aboard from that unhappy vehicle its lady occupants, who were thus enabled to reach the station without the unpleasant necessity of trudging through the snow. A generous revenge!

Indians and Motor-Cars.

LOCOMOBILES are becoming more familiar sights in our London streets, and H. H. Maharaja Sir Waghji, K.C.I.E., Thokore Saheb of Morvi, is using such a car almost every day in the West End. The accompanying photograph shows Prince Kumar Shri Harbhanji Rawji of Morbi driving a Loco-

mobile accompanied by his secretary, Oghad Kanji Cauwan. Verily the automobile's conquest is extending from west to east. In a few years it will be a world-wide commonplace.

'Cute Farmers.

MR. W. K. VANDERBILT has been the subject of a good many stories since he took to automobilism. One of the latest is concerned with the wily farmers of Long Island, where it was reported that if Mr. Vanderbilt by any chance should run into a vehicle he would pay the damages up to any reasonable sum reaching from 50 to 100 dols. Accordingly every Sunday morning along the route which Mr. Vanderbilt uses all kinds of strange vehicles may be seen, to which are hitched horses the value of which may be eight or ten dols. at the most. These farmers are eagerly watching for the machine, hoping that they have the good luck to get a horse or two killed. But Mr. Vanderbilt and his *chauffeur* are very expert motorists, and it seems quite doubtful if the cuteness of the farmers will ever be satisfied in this way.

Where Motors are Stored.

AUTOMOBILISM is so comparatively modern that the terms associated therewith are not yet finally fixed—so far as many subsidiary matters are concerned. Some folks are worrying as to the proper word to denote a lady motorist, and now comes a correspondent who is troubling himself and his friends as to the place where the motor-car is stored or kept. He suggests

"autogorium," and adds: "In our language, we have auditorium, where people hear things; emporium, where people do trading; natatorium, where people learn to swim, etc. Auditorium would be, perhaps, more in keeping with roots and derivations, but 'autogorium' would be more euphonious, and would not sound so much like auditorium." We could hear that the gentleman had been consigned to a "lunorium" without regret.

Motor-Car Drivers.

IN the discussion on motor-car services at the Automobile Club last week much was said about drivers, but little about their wages. This, however, is an aspect of the matter which cannot be overlooked. The handy man who can readily adapt himself to circumstances, and who is likely to meet all difficulties with some sort of a solution, cannot be obtained for a few shillings a week. At Edinburgh the Corporation insists on the conductors of public vehicles being over eighteen years of age—an age which simply prohibits conductors being employed on the present motor-cars, as the wages required by people of that age would prove profitless to the concern. Coming South, however, a wage of 10s. a week to a driver has been mentioned as actually being paid. In another place we hear of a wage of £1 0s. 6d. per week! Evidently the disparity in wages is a great factor in the proportionate success of these services, and sufficient experience has not yet been obtained to know exactly what is a fair and proper wage to pay. Probably higher rates than now prevail will have to be given ere the problem of capable drivers has been solved.

An Enthusiastic American "Chauffeur."

ONE of the most enthusiastic *chauffeurs* in the United States is Mr. Alfred C. Bostwick, a prominent member of the Automobile Club of America. Mr. Bostwick has a fleet of no less than eight automobiles, four being of French make, and the others of American manufacture. The French machines are the famous Panhard racing car he has used in several races; a Clement voiturette, a Prunel voiturette, and an 8 h.p. racing tricycle with Buchet motor. His American vehicles are a 9 h.p. Winton, a Locomobile, an Orient quadricycle, and a very smart phaeton turned out for him by the Electric Vehicle Company. As will be seen, the machines embrace electric, steam, and petrol motors, so that Mr. Bostwick has every opportunity for testing the various kinds of motive power and learning which are the best to use under all circumstances and conditions.

London Thoroughfares.

MOTORISTS are becoming more and more keenly alive to the importance of good roads in the enjoyment of their pastime, and anything that is concerned with the improvement of the surfaces should be of interest. Lieut.-Col. H. A. Yorke, R.E., suggests that in repairing the London streets, the old foundation is frequently interfered with—a source of constant annoyance when the work is completed, and believes that better roads could be obtained if the road metal were put down in two layers, as is done in India, and if the first were well rolled, though not to a perfectly smooth surface, before the second were spread. Mr. Allen McAdam, a great-grandson of the gentleman whose name is so closely associated with our roads, points out in the *Times* that the reason why the modern roads in London are so badly constructed is that any admixture of gravel or any loose material whatever vastly injures the durability of the road. If small granite blocks are used alone they become so jammed together by the weight of passing traffic that the roadway becomes almost as hard as if made by a single block. Every rainstorm on the modern London roads washes more or less of the gravel from the interstices of the granite, and the latter, losing its packing, becomes loose, and the cohesion of the road is thereby altogether lost. The roads consequently require frequent repairs, much to the detriment of the ratepayers' pockets.

Roads.

ROADS are almost as important as motors to automobilists, and we shall be glad to have from readers particulars of the roads in their localities which require the attention of the authorities. Our correspondents can also assist the growing army of motorists by sending similar letters to the local press, and so arousing local interest in the matter. Upon the improvement of the roads depends much of the future automobile advance, and hence everything calculated to improve matters is to be commended.

Covent Garden Ball.

"GOLLY, these niggers do move," exclaimed a fond old mammy, as she saw her ebony-coloured son dash by, seated on a high gig, with his arms folded, and being driven by an immaculately-dressed swell. A paraphrase of the same expression passed through the writer's mind while seated in a box at the last Covent Garden Ball. A rare commotion was in progress at the entrance doors, sounds of foghorns mingled with the minor noises of a discordant motor-horn, and then suddenly, the doors being flung wide open, a voiturette appeared on the scene. The three passengers—all well-known men—wore bearskins and had donned French goggles, but little time was allowed for us to take stock, for the merry company grouped themselves round and commenced pushing the car here, there, and everywhere to the discomfort of those who were not nimble enough to skip out of the way. The vehicle, which had been emptied of petrol, was gaily decorated with several of the 1,000-mile Trial flags and other devices, while in front was a plate with the inscription No. "A—" on. There is no doubt its appearance caused an immense and lively sensation and was voted the attraction of the evening, being selected to lead the gay procession when the awards for prizes were being made. We trust that the fact that the car bore a number "for this occasion only" will not prejudice the objection of motorists to numbering their cars in the eyes of the County Councils.

Hotels for Motorists.

THE suggested appointment of hotels which shall have a special tariff for members of the Automobile Club and also provide reasonable accommodation for vehicles has been advanced a step further by a letter just sent out to the leading hotels in the country. In addition to the fixed tariff, the proprietors will be required to store motor-vehicles at a charge not exceeding 1s. per night and 1s. for washing the carriage. A water supply with a hose pipe at least ten yards long will also have to be provided, and a supply of petrol kept.

The Simplicity of Motors.

JUDGING from the catalogues and price lists issued by the manufacturers of a certain class of productions in a country with which all our readers are familiar, perfection has been reached, and no improvements are possible. This is an error of obvious exaggeration which, of course, no maker of automobiles would commit. The sin is, however, rather pronounced in certain trades where rivals in business seek to attract custom by making impossible claims on behalf of their productions. Such a policy in connection with automobilism would be very unwise, and we are just a little surprised to find in the catalogue of a motor manufacturer the statement, "Our written instructions are ordinarily sufficient for purchasers, but we will send an operator at any time, at the cost of his time and expenses. Anyone can operate the vehicles in a few minutes." Such a roseate picture of the simplicity of a motor-car must appear very galling to the owner on the occasion of his first break-down. There is nothing incomprehensible about a motor-vehicle, but it is necessary that the operator should regard a knowledge of its mechanism and working as a serious matter, and not the subject of a few minutes' play.

AN UNREASONABLE TAX.

VERY interesting is the position of the automobile industry at the present time. The curiosity of the public has been fully aroused in the motor-car, and is leading to inquiries which promise to result in a very satisfactory state of affairs during the next few months. All are agreed that trade is going into a favourable channel, and that, provided the threatened opposition of the County Councils can be overcome, the prospect for the future is a most hopeful one.

External difficulties out of the way, there yet remain some perplexing problems which will have to be promptly dealt with by those who know the business from the inside. So long as the industry was in a fitful mood and emerging from its earliest conditions, many things were tolerated as necessary evils that had to be endured. It was the time of experimental work and tentative effort, and manufacturers were inclined to submit to arbitrary ways that would be intolerable in the days of confidence and assured success. Impositions are often disregarded and even acquiesced in when the output is small and the demand restricted, but when the transactions increase in extent and volume, agitation, revolution, and similar terms become descriptive of the state of feeling. Our advertising columns this week seem to reveal such a condition of affairs in the automobile industry. With an unanimity that is significant, manufacturers and agents are utilising the space usually devoted to showing forth the merits of their individual interests, to proclaim their dissatisfaction with the arbitrary procedure that promises to raise the cost of placing cars on the market and thus diminish the ultimate return of the trade. Small advances can be made without restrictions of output, but there is a breaking strain—even for the purses of wealthy enthusiasts, who like to see value for their money, and who cannot see much in a commission paid to those whose share in the production is some decimal point long removed. Of course brains must be recognised as a marketable quantity, and inventive skill deserves adequate remuneration, but when those who own the products of the latter, by purchase or otherwise, use them as a means of exorbitant taxation the matter can no longer be ignored.

The murmurs and rumours of the last few months with regard to the general feeling as to the policy of the British Motor Traction Company, Ltd., have at length crystallised in the formation of a Trade Protection Society, which intends to examine closely into the ways by which the progress of the industry is likely to be thwarted, and in the case of the carburettor they have an example which will secure the sympathy of the public. That those who use a certain carburettor—costing considerably less than a ten pound note—should have to pay a tax of 10 per cent. on the total value of the car (less the carriage work) seems a monstrous charge on the industry. On a carriage costing £200 the tax amounts to several times the value of the article upon which it is directly imposed—a charge so much out of proportion that the agents and manufacturers have rightly decided to combine in a way that, determinedly pursued, should lead to a more reasonable condition of things. The object of the present movement is not to avoid payment of proper charges on valid patents, but to protest against being charged without reason on those parts of the car with which the British Motor Traction Company have nothing whatever to do. Those who have entered into the controversy know the value of patents and are prepared to appreciate them at their full value, but because they adopt one particular device they do not see why they should have to pay a ten per cent. tax on everything connected with the car. In this view they will have the sympathy of the public and of all interested in the future of the industry. The outlook is good, and trade is getting brisk; hence, unless decisive action be shortly taken, the cost of motor-vehicles will be raised to a point from which it will be impossible to reduce them for some years to come. To be able to put their cars on the market at a price which, leaving a fair margin of profit, enables them to come within the range of the middle classes, is the general object of those in the trade. But that is almost impossible unless the licenses required in the industry are obtainable at reasonable

rates. The matter, therefore, is one of no narrow or isolated importance. It is an essential factor in the future welfare of the industry, and, consequently, we hope it will be carefully considered by all automobilists with a view to a satisfactory conclusion of the present unpleasant and unprofitable position.

COUNTY COUNCILS AND MOTOR-CARS.

DEMONSTRATION AT WARWICK.

THE Automobile Club of Great Britain has organised a series of demonstrations before various public authorities, with the view of showing the efficiency and safety of motor-vehicles. One, if not the first, of these demonstrations took place before the Roads and Bridges Committee of the Warwickshire County Council at Warwick on Wednesday last. The chairman of the committee is the Marquis of Hertford, and other members present were Aldermen Dickins and Bourne, Councillor Taylor, and Messrs. J. F. Johnson and Vero T. Glover. There were five smart-looking cars present, Mr. Robert Bird, of Birmingham, sending a 16 h.p. Panhard; Mr. Archibald Millership a Lanchester; and Mr. Siddelay, of Birmingham, a 6 h.p. Daimler, driven by Mr. Johnson, the Secretary of the Automobile Club. Mr. John Gretton and Mr. George Iden had each a Motor Manufacturing Company's car.

The committee met at ten o'clock, and witnessed the demonstration in the thoroughfare in front of the Shire Hall. They appeared most impressed at the facility with which the cars could be pulled up. Later on the members of the committee took trial trips in the cars. The trials created little interest among the people of the old town of Warwick, for motor-cars are constantly passing through Warwick from Coventry and Leamington, both of which places are centres of the industry. Such trials as these will do a great deal to neutralise, if not to put a stop to, the effect of such resolutions as we have seen recently passed urging the Local Government Board to reduce the speed limit to ten miles.

It is reported that the King of the Belgians has ordered a motor-caravan to cost £6,000. It will contain three rooms, a parlour, a bedroom, and a servant's room, while the engine will develop 30 h.p.

THE Linsky Cup race, organised by the Automobile Club de Nice, will be run on the 21st inst. The prize consists of a splendid silver service in the Russian style, given by Colonel de Linsky. The race is reserved for four-wheeled automobiles, not exceeding 500 kilogrammes, and the course (Gagnes-Grasse-Saint-Vulmier) is about forty-five kilometres, with stiff hills.

A MEETING has been called for the 22nd inst. to consider the advisability of forming a branch in Ireland of the Automobile Club. The circular letter has been signed by the following:—Mr. W. D. G. Goff, Waterford; Colonel Magrath; Captain Langrishe; Lieut.-Colonel H. Irvine; Mr. E. O'Connor, D.L.; Mr. J. Herdman, D.L., Strabane; Mr. E. C. Herdman; Mr. W. B. Jameson; and Mr. Pryce Peacock. The meeting will be held in Dublin.

MESSRS. LAIRD AND LEE, of Chicago, have sent us a copy of Lee's American Automobile Annual, which will undoubtedly prove helpful to all interested in automobiles in America. Much of the material that has been compiled by the editor is historical in nature, but the work is brought up to date by discussions and descriptions of new and improved methods of motor-vehicle construction and operation. The work is divided into six parts, the first of which treats of the internal combustion motor system etc. Steam-power vehicles are next taken up, and then the electric storage-battery vehicles are discussed. Part IV. gives other forms of motor power, such as compressed air, liquid air, carbonic-acid gas and combination motors. In the next part steering, wheels, tires, differential gearing, bearings, etc., are treated. Copies of the Chicago and New York city automobile ordinances are given, as well as several automobile "don'ts," and the book is completed by a blank form of automobile log for a run. The volume is bound with a flexible leather cover and is of the ordinary handbook size.

THE GILBERT HEAVY-OIL CAR.

THE accompanying illustration shows a new light two-seated car which has just been completed by Messrs. Ralph Gilbert and Son, of John Bright Street, Birmingham. The new vehicle is now going through its road trials, being yet in an unfinished state as far as body work, mudguards, etc., are concerned. This machine is, state Messrs. Gilbert, the first of its kind, and is totally different from any car before the public. It has been designed and constructed to meet the demand for an inexpensive and simple car combined with lowest possible cost of running, being specially designed for working with ordinary Royal Daylight paraffin oil, but running equally well with petrol of any quality without any adjustment. The motor is of 3½ h.p.; it is horizontal and of special design, working on the two-cycle principle, the only moving parts consisting of the piston, connecting-rod, and crankshaft, no cams, eccentrics, or rocking shafts being employed. The exhaust or induction valves work automatically; the combustion is claimed to be absolutely perfect and free from deposit or smell. Messrs. Gilbert inform us that a 6-h.p. engine of similar design was made and fixed in their works over two years ago, the valve and piston of which have never been removed or cleaned in any way.

The transmission is by belts and jockey pulleys to the differential countershaft, thence to the road wheels by Brampton's roller chain. Two powerful band brakes, worked by a foot pedal, and also tire brakes, are provided. The tires are of the

North British Rubber Company wired on section. Two speeds—four and fifteen miles per hour—are provided, any intermediate speed being obtained by adjusting a hand regulator, the motor being under the same control as a steam engine. The vehicle, the whole of which, including engines, frame, wheels, axles, body, etc., has been made at Messrs. Gilbert's works, weighs complete with oil and water about 7½ cwt.

THE MERCEDES 35 H.P. RACING CAR.

IN our issue of December 15th we published a brief illustrated description of the new 35 h.p. Mercedes motor which has been adopted by the Daimler Motoren Gesellschaft, of Cannstatt, Germany. On page 773 we are able to give an illustration of the first car turned out from the Cannstatt works fitted with the new 35 h.p. four-cylinder engine. The car, as depicted in the engraving, is fitted with a light two-seated racing body, but the engine and gear being fitted on an independent frame, any kind of body can be fitted. The transmission mechanism follows the usual Cannstatt Daimler lines, a new feature being, however, found in the clutch, which is of an improved form, so arranged, it is claimed, that it cannot fire or slip.

FRENCH AUTOMOBILISM IN 1900.

(From our Paris Correspondent.)

WHEN looking back upon the final stage of the nineteenth century, through which we have just passed, not even the most enthusiastic advocate of the horseless vehicle movement can do otherwise than admit that both from an industrial and a sportive point of view French automobilism in the year 1900 has been a disappointment. Perhaps we had been anticipating too much, but the prospects for the year just concluded were so exceptionally brilliant that our expectations seemed fully justified, and certainly the circumstances which have prevented their realisation did not give at that period the slightest warning of their approach. Twelve months ago not a cloud was to be seen in the sky. The growth of the movement, rapid from the day of its birth, had made extraordinary advances during the year 1899, and indications of a continuation of this progress were everywhere apparent. The constructors were inundated with orders for existing and enquiries for future types, the carriage builders were working day and night to keep pace with their clients' requirements, and if a slight falling off of the interest in motor-cycles was apparent, this was more than compensated for by the daily increasing demand for *voiturettes*. The legislation, the public, and the press had alike the strongest sympathies with the automobile movement; indeed, not a single discordant element existed to mar the perfect harmony of the motor's life and prospects. Such, then, were the conditions prevailing when the year 1900 made its advent, and if they were favourable the outlook was even more so.

We had in prospect an international exhibition of gigantic proportions, bringing with it an influx of wealthy visitors, whose presence in the capital could not fail to exercise a most favourable influence upon the automobile industry. Although not without fears as to a possible restriction of space in the Exhibition proper, we had every reason to believe that if the authorities found themselves compelled to limit their grant to the new industry, they would then take steps to ensure the establishment of a special automobile annex in the heart of fashionable Paris, where the cars would be shown to the best possible advantage.

A series of automobile *courses* was also in contemplation, giving promise of exciting sport, and calculated to improve the car as racing has improved the horse. Commencing with the meets at Pau, Nice, and Salon, race would succeed race, until, after some nine months of sport, the annual hill-climbing contest at Gaillon would bring the season to a close. All the old-established and time-honoured events, such as Paris-Bordeaux, Paris-Roubaix, Paris-Lille, Paris-Saint Malo, Paris-Boulogne, and Paris-Ostend, would again take place, and in addition we were promised certain new *courses* commemorative of the Exhibition, and, above, all, the race for the Gordon-Bennett International Cup. Now could a racing enthusiast desire more? Certainly not more, perhaps, indeed, a little less, for one or two of the events seemed likely to be promoted rather for the personal gratification of the organisers than for the good of the automobile movement. But this was merely an impression, and the length and diversity of the programme more than justified our anticipations for a real sporting season; and, finally, we had in prospect a large number of competitions which would assuredly bring to light much that was new, and would furnish us with additional and valuable data. Competitions for light and for heavy cars, for electric, steam, and oil vehicles, for motor-cycles and for *voiturettes*, all were included, and by reason of the diversity of the regulations under which they would be decided, these contests would render the industry invaluable assistance from both a scientific and practical point of view.

Such, then, were our prospects twelve months ago, and considered in conjunction with existing conditions, I think that they amply justified our expectations for an exceptionally prosperous year. And now let us look at the realisation, or rather one should say the non-realisation of these bright anticipations. Taking them in the order we quoted above we commence with the Exhibition, the world's show, which was to do so much for the new industry. Our fears with regard to the allotment of space in the Champ de Mars section of the show were unfortunately only too well founded, for the authorities could not make a concession of anything approaching the dimensions asked for by the organisers of the automobile class, and consequently many firms were crowded out, while others were only able to exhibit a single specimen of their productions. The stands of even the leading houses were of modest proportions, and the cars, crowded together as they were, did not show to advantage. This was bad enough, but what was infinitely worse was the decision to instal the automobile annex at Vincennes. We had hoped for the Bois de Boulogne; we got the Bois de Vincennes!

result, and accordingly showed but little interest in the venture. They exhibited, certainly, but the vehicles to be seen on many stands were antiquated, and, moreover, dirty and neglected as they were, their appearance was far from attractive. Of course, a certain number of modern cars were shown, but no attempt was made to keep them clean, and they appeared on the stands just as they had come in from a trial trip, covered with dust and dirt. While in the French section there were at least some vehicles to be seen, the same cannot be said of all the foreign divisions. With the exception of Germany, who made a capital show, the foreign automobile element was infinitesimal; indeed, neither England nor Italy exhibited a single car. The result of this indifference was a truly desolate exhibition, likely to do more harm than good to the industry. Throughout the summer strenuous efforts were made to attract the public by means of *fêtes*, gymkhanas, etc., and while some of these festivities were successful enough, the spectators were not of the automobile buying class. No, it was rather the *petit bourgeois* and the *ouvrier* who attended these *fêtes*, and from them the automobile industry reaped no pecuniary advantage whatever. Practically, no

THE CANNSTATT-DAIMLER CO.'S 35 H.P. "MERCEDES" CAR. (See opposite page.)
 (Cliché de) (L' France Automob.)

Situated in a neighbourhood of indifferent repute, the Bois de Vincennes is far removed from the fashionable quarters of Paris, with which, moreover, it has no convenient means of communication. Its only recommendation for an exhibition is its extensiveness, and this quality is possessed to the same degree by the Bois de Boulogne, where unquestionably the automobile annex should have been installed. Had it been located there, I am confident that exhibitors would have had a very different experience to that which they passed through at Vincennes, and that to-day they would be able to look back upon the big show with some degree of satisfaction. Here we have a vast park placed right in the heart of fashionable Paris; there we have another, situated in the East end of the capital, and the second is selected for the display of an *article de luxe* like the automobile. What folly! Apparently the authorities were imbued with the idea—laudable enough in itself—to give to the East-enders a share of the year's festivities, but in selecting the automobile for the purpose they entirely ignored the interests and the requirements of the new industry. Once this decision was made public, exhibitors knew that little or no business would

business, therefore, was done at Vincennes, and even at the Champ de Mars matters were not very prosperous. It is really difficult to explain why in the latter section the results were not more satisfactory. Early in the year, when the Parisian was at home, the show was incomplete, and many people went no further than the pleasant promenades by the side of the Seine. Then, later on, when the Parisian had left the capital, the heat was so intense under the glass roof of the show, that the foreigner was prone to scamp his inspection of the exhibits in order to get back to some cool spot where, comfortably installed with a smoke and a drink, he could listen to the music and watch the crowd. Whatever may have been the reason, the fact remains that the business done did not fulfil anticipations, and that with but few exceptions exhibitors were greatly dissatisfied with the results of the show. Having occasion to make almost daily visits to the automobile section, I was able to keep myself *au courant* with the progress of affairs, and the almost invariable reply to my inquiries was, "We are doing very little." So much, then, for the Exhibition; let us next look into the other events of the year.

(To be continued.)

CORRESPONDENCE.

MOTOR PATENT MATTERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In connection with the British Motor Traction Company, Ltd.'s warning concerning infringements of Maybach's Patent No. 16,072, A.D. 1893 (amended), for a float carburettor, the accompanying drawing and extracts from G. Wilkinson's Patent No. 10,051, A.D. 1890, which expired in June, 1894, are of interest. The drawing shows a constant-level carburettor with jet practically the same as the "Maybach" except that the jet is turned upside down and has a needle valve in it to regulate the amount of hydro-carbon sucked through.

Wilkinson in his Patent states: "I arrange the connections between the apparatus and the engine or motor so that the suction of the piston or pistons produces a partial vacuum in the receiver D."

Also, "The liquid hydrocarbon is supplied from a tank or reservoir, or other device whereby a head or pressure may be maintained to a vessel or chamber E by means of a pipe k. The orifice of the pipe k may be coned to form a seating for a valve attached to the top of a float within the vessel E, so that a level or head of liquid is maintained therein. I do not employ the vessel E in all cases, but may adopt any other method of

or means for maintaining an approximately equal and regular pressure or head of liquid hydro-carbon. The float, valve, and seating are shown by the dotted outline. From the vessel E, or its equivalent, the liquid hydro-carbon is conveyed to a nozzle P upon the cover G, from which the flow is regulated by means of a tapered plug c provided with a screw thread to allow of said regulation. The fine jet thus obtained impinges upon a conical diverter d within the mixing chamber C, and is spread and diverted thereby, becoming partially mixed with the air entering at the orifice F."

And his first claim is for: "The method of, and means for, atomising and mixing liquid hydro-carbon with air at normal atmospheric pressure, for motive power purposes; the current of air, liquid and mixture being introduced by the suction of the piston or pistons of a motor substantially as herein described with reference to the drawings."

Compare this with Maybach's claim No. 1. "The method of producing the explosive mixture in hydro-carbon engines, consisting in sucking liquid hydro-carbon out of a nozzle cl fed from supply basin a by pipe c and extending into connection b2 between air inlet channel bl and mixing chamber b, said sucking being performed by the air sucked by the working piston through said channel bl, connection b2 and mixing chamber b, and the

level of the hydro-carbon within basin a being kept on the same height by a swimmer valve d, acting on the main supply tube e, substantially as described."

One has only to substitute the lettering used by Maybach in the above claim for that used in Wilkinson's specification, and it is seen that they are identical. It is difficult, after this, to understand how the Maybach patent of 1893 prevents anyone, who chooses, using a constant level float and jet carburettor as described by G. Wilkinson in 1890. The lower portion of Wilkinson's drawing (not reproduced) shows method of heating the mixture before it enters the cylinder, and does not affect the matter in question.—Yours faithfully,

T. B. BROWNE.

WATER IN CRANK CHAMBERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In clearing out the oil-containing crank chamber of the motor on my De Dion trike the other day, I was surprised to find a large quantity of water flow out with the oil. I have been puzzling over this, but cannot understand where the water originally came from and how it got in the crank chamber. Perhaps some motor-cyclist who has had a similar experience can give an explanation.—Yours truly,

LUBRICANTOS.

THE BURSTING OF IGNITION TUBES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have lately driven a 6 h.p. "Daimler," and have had several ignition tubes burst. What is the reason? Is it (1) too much pressure, (2) poor platinum, or (3) not put in properly? It is the left tube that gives the trouble. The right one has not had anything the matter with it for nearly six months. Can any of your readers inform me what is the cause of the bursting? I am only an amateur, having only driven a motor-car since last Easter.—Yours truly,

PILOT.

QUERIES RE BELT-DRIVEN CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Perplexed," as an engineer of considerable experience, I should say that a lace belt is preferable to any metallic fastening that can be produced, as the laces will give and not break out the holes like metal hooks. The best way to do this is to cut the belt and allow about an inch when pulled as tight as possible with the bands round the pulleys, the ends to butt when laced; then make three holes in the ends to correspond with each other, about half an inch from the edge, making all crossings on the outside. Let the lacing go through the holes twice; then, to finish off, cut a small slit in the end of the lace, pull the other end through and slit it each side, which will make it fasten off in the slit cut in the other end, "Perplexed" will find this to make a neat and strong joint. The belts can be obtained at any engineers' stores.—Yours truly,

F. C. GRIMSLEY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—On my small Benz car, over a distance of about 15,000 miles, I found the usual iron clips answer admirably, but they had to be fixed very true and well riveted through the other side. I now have a 7 h.p. Victoria, and find in this case belt lacing is best, and if "Perplexed" will obtain from a good harness maker a yellow thong, the best kind of which should be very oily, he will find this most thoroughly reliable. If he likes to call at 12, Sussex Street, Pimlico, I will show him the best way to use it.—Yours truly,

H. COVE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of the 12th instant Mr. A. J. Aldred, replying to Queries re Belt driven cars, recommended a belt of "best orange tan" for the top speed and a Dick's canvas belt for the low speed. Will Mr. Aldred kindly say why a Dick's canvas belt should not be used for the top speed?—Yours faithfully,

C. TAPLIN.

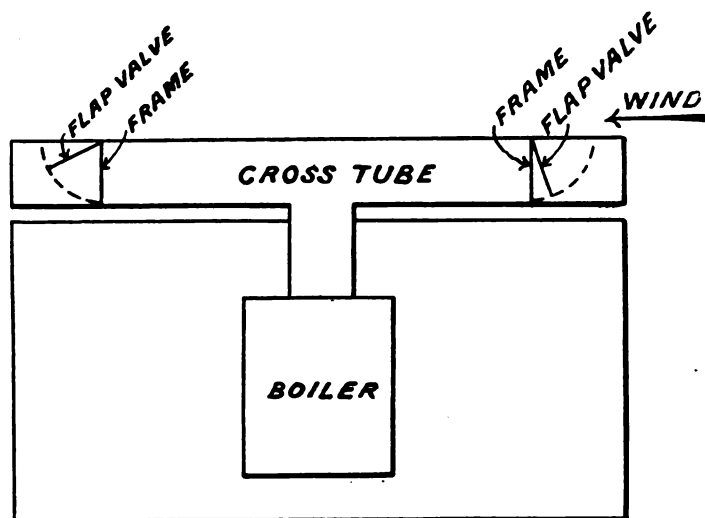

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With regard to belts, fasteners, etc., "Perplexed" will do well to apply to J. Roberts and Co., 135, Minories, E.C., who supply a leather belt specially prepared for his purpose, and joined by clips, copper rivets, wire, or strong lace sewn as he may desire. The work and the materials he can thoroughly rely on speaking as I am from actual experience, being the owner of a 3 h.p. Benz car.—Yours truly, "ONCE PERPLEXED."

THE PREVENTION OF "FIRING BACK" ON LOCOMOBILES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—When reading Mr. Egerton's interesting article in your issue of January 5 I noticed that he had trouble with the "firing back" of the burner of his Locomobile, and it occurred to me that it might be of interest to him and other users of this type of vehicle to know that this trouble can be prevented by a very simple arrangement. In August last, after several ineffectual attempts to prevent "firing back" on the vehicle I have in use, I thought it would be well to try the effect of the mica flap valves commonly used for the ventilation of rooms in buildings. I made a new sheet-iron cross tube of rectangular cross section, and introduced a small brass frame carrying a hinged mica flap opening outwards about six inches back from each end of the tube, somewhat as shown roughly on the accompanying sketch. It will be seen that a wind coming from, say, the right, closes

down the flap on the right-hand side, leaving a free passage for the products of combustion through the open valve to the left, and *vice versa*; and I have found this arrangement quite satisfactory in preventing "firing back," and the consequent trouble, with burnt gauzes, etc. This arrangement has not been patented and may therefore be fitted by anyone.—Yours truly,

J. A. B.

MOTOR-CARS FOR MEDICAL MEN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I regret that Mr. Truman should think that I had any idea of "crushing" him; I assure him I had not. If I may trouble him to refer to my letter he will see that I said: "The motor wanted by a medical man is identical with that required by a commercial traveller, with the exception of a few minor details." By the minor details I meant such matters as, for instance, space for samples, which have nothing to do with the motor proper, and are mere matters of coachbuilding.

In my list of requirements I forgot to mention cogs always in gear. If not trespassing too much upon your space, I will condense and revise these as follows:—Engine, 5 h.p.; tonneau body; water cooled; cog-wheel transmission, cogs always in gear; tube

and electric ignition; artillery wheels, and solid rubber tires; roller bearings; central lubrication; hood removable; seat starting handle.

I see no reason why a carriage of the above type should not be built at a moderate price, say £230.—Yours truly, W. W. HARDWICKE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a medical man who has had practical experience of a motor-car for a period of sixteen months, during which time I have covered more than 6,000 miles, I may perhaps be permitted to join in the correspondence which Dr. Hardwicke and Mr. Truman are contributing to your valuable columns. To be precise, I do not know whether my vehicle should be called a "car" or a "voiturette," anyway it is a most efficient vehicle for use either by a doctor or a commercial traveller, unless the latter desires to carry very bulky samples. It is a 5 h.p. Marshall, and I have run it daily, with very few exceptions, ever since I have had it. The roads in my district are both hilly and, usually, very muddy. I cannot choose my days, but must turn out, rain, snow or high wind; but with a leather apron which I have had fitted, I can comfortably defy the worst of weather. I do not like a hood, though the makers fit a very neat and effective one. I did not use a hood on my horse-drawn carriages—but every one to his taste. I have had very little trouble with belts composed of rubber and canvas; they stretch and require taking up when new, but after the first week or two they will run for months without attention. I have a leather guard to protect the belts from wet and grit. It is a pity that some thoroughly efficient method of protecting the chains has not yet been introduced. I have ascertained, by experience, that chains cost nearly 1d. per mile. The electric ignition has never given me any trouble. The cells supplied with the car ran down very soon, but I effectually remedied this by getting woven-glass accumulators from Mr. Van Raden, with which I am perfectly satisfied.

I am pleased to say that, although paint and polish are beginning to look slightly the worse from the rough use and bad weather to which the car has been subjected, the car is not only running as well as ever it did, but, truthfully, better. It is strong and well made for every-day use. As to speed, I do not propose to enter it for the Gordon-Bennett Cup, but it amply satisfies me, for I can easily manage to do the *full legal limit* even in this very hilly district.

With the exception of the pneumatic tires and the chains, the upkeep of the car has been insignificant, and including both these items there is a very substantial saving as compared with horse traction. When one can get a day or half day for a run into the country there is no tired horse to consider, even if there were no other advantage in the possession of a motor-car by a doctor; then is the time that the full advantage of this form of locomotion impresses itself upon one. Those who have experienced this double gain, to pocket and to enjoyment of life, as I have done, can never think of again returning to the use of the now superseded hay motor.—Yours faithfully,

FRED. FARROW.

MOTOR-CARS FOR PUBLIC SERVICES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I attended and took part in the discussion on Mr. Outhwaite's paper on Motor-cars for Public Services, on Wednesday, the 9th inst., at the Automobile Club. Being one of the early pioneers of the motor industry, especially on public and other service work, and having had a fleet of cars running in various parts of the eastern counties for the past three and a half years, the subject is one in which I take a great interest. I was especially interested to hear of the successful working of one particular car, which Mr. Bell, of Bournemouth, specially mentioned. The details he gave were, I believe, as follows:—He described this particular car as carrying eight passengers with driver; that it had run about 22,000 miles; had carried nearly a million passengers; and had earned over £600. This is good; but what struck me was the reported cost of repairs to the car

during the period in which it had performed this work and which amounted to the small sum of £29 only. I am fully aware that no two cars are alike, and although my own are not second-rate cars, but are built by the best makers in the kingdom, I have never been able to run a car, probably not half this distance, at such an exceptionally low working cost, and which, I must confess, appears to me to be an almost utter impossibility. Of course a deal depends on the route over which the car travels, but, from my own experience, the cost of tires alone would greatly exceed the amount mentioned by Mr. Bell for the whole working. I find a set of tires for a similar type of car to Mr. Bell's would cost roughly about £10 to £12, the average life of same, on good routes and free from tram lines, being 3,000 to 4,000 miles. Thus it will be seen, taking it that a set of tires will last 4,000 miles, and putting it well on the right side, the cost of tires would greatly exceed Mr. Bell's repair quotation. Over and above this expense there would be other repairs to a car running such a distance, although I must admit the tires form the one great item. As this is a question affecting a large number of public service companies, perhaps Mr. Bell will kindly state what tires were used.

Yours faithfully,

FRANK MORRIS.

THE POLICE AND SPEED.

TO THE EDITOR OF THE *Motor-Car Journal*.

SIR,—With regard to your Continental correspondent's remarks on this subject in your last issue, I think many motorists can give you cases where the speed mentioned (sixty-five miles) has been greatly exceeded by riders in England, in the estimation of the police. Personally, I have been told I have gone at the rate of eighty miles an hour, up hill, through traffic, and on a $1\frac{3}{4}$ h.p. De Dion tricycle! As the case may be of interest I give the circumstances below.

Last June I rode down from London to Hastings to join my wife. My stock of petrol being nearly consumed I was making my way towards Bohemia, which is rather a stiff ascent from the Memorial, in Hastings, at a speed I considered within the legal limit. I had gone about 300 yards from the Memorial when I noticed the horses of a pair horse carriage evidently meaning mischief. I knew also the occupant of the carriage as a doctor attending a patient lying ill in the same house at which I was staying. I decided to turn back so that the carriage could get well in advance, and returned leisurely to the Memorial, where I was stopped by a policeman on duty there who accused me of going at a speed of eighty miles an hour! I smiled, and thought he was joking, but soon found he was in earnest; there was the usual crowd and he began to call for two or three witnesses to prove his statement. But not wishing to have a compulsory stay I used my best endeavours to satisfy him, succeeding so well that I got away with a serious caution from him, he stating he should charge me next time I went at that rate.—

Yours truly,

W. HAYES.

TROUBLE WITH GEARING OF MOTOR-CYCLES.

TO THE EDITOR OF THE *Motor-Car Journal*.

SIR,—Having experienced a great deal of trouble with the gearing of motor-tricycles and quads, I seek a little advice about the same through your valuable journal. I cannot get over the grinding noise of the gearing. I fitted new gears and differential wheels, but after a few miles run I found them no better—the only ones that do not trouble me are not fitted in a case—they have been well lubricated, but this has not improved matters. Any assistance will be greatly valued by

Yours truly,

GEAR CASE.

AXLES AND BEARINGS FOR MOTOR-CARS.

TO THE EDITOR OF THE *Motor-Car Journal*.

SIR,—I read with much interest the account in your last issue of the run from John O'Groat's to Land's End on a Locomobile. I noticed a mention that one of the ball races on the axle went wrong, this being afterwards filled with grease, the car running 600 miles with a plain bearing without trouble. In my opinion it would be a great advantage, especially when travelling over

rough roads, if Collins or mail axles were applied to motor-cars, with hubs made to suit the same. In the first place they could always be kept lubricated and free from dirt; secondly, these can be taken off in a few minutes; thirdly, wheels could be washed with safety without water getting into bearings,

Yours truly,

W. BOBBETT.

THE DURABILITY OF MOTOR-CARS.

TO THE EDITOR OF THE *Motor-Car Journal*.

SIR,—I see you ask for records of cars. I received my Y.M.C.M.C. Jackson car on November 3rd. It is fitted with a double-cylinder $4\frac{1}{2}$ h.p. motor. I have only had three fine rides since I got it; I have run a total of 530 miles, the amount of petrol used being twenty-four gallons, which is not bad, considering the state of roads and the hilly country in the Harrogate district. The cost of repairs has amounted to 10s.; ignition tube burst, 6s.; a cotter-pin came out of the starting handle, and the clutch on starting handle was defective and had to be replaced. The longest run was from London to Bradford—210 miles in eighteen hours running time. I should mention that it was raining the whole way and the roads were covered with mud and new metal. The cooling water lasts for weeks, while the lubrication wants attention about each twenty-five or thirty miles. Dunlop tires are fitted to the car, and I have had one puncture, caused by a sharp flint in the dark. The tires have only once been blown up since put on.—Yours truly,

JAS. EDW. TUKE.

THE NUMBERING OF MOTOR-CARS.

TO THE EDITOR OF THE *Motor-Car Journal*.

SIR,—May I be allowed to suggest that the ordinary carriage licence that motor-car drivers are compelled to take out yearly should be affixed to the car in a small slide, locked with square hold catch, easily opened by key or penknife? This would

serve a double purpose, shewing as it would the proper name and address of owner of carriage, and also that same was duly licensed. At the same time the order should also apply to the hay motor. The slide could be made as per accompanying sketch, something after the style of an ordinary dark slide, and affixed to any available part of the car by two small brass sets; the licence could then be pasted inside same.—Yours faithfully,

FRANCIS J. WATTS.

WANTED; A MOTOR WHEEL.

TO THE EDITOR OF THE *Motor-Car Journal*.

SIR,—Considering the present high price of motor-cars which are principally used for pleasure, would it not be a good move if

the commercial classes were catered for a little more? And unless the trade can compete with the horse-drawn vehicles in price such great alterations are not coming as some people seem to entertain. Take an ordinary man in business who uses a conveyance for the carrying on of such trade, doing all that is required. Does anyone seriously think that he will change his mode of cartage for one costing probably more than four times the amount, although it may be able to run continuously? You will have to convince him through his pocket before any great headway is made. Surely some of our English manufacturers (before it comes from elsewhere) can rise to the occasion, and if not possible on existing lines, why not try other means?

Without going into details, is there any reason why an engine placed on two wheels or on one, with little or preferably no gearing, the various speeds to be obtained by braking, and use of a quick-acting clutch, could not be sold at the price of a good horse? Such motor wheel should be used in the ordinary dog-cart.

Besides a motor pulling, little or no vibration would be felt. No doubt many will say this is unsightly and not practicable, that the wheels would slip, and so on. But for light delivery carts and for carrying two or more persons, or equivalent, these obstacles might be cast on one side. To the man with limited means, either for business or pleasure, such a cheap motor wheel would appeal to the million, and be more convincing than all the arguments hitherto brought forward.—Yours truly,
J. BROWNLOW.

MOTORISTS AND HORSES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—When a man rushes into print, as has the Marquis of Granby, with the statement, "As for a motor-car being stopped because of a nervous, frightened horse, such an event has, I fancy, never happened yet. . . . At any rate I have never heard of or seen such a kindly act on the part of a motor-carist," it is certainly time light should be thrown on the matter from the other side of the question. The term "abominable conveyances," employed by the Marquis in another part of his letter to the *Field*, is at once uncalled for and undeserved, and expresses merely his personal opinion of a machine of the construction of which he is absolutely ignorant, and the advantages of which he blindly ignores. Apart from the inference conveyed by his remarks—that drivers of motor-cars do not possess the ordinary instincts of gentlemen—one would ask on what his lordship bases his statements. How many cars has he passed when riding or driving, and in how many instances has the driver failed to "go steady" or "pull up" when signalled to do so? Again, is his lordship writing on behalf of the horse-driving world, or expressing his private "fancy" or the "hearsay" of his anti-automobilistic friends?

Writing from the standpoint of an automobilist who has driven motor-cars some thousands of miles on English roads, and being personally acquainted with all the chief motorists in this country, I can thoroughly substantiate the reply given by Mr. Claude Johnson, the secretary of the Automobile Club, to the statements made by the Marquis of Granby. Last year I had the honour of being the first to take Lord Alverstone, the Lord Chief Justice, for a drive on my car. On our way to Kingston, through Richmond Park, we met a lady and gentleman in a light buggy with a spirited horse. When about a hundred yards from us the driver held up his hand, and I immediately applied the brakes and stopped both car and engine. The next few seconds quickly revealed the absolute incompetence of the man on the box seat to handle his horse. Jumping down from my seat I went to the horse's head, and, walking between him and the car, led him by. Immediately this "gentleman" (?) had passed, he submitted us to a storm of abuse, and parted with the advice "to take it home and burn it." In this instance I only did what I have personally seen many drivers of cars do when I have been cycling or on foot.

Turning now to the statement made by Mr. Johnson that the holding up of a hand by a driver "is frequently misused for the purpose of their annoyance by drivers whose horses are by no means restive," the following instance will clearly prove the cor-

rectness of his remark. I happened to be on a visit to Lord Wolverton, at Queensberry House, Newmarket, a few months ago, and taking a car down there at his request, we were constantly out driving in the neighbourhood, often meeting dozens of very valuable yearlings and race-horses. My experience proved conclusively that the higher the breed the smaller the trouble in encountering a motor-car. On one occasion, Lord and Lady Wolverton, Lady Stanley, and myself set out for Cambridge, Lady Wolverton being at the helm. Being market day we met some dozens of conveyances, and owing to drivers repeatedly raising their hands we were delayed some thirteen minutes on the road. In five out of seven of these instances it was the driver of the conveyance, and not the horse, that was "terrified." I have spoken with several well-known gentlemen—owners of both horses and motor-cars—who have experienced similar incidents. Any unprejudiced person can see from the foregoing statements that the scales are somewhat evenly balanced, and, if anything, in favour of the motor-car. It would, of course, be incorrect to state that no drivers of motor-cars have been guilty of the offence for which they are blamed, but I should be sorry to say that all are alike. Why should motorists, as a body, be accused of deeds for which one or two "black-sheep" should be held responsible.—Yours truly,

MONTAGUE GRAHAME WHITE.

DEFECTIVE ELECTRICAL IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having, like many other readers of your esteemed paper, been for some time a sufferer through defective electrical ignition, principally on account of the difficulty in getting my accumulator charged, and the delay occasioned thereby, I was induced, like many others, to try a set of dry cells, also some primary cells that were advertised, but finding them impracticable, I had again to fall back upon my accumulator. A few days since a friend of mine introduced to my notice a set of Boron batteries which he had purchased. Somewhat dubious after so many failures, and having spent a lot of money through noticing puffed advertisements, I at length, somewhat reluctantly, ordered three batteries for charging the accumulators of my voiturette. The satisfaction I received from them was more than I had anticipated. I have now no trouble in charging my accumulators in a few hours, and always take the cells with me when touring. I have no intention to advertise the Boron Battery, as I have no interest in them, and state my experiences in the hopes of benefiting any brother motorist who may have encountered similar difficulties.—Yours truly,
(REV.) H. H. HIGGINS.

IN reply to Mr. Estcourt, "Cush" writes that "M. E. Delamare Deboutteville's address is: Fontaine le Bourg, near Rouen, Seine Inférieure, France. His carburettor—for a water-cooled motor—I believe to be the best made."

MR. MONTAGUE S. NAPIER writes us as follows: "I notice in your issue of the 5th inst. a letter from Mr. C. Friswell, in which he suggests that my firm is financed and directed by Mr. Harvey Du Cros. I desire to state that this is not the case. I am the sole owner of the business carried on as D. Napier and Son, and I have never received any pecuniary assistance from Mr. Du Cros. My only business connection with this gentleman has been through selling cars to himself and Mr. S. F. Edge in partnership."

MR. C. FRISWELL writes: "Referring to the answers to my query, which evidently Mr. Elderfield, Mr. Osborne, and Mr. Jarrott think it easy to fence round the name of Du Cros, they seem to forget that I added 'the Lawsonian Group.' However, as nothing turns on it except that which is common property, I do not wish to further trouble you."

THE opening of the cycle and motor exhibition in the Grand Palais, Paris, is fixed for Monday next, the 21st inst. The exhibition will remain open until February 10.

THE Union Automobile of Paris will give a banquet in Paris on the 23rd inst. in celebration of the election of M. Léon Serpollet as a *Chevalier* of the *Légion d'Honneur*.

The Vinot-Deguingand Motor-Car.

FIG. 1.—GENERAL VIEW OF CAR.

IN between the voiturette class of automobile and the high-powered type, such as the Panhard and Mors, a new variety—light cars fitted with a motor of sufficient power to take hills without any great diminution of speed—is steadily

coming into vogue in France. An example of the new type of car is the Marot-Gardon illustrated in our issue of the 15th September last. The accompanying illustrations show a new car recently put on the French market—the Vinot-Deguingand—which may be classified in the same category. The

frame of the car, which is slightly wider at the rear than at the front, is entirely built up of channel steel, and is spring-suspended on the axles at both front and rear. It carries the whole of the motor and transmission gear, thus forming a complete under-carriage to which any form of carriage body can be fitted. Fig. 1 shows a two-seated duc fitted with a detachable tiger seat at the rear.

The motor (Fig. 2) is of the two-cylinder vertical type, using petrol as fuel. The cylinders have a diameter of 85 mm., and the

FIG. 2.—GENERAL VIEW OF MOTOR.

stroke is 130 mm. Running at a normal speed of from 750 to 800 revolutions per minute, it indicates 5 h.p. The cranks are set at an angle of 180 degrees to each other. The pinion controlling the second motion or exhaust-valve control shaft is mounted centrally on the crank shaft within the oil-containing case. Two fly-wheels are provided. The inlet and exhaust valves are contained in the same casing, one above the other, in such a way as to be readily accessible. Both the cylinders and the explosion chamber are water-jacketed. The circulation is maintained by a small

FIG. 3.—VIEW OF FRONT OF CAR WITH BONNET REMOVED.

stroke is 130 mm. Running at a normal speed of from 750 to 800 revolutions per minute, it indicates 5 h.p. The cranks are set at an angle of 180 degrees to each other. The pinion controlling the second motion or exhaust-valve control shaft is mounted centrally on the crank shaft within the oil-containing case. Two fly-wheels are provided. The inlet and exhaust valves are contained in the same casing, one above the other, in such a way as to be readily accessible. Both the cylinders and the explosion chamber are water-jacketed. The circulation is maintained by a small

pump, the heated water passing through a radiating coil ere it returns to the tank at the rear of the frame. Electrical ignition is employed, and by means of the timing arrangement the speed of the engine can be varied between 300 and 1,000 revolutions per minute. The timing device comprises (1) a fibre cam carrying a metallic sector in communication with a part of the engine, and (2) a plate on which are fixed two insulated springs, bearing continuously on the cam. The two springs are connected with the primary wire of the induction coil, and each time the metallic sector comes in contact with the insulated springs a spark is produced in the cylinder corresponding to the spring.

FIG. 4.—PLAN OF CAR.

As will be seen from Fig. 4, the engine is located under a bonnet in the fore part of the frame. On one end of the motor-shaft is carried a wide pulley, the power being conveyed by a single belt to a fast and loose pulley on a short counter-shaft at the rear of the differential shaft 9. Three speeds forward—10, 20, and 35 kilometres per hour—and a reverse motion are provided. The variable speed gear consists of a train of spur wheels on the countershaft, any one of which can be made to mesh with corresponding pinions on the differential shaft. The variable gear, which is controlled by a single hand lever at the driver's side, works in an oil-containing case of aluminium. From the differential shaft to the rear axle the power is conveyed by the usual duplicate set of sprocket wheels and chains. Provision is made for taking up any slack or wear of the latter. No friction clutch is employed, the motor being thrown out of gear by means of a foot-pedal, the depression of which shifts the driving belt on to the loose pulley.

A foot pedal actuates a band brake on the differential shaft,

while there are band brakes, operated by a hand lever, on drums attached to the hubs of each of the rear wheels. In conjunction with the foot-pedal is fitted a device by means of which, on the application of the brake, the ignition is retarded, thus preventing any racing of the motor. Steering is controlled by an inclined hand-wheel, while the wheels are of wood shod with pneumatic tires. The car, which is made by Messrs. Vinot and Daguinard of Puteaux, France, weighs complete about 10 cwt.

HERE AND THERE.

A MEETING of influential traders and ratepayers of St. Pancras has been held to consider the question of widening the Hampstead Road at its junction with the Euston Road, and a committee, including representatives from all the large business houses in Tottenham Court, Euston and Hampstead Roads, was formed with a view of bringing the matter before the London County Council as a metropolitan improvement. It was resolved to urge the movement forward by every legitimate means, and to call a public meeting at an early date. The congestion of traffic at this corner is now so great that it is of the utmost importance that something should be done to relieve it, and the matter is likely to become prominent before the public between now and the County Council elections in March next.

THE Hozier Engineering Company, Ltd., of Bridgeton, Glasgow, has been appointed agent for Scotland for the M. M. Company's 5-h.p. motor.

AMONGST the novel features of the motor competitions that will be carried out at the Crystal Palace by the English Motor Club on April 27th, will be a section for cars driven by ladies. There are so many ladies now driving cars that this should prove one of the most interesting items of the afternoon's sport. There will also be a section for steam cars, and in all probability one for electrical vehicles.

It is proposed to hold an automobile show in Reading during March next under the auspices of the Reading Automobile Club, which numbers over fifty members. It is intended to make the show, which will be held in the Reading Corn Exchange, a representative one, and to include exhibits of all forms of motor-vehicles and accessories.

WE hear that the Motor Manufacturing Company, Ltd., have entered a vehicle for the 1901 Gordon-Bennett Cup race. Messrs. Charron, Levegh, and Girardot have been selected to represent France in the race, Messrs. Huillier, Pinson, and Giraud being named as "reserves."

THE Anglo-American Oil Company have recently introduced a new screw stopper for the rectangular tins in which they supply Pratt's motor spirit. It was found that there was a difficulty in unscrewing the screw stoppers, which are necessarily screwed up very tightly. The new stopper is provided with slots into which a coin or any other article may be inserted and the stopper easily removed.

THE AUTO-STEAM GENERATOR SYNDICATE, LIMITED, has been registered with a capital of £5,000 to carry on the business of cycle, vehicle, and launch builders, &c.

AN inquiry was held at Congleton recently into the circumstances attending the death of John Booth, aged thirty-four, who was driving his horse and cart when the horse shied at an approaching motor-car. Mr. Booth was thrown from the vehicle and received injuries which resulted in his death. The jury returned a verdict of accidental death, exonerating Dr. Bowman, the owner of the motor-car, from all blame, and handed over their fees for the widow. Dr. Bowman intimated that he would show his sympathy with the widow and family in some practical way.

TO THE KLONDYKE BY MOTOR-CAR.

WHEN the little coasting steamer "Cutch" left Vancouver on one of her regular voyages to Skaguay last March, her manifest bore an item which had never appeared there before. It was "one automobile," of which M. E. Janne de Lamare was consignor and consignee. After the ship's arrival at Skaguay the cargo was, states the *Automobile Magazine*, transferred to the freight-cars of the new Yukon and White Pass Railroad, and a few days later the first automobile in Alaska rolled out upon the ice-crusted lake at Bennett. The machine carried two persons, one being M. de Lamare, who owns one-third of the town site of Atlin, B.C., the other his friend-chauffeur, M. Raphael Merville, a young French record-making motor-cyclist of last year. M. de Lamare and his friend returned to Alaska from the United States after developing a long-cherished plan for the employment of an automobile as the method of rapid transit to the Klondyke.

As he had traversed three times previously the 640 miles which separate Bennett from Dawson City, M. de Lamare entertained no illusions in undertaking the journey in an automobile. In point of fact, after a review of the situation, embracing the low and limited construction of their vehicle and the arrival of an unusually early northern season, both adventurers entertained considerable doubt as to the complete success of their expedition. The arctic auto-

ARRIVAL OF MESSRS. DE LAMARE AND MERVILLE IN THE FIRST MOTOR-CAR AT ATLIN, B. C.

mobilists arrived in Bennett the latter part of March, and though the thaw in former years did not begin until the middle of May, they learned that many of the streams further north were beginning to break. This was unwelcome news, as the Fifty Mile river, which lay in that direction, had been chosen as the best automobile course northward after leaving Lake Tagish.

The itinerary from Bennett follows: North on Lake Bennett to Cariboo Crossing, situated at the end of Lake Bennett, to Windy Arm, to Naies Lake; thence to Tagish Lake; thence to Tagish, at which point the Fifty Mile river enters Lake Tagish, northward on the Fifty Mile river to Miles Canon Pass, to White Horse Rapids, which never freeze. The route continues to Lake Lebarge, to Lewes River, by which Fort Selkirk, the future official capital of the Yukon Territory, is reached. From Fort Selkirk the course is over the Yukon River, by which the voyagers intended to descend to Dawson City.

The machine employed in the experiment was a three-wheel voiturette of the Bolleé type of 3½ h.p. The vehicle, which may answer all requirements on a good road and in a milder climate, failed to realise all that was expected of it in the Alaskan journey. As mentioned above, the carriage was low in construction, the foot-board of the trailer and the motor, which was attached to the rear wheel, being within a few inches of the

traction-base. After a few days in Bennett the *chauffeurs* left the little mushroom city followed by the shouts and the "good lucks" of the townspeople, who turned out *en masse* to watch the start of the carriage.

Learning of the open condition of the streams in the upper country, M. de Lamare found it necessary to change his original plans. It was at first intended that the commissariat and supply of fuel should be drawn on a sled attached to the rear of the machine. With a view to the probable speed of the vehicle and the unusually bad condition of the route, this plan was abandoned as impracticable. It was then proposed to proceed without the supply of provisions and depend on a possible meeting with prospectors or Indians, but that plan also was put aside, as the store of petrol was not to be ignored. As there was not an inch of unused space on the carriage the *chauffeurs* were compelled to engage a native with sled and dogs to follow with the provisions and fuel as best he might.

For the first few miles the lake-trail was good, and it was not until the vehicle had covered fifteen miles that the suggestion of subsequent difficulty presented itself. At this distance from Bennett the trouble of the *chauffeurs* began. Huge snow-drifts which freezing under a temperature of 52 deg. below zero at night became brittle on the crust under the sun's rays. In some places where the snow had been blown away, leaving the ice visible, water to the depth of two and sometimes three inches was encountered. But in spite of these obstacles the little machine maintained a speed of 15 miles an hour. The uneven trail made by the half-frozen drifts caused the vehicle to "kick" and "shake," performances holding forth no bright promise for the long survival of the motor. After many shocks and jars, each of which seeming to be the last, the hardy motorists reduced the speed of the carriage one-half. The trail became worse and worse, and when the expedition had put 22 miles behind, the solder broke away from a portion of the petrol pipe, which was swathed in strips of flannel to exclude the cold. A leak resulted, and the fluid running out on the fabric took fire. This necessitated a stop, and by the use of snow the flame was extinguished. As there was no solder at hand to repair the rupture, the repair was made by winding wire around the injured portion. This operation occupied two and a half hours, after which the outfit slowly and carefully proceeded to Cariboo Crossing, 28 miles from Bennett, arriving five hours later. At Cariboo Crossing a blacksmith was found and the machine was repaired *à la* Klondyke. At this point M. Merville, who, suffering from exposure resulting from the halt for repairs on the lake, fell ill, and the adventurers remained at Cariboo Crossing for the night. During the night the commissariat came up, and M. Merville having recovered sufficiently to proceed, the expedition set out on the following morning on the second stage of their journey. Though the running during the day cannot be described as "smooth," the trail was not as slushy as that of the previous day. Passing Windy Arm, which is a small peninsula a few miles north of Cariboo Crossing, the automobilists drove out across Naies Lake, which, at its northern extremity, joins Taku Lake in the east and Lake Tagish in the west. Few of the motor-wrenching hillocks of the day before were encountered on Naies Lake, and for the greater part of the way its surface was as smooth as glass. Due to a lowering of the temperature the pneumatic tires remained dry, and the adjustment to the fore-wheels of a novel set of runners, included in the outfit, was found to be unnecessary.

Though M. de Lamare was in possession of knowledge concerning the probable condition of the Fifty Mile river, he hoped to reach it before a thaw, making auto-navigation impossible, began in earnest. Therefore, on reaching Tagish, after a rough and eventful journey across Lake Tagish, the voyagers were downcast on finding the river, which enters the lake at that point, open. This circumstance having defeated their purpose to reach Dawson, the intrepid automobilists determined to subject the machine to a further test by essaying a journey to Atlin, 83 miles from Tagish. Leaving Tagish the pair turned eastward, returning by the old trail to Naies Lake. Crossing Naies Lake they entered Taku Lake. The trail improved as they proceeded, and

during the night the machine at some points maintained a speed of 40 miles an hour by moonlight. Golden Gate, a small place situated on the west side of a peninsula separating Taku Lake from Atlin Lake, was the first objective point of the adventurers. Fifty miles had been covered, and at a time when the journey promised to be speedily accomplished the cap of the carburettor became dislodged and was lost on the trail. Without provisions and unable to proceed with the vehicle, the automobilists waited thirty-six hours for the commissariat to come up. After its arrival temporary repairs were made and they proceeded at a reduced speed to Golden Gate. From Golden Gate the trail on Atlin Lake was good, and on April 4th the automobile arrived at Atlin. In Atlin the machine was overhauled, and a few days later Messrs. Lamare and Merville started on the return trip to Bennett, where they arrived after a passage no less eventful than the trip out. The expedition was purely an experiment, and as such it cannot be said that it is without its good results. Before his departure for Paris, M. de Lamare made the statement that next year, in an automobile of 6 to 8 h.p. he will experience no difficulty in covering the 640 miles between Bennett and Dawson City in forty-eight hours.

THE MYTHOLM DOCTOR'S CAR.

HEREWITH we are able to illustrate a new light car which the Yorkshire Motor-Car Manufacturing Company, Ltd., of Bradford and Harrogate, have just put on the market. The vehicle, which has been named the Mytholm Doctor's Car, is propelled by a $4\frac{1}{2}$ -h.p. single-cylinder petroleum-

spirit motor fitted in the fore part of a cross-stayed girder frame; it is not located horizontally as usual, but at an angle of 25 degrees from the horizontal. The cylinder is $4\frac{3}{8}$ inches bore, and the piston has a stroke of $4\frac{1}{2}$ inches; the normal speed is 700 revs. per minute. The valves are so designed that the explosive charge passes over the head of the exhaust valve on its way to the inlet valve. The cylinder, together with the exhaust valve, is water-jacketed. Natural circulation from two oval tanks, placed in front, is employed, the use of pump and radiator being dispensed with. By means of the use of two tanks four cooling surfaces are obtained. Either electric or tube ignition can be fitted, while a Longuemare carburettor furnishes the explosive mixture.

Three speeds forward are provided, ranging from six to eighteen miles per hour. The variable speed gear is operated by a single hand lever, on the steering post. The power from the motor is transmitted to either of two equal-sized pulleys on an intermediate counter-shaft; a striking-gear throws the belt from the one to the other pulley and a jockey on the under (and slack) side of the belt serves to tighten it. The belt is short and wide; it runs at a high speed and is said to work without giving any trouble. Within the two pulleys, and enclosed in a dust-

proof and oil-retaining case, is an epicyclic train of bevel wheels one planet wheel only being fitted. The outer concentric wheel of this train (that nearest the frame) is securely held by an arm to the frame. This device provides three different speeds in the following manner:—When the belt is placed on the right-hand pulley it revolves, together with its sleeve, freely on the counter-shaft, but the planet wheel carried by it causes the left-hand pulley to revolve at twice its own speed. Since the two-way clutch provided is engaging with this latter pulley, the counter-shaft is also driven at twice the speed of the pulley which the belt is running upon. This is the high speed. In order to obtain the intermediate speed, the belt is moved on to the left-hand pulley. The counter-shaft then revolves at one half the previous speed. The low speed is brought into action by throwing over the two-way clutch, and this is effected by a connection between the striking gear and the clutch lever; when the striking gear moves the belt towards the left-hand edge of the left-hand pulley it also actuates the clutch—this action is obtained by a chain connection and requires a motion of about $\frac{1}{2}$ inch of the belt guide. The effect of this operation is to cause the counter-shaft to revolve at one-half the speed of the belt-driven pulley, the pulley is running freely on the sleeve of the other pulley, but it is driving this other pulley and its sleeve at half its own speed, through the epicyclic train; the sleeve is now clutched to the counter-shaft, and hence the low-speed gearing is obtained. From the countershaft a single chain transmits the power to the rear live axle. Ample brake power is provided, while the steering is controlled by an inclined hand-wheel. The road wheels are of the cycle type, shod with pneumatic tires; the carriage body is adapted to accommodate two persons, and to afford ample luggage room; the weight of the car complete is 7 cwt. The car is also being made fitted with a tonneau body, and can be fitted with a reverse motion if desired.

THE Cinque Ports Cycle and Engineering Co., 14, George Street, Hastings, are working on a new two-cylinder petrol engine.

AT Walsall, on Tuesday, James Harris, for driving a motor-car belonging to Messrs. Smith, millers, at an excessive speed, was fined 20s. and costs.

AMONG those who have offered the use of motor-cars for the proposed Volunteer Automobile Corps, are Mr. Archibald Weir, of Ottery St. Mary, Mr. W. T. Pretty, of Ipswich, and Dr. Dawson Turner, of Edinburgh.

THE next House Dinner of the Automobile Club will be held on Wednesday, February 13th. The same evening a paper on "The 1,200-mile Trial of 1901" will be read. Representatives of manufacturers of, and of agents for motor-vehicles, who contemplate entering vehicles for the Trial are invited to be present at the discussion.

FRENCH motorists are greatly concerned at the squabble which has arisen between the French Automobile Club and the French Automobile Union. The latter society recently decided that all road-racing as a record of mere speed conditions should be abolished and that such races should only be allowed on properly-prepared tracks. The A.C.F. at once replied by a decision to disqualify all racers who accepted the conditions of the Union or who entered their machines for events organised by the Union. A further resolution declared that the Club would disqualify all makers whose machines were used in Union competitions. The result of these counter-declarations is awaited with interest.

THE well-known radiator, the "Loyal" has recently undergone some improvement in detail, the form of the radiating gills having been altered. The fluting is not now carried out directly from the centre, but runs in a curve, partly round the radiator, before reaching the edge of the gill. This gives a greater radiating surface without any increase of the weight of metal. The new design has been registered in England, and is now being supplied on all radiators by the British agents, the United Motor Industries Ltd., of 40, Holborn Viaduct, London, E.C. We hear, by the way, that the same firm have recently secured several very important new agencies.

MOTOR-CARS IN THE GERMAN POSTAL SERVICE.

“**D**ER Motor-Wagen” in a recent issue gives some results obtained with an electrical delivery van built by the Berlin Motorfahrzeugfabrik Gesellschaft, of Marienfelde, Berlin, and which has been used by the postal authorities in that city since October last year. The vehicle, of which an illustration is given herewith, is used for parcel delivery, and is capable of carrying a load up to nearly a ton. It is provided with two series electro-motors, which, at a speed of 600 revolutions per minute, develop 2½ h.p. each. Each of the motors is directly geared to one of the rear road wheels. The storage battery consists of forty-four cells of 100 ampère-hours capacity. The controller is arranged to give five forward speeds and one reverse, and has two positions for electric braking. During the snow period of last winter the vehicle ran on rubber tires, while ordinarily it runs on iron tires. The distance (in

kilometres) covered during each month up to June last is given in the following table:—

	On iron tires.	On rubber tires.	Total.
October, 1899	513	—	513
November, „	89	—	89
December, „	245	554	799
January, 1900	212	713	925
February, „	—	870	870
March, „	402	561	963
April, „	808	—	808
May, „	715	—	715
June, „	690	—	690
Total	3674	2698	6372 kilos.

The following are some additional particulars of the results obtained with the vehicle:—Mean charging energy per wagon-mile equals 592 watt-hours; mean energy consumption per wagon-mile equals 432 watt-hours; mean energy consumption per ton-mile equals 131 watt-hours; weight of the vehicle in running order equals 5,090 pounds; weight of vehicle loaded is 6,600 pounds.

After the vehicle had accomplished 2,880 kilometres (about 1,800 miles), the battery was taken out and cleaned. The reserve battery, which was used during this period, remained in the vehicle until 3,353 kilometres had altogether been covered, so that the total distance covered with the original battery up to date is 2,880 + (6,382 - 3,353) = 5,909 kilometres. After cleaning the battery a loss of capacity of 12 per cent. was noticed. It is to be remarked that three-fifths of the total distance covered was done on iron tires. This result would indicate that the use of iron tires with such vehicles is not at all impractical, provided the vehicle is

otherwise of suitable design, and that the roads travelled over are good. An inspection of the vehicle after having made something over 4,000 miles proved every part to be in good condition, and the vehicle is still in regular service.

THE New Grappler Tyre Co., Ltd., have just completed arrangements with Messrs. Atkey and Co., Ltd., Trent Street, Nottingham, to carry a large stock of Grappler motor tires during the season, so that there will be no delay to their clients in the Nottingham district in getting immediate delivery.

THE Discount Motor-Car Co., the publishers of *The Motor Mart*, are opening a large showroom and repository at 108, Euston Road, N.W., where clients desirous of disposing of their cars can place them under the charge of competent salesmen. The possession of these premises will also enable the company to undertake the overhauling of and putting into proper working order any cars sent to them, either for storage or sale.

AT Barry County Court last week a claim was made by Priscilla Barber against Mr. Gould, of the Windsor Hotel, Barry Dock, for £10 10s. compensation in respect of injuries. Plaintiff alleged that while alighting from a motor-car owned by defendant the car suddenly jerked her off the steps, causing her to fall and injure her knee. Defendant and the conductor of the car were called, and they denied that any accident was known to them to have occurred except from what plaintiff had said afterwards. Judgment was eventually given for £10 10s. and costs.

MR. S. J. DAVIES, jun., treasurer and general manager of the Locomobile Company of America, has arrived in London. He attributes the large productive power of the company to their making standard patterns and using the best machinery. In America, he says, motor-cars are being used by contractors who have building operations to watch in several places at a time. Mr. Wm. B. Parsons, the engineer in charge of the rapid transit tunnel, now being made in New York, uses a motor-car to cover the distance between Battery to King's Bridge, about fifteen miles. He found horses too slow.

SOME AUTOMOBILE CLUBS' BADGES.

The Automobile Club of Great Britain and Ireland.

The Manchester Automobile Club.

The Bavarian Automobile Club, Munich, Germany.

The Frankischer Automobil-Club, Nuremberg, Germany.

L'Automobile Club d'Avvergne, Clermont-Ferrand, France.

The Bordeaux Automobile Club.

L'Automobile Club Dauphinois, France.

L'Automobile Club de la Dordogne, France.

L'Automobile Club Biterrois, France.

DIARY OF 1900.

AN INTERESTING AUTOMOBILE RECORD.

(Concluded from page 766.)

JULY.

Awards made known in connection with the 1,000-mile Trial.
Extraordinary general meeting of the British Motor Company.
Automobilists' garden party at Strawberry Hill House, Twickenham.
Introduction of the Paris-Singer motor-voiturette.
English Motor Club held a hill-climbing competition at Godstone.
Automobile Gymkhanas at the Ranelagh and Sheen House Clubs.
Congress of Automobilmism in connection with the Paris Exhibition.
First Irish motor-car tour organised by the Shannon Development Syndicate.
Attention called to the Capel motor-car, the Argyll voiturette, and the Stonebow car.
The Automobile Club of France organised fêtes in connection with the Paris Exhibition.
Miss Vera Butler drove a Panhard car from London to Paris.
First run of the Scottish Automobile Club.
Automobile run of the Liverpool Self-Propelled Traffic Association.
The Paris-Toulouse Race.

AUGUST.

The Shah visited Paris and purchased several automobiles.
Run of the English Motor Club to Cobham.
Death of M. Lenoir, the inventor of the petrol automobile.
Results published of the Chiswick District Council's experience of motor-vans for municipal purposes.
The first motor race on an Irish track took place at Navan.
Porlock Hill mounted by Mr. S. F. Edge on his 16 h.p. Napier car.
New Leyland steam-wagon brought out.
Paper by Mr. E. Shrapnell Smith on "The Actual Cost of Motors for Street Watering and Dust Removal," before the Association of Cleansing Superintendents of Great Britain.
First run of the Yorkshire Automobile Club.
Annual motor-car trials in Paris.

SEPTEMBER.

Runs of the English Motor Club to Bedford and Wendover.
The toll on Maidenhead bridge lowered to 6d. for motor-cars and to 3d. for tricycles for one day.
Run of the Manchester Automobile Club to Buxton spoiled by a fog.
Rigal made a record of 20 kilometres in 16 mins. 16 secs. on his motor-tricycle.
General attention directed to the use of automobiles by the French military authorities in the autumn army manoeuvres.
The inaugural automobile race meeting on the Ostend Motodrome took place.
First long distance race in Germany—between Berlin and Aix-la-Chapelle.
The Prince of Wales went for drives from Homburg on a steam-car.
The Austrian Automobile Club held a hill-climbing competition.

OCTOBER.

Motor-cars came into prominence in many constituencies during the General Election.
Autumn tour of the Automobile Club to Monmouth and the Hendre—the seat of Lord Llangattock.
Formation of the Nottingham Automobile Club.
Mr. W. Worby Beaumont's great book on motor-vehicles published by Messrs. A. Constable and Co.
Mr. C. T. Crowden read a paper on Motors and Motor-cars before the Cycle Engineers' Institute.
Annual dinner of the Reading Automobile Club.
Return of Major R. E. B. Crompton from South Africa.
Demonstration of the Singer motor-bicycle at the Cycle Engineers' Institute.
Twin-cylindred New Orleans car brought out.
Heavy motor-vehicle competition in France.
The Automobile Club of France decided to organise, in 1901, an automobile tour on the lines of the English 1,000-mile Trial.
Alcohol motor competition in France.

NOVEMBER.

Reunion at the Trocadero of those who participated in the 1,000-mile Trial, and distribution of awards.
Mr. C. Jarrott made a British motor-tricycle hour record of 42 miles.
Automobile Club's trial of electrical vehicles at Chislehurst.
Motor-car run to Southsea in celebration of the fourth anniversary of the passing of the Light Locomotive Act of 1896.
Mr. Arthur Shippey appointed consulting electrician to the Motor Traction Co.
Annual dinner of the Automobile Club.
Inaugural run of the Nottingham Motor-Car Club.
Pick voiturette introduced to the public.
Formation of the Motor Trades Protection Society.
The Stanley and National Cycle Shows took place.
The question of tare limit revived by the Liverpool Self-Propelled Traffic Association.
Demester made a new motor-tricycle record, covering 71·265 kilometres in the hour. This was subsequently beaten by Rigal covering 71·563 kilometres in the same time.
Hill-climbing competition at Gaillon.
Messrs. Dennis Bros., of Guildford, removed to their new factory.
1,000-mile non-stop run of a Decauville car at the Crystal Palace.

DECEMBER.

The Automobile Club addressed a letter to county councillors, chief constables, etc., with regard to the proposal to reduce the speed of motor-cars from twelve to ten miles an hour.
Suggested route published for the proposed great event of 1901.
M. Georges Forestier gave the opening address of the fifth session of the Liverpool Self-Propelled Traffic Association on "Heavy Motor Traffic in France."
The Speedwell steam motor-wagon tested at Persley Quarries.
Mr. Joseph Pennell read a paper on "Motor-Bicycles," at the Automobile Club.
Christmas tour of the Automobile Club to Plymouth and the West of England.
Proposal before the Grimsby Corporation for street sweeping by motor-car.
Fourth annual meeting of the Daimler Company.
Public attention drawn to the Stirling motor-carriages.
Public service of steam buses inaugurated in Belgium, and of electric cars in Italy.
Professor Hele-Shaw's paper on "Road Traction," before the Society of Arts.

FURIOUS DRIVING CASES.

At the Glasgow Eastern Police Court, David Bowsie was charged with recklessly driving a motor-car in Dalmarnock Road and Oswald Street, Bridgeton, on 21st December, and knocking down and injuring Cornelius Brown. The charge was found proved, and a fine of 21s., with the alternative of 14 days' imprisonment, was imposed.

At Bournemouth Borough Police Court, on Monday, Mr. John Harvey, of Linden Hall, was charged with furiously driving a motor-car on January 1st. Police-constable Annels stated defendant came down the Old Christchurch Road at about fourteen miles an hour about half-past three in the afternoon, and when near Holy Trinity Church collided with a market gardener's van which was standing outside a shop. The horse attached to the van was forced on to the pavement, but no damage was done to the van save a little paint being knocked off. There was a lot of traffic about at the time, and he considered the pace was highly dangerous. Police-constable Pugh corroborated. Defendant stated there were three speeds to the motor-car, and during a run round the East Cliff the top speed band broke and he was obliged to run on the second one. He thought the policeman had over-estimated the rate at which he was travelling. At the time in question he was obliged to turn out of the way of a three-horse omnibus, which caused the car to collide with the van. Considering his machine weighed a ton, if it were running at fourteen miles an hour the impact of a collision would not merely force a horse a little forward and scratch off a little paint, but the van would have been knocked to pieces and hurled to some distance. The fact was when he collided the car was going only about a mile an hour. Superintendent Foster stated that on Saturday defendant was cautioned at the Square by Police-constable Greenslade for driving furiously, and letters had been sent to him by people on the East Cliff complaining of the rapid driving of motor-cars in that neighbourhood and saying it was dangerous for them to go out. The Bench inflicted a fine of £2, including costs.

A MOTOR-CAR INCIDENT.

At Knaresborough County Court, last week, there was a re-trial by jury of an action brought by Mr. Cecil Hutchinson, of Bilton Dene, near Harrogate, who claimed £6 13s. 8d. from Mr. Edmund Robinson, of Harrogate, for damage on account of defendant running with his trap into a motor-car; also for hire of vehicle on account of the accident. A verdict was given for the plaintiff for the amount claimed, with costs.

MOTOR-CAR LICENCES.

At a Justice of the Peace Court at Forfar, last week, Mr. Alex. Ross French, dentist, was charged, at the instance of the Inland Revenue authorities, with keeping a motor-car for which he had not taken out a licence. Mr. J. L. Alexander, solicitor, appeared for the defence, and claimed that, having in mind a prior case, as it had not yet been decided that Mr. French had bought the car, a licence was not required, and he claimed that the case should be dismissed. After consultation, the Justices decided to adjourn the case for eight weeks.

AN INTERESTING POINT.

At the City Summons Court, last week, Walter Charles Bersey, of North Street, Manchester Square, was summoned for causing a light locomotive to be used without having a competent person to direct its use and movement. Mr. Staplee Firth, solicitor, appeared for the defendant. Police-constable Flavell, 446, deposed to finding a motor-car with a crowd round it in Broad Street. An aged news-vendor had been left in charge, who said he knew nothing about motor-cars. After waiting twenty minutes the defendant came out of a restaurant and said

he was the owner. Cross-examined.—The proceedings were under the Locomotives on Highways Act, 1896, Article 2, section 8, which stated that a light locomotive "shall be in charge, when used on any highway, of a person competent to control its use and movement." It was standing still. He would say it was in use on the highway. The defendant, said he left the car so that it could not be started in his absence. He understood the section to mean that drivers should be competent. Mr. Firth contended that the defendant's view was right, and said an inanimate thing did not need control. The actuating force of this car was dormant, therefore there was nothing to control. Alderman Samuel Green decided to convict, and fined the defendant 20s. and costs, and stayed execution pending appeal on the point raised, Mr. Firth stating he should take the case to the High Court.

INJURED BY A MOTOR-CAR.

A CIVIL action came before the Hull Quarter Sessions, last week, in which Mr. Ernest Charles Littlewood brought an action against Mr. H. Hayter for the recovery of damages amounting to £18 3s., for personal injuries sustained by him in consequence of being run over by the defendant's foreman, who was driving a motor-car. Mr. Littlewood, a clerk in the employ of Messrs. Bailey and Leatham, stated that on the 4th of September he was returning from home after dinner on a bicycle, and, when near Wilberforce Street, whilst on his right side of road, the motor-car, which was coming from the city, crossed over the road and overturned his machine. He fell to the ground, and the machine went under the wheels of the motor-car. He was rendered semi-unconscious, and afterwards had to go to Bridlington for three weeks or a month. Even at the present time there were occasions when he could not walk well. In addition to the sum of £18 3s., which he had paid out of his own pocket, he claimed a reasonable amount for the inconvenience and loss sustained. The defence was that the chain of plaintiff's machine broke, and that the car was brought to a standstill when the collision occurred. Several witnesses were called, who contended there had been no negligence on the part of the defendant. The jury, after some consultation, gave judgment for the plaintiff, assessing the damages at £10.

LEAVING MOTOR-CARS UNATTENDED.

AT Stockport, last week, Mr. Frank Emery, of Levenshulme, was summoned for leaving a motor-car in the street, and not taking proper precautions to prevent it from starting. Mr. Emery told the Court that he had an automatic lock system on his car, so that by taking off a small screw the current was disconnected and the motor could not be started. At the time he challenged Inspector Skitt, of the County Police, who laid the charge, to start the car either by turning any handle or wheels, and he also said the car could not be pushed. A fine of 20s. and costs was imposed.

AT Warwick, on Monday, Mr. Ambrose Valentine, Leamington, was summoned by the police for causing an unnecessary obstruction by leaving a motor-car outside a public-house for an hour and a half. The facts were not disputed, but Mr. Crowther Davies contended that there was no unnecessary obstruction, as there was a width of 22ft. 9in. clear of the motor-car, sufficient for two vehicles to pass. The defendant was at the inn for the legitimate purpose of having a meal. The police stated that the car was drawn up near a dangerous corner, though it was admitted that no one was actually obstructed. The Bench by a majority decided that an offence had been committed, and imposed a penalty of 10s. and costs, but agreed to state a case.

MOTOR-CAR COLLISION.

THE case of Rev. A. W. Gross, Milton, v. Allan Hickman was heard at Northampton County Court, last week. This was a claim for £7 12s. damages caused to plaintiff's dog-cart and harness by the negligent driving of the defendant of a motor-car in Milton, on November 6th last. Mr. C. C. Becke appeared for the plaintiff, and Mr. Staplee Firth (London) for the defendant.

Rev. Thomas Lund, Chorley, said that on November 6, whilst with Mr. Gross, he was driving with a groom from Milton to Blisworth Station. As he neared the old turnpike the horse swerved on to the bank, the trap was overturned, and witness and the groom were thrown into the road. After the accident he saw the motor-car and the defendant. The defendant came up and said that he was very sorry, and asked if he could render any assistance. Witness heard no horn or other signal; if one had been given he should have heard it. The Rev. A. W. Gross said that he was sent for after the accident. Witness said to the defendant, "It is a great pity a lad like you should be in a motor-car all alone, buzzing about without giving any warning." Defendant said, "I did give warning." Witness replied that that would have to be proved. In the course of conversation the defendant asked witness what action he would take. Witness said that he would send the trap to Mr. Mulliner's at once, and he asked the defendant what he proposed to do. The defendant said, "I propose to pay the bill." Cross-examined: Witness was not excited, and he did not call the defendant a young "numskull," nor did he call his car a rotten old thing. He did not use violent language, and had never done so in his life. His Honour: When somebody is killed everyone is silent, but when no one is particularly hurt the language becomes coloured on the spot.

Defendant, sworn, said that he had had three motor-cars, and had driven many thousands of miles on them without accident. He thoroughly understood the mechanism of the Daimler car he was driving

on the day of the accident. He was driving from Northampton to Towcester, and had the machine under perfect control. On nearing the cross-roads he sounded the horn three or four times. Then he saw a horse coming along at a good fast trot, and crossed to the other side of the road to avoid a collision. The horse swerved, ran on to the bank, and turned the trap over. When Mr. Gross arrived he was in a terrific passion, and was very violent in his expressions. He never told Mr. Gross that he would pay the bill for the repair of the trap. Cross-examined: He was now within a month or two of seventeen years of age, and had been driving motors for three years. Mr. Becke: You started, then, when you were thirteen? Mr. Firth: Children of two years old drive them. His Honour: Will you tell me where they drive in order that I may avoid them? His Honour said that it was the duty of anyone driving a vehicle in the road to drive it in such a way as to show he was using all reasonable care to avoid injuring his neighbour's property. The question was whether that was neglected on this occasion. He did not think that defendant was furiously driving on this occasion, but there was a conflict of testimony as to whether he blew the horn loud enough for Mr. Lund to hear. In his opinion it was one of those cases which would occur and which would continue to occur for some time, inasmuch as the motor was an entirely novel piece of machinery, which had been introduced into the very complex conditions of modern civilised life. He did not find that there was any evidence of negligence on the part of the defendant which justified him in giving a verdict for the plaintiff. He hoped, under the circumstances, one party being to blame as much as the other, defendant would not ask for costs. Mr. Firth said that he would not ask for costs.

MR. W. P. THOMAS wishes to state that, in the course of the discussion at the Automobile Club on the 9th inst., he said the bearings of motor-cars were too small—not too large.

THERE are some very capable fellows on the American automobile papers, and the *Automobile Magazine* has unearthed a man in London who sends three pages of entertaining "copy" about the instructive experience "of the Hon. Leopold Cavviny," and the members of Parliament present at the 1,000-mile Trial dinner at the Trocadero. In connection with the latter function we are told that "diplomas were given to the representatives of the New Orleans Victorette among others." Possibly we shall be told that Mr. Louis J. Oates, the writer of the aforesaid, has received a diploma or other communication from the compositors on the *Automobile Magazine*—or vice versa.

AMONG the oils now in the market for motorists that known as the Wells-Lucas Phoenix oil can be recommended for water-cooled motors. We have found it very satisfactory, as have also many other automobilists throughout the country. The sole agents for the United Kingdom are Messrs. Joseph Lucas, Ltd., of Birmingham, and 1, Dyer's Buildings, Holborn, E.C. These oils are prepared by the Henry Wells Oil Company, and are known on the market as the Wells-Lucas motor lubricants. Their main features are the power of endurance at high temperatures, their good body in summer and limpid quality in winter. Having the advantage of leaving no carbon on the cylinder head, piston or sparking plug the oils are well suited for the purpose for which they are intended. Messrs. Joseph Lucas, Ltd., are also dealing in valves, pumps, motor-horns, outfits, greases, motor cycle leggings, etc. They have a capital little "Petrolet" lamp, and a very convenient pump with folding footpiece and telescopic handle is one of their leading lines for the season.

THE Motor-Car Journal.

VOL. II.]

LONDON, SATURDAY, JANUARY 26, 1901.

[No. 99.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

THE LATE QUEEN.

THE Empire and the world are in mourning, for this week has seen the passing away of one who had become part of the age and time in which she lived and reigned. And in common with those of every rank and race, we pay our tribute of respect and reverence to the memory of Queen Victoria, who for long widowed years, from a lonely pinnacle of Royalty, endeared herself to her people by tender regard for all who sorrowed, and by thoughtful interest in the cheerful duties of social life.

Ever ready to encourage the progress of the country, and to maintain our position in the world, the Royal family of Great Britain have never withheld their support from new movements likely to add to the comfort of the people or the prosperity of the Empire. And although the late Queen's age and infirmities prevented that interest in new means of locomotion and travel that would otherwise have been shown, all who are interested in automobilism have long recognised with genuine appreciation the help that, as Prince of Wales, our new King Edward the Seventh has rendered in popularising a form of travel and conveyance that made its first permanent appearance in the Victorian era. Other pens have already dealt with varied aspects suggested by the sad event which has shadowed the world this week. We would only join in the general sympathy with the Royal House, and add our testimony to the world-wide sorrow.

COMMENTS.

County Councillors Want Speed.

IN connection with the automobile demonstration held last week for the benefit of the Warwickshire County Council it is reported that some of the councillors asked the drivers to go faster, and were surprised to learn that the ten-mile limit that some would like to enforce had been reached. Under such circumstances the driver of a motor-car is in a quandary. At the same time we are glad to hear that the councillors recognise that the crawling of a car along the roads at ten miles an hour is something that cannot be endured, and if novices want to go faster, how can experts be expected to go slower?

"Revolution."

UNDER this heading, *La France Automobile* makes the startling and far-reaching announcement that Messrs. Panhard and Levassor have decided to largely reduce the price of their cars. Thus the 12-h.p. vehicle, which was catalogued at 22,000 fr. (£880), and of which more than one has been sold at a considerable premium, will be listed at 15,500 fr. (£620); the 8-h.p. car falls from 15,500 fr. (£620) to 11,500 fr. (£460), while the well-known 6-h.p. type will in future be catalogued at 7,500 fr. (£300) as against 10,500 fr. (£420). As for the 16-h.p. and 24-h.p. cars, which are only available to the wealthy classes, no change is, for the present, contemplated in their prices. In addition to reducing prices, the Panhard and Levassor Company are putting on the market a new light car of 7 h.p., to be listed at 7,000 fr. (£280). The car will be much lighter than the standard 6-h.p. Panhard; its two-cylinder engine will be fitted with both electric and tube ignition. Four speeds and reverse, operated by a single lever, will be available. In the new car, the water tank is placed within the motor bonnet in front of the dash, and the pump itself is in the tank. A body of the *tonneau* type, made of Partinium, is being provided for, the car complete weighing between 11 and 12 cwt.

The Nottingham Club.

THE first of what it is hoped will be an annual series of dinners in connection with the Nottingham and District Automobile Club took place at the Black Boy Hotel, Nottingham, on Saturday night, the visitors from London and other centres travelling to Nottingham "per motor-car." Mr. E. W. Wells (vice-president) occupied the chair, and others present were Messrs. G. H. Kirk (vice-president), M. Ross Browne, R. Cripps, R. Harbidge, S. Harvey, P. Huskinson, G. Rimington, H. Rimington, W. D. Wells, J. Burton, F. Burton, E. Williamson, J. G. Stafford, C. Johnson, S. F. Edge, C. Jarrott, C. Edge, A. Marwood, C. L. Stevens, A. P. Stevens, H. Belcher, J. W. Stocks, and A. R. Atkey (hon. secretary). A telegram of regret was also received from the Hon. C. S. Rolls and Mr. Mark Mayhew, who were journeying to Nottingham from London by motor-car, and had a breakdown at Grantham. The chairman proposed "The Nottingham and District Automobile Club." He said he should be giving expression to the feeling of every member of the club when he said that they offered the most cordial of greetings to their guests that evening. Though the club had only been in existence a few months its members were full of enthusiasm and anxious to do all they could to further the interests of automobilism.

Progress Reported.

MR. ATKEY said the want of a club on the lines upon which they were organised had long been felt in Nottingham, and though the Nottingham and District Automobile Club had only been in existence since October, it had already done much to justify its formation. The club had started with a very small nucleus, but that nucleus possessed the all-important qualities of

enthusiasm and goodwill, and the few gentlemen who met together on October 11th were actuated by the determination to see the thing through. Within a few weeks the membership of the club rose to thirty, and at the present time it was forty, of whom more than thirty were either owners or users of motor-vehicles. The club was formed with the primary object of self-help, but the organisation was gradually developing upon broader lines, and a future of usefulness and importance could safely be prophesied for it. Mr. Ross Browne briefly proposed "Success to Automobilmism." Mr. Claude Johnson, in reply, dealt with the subject of automobilism in a humorous vein, referring to several amusing experiences of his own while motoring. Mr. S. F. Edge spoke upon automobilism from a sporting point of view. He referred to the excellent condition of the main roads in Nottinghamshire. As a sport, he claimed that automobilism had supplemented cycling, and, as regards the possibilities of the two branches of sport, he submitted that there was no comparison. But before amateur motorists could get all the possible enjoyment out of their hobby they must completely master the mechanism of their cars.

The English Motor Club.

THE next run of the English Motor Club will take place on February 2nd to Farnham, Surrey, leaving the Embankment, Westminster Bridge end, at 1.30. The members will leave Ditton at 3 p.m., after gathering at the "Angel" on Ditton Common, and proceed to Farnham *via* Guildford and the Hogs Back. On Sunday the return will be *via* Frensham, where lunch will be partaken of at the Pond House, the run back to London being continued *via* Hind Head and Godalming. All motorists, whether members of the club or not, are invited to take part in the run. With regard to the Control Contest of the club, which is to be held in the grounds of the Crystal Palace on April 27th,

THE TILBURSTOWE HILL-CLIMBING COMPETITION CERTIFICATE.

this will, we understand, be divided up into the following sections:—(a) Motor-bicycles; (b) motor-cycles with three or more wheels, but not fitted with free clutch; (c) motor-cycles with three or more wheels fitted with free clutch; (d) ladies' driving cars; (e) voiturettes under 6 h.p.; (f) cars of 6 h.p., but under 12 h.p.; (g) cars of 12 h.p. and over; (h) racing cars; (j) steam cars; (k) electric cars; (l) 200 yards starting race.

Automobilism in Switzerland.

It is somewhat curious that a country which lays itself out to attract the tourist as does Switzerland should prohibit the use of the automobile over many of its most beautiful routes, but such is the regrettable fact. Already the roads of the cantons of Uri, Grisons, and Valais are closed to the self-propelled

vehicle, and it is more than possible that at an early date automobile traffic will be forbidden in the Tessin province. Granted that many of the roads are mountainous in the extreme, it is evident that where the horse-drawn vehicle can pass the automobile can also operate, and the action of the Swiss authorities is certainly a most short-sighted policy, preventing as it does the patronage of the country by numbers of motor men, who would gladly pursue their favourite pastime amid the beauties of Swiss scenery. Some reason might be given to the policy had Switzerland been the scene of a number of automobile accidents, but no serious mishap has ever occurred, nor has any grave incident arisen, to mar the harmony of the motor's existence in the Federation. Why, then, bar the routes to the motor? Surely the A.C.S. will not let this action go unprotected, for otherwise the feeling will undoubtedly spread, and in course of time the automobile will be prohibited on every road throughout the length and breadth of the land.

Numbering Cars.

A HORSEMAN writing to the *Field* on current automobile topics says the numbering of cars is bound to be distasteful to private individuals. "I would throw out as a suggestion the following proposal: All members of the Automobile Club should use as a *sine qua non* the arms of the Club in addition to their own crest or initial, as is usual on private carriages. Other motor-vehicles, including tradesmen's cars and hackney motors, should be rigorously numbered. Among their ranks will be found the scorching motorist, a far greater terror than the scorching bicyclist." There could be little objection to the placing of the Automobile Club's badge on the cars belonging to members, but the proposal to paint numbers on our privately-owned vehicles must be resisted with firm determination.

Stopping When Wanted.

A CORRESPONDENT at Wolverton has been giving the Press an instance of the courtesy of a Royal motorist. Driving along the road, he encountered our new King (when Prince of Wales) in a motor-car. On seeing that he was, somewhat unwisely, driving a young and unbroken horse, His Majesty very considerably had his motor stopped. We believe this would have happened in the case of any reasonable motorist, and it is certainly the rule rather than the exception. Hence, why all the fuss that opponents of the motor-car make as to the alleged thoughtlessness of motorists?

Tires.

THE perfect tire is not yet, but there are indications of the improvement that is being steadily made in the manufacture of suitable tires for motor-vehicles. Mr. M. Grahame-White has a pair of Clipper tires that he has run 4,973 miles over all conditions of roads, and although badly cut in several places, he considers they are good for another 1,000 miles. On the steam car that was recently driven from John o' Groats to Land's End Dunlop motor tires went through the whole journey with no trouble whatever. These facts testify to the excellent standard now being attained by British manufacturers.

Improving Roads.

WE have previously referred to the paper on scheduled roads and bridges, read by Mr. H. H. Humphreys, A.M.I.C.E., at the annual meeting of the National Traction Engine Owners and Users' Association. In that he urged that all users of the roads should combine to compel the local authorities to maintain good surfaces on all the roads over which any considerable traffic is likely to pass. The first point is valuable, and we recur to it again in order to suggest that it might appropriately be mentioned at the conferences now being held with councillors and others. If automobilists practically demonstrate the reliability

of motor vehicles for the education and enlightenment of our local rulers, the latter should be willing to listen to suggestions for the maintenance of their roads. In some particular cases, the councillors might be taken over bad bits of road, in order to convince them of the torture that can be inflicted by improper attention or the lack of repair. There is nothing like "ocular demonstration" of these things.

Glasgow and West of Scotland Automobile Club.

A WELL-ATTENDED meeting of Scottish motorists was held in Glasgow on Friday last week to consider the question of the formation of a Glasgow Motor Club. Mr. Nisbet presided, and after a few opening remarks called upon Mr. C. Johnson, the secretary of the Automobile Club of Great Britain to address the meeting, in which he urged the new club, if formed, to become affiliated to the central body. Finally, a committee was appointed to go further into the matter. It seems probable, remarks the *Scottish Cyclist*, that this committee will support the view that the new club should be of the nature of a division of the already-existing Scottish Branch of the Automobile Club, which has its headquarters in Edinburgh—a club fitted to promote the higher aims of the parent Club while affording the advantages of association to its members.

The Sultan of Turkey.

THE Sultan of Turkey is a timorous person, if a telegram received from Constantinople is to be believed. For although he has become an automobilist or, rather, the owner of a motor-car, he has not cared to trust his body to the vehicle in his own capital. Two officers of the court are appointed to take drives for him, and the Sultan enjoys himself by watching from his window the departure and return of the car. How different to the enthusiastic Shah of Persia, who apparently delights in his automobile in no ordinary degree.

The Gordon-Bennett Cup Race.

IN compliance with a request received from the Automobile Club of Great Britain the French Automobile Club has decided to reconsider the question of the date of the Gordon-Bennett international challenge cup race. The contest had been originally arranged for May 5. The A.C.G.B.I., however, pointed out that this would be contrary to the Cup rules, which provide that the race shall be run not earlier than May 15 every year, the date to be agreed upon before February 1 by all the clubs concerned. The event will probably come off not later, however, than the third week in May, owing to the Paris, Berlin, and Vienna contest having been fixed for an early date in June. The Cup race is being looked forward to with immense interest by Parisian *chauffeurs*, as it is expected, chiefly owing to the participation for the first time of British competitors, to be a much more exciting contest than that of last year.

Public Services in Algeria and Tunis.

THE frequent visits of French and Belgian automobilists to Algeria and Tunis have done much to popularise the horseless vehicle movement in these two French possessions, and now the proposal to organise a series of public services in the latter colony is being welcomed with enthusiasm. The majority of roads in Tunis are excellent, which will simplify enormously the work of the large vehicles which it is proposed to put into circulation. The exact itineraries have not yet been decided upon, but it is anticipated that the first services will be Tunis-Bizerta, Portofarina, Béja-Tabarca, Tunis-Medjez el Bab, Testour, Teboursouk-Kef, Soussa-Sfax. Doubtless the French Automobile Club's tour will increase the favour with which automobiles are viewed, and tend to advance considerably the interests of the industry in these two countries of Northern Africa.

The Shah's Motor-Car.

IN a recent issue *Le Velo* published certain extracts from a letter addressed to M. Serpollet by General Lemaire, the director-in-chief of the military music of the Shah of Persia, and although they rather give one the idea of having been written for reproduction these passages are none the less interesting. The engineer sent out with the car would appear to have had no little trouble in delivering the precious vehicle safe and sound to its royal master, and only succeeded in doing so by transgressing the Shah's instructions. Arriving at Recht, M. Marnay, the engineer in question, found no means of continuing the transport of the large case containing the car, so decided to unpack it in spite of his instructions to the contrary. This done, half a dozen horses were harnessed and the carriage drawn to Kasebine, a town situated some ninety miles from the Persian capital. This journey doubtless had its exciting moments, for the road is of a mountainous character and some of the descents negotiated are exceptionally rapid. Once safely arrived at Kasebine the *chauffeur* thoroughly explored the environs of the town

M. SERPOLLET GIVES THE SHAH A LESSON IN MOTOR-DRIVING.

during the three weeks that he was awaiting his royal master, and this seems to have served him in good 'stead,' for it enabled him to give the Shah an entirely successful maiden trip over Persian roads in spite of their deplorable condition after much rain. From Kasebine the monarch was driven through to Teheran, and it is not difficult to understand that his passage *en automobile* created a profound sensation among his people. If in Europe the sight of a royal personage on a motor-carriage still attracts attention, what must be the effect in a country so remote as Persia, when a monarch goes motoring through his domains? Several members of the Persian Government and certain high officials attached to the Court have motor-vehicles on order with firms at Paris and Vienna, and in a few months' time the motor-car will be quite a common sight in Teheran and its environs. The Shah, it would appear, deems none but the Serpollet car suitable for Persian roads and conditions, but that is as may be, and the proof will be forthcoming later on.

The Steam Car Company, Ltd.

FOUNDED with the object of building steam motor-cars on Mr. House's well-known system, the Steam Car Company, "House's" System, Ltd., comes into being with Messrs. G. F. Arney (Farnborough), J.E. Hutton, J.P. (Northallerton), and H. A. House as directors, and a nominal capital of £10,000 in £1 shares. Messrs. Firth and Co. are the solicitors, Mr. G. R. Helmore the secretary, and the registered offices are at 84,

Chancery Lane, W.C. The exclusive services of Mr. House, as far as motor-cars are concerned, have been secured. We understand that two sample cars are well on the way—one, a light steam car to carry four people and also a light steam van for commercial purposes.

Punch Tries Again— and Fails.

THE efforts of Mr. *Punch* to find humour in the troubles of the motorist are commendable so far as persistency is concerned; but the results, from the smile-raising point of view, are saddening in the extreme. This week the owner of a motor-car that is palpitating by the kerbstone is depicted to be attempting to discover the cause of its agitation by means of a hay-fork, and assures the yokels looking on, "There's no need to be alarmed. It will be all right as soon as I've discovered the what d'ye call it." The artist has given us a better drawing of a motor-car than usually appears in non-technical papers, but he should know that owners have abandoned the yachting cap and do not carry hay-forks to deal with emergencies. Verily *Punch* has not yet caught the spirit of motor-car humour; in fact, some motorists have not yet got so far as its discovery.

Irish Automobile Club.

THE organisation of automobilists into clubs and associations continues to progress, and we record with considerable pleasure the establishment of an Automobile Club for Ireland. This was formed this week in Dublin at a meeting over which Mr. W. G. D. Goff, of Waterford, presided. The chairman briefly explained the objects of the club and drew attention to the many advantages which membership would secure. He dwelt particularly on the club's aversion to furious driving and reckless contravention of the traffic laws. Mr. C. Johnston (sec. A.C.G.B.I.) gave a sketch of the growth of the Automobile Club, and explained the governing principles. He detailed some of the latest matters which had been under consideration. One of these was the formation of a Defence Committee which could render members great assistance in cases where they had been unjustly prosecuted. He hoped the Irish Club would be a success, as its progress would undoubtedly weigh with the Automobile Club, and induce them to favourably consider Ireland as the venue for some of their tours. Indeed Mr. R. J. McCreedy said that the Irish Club had already received twenty-eight applications for membership, and that at least fifteen more might be reckoned on, thus bringing the membership to over forty. He also announced that Mr. Alfred Harmsworth had promised to make a donation of £50 to the funds of the new club. A temporary committee was then formed, which will draft rules, etc., and present them at the next general meeting. Amongst the members selected for the committee were:—Lord Louth, Hon. Leopold Canning, Capt. Langrishe, Col. Magrath, Lieut.-Col. Irvine, Messrs. W. D. Goff, E. O'Connor, D.L., R. J. McCreedy, W. B. Jameson, E. C. Herdman, J. F. Colohan.

Why not Bournemouth?

BRIGHTON and Southsea have been visited by the Automobile Club officially, and now beautiful Bournemouth is pleading for a visit. The number of private motorists in the town is steadily growing, and the town will doubtless have an automobile club of its own ere long. One of the local papers, in voicing the wish for a trip to Bournemouth, extols the drive from London through Ripley, Alresford, Winchester, Southampton, and the New Forest as being one of the most beautiful in England, while the roads are described as perfect. And to the ordinary attractions of the place it adds the suggestion of a flower *fete* for motor-cars, such as those that form part of the season's programme at Ostend, Nice, Dieppe, and other Continental places.

Cars in Paris.

FEW English people—except, of course, those who are familiar with Paris—have any idea of the number of motor-vehicles to be met with in France. The Hon. Leopold Canning gives some notion of the popularity of the automobile in a letter with which he has just favoured us. It appears that on Sunday he went for a spin to St. Germain and back to Paris on his 8-h.p. Panhard. The day was fine, but the roads were everywhere deep in mud. Certainly it was not an occasion to tempt many people out, but by the time they reached Versailles for lunch—*via* the Bois de Boulogne and out of the Porte de Suresnes—they had counted seventy-four motor-vehicles on the road. Nine-tenths of these were voiturettes, two were steam lorries, and only two motor-cycles were of the number. Putting up at Versailles, they had lunch at the table next to that at which sat M. Levegh, and in the yard their Panhard stood by the 30 h.p. Mors which won the Paris-Toulouse race. Ere they left the hotel two other cars entered the yard—a 3½ h.p. Renault and a 3½ h.p. De Dion. After going to St. Germain, the party returned home by another road and again saw a good many motor-cars. Passing again through the Bois de Boulogne, Charron was descried mounted on horse-back. Comparing notes on their return it transpired that 118 cars had been seen during the trip—not so bad for a muddy day.

Manufacturers Petitioning.

FOLLOWING on the circular from the Automobile Club to county councillors and others armed with "a little brief authority," comes a petition from manufacturers and sellers of automobiles in which the serious discouragement to trade by the proposed restrictions is well pointed out. It is shown that in France 10,000 workmen find employment in the motor-car trade, and there must be another 90,000 working in the allied industries. It is to be hoped that the petition will be largely signed, and that those manufacturers and agents who have not yet received a copy will communicate with the secretary of the Automobile Club without delay.

Breakdown at Kimbolton.

THE other day Mr. A. Bird started on his motor-car from Birmingham, intending to reach Cambridge by night, but on the Kimbolton to Tilbrook road the engines of the car broke down and the vehicle was dragged by a horse into the White Lion Hotel yard, at Kimbolton. Mr. Bird lost no time in apprising his son at Birmingham of the mishap, and on Saturday morning Mr. Bird arrived at Kimbolton on another car. The defective engines were very troublesome, and it was not until Sunday morning that Mr. Bird could continue on his way to Cambridge and Mr. Bird, junr., return to Birmingham. Much interest was caused in Kimbolton by frequent trials of the motor-vehicle in the White Lion yard, and the inhabitants could learn for themselves that even an injured motor-car is not a dangerous and harmful thing.

Ordering Early.

SEEING the activity which is anticipated in the automobile industry, we would suggest to intending purchasers that early orders are more likely to secure prompt delivery than those that are delayed. People will want cars for the spring, and with the first burst of seasonable weather will endeavour to be out and about. Hence the necessity for promptitude in giving orders. Makers will evidently have plenty to do to get the cars already in hand finished for the season, and those who now give their orders have to be content with the promise of delivery after a longer period of waiting than was the case a few weeks ago. As the year progresses, this period between the time of ordering and delivering cars is likely to be lengthened.

**The Automoblist's
Pocket Book for
1901.**

COMMENCING in 1897 with about fifty pages of large type, the "Automotor and Horseless Vehicle Pocket Book," published by Messrs. F. King and Co., has now descended to small type, but has also extended to 350 pages—sure evidence of the growth of the industry. We are glad to see that the electrical portion has been entirely re-written, and that the glossary has been made much more complete than in previous editions. Legal information, signs of weather, the storage of petroleum, the Inland Revenue regulations on "moto-vehicles"—why is the "r" deliberately omitted in motor?—arithmetical tables, and the usual technical information, all of which has been carefully brought up to date, form features of the book, as in previous editions. The lists of clubs and associations, limited liability companies, and persons interested in the automobile industry in this country are extremely useful, and altogether Messrs. King and Co.'s excellent little annual starts the century well.

In Belgium.

It is well known that in Belgium the rivalry between the two leading automobile clubs is proving distinctly detrimental to the development of the new means of locomotion, and now it would appear that certain Belgian *chauffeurs*, who have the welfare of the industry at heart, are determined to put a stop to this unhappy state of affairs if possible. With this object in view it is proposed to form a federation of all the automobile clubs and associations in Belgium, somewhat on the lines of the Federation of the South-Western Clubs of France, and for this purpose efforts are being made to call together at Brussels representatives of all the leading organisations. Whether the various clubs will send delegates, and whether those delegates, if sent, will manage to agree remains to be seen, but the idea, at any rate, is an excellent one, for it is indeed sad to see a young and promising industry hampered in its movements by the very associations pledged to push it forward. The scheme by no means proposes to destroy the distinctive character of each club; it simply seeks a means of establishing their united solidity; of developing the use of the self-propelled vehicle and of defending the automobile movement against all unjust attacks. Such a federation would be beneficial to Belgian automobilism, but the difficulty in forming it will undoubtedly be great, for in the case of the Moto Club at any rate there exists a sentiment more favourable to the success of the club than to the welfare of the industry. Such feeling is not creditable, and the sooner it is put on one side and the association makes common cause with the other leading clubs the better will it be for the automobile movement in Belgium.

**Electric
Automobiles.**

To such men as Reckenzaun and Immisch in England and Jeantaud in France is due the inception of the modern electric carriage, and in a new pamphlet on the subject by Mr. Henry F. Joel those interested will find much useful as well as interesting information with regard to the advance that has been made during the last few years. The difficulty of re-charging has been the great drawback to the progress of electric vehicles in this country, but this is now being overcome, and Mr. Joel refers to the formation of an association of electric carriage builders to obtain and increase the facilities for re-charging. Even now the list of such opportunities is fairly comprehensive, including Chelsea, Hampstead, Richmond, Windsor, Watford, Stratford, Leyton, Harrow, Chislehurst, Woolwich, Weybridge, Willesden, Greenwich, Putney, all on main roads leading from London, whilst still further out there are charging stations at Guildford, Crawley, Woking, Tunbridge, Chelmsford, Luton, Cheltenham, Reading, Maidenhead, Brighton, Southsea, Hastings, Oxford, Bath, Bedford, etc., and so on.

THE COLUMBIA JAUNTING CAR.

THE somewhat novel vehicle depicted in the accompanying illustration has lately been put on the market by the Electric Vehicle Company, of Hartford, Conn., U.S.A. Generally speaking, the machine is identical with the tricycle parcels carrier brought out by the same concern a year or so ago, the only difference being the novel jaunting car body fitted in place of the parcels chest. The frame is of tubular construction, while it will be noticed that plate springs are introduced between it and the body, with the object of reducing the vibration transmitted to the passengers. The machine is driven by a small water-cooled petrol motor of the vertical type, located in front of, and geared by a friction clutch and two-speed gear to, the rear axle. The driver sits on a cycle saddle and has at hand all the control levers as also the steering bar. Pedals and chain gear are provided as usual for starting the engine, but owing to the use of a clutch this can be done without having to propel the machine at the same time. The steering device is of a novel character: the handle-bar stem terminates in a bevel wheel meshing with a similar pinion on the end of a long rod which runs parallel with the top tube of the frame. This rod has another bevel pinion at its forward end, this gearing with a correspond-

ing pinion on the stem of the forks carrying the front wheel. In addition to the driver the vehicle can carry four persons of light weight, or two heavy passengers. In the particulars sent us no mention is made of the horse power of the engine, but the machine can, we understand, convey a full load at a speed of about twelve miles per hour. The road wheels are of the cycle type, 28 in. diameter, shod with 2½ in. pneumatic tires. The petrol tank has a capacity sufficient for a run of 75 miles. By detaching the body the machine can be quickly converted into a carrier tricycle.

THE Woodruff Motor Carriage Co. has been formed in Cleveland, U.S.A., with a capital of £10,000 to manufacture automobiles.

THE *Auto-Vélo* states that, in connection with the automobile race from Paris to Berlin, the Automobile Club of Germany, which is organising the race in collaboration with the French Automobile Club, proposes that the contest shall be open to motor-cycles, voiturettes, and cars, the latter category including two classes—speed and touring. In the latter class automobiles must be driven by their owners. All those who complete the distance will receive a commemorative medal, whatever their time may be.

MR. ALBERT C. BOSTWICK, the well-known American *chauffeur* who has in the neighbourhood of half a dozen different types of automobiles, among which are his Panhard car, his Winton roadster, a De Dion voiturette, and his tricycle, has had a workshop constructed at his country home at Mamaroneck. It is a separate building, at the rear of his new stable. It is equipped with a three horse-power Nash gas engine, a shaping machine, lathe and grinder with bench and vices. There is also a floor pit for working under an automobile.

THE VINET VOITURETTE.

IN our issue of June 23rd last we gave a brief description of a neat voiturette which has been put on the market by M. Vinet, of Rue Brunel, Paris. Since then several modifications have been made in the vehicle, of which we are now able to publish illustrations, and some additional particulars. The car, which is built low, has a frame of tubular construction. From the plan (Fig. 2) it will be seen that the motor—a $3\frac{1}{2}$ h.p. water-cooled De Dion—is located under a bonnet at the front.

Three speeds forward—10, 20, and 35 kilomètres per hour—and a reverse motion are provided. The power of the engine is transmitted by a single belt to a small countershaft at the back of the rear axle. The change speed gear, which is entirely enclosed and works in an oil bath, consists of a train of spur wheels on this shaft, any one pinion of which can be made to mesh with a corresponding gear wheel on the rear live axle. The variable speed gear is controlled by a hand lever (24) working in a sector

FIGS. 1 AND 2.—ELEVATION AND PLAN OF VINET VOITURETTE.

at the side. No friction clutch is employed to throw the engine in and out of gear with the transmission mechanism; instead, the belt is made to run slack, or can be tightened as desired by means of the jockey pulley (42), which is controlled by a hand lever (48) and a foot pedal (38). Thus in the case of a block in the traffic, the motor can be instantly thrown out from the transmission by slackening the belt; this being also done when the speed gear is altered. Ample brake power is provided, a foot pedal (39) controlling a hand brake on the differential, while hand brakes are also provided on the hubs of each of the rear wheels. The frame is spring suspended on the front axle, while the body is connected by C-springs to the frame at the rear. Steering is controlled by an inclined hand wheel, while in connection with the cooling of the motor a radiating coil is fitted to the front of the bonnet. Wooden wheels are fitted, shod with pneumatic tires. It will be noticed that not only is the wheel base relatively a long one, but that the centre of gravity is very low, there being consequently very little liability for the car to overturn.

THE East Riding Cycle Company, Grosvenor Street, Beverley Road, Hull, inform us that the Liberia voiturette is now being fitted with a $6\frac{1}{2}$ h.p. Aster motor instead of 5 h.p., as previously.

FRENCH AUTOMOBILISM IN 1900.

(From our Paris Correspondent.)

(Concluded from page 773.)

LET us now see what became of the brilliant racing programme. The first event on the list—the parcel post race of January 14th—was abandoned, only the promoters knowing exactly why, and then on February 4th the course for the Chauchard cup was successfully decided at Nice. A fortnight later the catalogue race over a distance of ninety miles in the neighbourhood of Paris passed off without mishap, and three days afterwards, that is on February 21st, we witnessed the opening event of the Pau meet. This race was Pau-Peyrehorade-Pau, and Pascualt on his Peugeot finished first, averaging thirty-two miles per hour over a distance of eighty-eight miles. The following day the “Circuit du Sud Ouest” was decided over a route of 335 kilomètres (209 miles) in length. This event was rendered noteworthy by reason of an extraordinary performance by René de Knyff, who, driving his famous Tour de France car, actually averaged 70 kilomètres (43½ miles) per hour over the distance, a hitherto unprecedented speed. The second man finished three-quarters of an hour behind the winner, while Charron, one of the hot favourites for the race, broke down at Saint-Sever. On March 10th the “Coupe des Voiturettes” was run off between Paris and Rouen, and Théry, mounting a Decauville, made an average of nearly forty-five kilomètres per hour over this difficult route. So far everything had gone smoothly, and the interest taken in automobile races was universal, when, suddenly, during the famous week at Nice, the terrible accident on the hill of La Turbie, in which the German engineer Bauer lost his life, occurred and created a profound sensation.

Fortunately, the remaining fixtures in the South—those at Cannes and at Salon—gave rise to no untoward incident, and the agitation had practically subsided when the regrettable affair in the Paris-Roubaix motor-cycle race of April 15th caused a fresh outburst of feeling against automobile racing. It will be remembered that a couple of competitors in this event dashed into a group of spectators who had most imprudently stationed themselves around the Croix-des-Noailles in the forest of Saint-Germain, causing serious injuries to two persons. With that impetuosity so characteristic of the nation, the authorities, the press, and the public immediately united in one loud cry of “A bas les courses,” and then, not satisfied with the cancellation of all but a few provincial fixtures, they commenced a regular crusade against everybody and everything connected with the automobile movement. In the capital the cyclist police brigade was formed, and for a time so extreme were the measures adopted by this corps that the Parisian motorist simply did not dare to drive his car for fear of being summoned, the usual pretext being furious driving, or *exès de vitesse*, as it is styled this side of the Channel. In the Avenue de la Grande Armée—the home of the industry—business was practically at a standstill, and where formerly dozens of cars were to be seen passing up and down, the “reign of terror” saw but one or two, and they crawled along in fear and trembling. The police, too, were energetically aided in this campaign by the magistrates, who condemned offenders—or alleged offenders—not only to pay substantial fines, but also to terms of imprisonment more or less severe. The strict legality of these sentences of imprisonment for furious driving was seriously questioned, and eventually, acting upon the instructions of Monsieur Monis, the Minister of Justice, the magistrates relinquished the practice, but not before a goodly number of motor men had suffered the degradation. The effect of these measures upon the industry was disastrous. Had the agitation ended with the cancellation of races the blow would have been severe enough, but at least it would have been confined to a portion only of the industry,

for it is not every constructor who builds speed machines. But sweeping as it was, the agitation did not only cause heavy losses to those firms who annually lay themselves out to contest races, and who in May last had a number of specially built and costly vehicles ready in their works, but it also brought trouble to every firm engaged in the industry, for the public dare not buy self-propelled vehicles so long as the persecution continued. Yes, the automobile movement was terribly punished for the indiscretions of the few, and even to-day matters have not entirely returned to their normal condition. Certainly the persecution did some good, for it toned down the recklessness of a number of *chauffeurs* whose manner of driving brought discredit upon automobilism, but the lesson might have been taught equally efficiently by a means less detrimental to the whole industry.

I have said that practically all events were prohibited following upon the Paris-Roubaix mishap, but the authorities sanctioned a few provincial races in addition to the two great *courses*—the Gordon-Bennett Cup race and Paris-Toulouse-Paris. Among these races decided over routes far removed from populous centres I may cite the *courses* for motor-cycles, for *voiturettes*, and for motor-bicycles promoted by *Le Vélo*, and run off respectively on May 10th, May 17th, and May 31st. A stretch of road on the Etampes-Chartres route was the selected course, and Marcellin, Cottureau, and Buquet were the respective winners. Another event decided far a-field was Bordeaux-Périgueux-Bordeaux, noteworthy for the first appearance of the 1900 Panhard. It was Giraud who drove the new model, but he only succeeded in finishing second to Levegh on his all-conquering Mors. Then, on June 14th, after an infinity of troubles with the Government, the first race for the Gordon-Bennett Cup was decided, and a woeful chapter of accidents it was. No serious mishaps, let me hasten to add, but *pannes*, from one cause or another, were so numerous that long ere the finish Charron and Girardot were the only two competitors left upon the road, and the former's lead was so great that his success was assured. The route was Paris-Lyons, with a détour, making a total distance of 566 kilomètres (354 miles), and the winner's time was 9 hrs. 9 mins. 49 secs., Girardot taking about an hour and a-half longer. A fortnight later at Salon a 100 kilomètre race was won by Jenatzy in the big car category; Camus among the *voiturettists* and Vitalis in the motor-cycle class being the other successful competitors. During the first three weeks of July no road race was decided, but at the end of that month the exhibition event, Paris-Toulouse-Paris, was run off. The three winners were respectively Levegh (cars), Renault (*voiturettes*), and Teste (motor-cycles). The distance was 1,446 kilomètres (904 miles) and the outward journey was run off in a single stage, during which tire troubles were the order of the day, owing to the great heat prevailing. The winner's average speed for the entire distance was 64 kilomètres 700 mètres, while Pinson and Voigt, who finished second and third respectively, both averaged over 60 kilomètres per hour throughout.

With this *course* the long distance road-racing season came to an end, and the only other speed trials held on the road were those at Canteloup and Gaillon. At the former of these hill-climbing contests the Baron Henri de Rothschild won in the big

vehicle category, but his German Daimler was not opposed by any of the fast French cars, and the time made was by no means exceptional. At Gaillon the Mors racers were very much in evidence, securing the first, third, and fourth places in the big vehicle category; but the most sensational performances were furnished by Béconnais, the motor-cyclist, who in one instance mounted the kilomètre of hill in 55½ seconds. This was the last event of the year, a truly meagre programme to that which we had been anticipating, and one which was far from satisfying the men who had purchased powerful cars and found themselves unable to race them to any extent.

And now to the third item which figured in our anticipations—the competitions. Here, at any rate, our expectations were more fully realised, for not only were all the events on the original programme duly carried out, but in addition we witnessed two most interesting supplementary contests, viz.: the Alcohol and the Fuel Consumption competitions. The majority of the trials were held in connection with the Vincennes annex of the Exhibition, and were directly organised and controlled by the Automobile Club of France. They embraced, among others, a motor-cycle competition, held in June; a cab and delivery vehicle contest, organised in the same month; a *voiturette* competition,

held in August; a series of trials for light delivery cars, in September; and the annual *Poids Lourds*, or heavy car trials, held in October. The competitors were in one or two instances not very numerous, but the trials excited considerable interest, and were carefully followed by a large number of those automobilists who take a deeper interest in the movement than does the mere amateur driver.

Much valuable data was forthcoming, and the contests made prominent the qualities of certain apparatus—such as the Rochet carburettor—until then but little known and appreciated outside the inner circle of automobilism. Certainly if our expectations in other directions had been realised as fully as were those with regard to the programme of competitions advocates of the

new means of locomotion would have but little cause for complaint. But if from a sportive and from a commercial point of view the year 1900 has not brought all the success anticipated, it must not be thought that no progress whatever has been made in the French automobile world. To-day the construction, both theoretical and practical, of self-propelled vehicles is unquestionably superior to what it was twelve months ago. Clever brains and skilled hands have been hard at work, and as now constructed the automobile is safer, more reliable, and more pleasing to the eye than it was a year ago. The year's work has once again emphasised the fact that the progress of the automobile is to be one of evolution rather than of revolution, but if no strikingly radical changes have been effected the improvements made have been carried out on sound principles and combine well together to make a harmonious whole. The year has not seen the apparition of that wonderful motor which is destined to revolutionise the entire industry, and which continues to lurk in the background, with the same pleasing modesty which has always been its most striking characteristic.

As in the case of former years, 1900 has witnessed practically no changes other than those following well-known lines or modifying existing systems. If one type of vehicle has made really great advances, it is the *voiturette*, for, whereas a year ago

FIG. 3.—THE VINET VOITURETTE (see opposite page).

a reliable small car was almost unknown, to-day several constructors are turning out very excellent little cars. As might naturally be expected, this happy state of affairs is entirely due to public demand. In 1899 the trend of public opinion was all in favour of the voiturette, and those makers who grasped the situation and laid themselves out to supply the want are to-day those best pleased with their season's work. Formerly, if a man wished to motor in comfort and in safety, he was compelled to spend a very considerable sum on the purchase of even the most modest of horseless carriages, and this vehicle did not give him entire satisfaction, for, by reason of the scanty margin of power, hills were negotiated at a snail's pace. To-day, for about one-half the cost, the would-be automobilist can procure a reliable and comfortable small car fitted with a motor as powerful as that on the larger vehicle, which enables him to tackle all hills with certainty and rapidity. This little car is free from the great majority of disadvantages, and entails but a fraction of the maintenance expenses of the large carriage. A year ago such a vehicle did not exist, and now one sees dozens flitting about the streets of Paris. With the perfect improvement of the voiturette the sale of the low-powered large cars has suffered considerably, as has also that of the motor-cycles, indeed, the diminution in the case of the latter type of automobile has been one of the features of the past year.

Looking at the larger vehicles, one cannot help remarking the tendency of makers to exaggerate the horse-power. If during the last twelve months constructors had directed their endeavours to the lightening of their vehicles rather than to rendering them more powerfully engined with the corresponding increase of weight, we should not have to-day upon the road high-powered machines of less efficiency than those carrying motors of half the force. It would be infinitely more practical to increase a car's efficiency by a judicious reduction of its weight than to endeavour to do so by adding power—and weight at the same time. But during the past season the latter course has been the favoured one by many motor-car constructors, and the results have not been happy. Summed up, the year 1900 has been somewhat of a disappointment, but one's regrets at the non-realisation of the brilliant commercial and sporting prospects of twelve months ago are tempered with the reflection that great progress has been made in the construction of the various types of self-propelled vehicles, and that the future of French automobilism will be strengthened by the work done and the experience gained during the year 1900.

THE question of a mile motor racing track is being discussed by the Automobile Club at Boston, U.S.A.

SEVERAL small German motor sale branches have been amalgamated in Munich, under the name of Die Bayerische Motoren und Automobile Gesellschaft. The capital is £7,550.

It is reported that the Italian post and telegraph authorities are about to inaugurate some experiments with motor-cars with the view of their substitution for the existing horse-drawn vehicles.

IN celebration of their election as *Chevaliers* of the *Légion d'Honneur*, M. Amédée Bollée père, and M. Léon Bollée, of Le Mans, France, gave a banquet a few days ago to their employés.

THE bicycle as well as the motor-vehicle (or rather, the motor car as well as the bicycle) will, says the *Morning Post*, probably have an important share in the civilised wars of the future.

COLONEL WARD, C.B., who has recently returned from South Africa, and Lieut.-Colonel Elmslie, Deputy Assistant Director-General of Ordnance, have been appointed members of the War Office Committee to consider the subject of mechanical transport for military purposes.

MR. WILLIAM K. VANDERBILT, JUN. the American *chauffeur*, recently drove his big German Daimler over the fifty miles of Long Island roads between Long Island City and the country house of his father at Oakdale in one hour and twenty-seven minutes. This performance is better than the ordinary railway train makes over the same course.

CORRESPONDENCE.

MOTOR-CARS FOR MEDICAL MEN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I must apologise to Dr. Hardwicke for misunderstanding him. I now realise, however, that he refers to a car of *general utility*, which, after all, should be the standard pattern of each motor. His specification describes the new water-cooled Renault fairly accurately, with the exception of "cogs always in gear" (which has its disadvantages), and the double form of ignition, which could easily be fitted. I much doubt whether he would find solid tires an advantage, but I heartily agree with him as to artillery wheels. If Dr. Hardwicke should contemplate a Renault car, as the most desirable, I should very much like to give him a (private) "tip," if he would allow it!

I am glad to notice Dr. Farrow's satisfactory experience with his car, and I regret that I cannot endorse it, with regard to the question of a belt drive. My experience of this form of transmission was very unfortunate.—Yours truly,

CLAUDE A. P. TRUMAN,
Hon. Secretary Reading Automobile Club.

MOTOR-CARS FOR PUBLIC SERVICES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was somewhat amused to read the letter of Mr. Frank Morris on the above subject in your issue of the 19th. Mr. Morris in his letter reviews the experiences of a Bournemouth motor-car proprietor, who is purported to have stated with regard to one particular car that it had run 22,000 miles, carried a million passengers and earned £600. The only item, however, which seems to have perplexed your correspondent is the cost of repairs during this remarkable performance, which only amounted to £29. Now, as a passenger on the Bournemouth service, I have always paid threepence, and presuming the owner in question charged this amount it seems to me the car should have earned twelve thousand, six hundred pounds! Again, presuming that each of the passengers travelled one mile only, the car during the whole 22,000 miles could not have turned a wheel without a full complement of forty-five fresh passengers leaving and boarding the car at the end of each running mile.—Yours faithfully,
CYCLOMETER.

THE BURSTING OF IGNITION TUBES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Pilot" the principal cause of ignition tubes bursting is not either of those mentioned by him, but to sudden change of temperature due to the hot flame being driven off the tube by the wind. I have only once seen a tube which had been fairly burnt out by use, and this was taken from a Daimler parcel van. How long it had been in use I cannot say, but the top end had swelled all over and instead of bursting with a long crack, as is usually the case, a small round hole was blown out with clean edges. The lamp-box supplied upon Daimler motors does not give a sufficient supply of air for a really strong flame such as is required to give a bright yellow red tube, which alone will give the best results, except with the door open. But if the door is left open, burst tubes, especially in the rear cylinder, are certain to result. A fair compromise may be obtained by leaving the door, which should be slightly bent over to leave a crack all along, on the first notch of the latch, but the best way of all is to substitute two straight tubes of ample size, as is done in the Peugeot cars.

While on the subject of ignition I should like to mention that I have found the lamps supplied by the London Autocar Co., much superior to the ordinary Daimler lamp, giving a much better flame, and being easier to take to pieces to attend to, and incidentally only about half the price.—Yours faithfully,

FRANK SHEPPARD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see a letter in your last issue *re* platinum tubes for ignition purposes and the frequent bursting of the same. I have

my car, a 5-h.p. double-cylinder motor Jackson Doctor's car, fitted with special tubes of a certain alloy. These I have found from experience extending over six months answer in every way better than platinum tubes, and at the same time have the following two most important advantages. They cost less than half the price of platinum ones, and are guaranteed against bursting for six months use. They have saved me pounds sterling already. They can be had either with flange for Daimler motors or to screw into the cylinder head.—Yours truly,
JAS. ED. TUKE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to "Pilot's" query in your issue of January 19th, I cannot claim to speak in any sense as an expert, but once when, in my early motoring experiences, I had two ignition tubes burst within five minutes of one another, I found that I had a leak in the cylinder-head joint (owing to over-heating through the pump stopping), and water was finding its way inside the cylinder. In my case the fractures were probably caused by water being blown or drawn on to the incandescent tubes. I do not see how pressure could cause a new tube to burst, nor yet improper adjustment. It is surprising how long platinum tubes will last with careful treatment—some thousands of miles.—Yours faithfully,
EDGAR SOAMES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Pilot," the cause of his trouble with regard to burst ignition tubes is probably due to (1) pre-ignition, either due to (2) faulty adjustment of the tube, or (3) to carbon deposit in the cylinder. He would do well to make sure there is no such deposit; if not, the cause is (1) that being caused by (2).—Yours truly,
G. CALVERT.

THE "STAR" CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the recent action in the Dublin Law Courts brought against me by the purchaser of a "Star" motor-car, in which it was contended that the car would not perform all that I claimed for it, I should be much obliged if you will kindly allow me to state that my faith in the "Star" car is in no way shaken by the fact that the Court decided against me, and I am perfectly satisfied that it was fully up to specification and did all that the company claimed for it.

Yours faithfully, W. R. McTAGGART.

QUERIES RE BELT-DRIVEN CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As a constant reader of your valuable journal, and an enthusiastic motorist, I have read with interest the several letters in your correspondence column *re* Belt Driving. I have noticed, however, that nothing has been mentioned *re* the up-keep and preservation of belts which, to my mind, is the important point. From many years' experience with both fast and slow driven belts on all kinds of machinery I have come to the conclusion that there is nothing like castor oil which, if used judiciously must give satisfaction.

My mode of procedure with a new belt is as follows:—After loosening the roll I place it for a quarter of an hour in moderately warm water (not boiling), then, after draining it, I put it in a vessel containing enough castor oil to cover it, and let it soak all night. In the morning it is taken out and hung up to drain for two or three days, then stretched in position required. After being taken up about twice it never requires any more attention. Belts treated in this way, with the additional attention of a weekly application of a small quantity of castor oil on a piece of waste applied to the outside of the belt, will last for years, and as long as the thinnest possible portion remains. It will be found that there is no trouble experienced through slipping, although the belts are run very loose, and that a great increase of power is obtained through being able to run them loosely. The explanation to my mind is that belts require feeding and nourishing as well as other things, and the application of castor

oil feeds and keeps the pores of the leather open and in a healthy state. If you have any respect for a belt never apply resin or anything containing resin, which has just the opposite effect to above, and is ruination. The oil may be applied without the warm water process with a piece of waste as before said whilst the belt is running, but this method is not quite so satisfactory, although recommended for belts which are already in position.

Yours faithfully, H. P. WHITE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to Mr. Taplin, I have never actually tried Dick's belting for the top speed, but I do not think it would work as well as a good leather belt. For low speed nothing could be better than Dick's belt, but several who have tried it for the top speed have told me that it was not a success. To drive a belt-driven car properly, it is necessary for the belt to have a certain amount of "slip," and not to grip too much, which, judging from the way Dick's belt holds on the low speed, I should imagine would not give the nice working a leather belt in good order would. I do not think Dick's belt would allow of being manipulated, *i.e.*, sometimes just touching driving pulley, at others half or full on, according to the requirement of traffic, etc. I am not speaking from experience, as I said before, but simply from my own idea, which is confirmed by the experience of several motoring friends.

A great mistake is made in using resin and other sticky compounds. To get the best results a belt, especially for top speed, should be soft and pliable, and clean and free from all sticky mess, so that it can leave the pulleys freely. I find that the best thing to use is a little castor oil applied to the outside of the belt occasionally. This softens and preserves the belt and causes just sufficient "grip."

With regard to belt fastening, "Perplexed" will find it rather a nuisance to have to unlace and lace up his belt every time it requires taking up. For motors of about 3-h.p. I know of nothing better than Harris's clips, as they can be unfastened and replaced so easily; but with belts having to transmit more power, as in 16-h.p. wagonettes, I use Jackson's clips. They are good, but not so convenient as Harris's, though far more so than lacing. I quite agree with Mr. Grimsley regarding belt fastening. Lacing is undoubtedly best for stationary work, where the length of the drive generally is adapted to give the belt a chance without the tension having to be so nicely adjusted as is rendered necessary by the "short centres" in a car. My experience is that clips are best for car work, owing to the belts having to be "taken up" so frequently.—Yours truly,
A. J. ALDRED.

MOTOR PATENT MATTERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Seeing that the automobile patents are now attracting so much attention, and granting that they must be of some importance and value, otherwise they would not be infringed, why is it that some popular automobile body does not intervene and buy up the existing interests? Cannot the rich folk of the Automobile Club get rid of the Lawson interest, if desirable, at the present prices? A company well organised with about £300,000 capital could sail right in and collar the whole automobile industry of Great Britain, together with the control of the Daimler Motor Company, the British Motor Company, the Motor Manufacturing Company, the De Dion Companies, and several others, whose capital would amount to several millions.

There is no question about the future of the best automobiles, such as Daimlers and De Dions. Hundreds are now selling, and the only grievance appears to be that people cannot imitate them without being troubled with litigation.—Yours faithfully,
A. M. HAYWARD

TROUBLE WITH GEARING OF MOTOR CYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I venture to suggest in reply to "Gear-case" that his trouble with noisy gears in quads or trikes is caused by

the wearing of the insufficient bearings between the inside ends of the axle halves and the differential box. If the machines are De Dions, or imitations of same, the bearings consist of about $\frac{3}{4}$ in. mild steel axle running in the cast iron of the differential case. I cured one noisy De Dion by shrinking steel-tube collars on the axle ends, and then boring the differential box to fit. The contrast between these axles and those of the Ariel machine is most marked. With the latter the axle ends are about 2 ins. long, and the same diameter, of hardened steel, running in phosphor-bronze bearings.—Yours faithfully,

T. MARTIN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have had the same trouble as your correspondent, "Gear Case." On examination, I found that one of the differential wheels had split in the key way; I got another wheel, but the edges of the key bed on the axle being worn, I had to have a larger key. This had a tendency to work loose, so I had the wheels brazed on the axle.

I have found also that a new pinion, especially one of hard steel, has a tendency to "chatter." I tried some time ago to get a pinion made of vulcanised fibre, but was unable to get one. I may add that I have been much interested in Mr. Craig's articles.—Yours truly,

CHAIN.

A NEW MOTOR FUEL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was much interested in reading in your last week's issue details of the carburettor using crude oils, and would like to mention that I have experimented considerably in this direction. My carburettor is fitted to a $3\frac{1}{2}$ h.p. De Dion, and has gone through exhaustive trials. Although there are yet certain necessary improvements to be made I can safely say it forms no deposits in the pipes or combustion chamber, and gives off no fumes or noxious smell after the motor has run a couple of minutes. The complete apparatus weighs ten and a-half pounds, and can yet be reduced. I hope in the near future to prove its capabilities.—Yours truly,

R. REYNOLD JACKSON.

FERRY CHARGES IN SCOTLAND.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be obliged if you could spare me space in your columns to air the following grievance, and also as a warning to other motor-car owners who may happen to live in or visit Scotland. On September 25th I bought from a firm in Edinburgh a 3-h.p. Benz car, and resolved to bring it to Culross by road. As the firm had another car going in the same direction, we agreed to run to Culross in company. We left Edinburgh, two people being on each car, and ran to South Queensferry, where we put the two cars on board the ferry steamer for the purpose of crossing to the north side of the river Forth; we had hardly got on board when a ticket-collector or fare-taker came and demanded the sum of five shillings as fare for each car, which would also include ourselves. We asked the person to wait for one minute to allow us to wipe the water off our faces, it having poured all the way from Edinburgh; but he informed us in a most insolent manner, "I have no time to wait for you; pay five shillings for each car," which we did. On reaching home, I made inquiries about the ferry charges, as it seemed to me exorbitant that 5s. should be charged for a small car weighing 6 or 7 cwt. I am told that the charge for a horse and cart is 2s. 6d., which includes return if coming back on same day; a carriage and pair of horses is charged 3s. 6d., also including return. After making these inquiries, I wrote to the manager of the North British Railway Company, who are the lessees of the ferry, on October 29th, asking for an explanation of this charge, and in answer I received a letter dated October 30th, in which the manager promised "to look into the matter." I waited till November 14th, and having had no further letter, I again wrote to the manager, and received a reply dated November 17th, in which he "regrets that he is not yet in a position to reply to my former communication, but hopes to do so shortly." Getting no further information, I wrote again on December 18th, and

received no reply; on January 12th, I wrote once more, with a like result. Perhaps some of your Scottish readers would be good enough to tell me what the charge is for cars crossing by this ferry; it seems hopeless to expect either an answer or civility from the North British Railway Company. Possibly, they, like the toll-keeper who charged a car owner toll for six horses as he had a 6-h.p. car, charged me ferry dues for three horses and a carriage as well.—Yours truly,

JOHN CUNNINGHAM.

MR. ALAN A. L. HICKMAN writes:—"In your report re my case at Northampton County Court, you mention that the car I was driving was a Daimler. Allow me to mention that it was the M.M.C. Panhard I have had nearly twelve months, which I have driven over 3,000 miles on, and which has given entire satisfaction."

THE British Motor Traction Company, Ltd., write: "As there seems to be some serious misunderstanding in reference to the Lanchester patent action recently taken by this company, we would like to point out that we won this action in the Court of Appeal, but the House of Lords decided that the article in question was not an infringement of the Lanchester patent, but they did not in any way interfere with the certificate of its validity which was granted to us in the first instance by Mr. Justice Stirling and upheld in the Court of Appeal."

A SERVICE of electrical cabs has just been started in Vienna.

OWING to the death of the Queen the dinner of the Yorkshire Automobile Club, which was to have been held on Wednesday, was postponed.

MR. SIDNEY STRAKER, A.M.I.C.E., M.I.M.E., of 110, Cannon Street, E.C., has tendered his resignation as consulting engineer to the Daimler Motor Co., Limited.

THE Austrian Daimler Motoren Gesellschaft (Berenz, Fischer and Co.), of Vienna is building a special motor-wagon to the order of the Austrian military authorities.

It is reported that the King of the Belgians has just ordered from a Paris firm an electric motor-car which is expected to attain a speed up to 55 miles an hour.

Two automobile clubs are in process of formation in Brooklyn, N.Y. The first is called the Automobile Club of Brooklyn, the second the Automobile Club of Long Island.

A BILL drafted by the law committee of the Automobile Club of America has been introduced into the United States Senate modifying the statute relating to the carriage of gasoline on passenger boats.

It is reported by a French contemporary that a motor omnibus service is about to be started on the Island of Corsica between Massiglia and Bastia. At first two Panhard and three De Dietrich cars will be put on the service.

MR. E. W. HART, of Luton, has just issued a small but handy catalogue, in which full particulars and illustrations of the Sirene voiturettes are given. The car is being made with various types of bodies, from the ordinary two-seated one to the comfortable *tonneau*.

THE St. Louis Automobile and Supply Company, of St. Charles Street, St. Louis, have sent us a copy of their catalogue of motor-cars, motors, and motor accessories, which is one of the most complete lists we have so far received from America. The company are making and supplying frames, complete with motor and transmission gear, ready to receive any desired form of body. Several types of car are illustrated in the list, as also is a new variable gear giving two speeds and reverse. Other pages are devoted to chains, hubs, tires, engines, boilers, etc.

ONE of the cars of the Edinburgh Autocar Company came to grief last week in Shandwick Place, Edinburgh, under peculiar circumstances. It is believed that one of the oil tubes burst, and the oil becoming ignited, the flames were carried to the framework of the car, which was running along the thoroughfare with its usual complement of passengers. The driver immediately drew up, and all alighted without any damage being done to themselves or their clothing. The woodwork of the car was quickly consumed, and the firemen could do little more than cool the heated iron frame and run it into the side of the street.

AUTOMOBILISM IN HOLLAND.

AUTOMOBILISM has not developed in Holland to such a degree as the good condition of the roads in such a flat and level country would make one think it should. Still, it is steadily and continuously marching forward. It is admitted already that the motor-car is not altogether a nuisance, and it will not be long before it will be recognised as a necessity. Dutch farmers, who look with animosity upon any new invention which might possibly frighten their horses, are compelled to acknowledge their impotence to bully the motor-vehicle off their roads, as they tried to do the bicycle, luckily in vain. To prove my assertion, remarks Mr. G. A. Von Hunteln in the *Horseless Age*, that the progress of automobilism is not in proportion to the number of inhabitants, I may state that, with a population of 5,000,000, only about 300 automobiles are to be found. The first motor-car crossed the frontier about five years ago, and was soon followed by a good many more.

In 1897 some owners of motor-vehicles founded the "Nederlandsche Automobiël Club" (Dutch Automobile Club), headed by the president of the Automobile Club of France, Baron van Zuylen van Nyevelt, as honorary president. The number of members soon increased, and now amounts to some 180. The task the club has set itself is practically the same as that of the greater part of bicycle touring clubs. In 1899 and 1900 the club organised several excursions, followed by the customary festivities and an annual club meeting, which, on the whole, were a great success. In March, 1900, its board collaborated with that of the Dutch Bicycle Dealers' Association in organising a bicycle and automobile exposition, which attracted a great many visitors and even brought some profit to its organisers.

All automobiles running in Holland are fitted with petrol motors, with the exception of those used by the Royal Postal Department for the collection of mails from the letter boxes in the principal cities, viz., Amsterdam, Rotterdam and The Hague, which are electrical. As we have not yet a motor industry of our own (we shall have a factory putting motors of its own invention and make upon the market ere long), nearly all automobiles are of foreign origin, chiefly German and French; these are giving satisfactory results so far. The type of vehicles used varies according to the work they are expected to do, from two-seated light vehicles of 3 h.p. to heavy passenger 'buses. The greater number of motor-vehicles belong to wealthy gentlemen who are "on pleasure bent," and only a few are serving industrial purposes. Among the latter we reckon the electric mail wagons referred to above, which, by the way, did not prove quite a success.

Automobile traffic in Holland is regulated by Royal and municipal acts and edicts. The pace at which motorists are allowed to run is brought within a reasonable limit with an eye to the safety of pedestrians and horse drivers. All automobilists must hold a licence, granted by the Home Secretary of State on application after inspection and test by a state official. This officer pays special attention to the ability of the driver, and every vehicle must be fitted with powerful brakes, so that, when driving at top speed within the limits of the regulation, it can be brought to a dead stop in about 20 yards. This test successfully performed, the licence is granted, and the owner of the carriage has a right to drive freely on State roads and highways. The vehicle has to show a plate bearing the registered number of the licence. This register number is of great convenience to the police officials in signalling and bringing before the court anyone who dares defy the regulations. Following the steps of the Ministerial Department, municipal boards of government also thought fit to issue laws and by-laws prohibiting furious driving in order to prevent accidents to traffic in some streets, either narrow or crowded ones, and in very rare instances prohibiting altogether the use of automobiles within the limits of their jurisdiction, thus causing an impediment to the free and healthy development of automobile traffic. In Amsterdam every automobile must carry a plate bearing the signature of the chief police commissioner, as a proof that the owner holds a municipal licence. Automobile traffic (the speed

not to exceed the moderate trot of a horse) is free, except in asphalted streets, which are nearly all narrow, notwithstanding their being the principal thoroughfares.

Vexations from police officials are seldom heard of, although Mr. Von Hunteln knows of a driving case in which the *chauffeur* was fined 20 guilders by the justice of the peace, and on bringing this case before a higher court it was dismissed. The attorney for the crown considered this an unjust verdict and brought the case before the Supreme Court of Justice. The bench decided that the J. P.'s verdict was right, although the bar severely criticised the deposition of the constable who arrested the defendant, and fined that unlucky gentleman (look at the unfathomable depths of the paths of justice!) the sum of 40 guilders, judging that the fine imposed by the J.P. was not sufficient for the seriousness of the infringement. In a second case this very same gentleman was brought before the court in a furious driving case, although he could prove, and two witnesses could swear to the fact, that his automobile, on the day he was arrested, was in a more or less defective condition, so that he was unable to drive at the "*grande vitesse*," or more than five miles an hour, strictly in conformity with the regulation. The case was dismissed with hilarity.

THE ROCHET-SCHNEIDER 12-H.P. CAR.

LA SOCIÉTÉ ROCHET AND SCHNEIDER, of Lyons, France, have lately completed the first car of a new type, and of which an illustration is given herewith. The vehicle is a radical departure from the cars hitherto turned out by the Lyons firm. The latter have been provided with horizontal engines and belt transmission; the new car follows closely the Panhard system, it being fitted with a

four-cylinder motor of the Daimler type of 12 h.p. The engine is located under a bonnet in the fore part of the frame, and transmits its power through a progressive friction clutch to the variable-speed gear box. Four speeds forward and a reverse motion are available, the changes being controlled by a single handle. There are several interesting features in the Rochet-Schneider motor. The valves are arranged in a special way to enable them to be withdrawn for inspection by the removal of a couple of nuts, one for each valve. Ample brake power is provided, while the artillery-type wheels are shod with pneumatic tires. Steering is controlled by the usual sloping wheel. Altogether the new Rochet-Schneider car has the appearance of being substantially built, and since it has been placed on exhibition in Paris it has attracted considerable attention.

ACCORDING to a German contemporary, the Motorfahrzeug- und Motorenfabrik Gesellschaft, of Marienfelde, Berlin, has received orders from an English concern, the value of which is roundly £25,000.

The Mildé Electrical Vehicles.

FIG. 1.—THE MILDÉ ELECTRICAL 8-SEATED OMNIBUS.

AMONG the many firms in France devoting attention to the construction of electrical vehicles is Messrs. Ch. Mildé, Fils, and Co., of Rue Desrenaudes, Paris, several types of whose cars we are now able to publish some particulars and illustrations. The Mildé motor is of a special type composed of two armatures revolving in one field, so that, acting as a differential, it suppresses the mechanical balance gear, and thus greatly simplifies the mechanism. It is claimed to be light and to have a very high efficiency, while, being of the compound type, it can be employed for electric braking and for recuperating the batteries on down grades. The motor shaft carries spur wheels, which gear directly on to toothed wheels fixed on the driving axle. This has, of course, necessitated a careful system of suspension. The bed of the motor is hinged at one end on the axle, and at the other it is supported from the under-

FIG. 2.—ELEVATION OF FRAME OF OMNIBUS.

frame by a vertical spindle pressing down on the spiral spring. The effect of this arrangement is to give the motor a segmental motion around the toothed wheels, so that, however unlevel the road traversed may be, the pinions are always in close connection with their corresponding wheels. The motor and gearing are entirely enclosed.

The accumulators employed are of the Heinz type, to which it is claimed a great durability is imparted by the method of binding the plates with asbestos to prevent disintegration. The battery, which comprises forty cells, is suspended from underneath

FIG. 3.—ELEVATION OF "AVANT-TRAIN" OF LANDAULET AND CAB.

the car by cables and pulleys, one end of each pulley being wound round a shaft carrying ratchet wheels at the ends, so that it can be easily lowered to the ground. The car is then pushed forward

clear of the battery, and is run on to another, which is attached by the cables and raised in position. The operation can be performed, if necessary, by one man. The speed controller shaft is concentric with the vertical steering rod, the controller hand lever being fixed below the steering hand wheel. The cells of the battery remain always in series, and the controller has thirteen different positions, giving six speeds ahead, with two reverse

omnibus complete, with its load of eight to ten persons including the driver, is about three tons.

Figs. 3, 4, and 5 represent two examples of Messrs. Mildé's type 2 and 3—viz., a three-quarter landaulet and a cab. In this type the motor and accumulators are all connected up to and carried by the fore-carriage. The advantage of this arrangement is that it can be adapted to any type of carriage without modifying the body. This placing of so much of the load on the front axle would obviously seem to affect the steering, but this difficulty has been overcome by the adoption of a steering gear consisting of the usual vertical spindle terminating in a large pinion and connected by a chain with a smaller pinion running on a toothed segment which constitutes the back part of the frame carrying the motor and battery. This arrangement gives to the fore-carriage a great amount of lateral rigidity, and at the same time allows of a very wide steering angle. The landaulet is provided with a motor weighing 264 lbs., and giving an output of 2,400 watts at 76 volts and 1,600 revolutions per minute. The vehicle is geared up to a maximum speed of about twelve miles per hour, the consumption on the level being from 28 to 30 ampères. The cab is equipped with a motor having an output of 1,700 watts at 76 volts and 1,900 revolutions per minute. The battery of the landaulet comprises forty cells, having a capacity of 150 ampère hours, sufficient for a run of from 70 to 75 kilomètres, the weight being about 960 lbs. In the cab a 100 ampère-hour battery is employed.

FIG. 4.—THE MILDÉ ELECTRICAL LANDAULET.

speeds, two electric braking positions, two stops, and a battery recuperation notch.

In Fig. 1 we illustrate one of the Mildé heavy types of vehicles—an eight-seated omnibus. These are equipped with a standard frame, to which any type of body, such as that of a lorry, delivery van, or brake, can be fixed. The frame is made of U iron, and is supported by four strong semi-elliptic springs. The steering is effected by means of a steering hand wheel, a vertical rod, a bevel pinion, a gear sector, a connecting rod, two steering spindle levers, and a connecting rod between the latter. The motor has two armatures on independent shafts, revolving in the same field frame, and each working through spur gears on one of the rear road wheels. The motor is carried on an oscillating base, pivoted on the rear axle, and suspended from the frame by two coil springs. The gearing is enclosed in a casing, and the ratio of reduction is 1:15. The weight of the motor is 484 lbs., and it has a normal output of 3,800 watts (5 h.p.) at 76 volts and 1,200 revolutions per minute. The latter motor speed corresponds to 80 revolutions per minute of the road driving wheel, and a speed of eight and a half miles on the level. With the maximum load of 6,600 lbs. the current consumption on the level is from thirty-six to thirty-eight ampères, and the specific energy required per ton mile is, therefore, about 114 watt-hours. The battery has a capacity of 200 ampères at a five-hour discharge, and its total weight is between 1,550 and 1,600 lbs. A single charge is sufficient for a run of thirty-eight miles.

Besides the electric brake and the recuperating action of the motor, two mechanical brakes have been provided. The first of these is a hand brake, acting on brake drums, fastened to the hubs of the driving wheels and concealed in the gear case. It is operated by a double-foot lever, placed under the feet of the conductor, on each side of the controller. The lever to the left simply acts on the switch, breaking the current when it is desired to slow down, while the lever to the right first interrupts the current and then draws on the brake. The other brake is a shoe brake on the rims of the rear wheels, operated by a hand lever to the right of the conductor. The road wheels are of the artillery type, shod with solid rubber tires. The weight of the

MR. CORNELIUS J. FIELD, manager of the De Dion-Bouton Motorette Company, Brooklyn, N.Y., delivered a lecture last month on the automobile and its uses, before the students of Sibley College, Ithaca, N.Y. He favours the petrol motor for general light work, but sees a field for steam and electricity in heavy work.

FIG. 5.—THE MILDÉ ELECTRICAL CAB.

THE Moto-Club de France has changed its proposed "Tour de France" to a "Tour des Vosges" of 1,111 kilomètres (695 miles) to be covered in 10 days, starting on May 26th. The itinerary will be—Reims, 160 kilomètres; Mézières, 87 kilomètres; Verdun, 103 kilomètres; Nancy, 105 kilomètres; Epinal, 96 kilomètres; Gérardmer, 72 kilomètres; Plombières, 80 kilomètres; Vittel, 75 kilomètres; Bar-le-Duc, 110 kilomètres; and Paris, 225 kilomètres.

THE BAINES MOTOR-BICYCLE.

THE adaptation of the two-wheeler single track form of cycle, the bicycle, to motor use finds many advocates. This week we are able to illustrate and describe a new motor-bicycle which comprises several novel points. The machine is the invention of and has been patented by Mr. E. A. Baines, works manager for his brother, Mr. W. A. Baines, Central Works, Church Street, Gainsborough, and he has made the whole of it except the engine. As will be seen from the illustration, the frame of the machine is low-built like the "Cob" bicycle. The back wheel is 26in. in diameter by 2½in., the front one 28in. by 2½in. The lower tube from the bottom of the head to where the pedals are usually placed is divided half way down and, with the main down tube, which is also divided, forms the frame for the motor—a 1½-h.p. De Dion. The down or "seat" tube forms the silencer, which is very large and does not get heated. The outlet consists of a series of holes at the bottom; it is stated to act perfectly, and its form—short and wide—prevents back pressure. The back stays are of the swinging type. The back wheel is provided with two double row ball bearings carried in spherical-seated cages, the outer part being hinged so that the back wheel can be removed without interfering with the adjustment of the bearings, thus facilitating the work of repairing tire punctures. The front forks have duplex stays and the whole machine is built especially strong to withstand any strain. The mudguards are 4in. in diameter, while the petrol

tank, which has a capacity of 1½ gallon, is made oval in shape so that there shall be no rough corners.

As already mentioned, the engine used is a 1½-h.p. De Dion; the valve box has been moved from the side to the front so as to be in line with the machine, and so reduce the width. The sparking plug is under the valve box and induction valve; there is thus only two inches of exposed wire in any part of the machine, so that the risk of short circuiting is materially minimised. The throttle valve, which is located immediately over the inlet valve and close to the carburettor, is operated by a rod passing through the tank, on top of which is a small handle; it is so arranged that it can be fully opened to the carburettor or the outer air. When open direct to the air the valve shuts off the mixture and opens the cylinder to the air, so allowing it to cool when running down-hill. This handle also shuts off the current when the valve closes to the carburettor.

The carburettor is described as being on an entirely new principle; it is of the jet type, without a float. The petrol is kept at a constant level by means of an arrangement which allows the surplus petrol to overflow. A part of the exhaust is made to pass under the carburettor so as to prevent it becoming too cold. The compression also opens into the exhaust in order to prevent the usual noise at starting, when the compression cock is open. The flow of the petrol from the tank to the carburettor is governed by a needle valve set by a dial. The mixture needs very little adjustment.

There are no levers on the handle-bars except that for the band brake. The only taps are those controlling the throttle

valve, the compression cock, and the ignition. A "Blake" induction coil is used; this is carried in the top part of the case shown at the rear of the front wheel. The trembler is also well protected from wet; indeed, the ignition apparatus is much on the lines of that adopted in voiturettes. There are two Peto and Radford accumulators carried in the case, only one of which is used at a time.

The engine is so arranged that it can be run free, a friction clutch in the brass case being worked by swinging pedals which also apply the rim brakes on the back wheel. A metal guard is fixed on the right side of the motor, near the pedals; by pressing the front part of the latter downwards the engine is put into gear. Should an obstruction be met with, or in any other emergency, the rider "back pedals," in other words, presses the heels down, and the engine is disconnected and the rim brake applied, the engine being allowed to work till the rider desires to go forward again. To start, the engine is disconnected from the driving gear, which consists of chain and gearing, and the machine wheeled forward, the motor, having no load, starting easily. When ready to depart, the rider simply mounts and puts in the clutch. There are no pedals to revolve, it being considered that the engine is powerful enough for all purposes. In addition to the rear wheel rim brake, a band brake on the front-wheel hub is also being provided.

MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

Military Motor-Cars in Italy.

THE Italian military authorities have recently carried out some trials with the 50-h.p. De Dion steam-wagon lately ordered from Paris. The vehicle, in addition to carrying its own fuel and water sufficient for a run of twenty miles, has been shown to be capable of transporting loads of four tons at an average speed of from six to eight miles per hour, while hills of gradients of 8 and 10 per cent. have been mounted. Although the trials are to be continued, the opinion is strongly held in Italian military circles that such vehicles are likely to play an important part in the transport of heavy military stores in the future.

The Italian Tour.

THE work of organising the automobile tour of Italy, which is to take place in the month of May, is steadily progressing, and already the itineraries, as well as all general arrangements, have been definitely settled. To meet the requirements of all competitors alternative routes have been selected. The entire journey totals up to some 1,089 miles, but for those who cannot make the complete round a special category will be reserved, and here the motorists will have the choice of making either 632 or 670 miles. English automobilists should note that entries will not be accepted after April 15th, and that they should be accompanied by a remittance of three pounds if it is intended to make the entire journey, or two pounds if the shorter itinerary is to be followed. These fees include the right of stabling the car *en route*, and the supply of petrol at reduced prices. Coupons for board and lodging will be issued, so that participants in the tour will know exactly what the trip will cost them. The daily runs will in no case exceed 130 miles, and after the first week of travelling a day's halt will be made at Rome. It is anticipated that a number of Riviera automobilists will participate in this delightful tour, and it is probable that several motor men from Paris will also reserve the month of May for the purpose of this long jaunt. Here is the itinerary:—

First day	Turin, Asti, Alexandrie (lunch), Novi, Genoa.—110½ miles.
Second day	Genoa, Chiavari (lunch), Spezia.—68 miles.
Third day	Spezia, Viarege, Pisa (lunch), Pontevendra, Empoli, Florence.—104 miles.
Fourth day	Florence (lunch), Siennese.—104 miles.

Fifth day	Sienne, Grosseto (lunch), Ortebello, Civita-Vecchia.—130 miles.
Sixth day	Civita-Vecchia, Rome.—44 miles.
Seventh day . . .	Rest at Rome.
Eighth day	Rome, Civita-Castellana (lunch), Narni, Terni.—62½ miles.
Ninth day.....	Terni, Saint-Gemini, Todi (lunch), Perugia.—57½ miles.
Tenth day	Perugia, Gubbio, Scheggia, Toscombrone (lunch), Tano, Pesaro, Rimini.—107 miles.
Eleventh day.....	Rimini, Cesena, Forli, Faenza (lunch), Imola, Bologna.—70 miles.
Twelfth day	Bologna, Ferraro, Rovigo, Padua (lunch).—77 miles.
Thirteenth day ...	Padua, Vicence, Vérona (lunch), Brescia.—93 miles.
Fourteenth day...	Brescia, Lodi (lunch), Milan.—62½ miles.

A Law Suit.

THE first stage of a law suit, which for some time past has excited considerable interest in Parisian automobile circles, was reached last week, when the court found a verdict in favour of the petitioners, and decided the knotty question as to whether the offending driver was or was not in the employ of the owner of the car at the moment of the accident. The facts of the case are these. On September 20th, a certain *mécanicien-chauffeur*, named Dubuisson, was driving the automobile of the Duke of Chaulnes when, in the rue Réaumur, he knocked down a small boy some twelve years old. The parents of the victim promptly commenced an action against the driver and against the Duke as civilly responsible, and it was with regard to the latter question that the intricacies of the affair arose, for the nobleman declined to accept any responsibility in the matter upon the ground that Dubuisson was not in his service. After hearing the evidence of numerous witnesses and perusing the correspondence which had passed on this subject, the court found the case so difficult that judgment was held over for a week in order to permit of further deliberations. The court have now given a judgment, finding Dubuisson culpable, and condemning him to two months' imprisonment, with, however, the benefit of the Béranger law, or first offenders' act. Moreover, the unfortunate driver has been ordered to pay to the parents of the victim a provisional sum of £40, pending the report of the doctor appointed to examine the case. The court have also found the Duke of Chaulnes civilly responsible for the mishap, holding that although the driver had not been definitely engaged at the time of the accident, he was on trial for a permanent engagement, and consequently that the Duke was responsible for his actions. Such cases as this should awaken proprietors of automobiles to the risks they run, not only when driving themselves but also when their cars are in the charge of their servants. Only too many owners are either ignorant of, or totally ignore, this condition of affairs, and this too in France where the insurance companies lay themselves out to grant policies covering these risks at very moderate figures. Frequently it is a case of "penny wise and pound foolish," for there are many men who shrink from paying a five pound note, little appreciating the risks they run by not effecting the insurance. Insure then, all motor men, not with the idea of being able to drive less carefully, but with the idea of saving both time and money should by any chance an accident occur.

The Mors Company's New Features.

SEVERAL new features are being adopted in the 1901 models of the Mors cars. Firstly, it may be mentioned that the well-known combination accumulator and dynamo ignition is being superseded by a new rotary magneto-electric device which has been patented by the Mors Company. Another new department is to be found in a special regulator acting on the gas admission, a device which is claimed to materially reduce the amount of petrol consumed. In addition to the standard 5 and

10 h.p. cars, a new light car fitted with a four cylinder engine of 8 h.p. is being got ready for the market.

The Paris Salon.

BY the time these lines are in print the *Salon de l'Automobile, du Cycle et des Sports*—to give the exhibition its full title—will have opened its doors, and crowds of motor men will be thronging the Grand Palais in search of automobile novelties. As already announced in the columns of the *Motor-Car Journal* the original intention of the organisers was to inaugurate the show on Monday last, the 21st instant, but such was the difficulty experienced in clearing the palace of the thousand and one articles exposed there during the recent big exhibition, that Monsieur Rives and his fellow-workers found themselves with insufficient time to complete the work of installing the Salon, and on the 18th instant were compelled to issue a circular-letter announcing the postponement of the opening ceremony until Friday. To appreciate the labour one should compare the interior of the palace to-day with what it was a month ago. It has not simply been an affair of clearing out one lot of exhibits to make way for another, but the very palace itself had to be rendered practicable for a winter exhibition. The heating and lighting have been no slight undertakings, while the erection of the stands necessary for some 550 exhibitors has entailed a vast amount of work executed under high pressure. But even as I write all this is in perfect order, and in the evening the brilliantly illumined palace attracts much attention from the crowds accustomed to seeing its dark, unlighted mass looming up against the sky. It is, too, ideally situated for an exhibition, and with an ordinary amount of luck the exhibitors should do excellent business, and so forget their disappointment at the meagre results obtained from last year's big show. The Champs Elysées is easily reached from any part of Paris—bus, tram, and boat all can be utilised, and the visitor finds himself within a stone's throw of the Grand Palais, which is situated on the left-hand side of the avenue as one mounts towards the Arc de Triomphe. At present cycles and automobiles of every shape and form are to be seen entering, while all day long numbers of self-propelled machines are to be found before the doors awaiting the return of the owners, busily engaged in the chaos of the interior. It gives one a capital impression of the extent of the automobile industry here in France, and the bustling activity displayed affords abundant proof of the life and vigour of the trade in spite of last year's troubles. On Friday we are to have Monsieur Millerand, the Minister of Commerce, at the opening ceremony, and, doubtless, during the show other Ministers will evince their interest in the automobile movement by visiting the show. Unquestionably one of the most attractive sections will be that devoted to the exhibition of early and historic motor-vehicles, for never before has such a complete collection as that of the Grand Palais been brought together. From the Daimler Company at Cannstatt there comes the first bicycle, quadricycle, and motor made by the firm; from Benz comes his first tricycle (1886); the Decauville Company send their first four-wheeled voiturette; M. Jeautaud lends the first electric carriage built in France; De Dion and Bouton expose a complete series of their machines dating from 1895 to 1900; Peugeot sends a motor-quadricycle dated 1891; the Bollée family lend some of their famous vehicles, and others are forthcoming from firms too numerous to mention. Nearly the whole of these curiosities are already safely installed in the palace. Many of the big cars, too, are already in their places, and not the least interesting of these is the caravan in which M. Turgan recently accomplished a lengthy tour in Tunis. The exhibition will remain open until Sunday, February 10th, and next week I hope to give some particulars of the exhibits made by the various firms interested in the automobile industry. But come and see the show for yourselves, all English motor men. I am sure you won't regret the visit.

"L'AUTOMOBILE ILLUSTRE," Brussels, states that there is no truth in the statement that the King of the Belgians has ordered a 30 h.p. touring caravan.

THE LINSKY CUP RACE.

THE first race of the year 1901, known as the Linsky Cup, and organised by the Automobile Club of Nice, took place on the 21st inst. The course was Cagnes, Ville-neuve, Loubet, Le Rouret, Magagnosc, Grasse, St. Vallier, and the Col de la Faille, an altitude of 1,400 mètres; distance, 45 kilomètres, or under thirty miles. It is a give-and-take piece of road, but mostly uphill. The cup was presented to the A.C.N. by Colonel Linsky, and goes to the vehicle covering the distance in the shortest time.

The rules for this race are as follows:—1. Every competitor must have a thorough knowledge of the current racing rules of the A.C.F., and declare that he will abide by them; 2. This race is restricted to four-wheeled vehicles, fitted with a complete carriage body, and the total weight must not be more than 500 kilos.; 3. The vehicles must be provided with two seats, which shall be occupied, and must be driven by a member of a recognised automobile club; 4. The competing cars must start at intervals of one minute, and it is not allowed to effect repairs with anything besides what is carried on board. It is also forbidden to receive assistance by being pushed, except at the start; 7. The car covering the distance in the shortest time will be awarded the Linsky Cup. A silver medal will be given as second prize by the A.C.N., who will also award diplomas to all cars reaching the winning post within half an hour of the first arrival.

The following entries were received by the A.C.N.:

Fred. Flores	...	Cottéreau voiturne	...	5 h.p.
M. Lautard	...	Decauville voiturette	...	6 h.p.
B. Laumailié	...	Che-ray voiturette	...	8 h.p.
J. Bary	...	Renault voiturette	...	4 h.p.
P. Chauchard	...	Clément voiturette	...	4 h.p.
L. Oustric	...	De Dion voiturette	...	5 h.p.
A. Deville	...	Cottéreau voiturne	...	5 h.p.
De Chapuiset	...	Decauville voiturette	...	5 h.p.
L. Ravenez	...	Decauville voiturette	...	5 h.p.

Only six competitors, however, turned up at the starting point, three of them, Thierry, Gilbert, and Navello, taking the place of three other absentees. At 10 a.m. the competitors were sent off by M. Huet, the official starter, at intervals of one minute. The modest horse power possessed by these voiturettes must not be taken for granted, but with a grain of salt. Like the Scotchman "I hae me doots" that such a remarkable decline of horse power should be possible, when the Decauvilles were 8 to 10 h.p. last year. My friend 'X,' who is typical of *chauffeurs* generally, takes pains to impress me with his voiturette when I meet him on the road on ordinary occasions. Says he: "This is the finest and fastest voiturette in this part of the country, and is 10 h.p." Friend 'X' has forgotten all about this when I meet him at the starting point the day of the race, and says: "Of course, I don't expect to do anything to-day. My voiturette is a humble touring vehicle, a mere 5 h.p.!" To arrive at a correct horse power, a medium between the two statements is nearest the truth.

This race, I regret to state, cannot be considered a landmark in the history of voiturettes. The distance was very short, and yet—whisper it gently—only two turned up at the finish! It is almost incredulous in these days of vastly-improved motor-cars. Thierry only got a hundred yards from the start, and then gave up! Flores next had a puncture, then broke his trembler, and also gave up. Navello next had troubles with a pinion, and was put *hors de combat*. The epidemic spread to Gilbert, who reached St. Vallier, and was afterwards seen no more. This left only two in the field, or rather on the road. The race was now between De Dion and Decauville—Oustric and Ravenez. The members of the A. C. N. had motored to St. Vallier to see the winners come in. The panorama from the winning post at the summit of the Col de la Faille is magnificent, commanding a view of the Isles of Lérins, of Cannes, Nice, and even of Corsica on a clear day.

A shout! and here comes the winner! It is Ravenez, on a Decauville. For the 45 kilomètres his time is 1 hr. 32 mins. 3 secs., being an average of 30 kilomètres an hour on the whole course, extremely good when one considers the hilly nature of the road.

The next, and only other arrival, was Oustric, on a De Dion voiturette—time 1 hr. 45 mins. 2 secs.

After the race a *réunion* and lunch, arranged by the A.C.N., took place at Grasse, among the members who arrived in their motor-cars being Prince Lubecki, Count Broel, Barons H. de Rothschild and A. de Rothschild, Colonel Linsky, Messrs. Gondoin, Lemaitre, Jellinck, Desjoyeaux, Pinson, Roux, Gautier, Fernandez, Guidi, de Bary, Laumailié, Chauchard, Jouinot-Lambetta, Platés, Duditliu, Huet, de Chapuiset, Portal, Deville, Clerissy, Mical, etc. The president, M. Gondoin, gave the toast of "Colonel Linsky," the generous donor of the cup, which was received with immense applause. Other toasts followed, and the caravan commenced its return to Nice about four p.m.

LEOPOLD CANNING.

THE Newfoundland papers are giving prominence to automobile doings in Europe.

It is reported that two new cars of no less than 70 h.p. each are being built by the Mors Company, of Paris, for the forthcoming Nice week.

A MOTOR race has been held on the Tsarskoje-Selo-Strelina route in Russia. The distance was 40 versts, and this was covered in 1h. 36m. by M. Hendic in a voiturette.

THE *Motor World* of New York remarks that three "dollars and costs" is the usual charge in Chicago for motor-vehicle scorching—when the perpetrators are caught.

BRIGADIER-GENERAL GREELY, chief signal officer of the U.S. army, has sent a motor-vehicle to the Philippines for use by the Signal Service during the winter operations in the transportation of signal apparatus.

THE Automobile Club of Southern California has been formed at Los Angeles, Cal., U.S.A. The purpose is to promote a social organisation composed of persons owning, manufacturing, or interested in automobiles. Future plans include a club-house in the suburbs of Los Angeles, races, excursions, etc.

MR. J. E. McFARLAND, a student at Johns Hopkins, Baltimore, U.S.A., recently covered the distance between that city and Washington on a motor-vehicle in 3h. 14min., which performance was 7min. better than the journey has ever been made by any other automobile.

THE American Bicycle Company has acquired the patents of Mr. Elmer E. Sperry, of Cleveland, Ohio, relating to storage batteries and constructional features of electrically propelled vehicles. These patents have so far been exploited by the Cleveland Machine Screw Company, of Cleveland, Ohio.

MR. CLARENCE G. DINSMORE, a prominent member of the Automobile Club of America, is having built for his use a special German Daimler touring car which will be one of the finest specimens of up-to-date automobile work that has been turned out of the Cannstatt factory. The propelling power will be a 30-h.p. Mercedes motor.

THE major commanding the battalion of the 10th line regiment at Louvain, Belgium, has decided, in connection with the forthcoming spring marching manoeuvres, to carry out some trials with despatch bearers mounted on bicycles and motor-cycles. The victualling of the soldiers, too, will be maintained during the manoeuvres by means of motor-wagons.

MR. CROKER, chief of the fire brigade in New York, is interested in the automobile question, and believes that the motor-car can be used in the fire department with advantage to the department and to the city. He has examined all the various makes and styles, and states that he believes an electric vehicle guaranteed to run a considerable distance without recharging would come nearest to filling his official requirements.

CALLING in at Messrs. Friswell's dépôt in Holborn Viaduct, E.C., the other day, we were able to inspect a car that is new to the English market. The vehicle is of Belgian construction, but is built in accordance with the designs of Mr. C. E. Duryea, of Reading, Pa., U.S.A. As we hope to illustrate the Duryea car in an early issue, we will merely remark on the present occasion that the engine appears to run very quietly, and that even when the car is standing still and the motor is in motion no vibration is apparent.

SOME NEW CARBURETTORS.

WE have already illustrated one form of the "Abeille" carburettor (see *Motor-Car Journal*, December 29th, 1899) made by Messrs. Dalifol and Thomas, of Paris. The firm have since introduced a new form of carburetting device, of which a part-sectional view is given in Fig. 1. The device consists of a cylindrical body, which carries at its upper part an air inlet, and has at its lower end an L piece for connection to the inlet valve. The main feature of the carburettor is a double-seated valve *D* which shuts off at the same time the air and petrol supply. The air entering at *E* is to be drawn through or around some heated parts. Over the pipe at *E* is a sleeve. Both pipe and sleeve are pierced by an equal number of coinciding holes, through which cold air is admitted and mingles with the hot air. By turning the sleeve around on the pipe the opening of the holes and consequently the amount of air admitted through them can be adjusted, and thus the temperature of the air be regulated.

At every suction stroke of the piston the valve *D* is lifted off its seats, against the force of the spring on its rod. Air and petrol are thus admitted. The petrol enters by the pipe *B*, passes through the needle valve *C*, and is expanded over the corrugated surface of the valve *D*. It is instantly evaporated, and carried along by the air passing the valve. In the lower part of the carburettor chamber are placed some layers of metal gauze, and the mixture in passing through this gauze is rendered more homogeneous and more perfectly gaseous. On the lower arm, or connection *F*, of the carburettor is placed a sleeve, similar to that at *E*, by means of which the richness of the mixture can be regulated. This sleeve is provided with a lever arm *G*, and the regulation can be effected when the vehicle is running. The admission of the petrol is regulated once for all by adjusting the needle valve *C*.

Another French carburettor which is stated to have given good results in practice is the De Sales-Braley, illustrated in Fig. 2. The principle adopted is to cause air to traverse textile material saturated with petrol, so that the air takes up the latter, and a saturated vapour, consisting of air and finely-divided petrol, is produced, which may then be mixed with air

FIG. 1.—THE DALIFOL-THOMAS CARBURETTOR.

in any desired proportion, and the mixture used in the motor to produce an explosion. Referring to the illustration, it will be seen that the carburettor consists of a chamber, 1, divided into two compartments, 2 and 3, by means of a partition, 4. The compartment, 2, has inlets for the spirit which flows from the tank by the pipe, 5, closed reservoir past a needle valve, 6, which is opened by suitable levers, 7, against a spring,

8. This lever is actuated by the rod, 9, of a piston, 10, which moves by atmospheric pressure in consequence of the partial vacuum formed in the box, 3, by the suction of the motor. The piston, 10, which slides in a cylinder, 11, having openings, 12, closed by the piston when at rest and uncovered when

FIG. 2.—THE DE SALES-BRALEY CARBURETTOR.

it is raised by the atmospheric pressure. The air sucked in penetrates into a cylinder, 13, pierced with holes, 14. The upper portion of this cylinder is provided with alternate layers of metal gauze and a spongy fabric, 15, 16. The whole forms a cushion to which the density required for obtaining the desired degree of carburation is given.

The chamber, 2, communicates by an opening, 20, with a pipe, 21, to which fresh air is admitted through a valve, the openings, 23, of which can be regulated by the lever, 24. The method of operation of the device is as follows:—The suction of the motor causes a partial vacuum in the box 1, atmospheric pressure raises the piston, 10, air passes in by the holes, 12, into the compartment, 3, penetrates by the openings, 14, into the box, 13, traverses the fabric, 16, impregnated with petrol, becomes saturated and passes into the pipe, 21, where it becomes mixed with the required quantity of fresh air, the latter being admitted through the holes, 23, in the valve. The piston, 10, on rising actuates the lever, 7, through the rod, 9, which allows a predetermined quantity of petrol to escape past the needle, 6, and flow into the fabric, 16, which is thus at each aspiration impregnated with the quantity of spirit necessary to convert the air into vapour.

It is claimed for this carburettor that it carburets the air to saturation in such a manner as to prepare a homogeneous mixture. The explosive mixture is formed outside the cylinder in a restricted space. The admission of the petrol is regulated by the requirements of the motor itself in such a manner as to prevent waste. Hand regulation is reduced simply to the introduction of fresh air, that is to say, to the movement of the lever, 24. The delivery of the petrol is proportional to the quantity of air to be carburetted, by the simultaneous action of the piston and the needle valve.

SOME trials are being made in Barcelona, Spain, with an eighteen-seated electric omnibus which has been built in that city by La Compania General Espanola de Coches Automoviles.

HERE AND THERE.

SIR HICKMAN BECKETT BACON, Bart., has been elected to and has accepted the first presidency of the recently-formed Lincolnshire Automobile Club.

MR. H. WATERS, of Aston, Birmingham, informs us that arrangements have now been concluded under which he holds the sole and exclusive sale in the Coventry and Wolverhampton districts of all motor-car springs, axles, and ironwork manufactured by Messrs. Richard Berry and Son, of Alma Street, Birmingham, and Messrs. J. Brockhouse and Co., of West Bromwich.

AT the recent motor-car exhibition in New York an innovation in automobile sport was tried, in the form of a pursuit race. The competitors comprised a steam and a petrol car. The character of the machines made a flying start necessary for equity. After ten laps the petrol car was declared the winner.

MESSRS. Brampton Bros., Ltd., of Birmingham, have sent us a copy of their new catalogue, which, among other things, gives full particulars of the many sizes of motor-car chains and chain wheels made by this firm, and which are so largely used. Saddle and tool bags also find a place in the list.

WITH regard to the Mytholm Doctor's Car illustrated in our last issue, we find we were in error in stating that a Longuemare carburettor is employed, the Yorkshire Motor-car Manufacturing Co. informing us that they are using a special carburettor, one of their own construction, which gives equally good results without the disadvantages of the former.

By the last American mail we learn that the Electric Vehicle Company, of Hartford, Conn., has purchased the entire capital of the Riker Electric Vehicle Company. In addition to the purchase of the Riker Company's stock, the Electric Vehicle Company has acquired from Mr. A. L. Riker personally all his foreign patents for motor-vehicles. The organisation of the Riker Electric Vehicle Company, it was stated, will be maintained, control being held through stock ownership, and the Riker business will go on very much as formerly.

A MOST handy universal drilling machine is being put upon the market by Messrs. Wallach Brothers, of 57, Gracechurch Street, E.C. It will be welcomed not only by repairers but by all amateur mechanics. With it holes up to $\frac{1}{2}$ in. diameter can be drilled in any kind of metal by hand with little fatigue and great rapidity, in any position, and in every direction. The tool weighs but 7 lbs., and is particularly portable. Messrs. Wallach issue a circular giving illustrations of twenty-three positions in which this handy device can be used.

As mentioned in these columns some time ago, the London Autocar Co. of Gray's Inn Road, W.C., are now marketing a complete set of parts for converting an ordinary safety bicycle into a motor-bicycle. The set of fittings comprises the motor, carburettor, silencer, accumulators in case, petrol tank (three quarts), special rim for driving belt, electric wires and handles, etc. We had an opportunity the other day of inspecting an ordinary safety that had been converted by means of these fittings. The engine, which is of the vertical air-cooled type of 1 h.p., is bolted to the lower cross tube of the frame, the power being conveyed by a belt working on a small pulley on the engine shaft and a light pulley clipped to the spokes of the rear wheel. The engine, which is an excellent piece of work, the contact breaker being especially noteworthy, is set in motion by the usual pedals and chain gear. The converted machine weighs complete about 47 lb., and can attain a speed of from 20 to 25 miles per hour. Mr. Rush also showed us a new induction coil which, in place of the usual vulcanite case so liable to fracture, is enclosed in a 4 in. brass tube, enamelled to any desired colour. The coil is insulated by a thick layer of paraffin wax, so that short circuiting

from damp is well guarded against; in fact, we were informed that the coil would work even when immersed in water, so well is it insulated. It is intended for use in connection with the ignition of the charge in motor-cycles and light cars, and will, it is stated, give a $\frac{3}{8}$ in. spark.

KENTUCKY is famous for horses, and Colonel Watterson, who edits one of the papers published in that State, has been denouncing the automobile as a costly, foreign, and dangerous thing. Seeing that many pugilists have graduated from the hammer and anvil, he asks what would become of the prize ring were the horse deposed by the motor-car?

THE Board of Governors of the Long Island Automobile Club has decided to hold a trial contest of 100 miles in March next, open only to American-built motor-cars. The trial will take place over Long Island roads, and a challenge trophy, presented by the club, will be awarded to the winner. This trophy may be competed for half-yearly thereafter. The contest will not be one of speed entirely, as simplicity and cost of operation will be taken into consideration. Racing cars will be barred.

ONE of the latest converts to automobilism is M. J. Arnaud, de l'Arrière, the well-known French owner and breeder of thoroughbreds, who has purchased a 24 horse-power Panhard car, from Messrs. Charron, Girardot, and Voigt. He has further requested the latter firm to furnish him with plans of an automobile horse-van, to be used for taking his racers from their training quarters to the various racecourses and back.

FURIOUS DRIVING CASE.

AT Glasgow, last week, James Butchart, cycle manufacturer, was charged with having, on 22nd December, driven a motor-car in a culpable, negligent, and reckless manner, at an excessive speed, whereby two men were knocked down and injured. He was fined a guinea, with the option of 14 days' imprisonment.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editor's hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

Vol. II.]

LONDON, SATURDAY, FEBRUARY 2, 1901.

[No. 100.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

NOW that King Edward the Seventh can be added to the growing list of crowned heads who are also motorists, his doings in connection with automobilism are of added interest. One of the most attractive exhibits at the exhibition now being held at Paris is a 9-h-p. Serpollet steam car built for the present King of England. It will be remembered that when at Homburg recently he went for several drives with MM. Serpollet and Gardner, and we published an interesting photograph showing the Prince of

Wales on the car. Evidently an order was given about that time, and when the present season of mourning is over we shall look forward to the King's renewed interest in automobilism.

The Motor-Car Exhibition in Paris.

The event of the week in Paris has undoubtedly been the opening of the motor-car exhibition in the Grand Palais, near the Champs Elysées. M. Loubet, the President of the Republic, honoured the Exhibition with a visit on Monday. The President, who was accompanied by M. Pierre Baudin, Minister of Public Works, made an exhaustive inspection of the exhibits. Afterwards one of the organisers of the show, raising his glass to drink to the President, broached, in fear and trembling, the momentous question of motor road-racing. Discussions on the subject have, as is already well known, divided French automobilists into two hostile camps.

The French Government and Racing.

"THE Government," M. Loubet replied, "has never had any intention of prohibiting races." The President went on to say that, so long as the authorities were duly informed of intended contests, and were given ample time to arrange for police measures along the route, automobile races would be permitted. French *chauffeurs* now jubilate accordingly, and look forward to a more exciting season than ever next spring and summer. Only once during the visit were any reproachful remarks made by the President. He thought some motor-men were regrettably careless, and mentioned a General who drove over to see him at Rambouillet in an automobile, at the time of the autumn manoeuvres, and who ran over four dogs and a hen during his progress through the town. Another *chauffeur*, of whom the President spoke with some horror, positively boasted of having during his career as an automobilist crushed fifty canine victims.

The Serpollet Banquet.

ON Wednesday, the 23rd ult., at the Grand Hotel, Paris, the Union Automobile gave a banquet in celebration of the recent nomination of its president, M. Léon Serpollet, to the *Legion d'honneur*. Under the presidency of M. Pierre Giffard, some eighty automobilists gathered together to do honour to the

well-known constructor, who during the course of the evening was presented with a handsome diamond cross in commemoration of the event. Naturally there was a profusion of speeches of the usual complimentary character, and M. Giffard seized the opportunity to pass some comments upon the burning question of the day and the excommunication of the Union by the Automobile Club of France. M. Serpollet himself made but brief reference to the "affair," confining his remarks almost entirely to the early days of his steam cars, in the course of which he related some most interesting incidents.

Motor Dust Carts for Kensington.

AT a meeting of Kensington Borough Council last week, it was stated that in response to advertisements issued by the old vestry, inviting designs and estimates for a steam propelled street cleansing and watering machine, an offer had been received from Thornycroft's Steam Carriage Company to supply a machine in accordance with drawings and specifications submitted by them, for £725. The borough engineer and surveyor reported that in his opinion the drawings, etc., fulfilled the requirements as embodied in the advertisement, except that no mention was made in the specification of a reversing gear. He also expressed the opinion that the adoption of a motor-wagon would materially assist in efficiently scavenging the streets. The committee recommended that the tender be accepted, subject to conditions as under: That the machine be provided with proper turning and reversing gear; that foot valves be provided with water distributors; that the water tank be provided with lidded apertures for filling, one on each side; that the company work the machine in the borough for one week free of expense to the Council; that the company enter into a contract to keep the machine in proper repair for ten years for £72 per annum. In consequence of the death of Her Majesty the further consideration of the matter was postponed until the next meeting.

A Mayor on Speed.

It is very gratifying to recognise how cordially the mayors and authorities of our great cities have encouraged the automobile movement. On the question of speed, the Mayor of Salford has been making some very sensible remarks to a deputation that recently approached him. "Much," he said, "must be left to the good sense of the drivers of the cars, as a high rate of speed which would be highly dangerous in towns would be perfectly safe in the open country." The sooner everyone realises this fact the better will it be for all concerned.

Motor-Vans for Municipal Purposes.

THE wise men who constitute the Borough Council of Bermondsey are very cautious people. At the last meeting a proposal was made to purchase a number of horses, and Councillor Shand asked if the advisability of obtaining motor-vans had been considered. On behalf of the Horse Committee Councillor Widdows replied that the matter had not been overlooked, but no action had been taken because of the expense.

This is the foolish policy that only looks to the first cost, without any regard to the ultimate saving. Experience has demonstrated that motor-vans for municipal purposes can be reliably and economically employed, and that the higher original outlay may secure quicker and cheaper work than the ordinary methods employed. The Automobile Club will have to have a municipal motor-van crusade among the metropolitan boroughs.

Common Sense at Nottingham.

A VERY sensible course has been taken by the Nottingham County Council with regard to motor-cars. The Highways, Bridges, and Buildings Committee have been considering the suggestion of various county councils, and while content with the speed limit as it exists at present, recommended that motor-vehicles should be registered and numbered. After a very reasonable discussion Mr. Bayley said the committee appeared to be more frightened than hurt. He suggested that the recommendations should be withdrawn for the present, and brought forward again subsequently. When they had more information with regard to the use of motor-cars in the county they would be better able to arrive at a decision on the matter. Colonel Denison, the chairman of the committee, expressed himself as not at all keen about the recommendations. He quite agreed the thing was in its infancy, and though he thought there were certain motor-cars which contravened the laws he was prepared to withdraw this clause of the report, and bring it forward again. Ultimately this course was adopted.

The 1900 1,000-mile Trial.

THE Automobile Club has kindly furnished us with the photographs, taken by Mr. Edward Kennard, from which the accompanying illustrations are reproduced. The pictures show the obverse and reverse of the silver-gilt, silver and bronze medal, given by the Automobile Club de France for the three vehicles which, in the opinion of the A.C.G.B., were,

irrespective of section or class, the first, second, and third in merit. It will be remembered that the medals were awarded as follows:—First, silver-gilt medal, Mr. Kennard's 8 h.p. Napier (No. 110); second, silver medal, Wolseley voiturette (No. 40); third, bronze medal, New Orleans voiturette (No. 27).

The Reply of the Marquis.

HAVING started a much-noticed correspondence in the columns of the *Field*, the Marquis of Granby has brought it to a close with a letter in which, while endeavouring to maintain his original position, he recognises that all motorists are not alike and there are some reasonable people even among those who own or drive motor cars. The upshot of the whole matter is that automobilists will do well to bear in mind the recent warnings of the Automobile Club with regard to the road, and if they will do that the opposition of such decided opponents as the Marquis of Granby may be dispelled, in time.

An Australian-Built Motor-Car.

Mr. T. O'Grady, is a voiturette or buggy, and provides accommodation for three persons, including the driver. A petrol motor is used for propelling purposes, this being situated in the front part of the body, its power being transmitted through a belt to a counter-shaft, on which are pinions gearing into spur wheels fixed on the back axle. A single lever, which is manipulated by the driver's left hand, is responsible for all operations. The steering is also controlled by the left hand.

Horse-Owners and Automobiles.

VERY significant is the fact that many of the leading automobilists are keen lovers of the horse. The Earl of Carnarvon and other gentlemen in this country can combine their admiration of the noble animal with a keen interest in the motor-car, and the Baron de Zuylen, who is a leader in the automobile world of France, owns one of the best stables to be found in the area of the Republic. It is also interesting to note that some of the best-known members of the Automobile Club of America were among the prize-winners at a recent great horse show in the United States. Mr. Albert C. Bostwick was one of the largest exhibitors at the show. He had many horses from his famous stables at Mamaroneck on view, and secured several ribbons. In the amateur driving competition for four-in-hands four years old and over he took the second prize. Mr. Bostwick, besides being a most expert amateur *chauffeur*, is an excellent driver, and he certainly did very good work in the horse show ring. He also won the class for the best appointed brougham. Dr. J. Grant Lyman was another large exhibitor, and he secured several prizes.

Stop when Desired.

HOWEVER distasteful it may be to the motorist to see a warning hand, it is his duty to obey the injunction, and to stop. The law must be respected, especially at a time when determined efforts are being made by prejudiced people to secure a further lessening of the privileges of motorists. At the Hove Police Court a driver of one of the licensed motor-cars that there ply for hire has been summoned for not taking any notice of an equestrian who had previously cautioned him. The same thing applies also to private owners, and we would associate ourselves with the Automobile Club in a desire to secure the future of automobilism by conforming, as far as possible, with the law as at present established.

In the Eastern Counties.

THERE are many keen automobilists in the Eastern counties, and they will be interested to learn that the illustrated lecture by Mr. Shrapnell Smith, originally fixed for the 13th inst., has now been postponed till the 19th inst. Colonel Crompton, R.E., will preside, and the patrons will include the Automobile Club of Great Britain and Ireland, who, from February 15th to February 18th, will be demonstrating before the West Suffolk County Council at Lowestoft, Beccles, and Ipswich, and will then drive on to Chelmsford for the lecture, probably giving displays at Chelmsford during the day to members of the Essex County Council and others.

Irish Roads.

IN various parts of Ireland gentlemen are interesting themselves in the state of the roads, and it only needs a great automobile tour to adequately impress upon the local bodies the necessity of improvement. Something of the kind is needed to demonstrate the profitable traffic that is likely to be found when the roads are properly cared for, and to incite the authorities to real effort in the matter. Meanwhile, we

notice that Colonel Magrath has promised the Wexford Corporation £5 towards the expense of properly rolling a certain bad road in the town, and has also offered to pay the damage, up to £20, that may be done to pipes in the road by the action of a steam roller. But local spirit in the ruling bodies must have fallen very low when private citizens have to make such offers.

Electric Ignition Troubles.

OWNERS of Daimler cars who may have found anything like intermittency in the electric firings of their engines will be interested in a discovery that Mr. Henry Edmunds has made after being troubled by this cause. He found that the fault was due to some water which, through a vigorous use of the hosepipe, had got into the chamber where the induction coil was placed, and there was a shortage across the terminals in consequence. As he remarks—

Little "amps" of current, little volts so sly,
Perchance may find a leakage, and run the battery dry.

Lincolnshire Automobile Club.

A MEETING of the Lincolnshire Automobile Club has been held at the Saracen's Head Hotel, Lincoln, Dr. Cragg, of Billingborough, presiding. It was decided that the executive committee should consist of ten, and the following were elected: Messrs. W. R. Pennell, W. S. White, C. Nelson, J. H. Foster, C. Hannam, T. W. Beverley, W. Cottam, J. R. Richardson, Parsons Wright, and Dr. Russell. Mr. G. J. Wilkinson was elected secretary, with Mr. C. Nelson as hon. secretary; Mr. R. B. Wrenford, of the National and Provincial Bank, Lincoln, was appointed treasurer; and Mr. J. H. Foster hon. solicitor. The following were elected as district representatives and to be ex-officio on the committee: Mr. Heinle, Gainsborough; Mr. A. A. Padley, Market Rasen; Dr. Pim, Sleaford; Mr. J. G. Bates, Grimsby; Mr. Wright, Wold Newton; Dr. T. W. Steel, Dalsterworth; Mr. C. J. E. Parker, J.P., Grantham; Mr. W. J. Gilpin, Bourne; Rev. A. Smyth, Sutton-on-Sea; Mr. F. Richardson, Sibsey; and Mr. H. Sawyer, Winterton. The club colours are to be "Lincoln" green and white, and headquarters are at the Saracen's Head Hotel, Lincoln. Sir Hickman Beckett Bacon, Bart., the Premier Baronet of England, has accepted the Presidency of the Club, and the Right Hon. H. Chaplin, M.P., Viscount St. Vincent, Dr. E. Cragg, Mr. W. B. Jevons, the Mayor of Lincoln (Mr. C. W. Pennell), Captain J. A. Cole, and Captain J. F. Laycock are vice-presidents.

Saved by a Fire Engine!

MR. ROWLAND OUTHWAITE has been saved by a fire engine. Driving a motor-car along Leith Street, Edinburgh, at a moderate pace, he was hauled to the police court, and several witnesses declared he had been travelling at nothing less than seventeen miles an hour. Fortunately the officer in charge of the engine was able to say that his vehicle was not going more than twelve miles an hour at any point of the journey, while in Leith Street he was not exceeding nine miles an hour. The Sheriff found the charge "not proven"—a not very satisfactory ending, but one for which the motorist should be thankful in these days of prejudice and antipathy to the motor-car.

Choosing Cars.

IT is practically impossible to recommend particular cars for particular persons owing to the difference in the mechanical capabilities of people. Whether a vehicle will prove suitable or satisfactory for a given service depends largely on the roads over which it has to run, and on the mechanical abilities of the operator. We have frequent examples of vehicles of the same make, bought at practically the same time, of which one gives full satisfaction; while the other is sent back to the factory after several weeks because the owner was unable to

keep it running. As in these cases the vehicles were operating on the same roads, the only ground on which the widely different results can be explained is that one of the owners was less mechanically inclined than another. Correspondents frequently ask for advice as to the type of car best suited for them, but to answer such questions knowledge of the abilities and habits of the correspondents, their training and experience, the topography of their locality, the nature of the roads, etc., are matters that should be familiar. Briefly put, our advice to intending purchasers is to study the various systems with a view to making an intelligent choice, and, that having been done, a few trial runs will convince the prospective automobilist as to the vehicle most likely to fulfil his requirements.

A Motor-Tricycle Record.

MR. E. J. HARRISON, of the Polytechnic Cycling Club, has an Eadie motor-tricycle upon which, during last year, he rode 7,400 miles. His repairs were three exhaust valves, which were burnt out, and the total mileage included six consecutive return Sunday journeys to Brighton with never a stop other than for lubrication. He was fortunate in not having a puncture on any of these Brighton trips. Mr. Harrison's experience is certainly exceptional, and, as "Teuf, Teuf" suggests, his fellow-motorists will be interested to hear what type of battery he uses and how he has managed to avoid the "oil on the contact-breaker" trouble.

MR. C. E. DURYEA'S LATEST ARGUMENT IN FAVOUR OF SINGLE LEVER CONTROL.

An American 1,000-mile Trial.

As already mentioned in these columns, the Automobile Club of America is organising a "contest of efficiency," to take place early in the spring. The contest will not be a race except that speed will count in selecting the winner. Many other points will also be considered. The distance to be travelled will be between six hundred and one thousand miles. A route has not yet been selected, but when this is done the Club will be ready to accept entries. The test will be similar to the 1,000-mile Trial held under the auspices of the Automobile Club of Great Britain. The conditions of the race will be designed to bring out the following points, on which the awards will be made; cost of vehicle, weight, horse power shown by performance, persons carried, price in proportion to seating capacity, price in proportion to power of motor, power in proportion to seats occupied, power in proportion to weight, mechanical efficiency as shown by hill-climbing trials, simplicity of transmission,

accessibility of mechanism, quality and sufficiency of speed gear, easiness of adjustment, steering gear, brakes and brake gear, ignition arrangements and apparatus, general design (mechanically), general design (appearance), average speed on trial out of control in proportion to average of legal limit, workmanship, especially of machinery, condition of vehicle at end of trial, regularity of running on trial, breakages and defects not previously mentioned, and general observance of trial regulations.

An Australian View of English Cities.

AUSTRALIAN readers are being supplied with up to-date information with regard to the automobile movement in the old country, and from a leading Sydney daily just to hand we learn with amazement and amusement that "there is not a single horse omnibus in the principal streets of Edinburgh, all the chief routes being served by 6 h.p. and 8 h.p. motor-cars carrying from ten to sixteen people, and travelling, where the traffic will allow it, at more than double the pace of an ordinary bus. In other cities similar evidences of the growing popularity of the motor-car can be seen, especially in the manufacturing centres. In towns like Manchester and Birmingham the steam engine is greatly in favour for traction, nearly all the heavy loads being drawn from the foundries by means of these engines. Leeds, among other cities, has its motor omnibus service, and the only reason why the motor cabs in London were taken off the rank was that the company owning them made the mistake of installing electric instead of oil motors." Edinburgh, Manchester, Birmingham and Leeds will probably be surprised at this Australian view of their progress.

Petrol.

A NEAT booklet, considerably above the average of such publications, has been issued by Messrs. Carless, Capel, and Leonard dealing with petrol, what it is, and where it can be obtained. It contains all the necessary information for the safe storage of petrol, and the rules of the railway companies for its conveyance. In addition it gives particulars of Messrs. Carless, Capel, and Leonard's special lubricating oils and greases for motor-cars, as well as a list of the agents from whom they can be obtained. Seeing that more than a hundred fresh names have been added to the list since the earlier edition the value of the new list to motorists is easily apparent, and there should be many inquiries for a copy of the booklet, which Messrs. Carless, Capel, and Leonard will be pleased to supply to all applicants.

Motor-Vehicles for Industrial Purposes.

THE subject of the motor-vehicle for business purposes is an unusually broad and far-reaching one. The first and all-important requisite of any motor-vehicle designed for business purposes is that it shall perform at least the same amount of work as a similar horse-drawn vehicle, and do it at less cost to its owner. The man of means may use for his personal pleasure a motor-vehicle to operate which he spends more money than his coachman ever dared expect to see expended on the finest horse in his stable, but municipal bodies, the railway companies, or the managers of large industrial undertakings, must be shown a very considerable saving before they will authorise the outlay necessary to change their system from horses to mechanically propelled vehicles, and, all things being equal, the type of vehicle which shows the highest ratio of economy and reliability in operation will be the foremost in the race for supremacy. The first cost will enter into the calculation only so far as the interest on the additional capital invested figures as an expense in operation.

Motor Delivery Quadricycles for Tradespeople.

WE are glad to notice that an enterprising outfitting concern at Clapham Junction, S.W., has lately put in service a motor-tricycle with a trailing car behind in the form of a parcels chest. We believe that there is room for a considerable business to be opened up with up-to-date tradespeople

in the way of providing them with a convenient and quick method of parcels delivery. On another page we illustrate a motor delivery quadricycle, a type of vehicle which is now becoming largely used in Paris, and which appears to be more convenient and less cumbersome than the tricycle and trailer arrangement. Who will be the first to place such a vehicle on the English market? As already mentioned, if the merits and usefulness of such machines were brought before the notice of tradespeople a good demand would, we feel sure, quickly spring up.

Non-Skidding Tire Competition.

It is not often that wet weather is wished for in the case of an open-air competition, yet this is the case with regard to the *concours d'antidérapant*, or non-skidding tire competition which is being organised by the Union Automobile de France for the latter part of March or the beginning of April. The competition is open to all nationalities, and the points to be considered are the absence of skidding, the damage to the tires owing to brake application, to the absence of noise, and to the weight of the tires. The drivers of the competing cars will be required to perform all the manœuvres prescribed by the jury and under the conditions laid down. Entries will be received up to March 1st.

Motor-Cars in New Zealand.

MR. N. OATES, who has lately returned to Christchurch, New Zealand, from a trip to Europe, took with him a couple of motor-vehicles of the latest type. Mr. Oates visited the Paris Exhibition, also the majority of the principal motor factories in England, for the purpose of closely investigating the question of motor-locomotion, and its suitability to New Zealand roads. It is probable that a public trial of both vehicles will be given in Christchurch at an early date.

A Chance for Novices.

DEVELOPING from the Exhibition idea comes news of a new move in the automobile world of the United States, which is worthy of consideration elsewhere. There is need of the opportunity for the would-be motorist to familiarise himself not only with the different varieties of cars, but also with their manipulation and management. This is provided in a combined show-room and track. Thus the automobilist may obtain some idea of the machine suited to his capacity before actual purchase—an advantage which is obvious.

The "Doe" Electric Carriage Lamp.

A BRILLIANT light for motor-car lamps is that given by the "Doe" electric carriage lamp, which is fitted with the "Doe" electric battery, of which the late Professor John Hopkinson expressed a high opinion, and which Mr. H. F. Parshall, M.I.E.E., has reported upon very favourably after a series of tests. The cell consists of a zinc carbon element employing a colourless electrolyte. One element consists of a zinc cylinder dropped into a tube of vulcanite and making its own electrical contact by gravity so as to be instantly replaceable without making other external electrical connections. The constancy of the voltage over a long period is one excellent feature of the battery, which, in the case of the carriage lamp, consists of four cells contained in a vulcanite case about 7 inches high and 4½ inches square. This is enclosed in a wood box which is so constructed as to be easily placed in the "boot" of a carriage. An ordinary flexible wire, which can be adapted to any carriage without detracting from its appearance, connects the battery with the lamp, which is of such a form as to secure the largest possible illuminating area not only at the front, but also at the side of the carriage. The lamp is being introduced by the Doe Portable Electric-Light and Power Syndicate, Limited.

The French Motor-Car Exhibition.

(From our Own Correspondent.)

LE GRAND PALAIS, PARIS—THE LOCALE OF THE EXHIBITION.

ALTHOUGH actually open to the public from ten o'clock in the morning of Friday, the 25th ult., it was not until half-past two in the afternoon, in the presence of a brilliant crowd thoroughly representative of fashionable Paris, that *Le Salon de l'Automobile, du Cycle et des Sports* was formally inaugurated by M. Petit, representing the Minister of Commerce, M. Millerand himself being prevented from performing the ceremony by unexpected and pressing business in the Chamber of Deputies. As I made my way to the Grand Palais at about two o'clock, I found the Champs Elysées in an extraordinary state of animation, while the Avenue Nicolas II. was almost impassable. Carriages of all descriptions, from the humble cab to the superb landau, were passing in a long defile before the entrance to the exhibition, kept fairly clear by the efforts of the *Garde Republicaine*. Upon the opposite side of the avenue, and before the portals of the Petit Palais, there were ranged some sixty automobiles, which, having deposited their passengers, were awaiting their return. Viewed from the steps of the Palais, it was a wonderfully interesting scene, the animation and brightness of which was heightened by the brilliant sunshine of a summer-like day. And if the exterior presented an animated spectacle, what must be said of the interior of the Palais? Crowded to excess—during the day there were some 46,000 visitors—one saw there celebrities in every phase of Parisian fashionable life. Politicians, artists, sporting men, actors and actresses, all had come to the big building in the Avenue Nicolas II. to see the automobile novelties for the coming season. Naturally the members of the Automobile Club were there in great force, and among those whom I saw inspecting the latest types of self-propelled vehicles I may mention the names of Baron de Zuylen de Nyvelt, Comte Recopé, Marquis d'Haucourt, Comte de Gosselin, Prince de Furstenberg, Comte d'Andigné, Baron Henri de Rothschild, Comte d'Harcourt, Viscomte de Lambertye, MM. René de Knyff, Krebs, Huillier, Girardot Sancier, Rives, Michael Lévy, Loisel, Camus, Binder, Clément, Charron, etc., etc. Under the great central dome the orchestra Dufayel found place, and throughout the afternoon a dense crowd surrounded the stand and revelled in a brilliantly executed musical programme. On Saturday there was again a capital attendance, and the day was rendered noteworthy by the visit of M. Waldeck-Rousseau, the President of the French Council, who, as a practical motor-man, was only too eager to see all that was

new. His stay was a long one, and his careful examination of a multitude of vehicles manifested the great interest which he takes in the new means of locomotion.

In spite of the terrible weather Sunday's holiday crowd patronised the show in great force, and during the day the total attendance mounted up to the respectable total of 15,000 persons. On Monday M. Loubet, the President of the Republic, and M. Pierre Baudin, the Minister of Public Works, paid an official visit to the show, where they were received by the Committee of Organisation. During the course of a long and minute examination of the various exhibits, among other topics, the question of racing was discussed, and it is infinite pleasure to learn that the head of the State is entirely favourable to its continuance. M. Baudin also shares the same opinion, and the Committee of the A.C.F. will now be able to make their requests for the necessary permission with every prospect of the authorisations being conceded. This is, indeed, good news, and, if for that reason alone, the Salon should receive the thanks of every automobilist, for it has afforded those in power the opportunity of seeing for themselves to what an extent the industry in France has already spread, thanks principally to the holding of races. And now, having followed the events of the first few days at the show, let us make a tour ourselves of the stands and see what the exhibitors have to show us.

Upon entering the exhibition from the Avenue Nicolas II., the first stand which attracts attention is that of MM. Gobron and Brillié, Boulogne-sur-Seine. There, conspicuously placed upon an elevated platform, is the new light car which the firm are presenting to the public as their novelty for the season. This vehicle is of the type for which a great demand has been steadily growing up, that is, the light carriage, something between the ordinary car and the voiturette. The specimen shown—a *tonneau* in natural wood, by Belvalette—bears not the slightest resemblance in appearance to the cars previously constructed by MM. Gobron and Brillié; indeed it follows the lines of a Mors or a Panhard. Built upon a tubular frame, the car carries an 8 h.p. vertical motor in front. This engine possesses two cylinders and four pistons, and runs with that absence of vibration for which the firm's motors are so justly celebrated. It is contained in a very shapely case, the fore part of which is open in order to permit of the attachment of the water-cooler. The steering is of

the inclined wheel type, upon the pillar of which is carried a lever regulating the admission of air, and at the same time the point of ignition. At the driver's right hand are placed three levers, one acting upon the band brakes, one giving the forward and reverse motions, and the third actuating the speeds, of which there are three. Intermediate speeds are obtained by one of two pedals, the other acting upon a band brake upon the differential. The weight of the car complete is about 1,000 lbs., and it runs up to thirty-five miles per hour on level ground. No chains are employed, the drive being direct. A reservoir is placed in front, and it can be filled with petrol or alcohol, or both, just as circumstances arise, for the Gobron-Brillié motor runs equally well under all three circumstances, and this, too, without making the slightest change in the carburettor. A striking proof of this quality was given in the consumption of fuel competition promoted by the *Auto Vêlo* last autumn. Upon that occasion MM. Gobron and Brillié entered two cars, and upon the day of the competition left it to the organisers as to which vehicle should run on petrol and which on alcohol. Both cars acquitted themselves most creditably. While visiting the stand of these constructors one is rather apt to overlook the larger vehicles in the pleasure of finding such a real novelty as the small car, but it is a mistake, for they are well worthy of attention. As now white four-seated phaeton, in which the ordinary driving chains have been suppressed, is particularly attractive in appearance; and then, too, there is a handsome dark blue car of somewhat similar type but fitted with a leather hood over the front seat. Both these cars are provided with 10 h.p. engines. Then one finds a specimen of the 12 h.p. six-seated carriage of which the firm have also made so many. This car accommodates two of its occupants behind in the *tonneau*, two on the driver's seat, and two in front, a disposition but seldom if ever seen except in the case of the Gobron and Brillié vehicle. Another 12 h.p. car is a victoria, tastefully painted in red and black, with black leather upholstery. The list of exhibits is completed by a 14 h.p. brougham, fitted with a removable top and closing hood. It is a remarkably handsome car, and, in spite of the heaviness of the body, the motor should drive it along at a great speed. Before leaving MM. Gobron and Brillié's exhibits I may add that the price of the new small car, complete with *tonneau* body, is but £272, a price at which the constructors will assuredly be inundated with orders.

In close proximity to MM. Gobron and Brillié one finds the stand of Mm. Turgan, Foy and Co., of Levallois-Perret (Seine), and a goodly show it is, for no fewer than eight of the firm's small carriages are there grouped together. All are fitted with the Filtz motor, an engine too well known to require detailed description. The two-seated cars generally carry the 4 h.p. air-cooled model, while the larger vehicles are fitted with water-cooled motors, developing 6 h.p. In both cases there are a couple of cylinders placed horizontally and end to end. The ignition is effected by electricity. The engine is placed in the fore-part of a frame built up of steel tubes. In the case of the cheapest type of vehicle made by the firm the four speeds are obtained by the use of belts, but in the more expensive models gearing is employed. In the former type, too, the steering is effected by means of a small wheel placed at the driver's right hand, whereas in the firm's better class vehicles an inclined wheel is provided. As at present arranged the gear-driven cars are fitted with two pedals: that upon the right actuates a couple of brakes upon drums attached to the rear wheels. The left pedal half down disconnects the motor, while if the movement be continued a couple of brakes upon the differential are applied. The forward and reverse gear lever, as well as the handle changing the time of ignition, and the lever actuating the speeds, are all attached to the steering pillar, conveniently to hand for the driver; indeed, the management of the car is remarkably easy, thanks to the capital arrangement of the controlling levers. For those automobilists who believe only in vertical engines, Messrs. Turgan and Foy are now making a 3 h.p. water-cooled motor upon this system, and a specimen—only air-cooled—is to be seen upon a tricycle at their stand. The firm's novelty is, however, a new rotary motor, which they are now building in

two sizes, viz., 3 and 5 h.p., and of which much is expected, the tests having proved very satisfactory.

The sight of the stand of Messrs. Marot, Gardon and Co., of Paris, calls vividly to mind the fire which, on the 11th ultimo, practically gutted their factory and destroyed many of the cars destined for the exhibition. Fortunately some were saved, and others being at the firm's Paris show rooms, a capital little exhibition is made. A couple of dainty 6 h.p. voiturettes with the water-cooler coiled round the motor casing in the manner identified with the firm, and a 6 h.p. motor and frame give a good idea of the excellence of the work turned out. Then there is Cormier's 5 h.p. tricycle upon which he won last year's Bordeaux-Périgueux race, averaging over 65 kilomètres per hour, and a new racing three-wheeler fitted with a 6 h.p. engine and a petrol tank of extraordinary proportions. The motors of both these machines are of De Dion and Bouton's construction. The list is completed by a two-seated voiturette with a motor case in front, but actually carrying the engine behind. In this instance it is a 6 h.p. Soncin, and the little car has been built for speed purposes. I fancy, however, that the position of the foot-pedals would be found extremely inconvenient, for they are raised fully eight inches from the bottom boards.

The ignition is electric, the Hydra dry battery being used. Among the small voiturettes none hold a better position than those constructed by the Etablissements Pieper; so little wonder, then, that around this company's stand is continually congregated a goodly crowd of motor men. Three two-seated cars and one three-seated—the third occupant being carried on a "spider" behind—make up the entire collection, but the daintiness and quality of the work make up for any lack of quantity. The models shown are of the type so well known, and it speaks well for their popularity that no new feature has been found necessary.

(To be continued.)

SOME AUTOMOBILE CLUBS' BADGES.

The French Automobile Club.

THE COLLIOT VOITURETTE.

THE feature of the voiturette illustrated in Fig. 1, and lately introduced by Messrs. Deliry and Sons, of Soissons (Aisne), France, lies in the motor. This is of the two-cylinder air-cooled type and is of 4 h.p. The two cylinders are arranged in the form of a V, the two pistons being connected up to a single crank on the engine shaft. The diameter of the cylinders is 80mm., while the stroke is 100mm., the speed ranging from 1,000 to 1,400 revolutions per minute. The ignition is, of course, electrical. As will be seen from the plan, the motor is located in the fore part of the frame and transmits its

FIG. 1.—GENERAL VIEW OF CAR.

power through a friction clutch *C* to the variable speed shaft. Four speeds forward—ranging from 6 to 30 kilometres per hour—and a reverse motion are available, the shaft carrying four pinions (Fig. 2), any one of which can be made to mesh with corresponding spur wheels on a short parallel shaft. The latter is geared by bevel wheels to the differential shaft, from which the

FIG. 2. SECTION OF VARIABLE SPEED GEAR.

power is transmitted to the rear wheels through the usual chains and sprocket wheels. The illustration shows a car fitted with bar steering, but in the more recent vehicles the steering is controlled by a vertical hand-wheel, on the standard of which the various control handles are mounted. Ample brake power is provided, while special attention has been given to the lubrication of the working parts. The frame is of tubular construction, and is spring supported on cycle-type wheels fitted

with pneumatic tires. Complete, the car weighs about 6 cwt. Messrs. Deliry are also making a similar car, but fitted with a water-cooled engine.

FIG. 3.—PLAN OF CAR.

THE BENZ MOTOR-LORRY.

AS recently briefly announced in these columns, Messrs. Benz and Company, of Mannheim, have lately taken up the construction of motor-lorries, and this week we are able to give an illustration of one of these vehicles. The lorry illustrated is intended for a load of 1 ton 5 cwt., and is fitted with a 6 h.p. petroleum-spirit motor. As will be seen, the engine is located in the fore part of the frame; it transmits its power by a single belt to a countershaft, which carries a train of spur wheels, any one of which can be made to mesh with corresponding pinions on the differential shaft, from which the usual chains and sprockets convey the power to the rear axle. Four speeds forward and reverse motion are available, the change-speed gear working in a dust-proof oil-containing case. The

engine is of the horizontal type, the water circulation being maintained by a pump. Artillery type wheels are fitted, and these are shod with solid rubber tires. The lorry measures 11ft. 10in. in length by 5ft. 3in. in breadth, while its weight, empty, is about 1 ton 2 cwt. With its full load the vehicle can, it is stated, attain a speed of ten miles an hour on the level, and ascend gradients of one in ten. Messrs. Benz are also turning out lorries intended for carrying loads of 2½ tons to 5 tons, the former being fitted with a 10-h.p. motor, and the latter with one of 14 h.p.

At the nineteenth annual meeting of the Institute of British Carriage Manufacturers, held at the Westminster Town Hall, Mr. Alexander Naughty, J.P., of Dingwall, N.B., has been elected president for the ensuing year.

LEADING men in Southsea and Portsmouth have given five valuable prizes for various contests in connection with the suggested run of the Automobile Club to the former town in the summer.

A NEW PANHARD-LEVASSOR CARBURETTOR.

MESSRS. PANHARD AND LEVASSOR, of Paris, have recently taken out patents for an improved form of carburettor, sectional views of which are shown in Figs. 1 and 2. The device consists of a body A, cast in a single piece, and comprising a reservoir cavity B, a lateral chamber C, a conduit D, by which the petrol arrives and a "depression" (or vacuum) chamber E. A cover F closes the reservoir B, and is provided with a guide G, for the stem I, of the float H. A ball K, forming a valve, rests on the edge of the orifice J. A plug L serves as a guide for the ball, the plug being drilled as shown. A coil spring M, located in the drill hole of the plug, presses against the ball from below, tending to force it against the edge of the orifice J. The reservoir C communicates with the "depression" chamber E by means of an adjusting piece N, which is screwed into the wall separating these two chambers, and extends to within several millimetres of the bottom of reservoir B. A chimney O is screwed on the depression chamber, above, and in the axis of tube N. The "depression" chamber has a reduced section R at the end, where the air enters, corresponding with the orifice of the adjusting tube N. Besides the air, admission may be regulated by the cap P, which, according to its position, obstructs more or less the passage of air through the air-admission orifices S.

FIGS. 1 & 2.

The operation of the carburettor is as follows:—The reservoir B being empty, the float H, by the intermediary of the collar T, reposes on the wall of the orifice J, and the ball is forced against the spring by rod I. The petrol now flows freely into the reservoir B until, after reaching a certain level, the buoyancy of the float overcomes its weight, and the ball-valve closes. When a suction stroke of the motor produces a rarefaction of the air in chamber E, the hydro-carbon liquid is drawn up through the orifice in N, and the motion of the jet being perpendicular to the motion, air entering through the reduced portion R is pulverised at once by the column of air. If there is a return of gases from the cylinder to chamber E, the consequent over-atmospheric pressure will force the liquid back through N, and the gases passing through the orifice will fill the upper part of reservoir B, and cannot return to the cylinder at the next suction stroke. The next charge will, therefore, be normal as regards carburation, contrary to the effect produced in carburettors now used, in which the adjusting piece N communicates with reservoir B by a channel of more or less suction. The tube O is intended to vary the carburation by means of a supplementary introduction of air, and to this end is connected by suitable piping to a valve or cock, which can be regulated by hand.

MR. C. G. WRIDGWAY is on a flying visit to this country.

MR. CLARENCE MACKAY is having built a motor-car, which is to "beat everything in America." The *New York Herald* states that he has cabled to a Parisian firm an order for a racing machine of about 32 h.p. The vehicle, which is expected to be capable of attaining speeds of fifty and sixty miles an hour, will be ready in May next and will cost over £3,000.

CORRESPONDENCE.

THE DE DION VOITURETTE.

TO THE EDITOR OF *The Motor-Car Journal*:

SIR,—Living away from ready help—and having trouble with De Dion pumps, I should be glad if any of your readers could inform me if these engines can be run on the circulation principle, without displacing tank from present position—and is the circulation principle effective. I have also had some trouble owing to the speed-clutch not gripping; is there any real remedy for this.—Yours faithfully,
AUGUSTUS KENT.

BURSTING OF IGNITION TUBES.

TO THE EDITOR OF *The Motor-Car Journal*:

SIR,—I have read with much interest the correspondence on the above subject, and feel I should like to say something on the matter. Of course, I am not a motor expert, but I have a car which was built by the Daimler Company two years ago, during which period I have made this question a study.

I have driven my car no less than 37,000 miles, and the two platinum tubes now in are the same as were fitted when the car was built, and I see no reason why they should not last as long again as they have. I am aware that most motorists expect to have to renew their ignition tubes often, but I believe I have overcome, to a great extent, that trouble and expense. I believe that ignition tubes should be taken out often, thoroughly cleaned, and then carefully adjusted, which is very important. I have known a tube to burst at the first explosion, and two others burst on the same car in one day. I do not, therefore, think it fair to attach all blame to the platinum, when more often the fault lies in another direction.

Again, a regular heat should be maintained, but owing to the uncertainty of the lamps at present in use this matter is one of considerable difficulty. How the desired result can be obtained I cannot, for various reasons, go fully into at the moment, but your readers may take it that further particulars will shortly appear in your columns.—Yours truly,
W. R. YOUNGS.

MOTOR-CAR SERVICES.

TO THE EDITOR OF *The Motor-Car Journal*:

SIR,—The correspondence which has lately taken place in your columns with regard to motor-cars for public services leads me to hope that we shall see a great improvement in the services at seaside resorts during the coming summer. Many of our leading towns on the coast have their motor-car services, but some have got into disrepute because of the careless way in which the cars are sent out—muddy and dirty from the previous day's running. This is a serious oversight, and one that will do more to repel the public against automobilism than anything else.—Yours truly,
A. K.

TUBULAR steel wheels for automobiles are being introduced by the Midgley Manufacturing Company of Columbus, Ohio, U.S.A. It is claimed that this wheel will always run true and will stand the most severe use. The spokes and hubs are coated inside with brass and the rims are made in two pieces in cross section, forming a continuous tube. The spokes are made from carbon cycle tubing and the hubs from the same grade of steel drawn and formed in dies.

A NEW steam engine for motor-cars, known as the "Acme," is being introduced by Mr. J. Coop, 7, Mornington Road, Southport. It is a two-cylindrical upright, double-acting engine, the cylinders being 2½ in. by 3½ in. with ground joints under heads. The valve gear consists of a plain slide valve and link-reversing motion, and the case, being on the outside, admits of easy inspection and adjustment. The crank shaft is hollow, forming an oil reservoir for automatic lubrication for the four main bearings. These are placed two on each side of the driving sprocket and connect the rods and eccentric straps. It is claimed that there is a correct distribution of weight, while the advantages include automatic lubrication, the automatic locking of the stuffing-box glands, centre in place of side pull on reversing links, and the interchangeability of parts.

THE GENESIS OF THE MOTOR-CAR.

SO suddenly has the automobile sprung into prominence that many of us are apt to look upon it as one of the remarkable and startling products of an inventive age. But the motor-car is by no means new. Horseless carriages are old, very old, and can be traced back to early times. At the beginning of the last century it was by no means uncommon to see an automobile, driven by steam, winding its way through the streets of London.

The history of the automobile is interesting, states Dr. Neuberger in the *Automobile Magazine*, because it teaches us something of a technical problem which long baffled many a keen mind, and which at last seems to have been solved just as a new century is dawning. If we examine the monumental records of the human race we find carved upon the stone memorials of the Egyptians a wagon or chariot driven by the repellant force of a jet of steam. Whether the vehicle was ever actually built or whether it was the idea of some brilliant inventor born out of his time archaeologists have not been able to determine. Be that as it may, at all events these graven records of a bygone

fragments of his writings which have come down to us he describes methods of building motor-carriages. It is not very certain when Hero lived. But it is generally agreed that he flourished between the first and second centuries A.D.; so that the theory that he was the builder of the chariots of Pertinax may have some foundation. With Hero and Pertinax the automobile seems again to have been lost. But in the writings of the scientist-monk Roger Bacon (1214-1294) mention is again made of wagons "which were moved only with the help of science and art, without the use of beasts." The passage is very obscure; nothing is said of mechanical construction. Nevertheless it can hardly be doubted that Bacon had a dim idea of an automobile.

The first motor-carriage which is actually known to have been used was that constructed in 1649 by John Hautzsch, a Nuremberg watchmaker. The vehicle was driven by a clock-train; and although the spring had to be wound up at intervals of a few minutes, it managed to crawl along at a speed of one mile per hour. Although its swiftness of motion was not very startling, the carriage met with the royal approval of Prince Karl Gustav of Sweden, who bought it for £100. In 1663 the

day prove that the idea of a wagon propelled by some mechanical means was known in the time of the Pharaohs, and that the realisation of this idea was attempted by a method which, technically considered, was far from being the worst that could have been chosen. With the fall of the Egyptian Empire the automobile seems to have disappeared for a time from the memory of man. It is not until we come to the Roman Emperors that we find traces of the automobile in the documents which have been handed down. There must have been some mechanically-driven vehicle in the time of the Emperor Pertinax (192-193 A.D.), for we find in the well-known life of that Emperor a passage which reads: "Emperor Pertinax sold everything which belonged to his predecessor, Commodus, and among other things newly-invented wagons in which a very ingenious but complicated mechanism automatically turned the wheels and simultaneously operated fans which served to cool the driver. The wagons also indicate the distance travelled and the time elapsed." These wagons may possibly have been devised by Hero of Alexandria, a well-known physicist, who constructed a great number of mechanical contrivances and scientific toys. In the

celebrated Isaac Newton also built an automobile, which, like its Egyptian predecessor, was driven by the recoil of a jet of steam.

By the close of the eighteenth century a number of automobiles were in use, all of them clumsy, heavy, and slow. In Augsburg an unknown craftsman built a wagon driven by steam and human power, which carried a cannon and three artillerymen. A similar vehicle was constructed in 1765 by Nicolas Cugnot for the Marshal of Saxony, which seemed to have a will of its own; for on its first trial (which was also its last) it ran against a stone wall, despite all the efforts of its driver to guide its course, and completely destroyed the masonry. In 1771 Cugnot built a better machine, which was to be used in the transportation of artillery. The inventor of the steam-engine, James Watt, devoted his attention to the construction of an automobile, and although he did not carry out his own ideas, nevertheless he lent his assistance to William Murdoch, to whom our modern system of gas-lighting is due. Murdoch, in 1781, succeeded, with Watt's help, in producing a tricycle driven by steam. Evidently the inventors to whom the modern motor-carriage owes its origin were men of prominence in the mechanical world.

Passing over the contrivances of Evans (1786), Symington

(1786), Trevithick (1802), and others, we come to the vehicle invented by a man to whom, more than any other, the automobile is due, Sir Goldsworthy Gurney. In 1822 he built a steam-carriage with which he even climbed hills. His ideas were further developed by Walter Hancock (1799-1852), whose heavy omnibuses, each with no less than six smoke-stacks, ran merrily along the highways of England. Only a single accident can be traced to the Gurney omnibus—an accident which suddenly checked the development of the automobile in England. The accident in question occurred in June, 1834, on the road between Glasgow and Paisley. As a result, however, the railway companies, who had long been enviously watching the rapid strides of automobilism, forced a bill through Parliament which stipulated that a man carrying a red flag was to walk before every "road locomotive" and that the speed was not to exceed four miles per hour. Naturally the enforcement of such a law completely checked the development of a motor-car.

Other countries took up the cause of automobilism. France seems to have been most interested in the efforts of inventors to provide practicable automobiles. But the vehicles were all driven by steam, and the necessity of providing sufficient boiler-space and fuel capacity had the effect of rendering the construction exceedingly cumbersome. It was not until the early seventies that the automobile began to assume the form to which we are gradually becoming accustomed. About that time the well-known manufacturers, De Dion et Bouton, were beginning to build vehicles driven by steam, which were lighter, more elegant and graceful than the awkward contrivances of Gurney's day. With the invention of a benzine carriage the future of the automobile seemed assured. But its inventor, Pierre Ravel, who received a patent for his contrivance, was compelled to wait many a year before his dream was realised. As he completed his model, war broke out between France and Prussia. His model was kept in an out-house, which was on the Parisian line of defences. One day officers appeared who gave orders to have the out-house pulled down, in order to make room for fortifications, under which the first benzine automobile to this day lies buried.

A TRADESMEN'S MOTOR DELIVERY QUADRICYCLE.

WE illustrate herewith a novelty in the shape of a motor delivery quadricycle, which is meeting with adoption by many enterprising tradesmen and newspaper publishers in Paris. The machine, which is made by Messrs. Wehrle and Godard-Desmaret, of Neuilly-sur-Seine, needs but

little description, for, as will be seen, it is simply a motor quadricycle, with a parcels chest in front, in place of the usual passenger seat. The motive power is supplied by a De Dion motor of 2½ h.p.; the parcels chest, which is very light, being made of aluminium, will carry a load of about 400lb.

MOTOR-CARS ON THE CONTINENT.

(From Our Own Correspondent.)

At Cognac.

THE example set by Lyons in compelling every automobile to carry a number when in the town would appear to be contagious, for the Mayor of Cognac has embodied a similar regulation in the bye-law which he has recently issued for the purpose of better regulating the vehicular traffic. Indeed, M. Duras goes one better than his colleague at Lyons, for he orders numbered lanterns to be carried by every automobile and every cycle; and the numbers must be legible at fifty yards. The limit of speed within the city boundaries has been fixed at four miles an hour, and as nearly every horse-drawn vehicle regularly exceeds this speed, people are asking why they also are not to be numbered. Needless to say, the automobilists and cyclists of Cognac are up in arms, and, aided by the local press, are determined to do all in their power to prevent M. Duras' bye-law being carried into force. May their efforts be successful will be the wish of every motor man.

A Projected Alcohol Competition, and the Union Automobile.

WITH the object of further opening up the inquiry into the use of alcohol for light oil motors, the Union Automobile of France proposes to organise for Monday, the 25th inst., a contest open only to those vehicles which were classified in the recent Alcohol Competition. A short course has been selected at Asnières, and the vehicles will be required to cover this once using petrol as fuel, and twice employing alcohol as the propulsive agent. It is required, in particular, to obtain reliable data as to whether or not the use of alcohol necessitates any change in a carburettor constructed for the employment of petrol, and to ascertain whether any difficulty exists in the starting of a light oil motor using alcohol as fuel. A scheme of judging similar to that used for the classification of the competitors in the alcohol contest has been drawn up; but people are asking whether the Union have not gone to a lot of unnecessary trouble in formulating these details, for, in view of the A.C.F.'s communication, it is doubtful whether any competitor will be courageous enough to put in an appearance. And it is not only the competitor himself who will suffer, but also the firm of contractors who make use of any result obtained for advertising purposes. It is obvious that a firm might depute one of their employees to compete regularly in any contests organised by the Union and then advertise on their own behalf the results obtained. To avoid this possibility the A.C.F. have added a clause to the original decision whereby any firm advertising the results obtained by one of the vehicles constructed by them in an Union event will be disqualified equally with the driver of the vehicle from participating in any races or competitions promoted by the Automobile Club and the societies in union with it. I do not think that the events—if any—promoted by the new society are likely to be very successful under these circumstances. *Apropos* of the name *Union Automobile* recently adopted in place of *Moto Club de France*, I should not be surprised if this also is relinquished at an early date; for, if rumours be true, the *Automobile Union*, whose shop is situated in the Champs Elysées, are of opinion that the name is likely to cause confusion with their own, and may take steps to prevent its use. As the new society appears to have no luck in its selection of names, would it not be as well to call it simply MM. Giffard, Serpollet, et Cie.?

A Practical Joke.

A CURIOUS automobile story comes from Agen, a story which illustrates very forcibly the folly of attempting practical jokes when in charge of a self-propelled vehicle. M. Lafon owns a motor-quadricycle, and while out driving one day last week he saw a friend quietly walking, heedful of motors and

their dangers. At the sight, M. Lafon was struck with the brilliant idea of driving his machine against his friend, and with out a moment's hesitation put his project into execution. But the intended victim, hearing the "teuf-teuf" of the motor, saved himself just in time, and, moreover, had the pleasure of seeing his humorous assailant, who had quite lost control of the machine, go sailing serenely through the window of a chemist's shop, which was conveniently placed for his reception. Then up came the "man in blue," or his Agen equivalent, and he promptly showed his appreciation of the affair by summoning the crest-fallen motorist on the score of furious driving. Sundry cuts and bruises, a damaged cycle, and a fine in prospect—such are the results of M. Lafon's outburst of humour. Moral, don't attempt practical jokes when motoring.

A German Electrical Delivery Van.

THE accompanying illustration shows an electrical delivery van constructed by Herr Heinrich Scheele, of Cologne. It is intended to carry a load of about 1½ ton, and is propelled by means of a 6-h.p. electro-motor. The motor shaft is geared to the rear axle by special chain gearing. The battery consists of forty-four accumulators, having a capacity sufficient to run the

vehicle 50 kilomètres on one charge. The cells, which complete weigh about 11 cwt., are carried in a box which is supported on springs to overcome the vibration due to the vehicle being fitted with iron-tired wheels. The controller is arranged to give three forward speeds, ranging up to 18 kilomètres per hour, and two reverse motions.

In reply to J. W., the address of Messrs. Dalifol and Thomas is 183 bis, Faubourg Poissonnière, Paris.

OWING to the death of the Queen the run of the English Motor Club to Farnham, which was fixed for February 2nd, has been postponed until February 9th. The arrangements as to starting time and route remain the same.

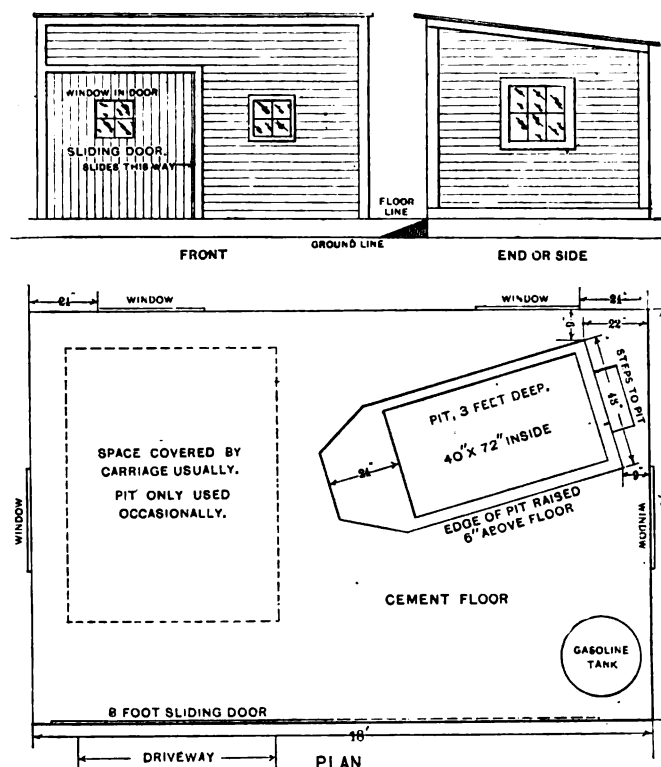

AN exhibition of motor-bicycles will be a feature of the meeting of the Society of Arts on Wednesday next, when Mr. Joseph Pennell will read his paper on "Some experiences with motor-bicycles."

WITH a registered office at 7, Hope Street, Wrexham, Messrs. J. Coleman Gittins, Limited, has been registered with a capital of £5,000, to carry on the business of cycle and motor manufacturers, etc.

THE Fabrique Nationale Automobile, Limited, has been registered with a capital of £20,000. Object, to adopt an agreement with Mr. H. T. Cheswright and another, and to carry on the business of motor-car, cycle, and motor-cycle manufacturers, carriage and vehicle manufacturers, etc.

A PRIVATE MOTOR-"GARAGE."

THE question of housing a motor-car is one that has to be considered as well as the buying of it. Mr. Frank C Hudson, of New York, sends an interesting communication on the subject to an American contemporary. "My space is," states Mr. Hudson, "limited, and a house 12ft. by 18ft. is about the limit at my disposal, so I have drawn out the plans shown, and would like suggestions from those who have had more experience as to improving them. The plan view shows the general idea, and it will be noted that the door is on the side, and slides to the right. The windows in the door and in the house are arranged so as to come together when the door is open, in order to admit light in either position. The dotted lines show where the car is to stand generally, and I have allowed 6ft. by 9ft., room enough for a large car, and also space to get around it to clean, oil, and repair. The floor I propose making of cement, and raised about a foot. The pit is on an angle in the corner with steps down from the back end. It is 40in. by 72in. inside, has raised sides to prevent running the wheels

in the pit, and pointed front end to aid in getting car in position. The idea of the angle is that the carriage can be backed on from the door, and can be run straight out through the door without doing the obstacle race act. The petrol tank is in the corner, as shown. As I have no use for an upper storey I have drawn a slant roof, although the house might be more artistic with a gable roof. If I had to economise space still more, I should put the pit under the carriage, in its main position, and have a sliding plank cover, which would be closed, normally, but could be rolled open at will. Having a separate pit, however, gives one the opportunity of housing a friend's machine when he comes to spend the night, instead of having to hunt up a livery stable."

MME. NEO, BOYER, the wife of the well-known Parisian motor manufacturer, has just passed the examination as a *chauffeuse*, and obtained a licence to drive through the thoroughfares of Paris.

At a meeting of the general committee of the National Cyclists' Union, held on Saturday last, a letter was read from the Secretary of the Automobile Club asking the union to sign a petition opposing the proposal of the county councils to frame by-laws restricting the speed of motors to ten miles an hour, and making the numbering of motors compulsory. It was decided to support the petition.

THE LEVASSEUR-WERTHEIMER VARIABLE-SPEED GEAR.

FIGS. 1 to 5 illustrate a new two-speed gear for motor-tricycles, which has lately been devised by Messrs. Levasseur and Wertheimer, of Neuilly-sur-Seine, France. The makers claim for their gear that it introduces no additional friction in the transmission, the change of speed being obtained by introducing in, or withdrawing from, the

FIGS. 1 AND 2.—ELEVATION AND SECTIONAL PLAN.

periphery of the pinion on the motor shaft several toothed segments, by which variations in the diameter of the driving pinion are obtained. It will be seen that the large pinion on the tricycle axle 10 is replaced by a large sprocket wheel, driven by a chain 17 from the sprocket 16 or the segments 21, according to which gear is in action. The sprocket 16 and

FIGS. 3, 4, AND 5.—DETAILS OF GEAR.

the segments 21 are rigidly connected with a pinion 12, and carried on a short shaft 13, supported in arms 15, in such a way that it can oscillate round the motor shaft 20. The spur-wheel 12, therefore, works as a satellite around the pinion 20, and transmits the power of the latter to the sprocket 16, or to the segments 21. The super-position of the latter to the pinion 16 is effected by two cleats 24 and 25, arranged on the shaft B, the ends of the cleats being helicoidally cut, in opposite directions. The cleats can be perpendicularly dis-

placed on the shaft 13; they are guided by the small fixed plates 26, and work in such a way that as one is drawn back the other is pulled forward until its helicoidal end is located in the line of rotation of the pieces 27 connected with the segments 21. The first segment which comes in contact, by means of its piece 27, with the helicoidal end of the cleat is displaced on the shaft 13, either in one direction or the other, according to which of the cleats are in contact with it. The cleats are moved by means of a rack and pinion gear 22 and 23, manœuvred by a cable 35, extending to the top bar of the frame of the machine. Owing to the shaft 13 being able to move round the motor-shaft 20, the length of the driving chain remains constant, notwithstanding the variable diameter of the driving sprocket. The tension of the chain is maintained constant during the operation of changing the gear by means of the springs 29. The change of speed is claimed to be made progressively, and without any shock or jar.

FIG. 1. THE DURYEA TWO-SEATED PHAETON. (See opposite page).

THE De Dietrich Company of Leunéville, France, have just established a large automobile garage at Mustapha, Algeria.

A CORRESPONDENT at Saigon, Cochin China, reports that the automobile movement is beginning to attract attention in that part of the world, there being already one motor-tricycle, two quads, and four voituresses in the city.

THE voituress is the vehicle now in fashion. Its moderate price and the facility with which it may be stowed offer to those who aspire to become chauffeurs the possibility of owning a carriage. So, establishments are everywhere to be seen actively at work in this line of manufacture. The success of the voituress is easy to understand. It supplies a want of the public; that is to say, it renders it possible to own a light and economical vehicle of reasonable price and capable of carrying two, three, or four persons at a medium speed.

THE Autocar Company of Ardmore, Penn., have lately completed a new type of two-seated car. The frame is built up entirely of steel tubing, while the differential gear on the rear axle is encased and is dust-proof. The wheels are of cycle construction, running on ball-bearings, and are provided with 2½-inch pneumatic tires. The motor is of the tandem double cylinder type, of 5-h.p. By means of a small lever, attached to the controlling handle, the speed of the motor may be varied from 240 to 1,000 revolutions. The cylinders, heads and valve chambers are all water-jacketed, and cooling water, to the amount of 3 gallons, is carried in a copper tank, located in the rear of the vehicle. The transmission from engine shaft to driving axle is by means of a chain and sprockets, and a gear wheel on an intermediate shaft, directly over the driving axle. A lever located to one side of the seat controls the entire transmission mechanism. A slight forward motion of the lever causes the vehicle to move slowly in a forward direction; by increasing the forward motion of the lever the speed of the vehicle is increased, while a backward motion of the lever will reverse the motion of the car. The weight of the vehicle, complete with supplies, is stated to be 725 lbs.

THE DURYEA MOTOR-PHAETON.

THERE are many motorists who will remember the excellent performance of the Duryea car in the memorable run to Brighton in 1896. Since that time many have wondered what had become of Mr. C. E. Duryea and his vehicle. We learn, however, that he has been busy at work perfecting his car, which is now being manufactured on a commercial basis by the Duryea Power Company, of Reading, Pa., U.S.A., and of which an illustration is given in Fig. 2, the official name given to it being a two-passenger driving phaeton. Power is supplied by a three-cylinder horizontal petrol engine of $6\frac{1}{2}$ h.p. The cylinders are $4\frac{1}{2}$ in. diameter by $4\frac{1}{2}$ in. stroke, and are fed by a single pipe from a simple vaporiser, and exhaust into a single muffler. Magneto-electrical ignition is adopted, a single generator furnishing the current. The cranks are set at 120 degrees, which gives regular impulses and with little noise or vibration. If one cylinder fails for any reason, the other two are amply able to drive the carriage home. The motor measures about 18 in. square by 9 in. deep, and weighs with fly-wheel only 200 pounds. The cylinders are water-cooled, the circulation being on the thermo-siphon system, while a throttle valve acting on the inlet pipe is provided, by means of which the speed of the engine can be varied between fifty and one thousand revolutions per minute. A detachable handle is provided for starting the engine, a feature of which is the employment of a hollow crank shaft.

As will be seen from the plan (Fig. 1) (page 814) the engine is located about the centre of the car. On an extension of the engine shaft is mounted the variable-speed gear, the connection between this and the rear axle being by means of a single chain. The variable gear is adapted to give two speeds forward and a reverse, and a position in which the engine is disconnected from the transmission. It consists of a compact epicyclic train in which the spur wheel is fixed upon the engine shaft, and in which either the intermediate part carrying the planet wheels, or the external circular rack can be held stationary, and in which, as a third alternative, these two portions can be locked together. A feature of the gear is that at ordinary speeds none of the auxiliary wheels are in operation. Intermediary speeds are obtained by means of the device which acts on the inlet pipe varying the amount of explosive mixture admitted to the cylinders. The driving chain employed is of a special type; it is of the block variety of $1\frac{1}{8}$ inch pitch; its feature is that it is self-oiling. The blocks are bored out in the centre, the chamber thus formed being filled with a piece of felt soaked in oil; this chamber intersects the rivet holes and permits oil to find its way on to the rivets. The felt also projects from the face of the block and

contacts with the chain wheel, deadening the otherwise sharp click of the chain, and keeping the face of the sprocket wheel well oiled. This arrangement is claimed to insure a life to the chain many times that found in other chains.

Attention may be drawn to the single front-steering wheel, owing to the fact that a stationary supporting spring passes completely through its centre. A transverse spring is attached at either end to the frame of the vehicle, and at its centre carries pivoting points both on its upper and lower sides. Pivoted upon these points is a false hub, to which steering arms are attached. The true hub of the wheel runs upon ball bearings about the inner block. For steering the vehicle cables are attached to the arms, and these pass over pulleys to the steering lever. The car complete weighs about 6 cwt. and is strongly built throughout. It has 3 in. tires, 30 in. and 36 in. wooden wheels, and a large one-piece axle extending through both rear wheels. Steering is controlled by a single lever pivoted to the front edge of the seat, operating the steering wheel without lost motion and making a very steady steering. The motor throttle and the variable speed

gear are operated by the same handle. Being between the riders this handle may be manipulated by either rider at will. The fuel admission is regulated by a twist of the steering handle. Raising or lowering the handle starts or stops the vehicle or changes the speed, while a side-wise motion of the handle effects the steering. A safety button is provided on the handle, which insures that the vehicle cannot be started accidentally, although the motor may be running. The body framework, which is of strong construction, performs the service of running gear, body frame, and motor support. The few mechanical parts are all enclosed within the body, but by lifting up the seat the machinery is exposed for inspection and repair. The sloping dash deflects the air

FIG. 2.—THE DURYEA TWO SEATED PHAETON.

downward, rendering, it is claimed, fast riding less unpleasant than in some vehicles. The low centre of gravity and the long wheel base are said to secure the greatest steadiness in running, and freedom from danger from upsets. The water and petrol tanks are easily accessible for filling purposes, and have a capacity sufficient for a run of 100 miles. A powerful hand brake is provided, operated by a central foot lever and acting on the chain wheel hub in either direction.

In addition to the phaeton illustrated in Fig. 1, the Duryea Company are building four-seated cars with seats dos-a-dos, or facing forward. These vehicles use the same mechanism as above described, and the same description applies throughout, excepting the number of passengers carried and the weights of body and axles. In a letter to us, Mr. Duryea informs us that while they make three-wheelers preferably, because they are lighter, simpler, more convenient, cleaner, and easier handled, they also build to order cars on the same principle but with the regulation four road wheels.

THE MILDÉ ELECTRICAL VOITURETTE.

IN addition to the vehicles illustrated in a recent issue, Messrs. Mildé, Fils, & Co., of Paris, are building the novel two-seated three-wheel electrical car illustrated in Figs. 1, 2, and 3. In this vehicle the motor and accumulators are located at the rear, the back wheels being the drivers.

FIG. 1.—THE MILDÉ THREE-WHEEL ELECTRICAL VOITURETTE.

The front wheel, it will be seen, is mounted on a special horizontal giroscopical circle, which moves within the front circular portion of the frame of the car, rollers being suitably interposed. The motor has an output of 1,000 watts, at 76 volts, and 2,100 revolutions per minute. The total weight of the vehicle, with passengers, is 1,474 lbs., and with this load the current consumption ranges from 11 to 13 ampères,

FIGS. 2 AND 3.—ELEVATION AND PLAN OF FORE CARRIAGE.

the car being geared up to a speed of about 12½ miles per hour. The battery comprises forty cells, having a capacity of 65 ampère-hours, or sufficient for a run of fifty to fifty-two miles on one charge. The Mildé vehicles are all fitted with ampère and voltmeters, and with the necessary instruments required for re-charging the batteries. In fact, the electrical equipment of the carriages is very complete, comprising as it does lamps and an electric foot-warmer.

SOME NEW MOTOR-BICYCLES.

THERE are several points of interest in the new motor-bicycle which has lately been put on the market by Messrs. Constantin, Cabanes, Rouanet and Company, of Argelliers, Aude, France. As will be seen from the general view of the machine (Fig. 1), the frame is exactly similar to that of an ordinary safety bicycle, no alteration being necessary except that of making the frame stronger than usual in order to carry the additional weight. As will be seen, the motor is located horizontally within the main frame; the petrol tank is fixed in the rear frame under the saddle; the induction coil is supported on the top bar; the silencer is situated under the

FIG. 1.—THE CONSTANTIN MOTOR-BICYCLE.

FIGS. 2 AND 3.—ELEVATION AND SECTIONAL PLAN OF MOTOR.

motor; on the lower tube of the frame below it is the carburettor, while under the bottom bracket between the pedals is the case containing the batteries. To deal first with the engine (Figs. 2 and 3), which is of the horizontal single air-cooled cylinder type. At a speed of 2,400 revolutions per minute it is capable of developing 1½ h.p. The valves, which are located one above the other, are so arranged that they can be quickly removed for inspection or other purposes. The exhaust valve, it will be noticed, is operated by means of a cam and pivoted lever. It will also be noticed that instead of the sparking and exhaust cams being mounted on the same short half-speed shaft they are supported on distinct shafts, this arrangement having been adopted in order not to have too large a projection on the

crank case. The latter is of aluminium, and is made in two parts. As above mentioned the carburettor is attached to the lower main tube of the frame. As will be seen from the sectional view, Fig. 4, it is almost triangular in shape. It is provided with a float showing the level of the petrol, while to facilitate the carburation part of the hot exhaust gases are made to pass by the pipe Z round the bottom of the tank. Coming now to the transmission, the motor-shaft carries a pinion gearing

FIG. 4.—SECTION OF CARBURETTOR.

with a small spur-wheel carried on a short adjustable shaft. On the end of the latter is a sprocket wheel which transmits the power by a chain to a large chain wheel attached to the left side of the rear wheel tube. The object of the pair of spur wheels and the short movable shaft is not only for the purpose of demultiplication, but also to allow of any wear of the driving chain to be taken up. The short intermediary shaft is mounted in slots, similar to the back fork end of a bicycle, except that the slots are semicircular instead of straight, so that the tension of the chain can be adjusted without the pinions coming out of the mesh. The usual pedals and chain gear are provided to start the engine and assist the engine up steep hills, a free-wheel clutch being contained in the hub, so that the pedals and chain can be held stationary when the engine is doing its work. The

FIG. 5.—THE PROGRESS MOTOR BICYCLE.

making and breaking of the electrical circuit is controlled by the left handle, as usual with motor-tricycles; there are also four taps or small handles on the top bar—one controlling the compression, one the carburation or mixture, one the volume of carburetted air admitted to the explosion chamber, and one the variable electrical ignition. The location of the engine and its various accessories are claimed by the makers not only to reduce the vibration usually felt, but also to render the machine very stable by reason of the low centre of gravity. The machine can, the makers state, ascend any ordinary hill, and on the level can attain a speed of 45 kilometres (28 miles) per hour. In view

of its low price (850 fr. in France), the machine should meet with a ready sale.

Still another motor-bicycle which has lately been put on the market is the "Progress," made by La Société Le Progres, of Vervins (Aisne), France, and of which an illustration is given in Fig. 5. The air-cooled petrol engine of 1½ h.p. is carried behind the bottom bracket and between the chain stays; it drives the rear wheel by means of a belt working on a light pulley. The engine is started and assisted by the usual chain and pedal gear, a free wheel clutch being fitted on the rear hub. The machine, which weighs about 66 lbs., can, it is stated, attain a speed of thirty miles an hour on the level and mount 10 per cent. gradients out with it being necessary to use the pedals.

SOME MOTOR-CAR TOURING HINTS.

IN contemplating a long tour by motor-car the first question which presents itself is that of suitable motive power. The average automobilist is, and will be, one who has no training in mechanics; therefore the carriage with the simplest, most easily mastered method of operation should appeal to him, provided that the carriage can travel over bad roads and can climb steep hills. The essential element which provides the power must be one that can be procured everywhere at points not more than 35 or 40 miles apart. The motor must also be of such

THE LONDON AUTOCAR CO.'S MOTOR BICYCLE.
(For description see page 802 of last issue).

construction that ordinary little repairs can be made by the talent procurable in smaller cities and villages far away from the "experts" domain. Mr. W. H. Stemmerman, accompanied by a companion, recently took an automobile trip on a light steam-car of something more than 600 miles through the United States, and it is from the experience gained in long-distance touring during the past season that he makes the following suggestions in the *Automobile Magazine*. Those who are waiting for the carriage in which you "touch the button" will probably continue to wait until they are past their motoring age. Nothing without labour, and for the immense amount of power exerted by a motor-carriage some return in the way of care and fuel must be made. Before a tour in a steam or other carriage is attempted it must be assumed that the operator has had at least several months' experience in running it, and knows the use and workings of every part of the mechanism. Many purchasers of motor-cars refuse to learn any more about their motors than to fill the petrol and water tanks and to start and stop. This is a mistake, and while they are not to be censured if they are not inclined to become machinists, they will soon find that it is absolutely necessary to master some details and soil the hands very often. Frequently some trifling derangement if seen and adjusted at once averts serious trouble.

Too much importance cannot be laid on the subject of oiling every part that needs it. Taking the oil can and blindly shower-

ing the engine with oil is not the way to do it. Every oil hole should receive individual attention. For the smaller parts, in which the holes are very small, a bicycle oil can should be provided. With such a can the oil can be forced into the place intended for it. A car upon which the brake does not act when going backwards as well as forwards is dangerous and should not be used. Before starting out on each day's run see that the petrol tank is completely filled, no matter how little of it may have been used the day before. Unknown roads are before the traveller, and ordinary calculations as to the amount likely to be consumed are very apt to be wrong. Therefore it should be put down as a rule to lay in a supply of petrol whenever it can be had.

Goggles made of plain mica with felt rims should be carried ready for use. In towns they are necessary on windy days to keep out dust, and in the country because it is sometimes impossible to see to steer the car on account of the myriads of winged pests that abound at certain hours of the day, and which are blown into the eyes unless they are protected. In putting the car away for the night when away from home it is well to see that it is either under lock and key or in the hands of a responsible party. There is always some one at hand either malicious or curious who may cause a mishap by meddling with things that should be sacred to him. A first-class man who is used to cleaning fine carriages may be allowed to clean the car, but no one should be permitted to touch the engine but the operator.

The enjoyment of a tour is made or marred by the travelling companion. A congenial, helpful companion, if found, is a treasure. He can look up the matter of roads and cross-examine the local inhabitants on the subject. While the operator concerns himself only about the machine and its needs, let his companion do all the questioning. It is well to get all the facts about the quality of the roads and distances every evening, getting the names of the intermediate towns between objective points. If the suggestions as here briefly outlined are carried out and a system of work adopted a motor-car tour will be found a unique, instructive, and enjoyable way of spending a week or two. It is not well to try to "make time" or to formulate a schedule. Lay out a route and make no promises as to when the return will be made. This will permit lingering in pleasant places, and side trips that may present themselves.

LA Société de l'Autogare is the name of a company that has just been formed in Antwerp with a capital of 35,000 fr. (£1,400).

THE service of motor cars from Aberdeen to Torry has been temporarily suspended by the Aberdeen District Motor Service Company, but will be resumed in April.

A SALE by auction of part of the stock of cars of the Automobile Association, Ltd., will be held at 1, Prince's Road, W., on February 7th, when Mr. C. Friswell will make his *début* as an auctioneer.

MR. GEORGE VON L. MEYER, the new American Ambassador to Italy, is an enthusiastic automobilist. He has also been personally interested in the practical part of the business, having lately resigned the presidency of the New England Electric Vehicle Transportation Company.

WE learn from an American contemporary that Mr. W. P. Kidder, of the Kidder Motor Vehicle Company, New Haven, Conn., is about to visit London and the Continent next month, bringing with him one of the company's new steam carriages.

THE managers of the Pan-American Exposition, at Buffalo, N.Y., are desirous of having the Automobile Club of America choose that city as the terminus of the Endurance Test which the club proposes to hold next autumn. One of the inducements which they offer is a road race, to be run on a stretch of road fifty miles long, near Buffalo.

IT is reported that the authorities of the Chicago Public Library may inaugurate an automobile service in place of the present delivery wagons, seven in number, which are in use for distributing books from the central library to the sub-stations. The proposition has met with support by reason of the fact that electric power for the vehicles could be furnished from the library plant.

ALLEGED FURIOUS DRIVING.

BEFORE Sheriff Henderson, in the Edinburgh Police Court, Rowland Outhwaite, manager of the Edinburgh Autocar Company, was charged with driving a motor-car furiously down Leith Street on the 17th December last. The accused pleaded not guilty. The evidence for the prosecution was given by four constables. They all agreed in saying that accused was going down Leith Street at the rate of seventeen or twenty miles an hour. The motor-car was at the back of a fire engine. None of the constables saw the car pass the fire engine, but one of them stationed at Pilrig said he noticed that the vehicle was making up on the tender every second. The accused said it was impossible to estimate the exact rate of speed, but as far as he could judge from the mechanism of the car, he was travelling at the rate of eight miles an hour. Lieutenant Barclay, who was in charge of the fire tender, said he was not going more than twelve miles an hour at any portion of his journey, and in going down Leith Street the tender was going at nine miles an hour. The Sheriff found the charge not proven.

MOTOR CAR LITIGATION.

IN the Chancery Division of the High Court of Justice, before Mr. Justice Farwell, Mr. A. J. Walter, last week, said he had two motions in the actions of the British Motor Traction Company v. Schlamm and the British Motor Traction Company v. Friswell and the Automobile Palace, which motions were for interim injunctions to restrain what was alleged to be infringements of patents, but it had been arranged with both sets of defendants that they should stand over till the trial, and that the costs of the motions should be costs in the actions. His Lordship concurred, and the motions stand over accordingly.

MOTOR-CAR ACCIDENTS.

A SERIOUS motor-car accident occurred near Bath on Sunday. A 6 h.p. car was being driven by Mr. William Whiting, who was accompanied by two friends, when one of the front wheels suddenly came off and the car was overturned, throwing the occupants into the road. One of the gentlemen sustained concussion of the brain, another a severe scalp wound, but Mr. Whiting, although he fell under the car, escaped with a severe shaking and bruising. All three gentlemen were conveyed to Bath Royal United Hospital.

ON Friday last week a singular motor-car accident occurred at Brookfoot, near Brighouse, Yorkshire. A young man named Naylor, of Preston, was making a journey from Littleborough to Wakefield, and when, in the darkness, ascending the rather steep hill at Brighouse Wood, something went wrong with the machinery, which suddenly stopped. The car, which was then half way up the hill, began to run backwards. Naylor was unable to stop it, and the result was that at the bottom of the hill the car ran into a wall. The driver was thrown out, and received a nasty cut on the face. He was conveyed in the Brighouse ambulance to the Halifax Infirmary, where his injuries were attended to. Strange to say, the car was only slightly damaged.

A DENSE fog marred the recent run of the Chicago Automobile Club to Milwaukee, U.S.A. Of the six vehicles that started only two reached Milwaukee, those of Mr. A. J. Eddy and Mr. H. M. Brinckerhoff. Mr. Eddy's car has a petrol motor, and made the run of about ninety-nine miles in seven hours. The other five vehicles in the run were steam cars.

THE Moto-Club de France is organising a ten-days' tour of France for May next. The tour, which will be on the lines of the English 1,000-mile Trial, will extend over a distance of about 1,500 kilometres. Messrs. Serpollet and Meyan have been entrusted with the arrangements. It is proposed to include two hill climbing and one speed contest.

A 20 h.p. touring car has lately been completed in Italy by Signor Ciro Bonacini, of Modena. The vehicle, which has accommodation for eleven passengers, is fitted with a 20 h.p. Bolide motor, the transmission consisting of a combination of belt and gear wheels. On the level a speed of 20 miles per hour can be attained by the car when fully loaded, while it is claimed to be capable of mounting 12 per cent. gradients at seven miles an hour.

AT a meeting of delegates from twelve of the leading American automobile clubs, held in New York, it was decided that steps should be taken to place guide posts at intervals along the principal roads leading out of New York to the various points of the compass, and extending as far as Boston to the east, Philadelphia to the south, Albany to the north, and Buffalo to the west. The work will be commenced in the spring.

THE Motor-Car Journal.

Vol. II.]

LONDON, SATURDAY, FEBRUARY 9, 1901.

[No. 101.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

A MEETING of the International Commission in connection with the Gordon-Bennett Cup was held in Paris on Friday, the 1st inst., to settle the date of the contest. Mr. C. Johnson repeated the representations which had been made by letter and telegram from the A.C.G.B.I., that the race should not be held earlier than the 1st July. M. de Knyff, who represented the A.C.F., stated it was the opinion of the A.C.F. that the

Gordon-Bennett race should be held prior to the Paris-Berlin race, inasmuch as the Gordon-Bennett race is looked forward to as the race of the giants of the respective countries, and if these cars were to take part in the Paris-Berlin race, and the Paris-Berlin race were held before the Gordon-Bennett race, the result of the latter would probably be a foregone conclusion, and the interest which is attached to the race would be forfeited. Count Sierstopff, who represented the Automobile Club of Germany, was not present at the Commission, but had registered on behalf of the Automobile Club of Germany a vote in favour of the Gordon-Bennett race not being held later than the beginning of June. The A.C.G.B.I. being, therefore, in the minority in proposing July, it was agreed that the Gordon-Bennett race should take place on Wednesday, 29th May; that is to say, the Wednesday after Whit-Monday. The course is to be from Paris to Bordeaux. The start will take place at about 3.30 in the morning from Ville d'Avry. The route will probably be by Ablis and Chartres and take in Chevanceaux and Monguion. The motor vehicles representing Great Britain and Ireland will be painted red. On the same day other racing motor-vehicles will take part in a race from Paris to Bordeaux. The start will be given half an hour to three-quarters of an hour after the start of the Gordon-Bennett cars. It will thus be possible for two out of the five carriages which are entered by the British Club for the Gordon-Bennett race which may not be selected to represent the club to take part in a race on the same day over the same course.

The M.M.C. Competitive Car.

As already announced, the Motor Manufacturing Company, Ltd., have entered a car for the forthcoming Gordon-Bennett race, and although no definite particulars as to the horse-power, etc., have been given out, we are informed that the designs have been drawn up and finally approved by the directors. The work of construction is already well in hand, and within a short time it is hoped to subject the new car to a series of trials on the roads in this country.

An Irish Tour.

EFFORTS are being made to secure an automobile tour in Ireland, and it is being urged in Irish newspapers that as the 1,000-mile Trial in Great Britain last year must have put at least £2,000—a very modest reckoning—into the coffers of the hotel keepers, a similar trip through a part of Ireland would be a

good thing for the country, and we believe it would be a good thing for the motor-car industry as well. There is now an Irish Automobile Club, and the scores of enthusiastic owners in all parts of the country would welcome an English automobile invasion.

Motor Dust Carts in the North.

LAST week we reported that two metropolitan boroughs had had attention drawn to the adaptability of steam motor-vans for the collection of street refuse. Now comes the news that the Corporation of South Shields have, for a fortnight, been conducting a series of experiments with a steam motor dust cart, and have been comparing its working with that usually employed. On one of the latest days of the trial there was a saving of twenty-five minutes in the loading and deposit of rubbish at given places, as compared with the horse and cart system. The decision of the authorities with regard to its adoption will be awaited with interest.

A Motor-Car Pawned.

MR. WAYLAND CHAMPION is a farmer of Reading who gave special attention to poultry farming, in which pursuit he made a loss of £1,000 in a year. Among the expenses he incurred while engaged in the venture was £200 for a motor-car. In the Bankruptcy Court the other day the Assistant Receiver was curious about the motor-car, and suggested that Mr. Champion had "pawned" the vehicle for £120 and gone to Paris with the money. The debtor agreed that the proceeds of the motor-car had been thus employed—a use for the automobile which hardly commends itself to keen motorists.

Automobiles and the Fire Brigade.

COMMANDER WELLS, R.N., has just issued his report on the fires in London, from which it appears that the strength of the Metropolitan Fire Brigade is about 1,000 of all ranks. The plant includes sixty-five land steam fire-engines, and, although hand appliances are very numerous, 250 horses are in the service. Surely the time is fast approaching when our fire brigade will have to consider the adoption of other motive power, and a start might be made by the employment of motor service wagons. This is already done in Paris, where an electric service wagon stands ready at most of the fire stations. This is able to get away more promptly than horse-drawn vehicles, while its rapidity of movement enables it to outstrip the horse with an ease and reliability that should secure a favourable consideration from all English visitors to the French capital.

Motoring in the Snow.

IN connection with motoring in the snow, recorded a few weeks ago, the following from an American correspondent will be of interest:—"An excellent example of the utility of the motor-car was clearly proved recently in Atlantic City, where the Electric Vehicle Company maintains an automobile service for the hotels. Twelve inches of snow fell the other day, blocking railroads, trolley cars, and nearly all the public conveyances. The motor-vehicles, however, continued to operate almost with the same degree of regularity as under normal conditions of

traffic. Those of the horse-owning cabmen who were able to weather the storm sought to make a golden opportunity for extortionate rates. The electric motor service ran under its regular rates, however, and won general favour for its service-ability in the emergency. A similar situation was encountered during a snowstorm at Lakewood, where a Columbia vehicle is in operation for the Lakewood Hotel. There was no interruption in the service, and patrons were carried between the hotel and the railroad station without delay, regardless of snow and slush."

French Cars for America.

CALLING in at the big garage in the Avenue de la Grande Armée, Paris, of Messrs. Charron, Girardot, and Voigt, last week, we were just in time to inspect one of two 12 h.p. Panhard car about to be despatched to America. The body took the form of a *tonneau*, the back being somewhat higher than usual; the woodwork was painted maroon, and this combined with the polished brass fittings gave the car a handsome appearance. The cars, which were being taken across the Atlantic by M. Combet, the firm's manager, form, we understand, part of an order for twelve high-powered vehicles received from a New York house.

Through Mud.

THE mud encountered in our London thoroughfares is not of very stiff consistency, but of the thin, watery character that helps the slipping of wheels and the skidding of cars. Not so some of the mud in country districts and in the United States. The accompanying photograph shows a

"Locomotive" going through adobe mud in Lake County, California. It will be seen that the rear wheels of the vehicle are practically free from dirt, showing that they are doing the driving, and that the carriage is not stuck in the deep and stiff mud.

Motor-Cars in Winter.

RECENT reports have shown how well automobiles have been able to withstand the most wintry weather. At Bourne-mouth and Lincoln the motor-bus services were not dislodged by the snow, while the ordinary horse-drawn bus arrangements were greatly interfered with. Similar circumstances have arisen with similar results in Newport, U.S.A., where automobiles have easily held a monopoly of facile transportation during the snow storm, and motor-carriages merrily rolled along over the ice, turning out occasionally where the highways had been obstructed by disabled teams and generally disproving any reputation of being fair-weather vehicles only.

Ice storms are accustomed to be dreaded in America, since for a time they put an effective blockade on all horse traffic, and even electric cars are sometimes stalled when the trolley wire is thickly coated with ice, but the automobile is a winner in such weather, and almost exclusively. Tests were made by Newport drivers for the purpose of seeing what could be done under such conditions, and the results were eminently satisfactory. One gentleman ran a steam motor-vehicle ten miles out into the country during a sleet storm, and experienced no difficulty whatever, while the horses were completely helpless, and wagons were frequently passed abandoned by the roadside. The little steam buggy made a record trip, and returned with a glassy coating that was a veritable varnish of ice, but it had solved the transportation problem during a snowstorm.

The Good-Roads Movement in America.

It has been recently decided by the Automobile Club of America to increase the membership of the club's committee known as the "Albany Post Road Committee." The object of the committee is to devise a plan for promoting the construction of a road from New York to Albany on the east bank of the Hudson—this road to be "boulevardized" wherever possible—and to establish along the road convenient stopping-places for luncheons, refreshments, etc., together with charging, repair, and supply stations. Mr. J. M. Hill, the chairman of the committee, believes that the territory through which the proposed highway will be made can be divided up into short sections in which local influences can be brought to bear to interest the people through the county commissioners and the other local authorities having under their government the construction of roads. Though there is little immediate prospect of carrying out the project, it is reasonable to believe that in two or three years such a road could at least be made to reach from the metropolis to Rhinebeck, after which, with the development of a little energy and public spirit, the plan might be consummated through the success obtained from the construction of this short stretch.

Motoring in California.

AN excellent test of the durability and practical utility of the motor-car was recently made in California by Mr. F. H. Holmes, a fruit grower of San Jose, who is the owner of a Stanley steam car, made at Lawrence, Mass. Mr. Holmes, after taking several shorter journeys through the country adjacent to his home and determining to his complete satisfaction the substantial character of his carriage, set out on a trip through the famous Yosemite Valley, into which several owners of light steam carriages had ventured with far from satisfactory results. Mr. Holmes, however, accomplished the entire trip of almost 2,000 miles without a breakdown, going in and coming back on his own wheels and with his own power. The roads in many places are exceedingly sandy or littered with stones, which are a severe strain on the tires, as well as on the whole running gear of the machine. During the year past, the period of time this carriage has been in service, it has made over 6,000 miles, and we understand that that the only part replaced was a new burner, which was substituted for the old-style burner in use at the time the car was purchased.

Enterprise Wanted.

LIFE from beginning to end is a re-adaptation. What is good this year is antiquated next season. This applies to motor-vehicle matters and methods, as well as to bonnets and cycles. Conditions change, and methods must change with them. The means and media by which success could be obtained in 1897 are now obsolete and worthless. The manufacturer who is not capable of growing and expanding, of noting and pressing into his service the new elements and forces that arise, will never secure that measure of success which will warrant him in staying in the motor-vehicle business. Only by carefully watching the doings of other firms and other countries can British firms gain a good position at home.

Motors versus Horses.

THE Hon. Chas. S. Rolls, presiding at a meeting of the Society for the Promotion of Kindness to Animals, at the Hon. Mrs. Henniker's house in London, has been putting in a word for the automobile. He said much cruelty to animals might be avoided by employing motor-vehicles for hauling heavy loads long distances, cab work, and work involving over-exhaustion to horses. Motor-vehicles were capable of travelling 400 miles a day, were tireless, and might be used for military transport in countries like Africa, where thousands of animals had been sacrificed owing to climate and difficulties of transport of fodder. Animal lovers should discourage the attempt by county councillors to fetter the use of mechanical transport in Great Britain. This is an aspect of the case which should not be overlooked.

The Virtue of Modesty.

MODESTY is a virtue that is a jewel in the character of the motorist. We remember a motorcyclist who once got to Brighton in an hour and a-half disclaiming any such rapidity in a police court. In fact he declared he could do the journey in about four hours. Another motorist of our acquaintance who frequently travelled at the rate of twenty to thirty miles an hour invariably avoided public confession, and when driven into a declaration always discounted his performances. Such modesty does credit to our British automobilists, especially when compared with the sensational speeds at which American drivers are too wont to startle the world. From the time that he took his famous German Daimler to America Mr. Vanderbilt has been written up and down in the daily papers in such a way as to make gullible readers believe that his driving is ever and always a combination of recklessness and high speed such as no other man in the world has ever been guilty of. Whether this reputation was bestowed upon Mr. Vanderbilt through his own desire or not no one but himself knows; but be that as it may, the result has been an injury to the cause of the vehicle, and no very desirable notoriety for Mr. Vanderbilt. Bucolic law makers, egged on by saffronised newspapers, are never over strict in their regard for accuracy, and Mr. Vanderbilt is in a fair way to prove this to the discomfort not only of himself, but of every man who owns a motor-vehicle in the United States.

Motor-Cars for Medical Men.

AN electric automobile was recently employed in a most novel and entirely satisfactory manner by Dr. Joseph Steadman, a prominent physician of Boston. The physician, in company with a professional associate, was recently called upon to perform a delicate and dangerous operation on one of his patients. The light in the room in which the operation was performed being of poor quality, Dr. Steadman ran a wire from his automobile, which he had driven up on the sidewalk in front of the house, to the operating room, attaching one end of the wire to the battery of the vehicle and the other to a thirty-two candle-power incandescent lamp. Turning on the current he gained a light sufficiently bright to enable him to perform the operation successfully. After such an incident who will be bold enough to assert that the motor-car is not pre-eminently the vehicle for medical men?

Saturday Runs.

A BUSY season is in prospect for the Automobile Club and a series of Saturday afternoon runs is about to be inaugurated, which should do much to promote sociability among the members. On the 9th prox., there will be a run to Virginia Water; on the 23rd of the same month a run to Sevenoaks, and on the 30th a run to High Wycombe. The Easter tour of the Club will be held from April 4th to the 11th, and on April 20th a run to Dunstable has been arranged. On April 27th a trip to Hertford will be the last of the series before the great exhibition

at the Agricultural Hall. Then on May 18th, there will be a run to Guildford; on June 8th, to Boxhill; on the 15th, to Sonning-on-Thames, and on the 22nd, to Reigate. These runs will start at 2 p.m. from the Club-house, and will be followed by a dinner on each occasion.

Feeding Boilers from Horse Troughs.

DRIVERS of steam cars must be careful as to where they replenish the water in their boilers, for the Works Committee of the Islington Council is considering the question of prosecuting a man who recently took water from a horse trough to feed the boiler of a steam trolley. Of course the horse troughs are primarily provided for the old-fashioned steeds associated with the antiquated method of road locomotion in London and other places, but to worry itself with such a matter as the replenishment of a boiler such as this seems to lead to the conclusion that the Islington Council has not much to do. The sooner it looks after the condition of its main thoroughfares the better, for judging by the condition of the streets on Tuesday there was plenty to keep every councillor busy from morn till eve.

ON A PARIS BOULEVARD.

Automobile Volunteers.

STEADILY the list of vehicles which are offered to the War Office in connection with the proposed corps of automobile volunteers is increasing, and, although there is no great excitement over the matter, a good deal of interest is being taken. It only needs a formal and sympathetic invitation from the War Office to secure many more promises of support. Meanwhile we hear that Earl Russell is willing to place his four-seated 8 h.p. Haynes Apperson petrol car at the disposal of the War Office, and that Mr. Frank Butler is willing to lend three vehicles—his 6 h.p. Panhard car, his 5 h.p. Renault voiturette, and his 12 h.p. Panhard car.

The Manchester Automobile Club.

A GENERAL meeting of the Manchester Automobile Club has been held at the Queen's Hotel, Manchester, when the hon. secretary, Mr. J. Hoyle Smith, in his report of the past season, said the club was founded on December 21st, 1899, and the first general meeting was held in the March

following. There were then thirty-eight members. This number has now increased to fifty-three, and there is no doubt will be considerably added to during the coming season. At the last general meeting the committee announced that they had undertaken to make all the local arrangements for the 1,000-Mile Trial, expenses of which were guaranteed by members of this club. The guarantors were never called upon to pay, for when the trials took place the Manchester arrangements were universally acknowledged to be very good and the show very successful. The total receipts of the show amounted to £127 0s. 9d., and the total expenditure to £102 0s. 9d., leaving a balance of £25, which was duly paid over to the War Fund. During the past year he regretted to say that the hon. treasurer, Mr. A. Mackillop, had to resign his position owing to ill-health, but Mr. S. Okell was elected to take his place. All the old members and officers of the 1900 committee had been re-elected, and in addition Dr. Marshal and Mr. F. E. Baron. During the past season there had been several runs. These were very successful as far as they went, but were not as well attended as it was hoped they would be this year. The committee will be glad of any suggestions from members of the Manchester Club as to dates, places to visit, etc., in connection with a series of runs it is proposed to hold. The treasurer's report was then read, showing that the club started the new year on a firm financial basis. Votes of thanks were passed to Mr. W. E. Rowcliffe for giving the use of a meeting room for the committee, and to the hon. secretary for his services during last year.

An Automobile Christening.

AUTOMOBILE marriages have frequently taken place, both on the Continent and in this country, and in that wonderful country known as the United States funerals by steam have been reported. Now comes news of a christening on an automobile which has taken place at the Church of St. Croix, at Brussels. This is, we fancy, the first time such an event has occurred. Probably some may imagine it adds a new terror to the ordeal; but apparently on this pioneer occasion everything went well—even the infant, who was naturally the central figure of the function. During the journey snow was falling, but that did not disconcert the party, and the baby from beneath the shadow of the umbrella looked on the world with the easy assurance of one who is making rapid progress.

Motor Delivery Vans.

MOTOR-CARS for commercial uses are likely to come prominently into notice in the future, and at the annual meeting of the Hyam Wholesale Clothing Company, Limited, the other day Lieut.-Colonel Colville referred to a motor-car which they had started at their factory at Colchester. He said he had been informed by the manager that the vehicle was a great success. The motor-car in question is a 9 h.p. Napier car, and is illustrated on another page of the present issue.

An "Experience" Meeting.

AN "experience" meeting has been held at the Waldorf-Astoria, New York, by members of the Automobile Club of America. Messrs. Chamberlin, Shattuck, Scarritt, Lyman, Buzby and others related experiences they had had the past season on the road, the object being purely educational. Mr. Scarritt made a plea for truth in the industry in general as well as in the exchange of minor experiences on the road. Dr. Lyman suggested that the club should start a subscription for the placing of substantial iron signposts on the main roads leading from New York to Philadelphia, Albany and Boston, as a guide to automobile tourists. Evidently the automobile is coming along in the United States, and promises to revive the interest of Americans in the scenery of their own country. From the express trains of the States little can be seen of the minor villages and settlements on the lines of recognised travel, but the motor-car will enable tourists to visit places hitherto inaccessible, and probably promote a more kindly feeling for the lesser known beauties of the country.

Sales and Wants.

WITH the development of the automobile industry and the improvements now being made the trade in motor-cars by private owners wishing to dispose of their vehicles is becoming extensive. We have lately noticed some advertisements of motor-cars for sale by private owners in the general newspapers; this, we would point out, is an extravagant and generally useless effort to dispose of such vehicles. The most effectual way, we would take this opportunity of suggesting, is by announcement in the columns of the automobile journals. And in this connection the wide circulation of the *Motor-Car Journal* among owners, buyers, and other interested persons serves a useful purpose.

A Self-Starter for Motor-Cars.

THE vibration associated with a motor-car when standing is so very unpleasant that anything calculated to obviate that is to be welcomed. An electric self-starter, which can be applied to all vehicles which have motors of two or more cylinders, has been devised by Messrs. Hayward and Fox, of Norwich, and has been successfully tried on a Daimler car for some months past. The vehicle can be left for hours standing, and when it is required to start all that is necessary to start the motor is the moving of the starting switch, while the driver is sitting on the car. The idea is certainly a good one, and its satisfactory development a matter of interest and importance to motorists.

Moving Faster.

THINGS moved so rapidly in the bygone Nineteenth Century that people are wondering whether the pace can be safely accelerated in the Twentieth. In many departments of activity the speed cannot be increased; in locomotion on the roads it is likely to quicken very considerably, especially when the crowded condition of our main thoroughfares is mitigated by the adoption of motor-vehicles occupying one half the space now required by the horse-drawn vehicle. Then new methods of regulating the traffic will be necessary, for the clatter of the horses' hoofs will have greatly ceased to add to the noise of cities. With the lessened irritation of sound and the much increased rate of speed recognised crossing places, just as are now necessary at several points in the City of London, will have to be established.

In the Rostrum.

IN the motor-car world Mr. Charles Friswell is so widely known that considerable interest attached to his *debut* as an auctioneer. This occurred on Thursday on the premises once occupied by the Automobile Association, and, surrounded by cars and faced by bidders Mr. Friswell seemed quite at home. About fifty lots were knocked down in good time, and with a pleasantness that gave quite a zest to business. Two Ducroiset 10-h.p. wagonettes, to seat eight and six persons respectively, were sold for £200 each, and for Sir David Salomon's Serpollet steam-car £80 was bid and taken. A 14 h.p. Benz wagonette fetched £275, and a Mors petit duc £110. Only three lots failed to find buyers. The sale attracted a goodly number of dealers and buyers, and Mr. Friswell is to be congratulated on the very favourable impression he made in his new capacity. A stranger would not have thought it to be his first appearance in the rostrum. A word should also be said in praise of the convenient way in which the lots were arranged for inspection.

A MOTOR club has been formed in Buenos Ayres, South America. The number of motor-cars in the capital of the Argentine Republic is reported to be rapidly increasing.

THE Washington Automobile Club has just been organised in Washington, U.S.A. The objects of the organisation are the same as those of other clubs already in existence. Mr. Charles E. Foster was elected temporary chairman, and Mr. W. J. Foss temporary secretary, and a committee of five was appointed to draft a constitution and by-laws.

The French Motor-Car Exhibition.

(From our Own Correspondent. Continued from page 808.)

FIG. 1.—THE GEORGES RICHARD 8 H.P. "LIMOUSINE" CAR.

NO carriages are more graceful or better finished than those of the Société des Automobiles Peugeot, Audincourt (Doubs), and many beautiful specimens of the company's work are to be found upon their stand, No. 38. No startling novelty is there shown, but the system of ignition employed upon one of the cars exhibited is interesting. The vehicle is a 5 h.p. four-seated light car, the front seat of which can be turned round to face forwards or face the driver, as may be desired. The motor is carried behind, and the two platinum tubes are so placed as to permit of their being heated by a single burner. Electric ignition is also provided, but it is intended that the tube or electric system be employed separately and not in unison as is so often done. Among the carriages, the new *tonneau* carrying a 5 h.p. engine in front is a beautiful vehicle, and illustrates the firm's new system of transmission by means of a chain from the motor to cross shaft and a chain from the cross shaft to the road driving wheels. Among the other cars are three of those handsome carriages especially designed for town work, which have done so much to render famous the name of Peugeot. These are, respectively, a victoria, a cab, and a coupé, all three constructed upon dropped frames, and fitted with 8 h.p. motors. A small 5 h.p. phaeton with awning and an 8 h.p. six-seated nondescript sort of vehicle complete the list of carriages, but there is a 4 h.p. light delivery van and an 8 h.p. lorry, the latter vehicle being intended for service in Madagascar.

La Société Anonyme d'Automobiles et de Traction, Quai National, Puteaux (Seine), only exhibit a couple of their cars built under the Bardon patents. These are respectively a "spider" and a *tonneau*, both fitted with 5 h.p. motors. No changes what-

ever have been effected in these vehicles. It is interesting, however, to learn that the company expect to turn out about April next the first of a series of light cars built under the Charron, Girardot, and Voigt patents. This carriage will weigh complete between four or five hundred kilogrammes and will carry a balanced motor developing from eight to ten horse power. It is anticipated to put this car upon the market at a remarkably low figure, and its appearance is awaited with interest in Parisian automobile circles.

La Société des Établissements Georges Richard, Avenue de la Grande Armée, Paris, make a special show of their small voiturette, and here again the *tonneau* form of body is shown marked favour, for no fewer than four of the six cars exhibited carry this type of body. With four persons up, this small vehicle contested the Chanteloup and the Gaillon hill-climbing races, and in the former made an average speed of thirteen kilometres per hour, while the latter was negotiated at the still higher average of fifteen kilometres. In the Consumption of Fuel Competition the cost of transporting the four occupants of the car over the seventy kilometres of route was only one shilling and tenpence—a truly remarkable record. In addition to these *tonneaux* (Fig. 2) there is a "spider" and a coupé, with small seat behind for mechanic. All these voiturettes are provided with three forward and one reverse speeds and three powerful brakes. The large cars comprise an 8-h.p. "Limousine," (Fig. 1) a four-seated phaeton in natural wood by Binder, and a curious kind of coupé. Driving from the inside, this car carries a seat at the back covered over by an extension of the coupé's roof. It presents a very smart appearance, but is probably a somewhat heavy vehicle for its 8 h.p.

motor. In the heavy-car class M. Richard exhibits a motor and frame, to which is attached the brake invented by M. Ernest Cuénod Vice-president of the Swiss Automobile Club. This appliance serves three purposes—viz., wheel jack, sprag, and brake. Placed right beneath the car, it consists of a couple of levers, each carrying at its lower extremity a shoe which can be forced into contact with the earth by means of a long and powerful lever placed to the driver's left hand. By bringing this lever into action the back wheels are lifted entirely free from the ground, and in case of emergency the brake should prove invaluable. The usual sprag can be entirely dispensed with, as also the jack, for, fitted with the Cuénod brake, a car carries both appliances combined in a single apparatus, and so placed that instant use can be made of it. I am of opinion that this appliance will be very largely employed, especially by users of cars in mountainous districts.

Unquestionably the most interesting features of the stand of the Société des Voitures Automobiles des Etablissements Decauville aîné, Boulevard Malesherbes, Paris, are the company's new light car and chassis. The new car weighs 450 kilogrammes, and carries upon the fore-part of the frame a motor of two cylinders of 0m. 095 diameter and 0m. 100 stroke. This engine develops 6 h.p. at 850 revolutions, and $8\frac{1}{2}$ h.p. when running at 1,200 revolutions. The two cylinders, which are in a single piece, are water-cooled, the circulation being effected by a centrifugal pump. A special feature is the absence of tremblers from the arrangement of the electric ignition, these parts being replaced by a disposition of an evidently more durable character. Placed just above the motor shaft is a shaft revolving at one-half the

FIG. 2.—THE GEORGES RICHARD 4-H.P. TONNEAU VOITURETTE.

speed. The end of this shaft has a small flat portion which serves as a cam. Passed over it is a box containing the contacts. These consist of two pivoted pieces of metal attached together by a spiral spring at their lower extremities, and at their upper extremities making and breaking contact with two platinum points. The shaft separates these two metal pieces, but in the course of the revolution its flat side permits the spiral spring to pull them together, and first the one and then the other makes contact with its corresponding platinum point. The transmission of the motive power is direct, the gear, differential, etc., being carried right at the back of the frame. Three forward speeds and one reverse are provided, and the car can run up to forty miles an hour on level ground. One lever only is used to actuate the change of speed and the forward and reverse motions. The other controlling appliances are a brake lever, a couple of pedals, respectively used for disconnecting the motor and applying brakes, and a small hand lever placed upon the inclined steering wheel pillar, for advancing the moment of ignition. The model shown is a *tonneau* of which the well can be instantly removed and replaced by a spider seat, a coupé, or other type of body. The price is £260 with *tonneau* body, which should bring the car within the reach of many would-be *chouffeurs*. The Decauville Company also exhibit a chassis of this model. Among the other vehicles shown is the historic 5-h.p. of the wonderful thousand miles non-stop run at the Crystal Palace. Another 5-h.p. model as well as two 8-h.p. cars call for no par-

ticular attention, but the type of vehicle designed for the use of banks is distinctly interesting. Placed upon an 8-h.p. frame, the body is by Jeantaud and resembles a cross between a coupé and an omnibus. The driver and the passenger beside him are protected by a wooden roof and then behind them is a compartment provided at one side with a seat, at the other with a locker up to the height of the window, and at the back with a large and strongly-constructed cupboard. It is a capitally arranged vehicle and one which should appeal strongly to firms engaged upon work necessitating the continual conveyance of specie, etc.

Nothing new is to be noted upon the stand of MM Renault Frères, Rue du Point-du-Jour, Billancourt (Seine), but no visitor can pass without stopping to admire in particular the beautiful finished frame and motor there exposed. It is a splendid piece of work and affords the best argument in favour of confiding orders to this firm. Three *tonneaux*, two spiders, and a delivery car make up the rest of the exhibition, but the photographs of the Renault search-light car are worthy of attention as showing to what a variety of uses the horseless vehicle can be put.

The stand of MM. de Dietrich et Cie., one of the largest and most imposing in this year's Salon, is in every sense worthy of a firm which has been in existence some two hundred and seventeen years, and which possesses at the present time no fewer than six factories. Of these works those situated at Reichshoffen (Alsace) and Lunéville (Meurthe-et-Moselle) occupy themselves with the construction of automobiles, those built at the latter place being naturally for the French market. It was in 1896, after the excellent performances of the Amedée Bollée vehicles in the Paris-Marseilles race, that MM. de Dietrich et Cie. entered into negotiations with the Le Mans firm, negotiations which eventually resulted in the construction at Lunéville of the Amedée Bollée cars. These vehicles are so well known that a detailed description of them would be out of place, but it will interest English readers to learn that the type now in vogue will be superseded at no far distant date by a car provided with a cross shaft and driving chains on to the rear wheels. The present system of two lateral shafts, carrying at their forward extremities pinions which gear with cog wheels on the road driving wheels, will therefore be no longer employed, and this will be an undoubted improvement, as this gear, after some use, becomes distinctly noisy. The first vehicle to attract the attention of the visitor when inspecting the stand is a large six-seated *tonneau*, carrying in front under a square casing an 18-h.p. motor giving some 24 h.p. on the brake. Weighing 13,000 kilogrammes, this car runs up to eighty kilometres, or fifty miles, per hour, and as its tank can carry eighty litres of petrol, some 300 kilometres can be negotiated without recharging. The motor is of the four-cylinder horizontal type; inclined wheel-steering is fitted, and to this pillar are attached the manipulating levers. The speeds are four in number, and the reverse is brought into action by means of a lever placed to the left of the driver. The tires on all four wheels are 120 mm. Michelin, and the vehicle is priced at £800. A somewhat curious car is a Berlin coupé, in which to the ordinary coupé there has been added at the back a seat protected by a large hood. Six people can be accommodated on this carriage, which is fitted with a 9 h.p. motor. Another original type is a six-seated car, of which Kellner has built the body. All the occupants face the same way, and the awning carries three glass screens, one at either end, and one which divides the driver from the passengers behind. Both these cars have curved splashboards to which the radiators are attached, but there are, in addition, a couple of vehicles upon the stand provided with the pointed prow characteristic of the Dietrich cars. These vehicles are respectively a "spider" and a *tonneau*, and each carry a 9 h.p. motor. The remaining vehicle shown upon the stand is a 12 h.p. omnibus destined for the use of the Société Française des Automobiles en Corse, Bastia, Marsiglia. It accommodates eight people, three upon the driver's seat and the remainder behind. A door at the side gives entrance to the middle or coupé portion of the car, while the other passengers reach their seats by means of a door right at the back. The arrangement is very neat, and the vehicle, painted in green and yellow, looks both smart and serviceable. MM. de Dietrich also exhibit in the heavy car class,

one vehicle being a 9 h.p. lorry as used by the military authorities.

As would be expected, the exhibition made by MM. E. Delahaye & Co., 10, Rue du Banquier, Paris, is an extensive one, and as the chassis constructed by the firm lends itself very readily to the carriage-builder's art, a great variety of types are to be found upon the stand. Looking at the smaller vehicles one remarks three examples of the well-known *voiturette* fitted with 6 h.p. engines. The first of these is a *tonneau*-shaped wagonette in natural wood, the upholstery of which is in a smart slate-coloured cloth. A dainty two-seated car, painted in blue and yellow, with a basket placed upon the platform behind, is the second example, while the third is a similar vehicle but is provided with a third seat at the back. This latter type is known in France as a "spider," and is much in favour, for the additional seat affords accommodation for the engineer. Among the larger cars one is at once attracted by the appearance of a 10-h.p. "Limousine," a kind of coupé, the two rear seats being entirely covered in, while the driver is protected overhead only. The bevelled glass windows of this carriage and its smart upholstery and painting combine to make a very attractive vehicle. Another car is the 7½-h.p. *tonneau*, while for those buyers who are on the lookout for a town vehicle a six-seated covered-in wagonette and a four-seated cab are well worth attention. A snowy-white phaeton upholstered in red leather is also a pretty car, and is one in much demand. Upon none of these vehicles is there any new feature excepting the ignition timing arrangement which is now being attached to all the cars constructed by MM. Delahaye & Co. The exhibition is completed by two motors, one developing 6 h.p., and the other 10-h.p., both being mounted for stationary work.

The car constructed by the Société Industrielle des Téléphones, 25, Rue du Quatre Septembre, Paris, under the Ader patents, is of such recent date and has given such satisfactory results that novelties are not to be looked for there. I described the car in detail in these columns during the Exposition Universelle, and I would therefore simply remind readers that the engine itself is at present made in two sizes. The one is of the two-cylinder air-cooled type, developing 3½ h.p. at 1,800 revolutions, and weighing about 56lbs. The other is a two-cylinder water-cooled engine giving 6 h.p. at 1,200 revolutions, and fetching down the scale at 100lbs. In both cases the cylinders are angled at about forty degrees, in this respect somewhat resembling certain of the earlier Daimler engines. The cars shown at the Grand Palais comprise a two-seated and a three-seated vehicle, the latter being of the "spider" type. Complete, these carriages weigh about 960lbs., or some 8½ cwt. There is also a very handsome cab with a small seat at the back for the engineer. Motors, frames, bodies, upholstery, etc., all come from the company's own works, an excellent guarantee of their quality.

The disastrous fire at Monsieur Vinet's factory in the Rue Brunel has not prevented that constructor from making a capital little show at the Grand Palais. Built upon a tubular steel frame the Vinet *voiturette* at once attracts attention by reason of its low centre of gravity and by its system of transmission. Without perhaps presenting any entirely novel features, this latter is deserving of notice on account of its simplicity and the smoothness of its action. The motor being carried in front the propulsion force is conveyed by means of a leather belt to a pulley keyed on to a shaft placed at the back of the frame and upon which slide three gear wheels. A lever placed at the left hand of the driver, who is seated on the left hand side of the car, actuates these gear wheels, which engage with corresponding wheels carried upon the back axle, thus giving the speed desired. Placed before the driver is a foot pedal which operates upon a jockey pulley destined to release the driving belt from the tension which may be given to it by the application of a powerful lever also placed at the driver's left hand. By this arrangement the motor is thrown in and out of gear with remarkable smoothness, and the trouble of a stretching belt is entirely overcome. The motor employed is the 3½ or the 5 h.p. De Dion, and a radiator is carried in front of the engine casing. The water circulation is effected by a centrifugal pump driven by a special chain, and the two band brakes with which the car is provided

act in both directions. M. Vinet gives a wheel base to his *voiturette* of 1 mètre 45, and its width is 1 mètre 215—measurements which, with the low centre of gravity, render the upsetting of the car practically impossible. A reverse gear is also provided. The cars shown are a couple of *tonneaux*, a three-seated "spider" and a two-seated "Duc," in addition to which a wheelless chassis gives the curious an opportunity of studying the details of the mechanism. I may add that M. Vinet's present address is 61, Rue de Villiers, Neuilly-sur-Seine.

La Société des Automobiles Koch, 14, Rue du Bac d'Asnières, Clichy (Seine), show a very interesting car intended for the transport of carrier pigeons employed for military purposes.

FIG. 3.—THE KOCH MILITARY PIGEON TRANSPORT CAR.

This vehicle (Fig. 3) resembles a large cage on wheels, and with its slate-grey paint looks every bit an army car. A smart phaeton, with a wooden coupé-like covering over the rear seats, and a dog cart are the other vehicles shown.

Among the *voiturettes*, that constructed and exhibited by Monsieur de Coster, Rue Petit, Saint Denis, is of particular interest, as the arrangement adopted for the protection of the motor and vital organs of the car is very ingenious. The specimen shown is a two-seated car, propelled by a 5 h.p. water-cooled Aster motor. This engine is carried in front under the usual case, which, as well as the splash-board and the flooring of the car, can be removed in a few minutes. When this is done one finds that the underside of the frame is cased in, and that the motor and gear rest as though in the bottom of a boat. By this arrangement every vital organ can be as easily inspected and worked upon as though placed upon a bench. Attached to the outside of this under casing is the radiator. Three speeds and reverse are provided, and the transmission is direct. The steering is of the inclined-wheel type, the ignition is electric, and the car exhibited is provided with a handy basket attached to the platform at the back of the frame. The price is £172, and M. de Coster will shortly be able to supply *tonneau* cars fitted with 6 h.p. Aster motors. The disposition of the engine and gear in their case is an excellent idea, and should render the vehicle entirely free from all those troubles so common in small, slow *voiturettes*.

(To be continued.)

MR. MARK MAYHEW, L.C.C., is to open the discussion on the 1,200-mile Trial at the Automobile Club on Wednesday next.

THE Ariel Cycle Company, of Birmingham, are putting a new two-seated *voiturette* on the market. The car is fitted with an Ariel 3½ h.p. water-cooled motor. A change-speed gear, giving normal speeds of 8 and 22 miles per hour, is fitted; the intermediate speeds being, of course, obtained by varying the electric ignition. The car is 7ft. long by 4ft. in width, and weighs 4½ cwt.

FRENCH SHOW GOSSIP.

THE Salon has been organised in the main by the Automobile Club de France, although various other bodies have also assisted in the promotion of a show which includes over five hundred exhibitors, most of whom appropriate a large amount of space. The whole of the vast floor is utilised, and the same may be said of the gallery, while several of the halls that lead therefrom are also occupied with exhibits of one kind or another. Though termed an international exhibition, it is undoubtedly French, as the entire number of foreign entries could be counted on two hands.

THE painting of the bodies of the cars is a study in itself; bright tints seem to prevail, and very effective they are.

CONSIDERABLE interest is being shown in the steam travelling caravan "Quo Vadis," in which M. Turgan, of Messrs. Turgan, Foy and Co., recently made a tour through Tunis.

THE effect of the cut in prices by Messrs. Panhard and Levassor is the leading topic of conversation, price lists with revised quotations being already largely the order of the day.

ONE of the most interesting exhibits in the gallery is undoubtedly that of M. A. Deschamps, who displays his auto-incandescent ignition device. The arrangement has attracted considerable attention.

QUITE a number of new motor-bicycles have made their appearance at the exhibition.

ONE of the cars which is attracting considerable attention is that shown by M. De Coster. The motor and transmission gear are laid, as it were, in the bottom of a boat. The front seat and bonnet are readily detachable, giving access to all the working parts, the wooden bottom shielding them from mud and dirt.

AT closing time the centre of animation is transferred from the inside to the outside of the exhibition, the large number of motor-cars drawn up in line waiting for their owners and passengers being a most striking object lesson of the great practical strides automobilism has made in France.

ONE of the busy men at the exhibition is M. Tourand, the proprietor of the well-known *garage* at Havre, from which place he drove to Paris *en auto* in less than six hours.

THE exhibition has been well visited by English motorists and motor-car manufacturers and agents. To undertake to say who was at the show would be to practically compile a directory of the trade, but hardly a day has passed without several familiar faces being seen, while last week end there was an unusually large muster.

THE Koch Company are reported to have so improved their heavy oil motor as to be able to turn out a car which shall be absolutely odourless.

ASTER motors are now being made up to 4 h.p. capacity air-cooled, and 6½ h.p. water-cooled.

ONE result of our visit to the show is the elicitation of the fact that there are quite a number of French motor-car builders anxious to fix up agencies for their cars in this country.

ALTHOUGH the Show is one for motor-cars and cycles, the former not only completely overshadow the latter in point of size, but also in numbers. We see from the *Vélo* that while there are only 562 bicycles and tricycles, there are in the building no less than 637 automobiles, consisting of cars, vans, motor-tricycles, quads, and bicycles. And this without including the motors and the thousand and one automobile accessories.

A SIDE hall of the Salon is devoted to an exhibition of motor "ancient history." Prominent among the old cars is the original steam carriage of Cugnot, built in the eighteenth century. There are also the first motor-vehicles designed by Gottlieb Daimler, dating from 1885; the first types of Benz vehicles; the early Bollées and Dion-Boutons; the first electric car; a Draisienne (1797); and many other cycles of historic interest.

ONE of the first persons we saw at the exhibition was M.

Charron. He has no necessity to have an exhibit of his own, as all the time he is surrounded by clients and others. It is Charron's firm that has secured the order for a powerful car from Mr. Clarence Mackay, referred to in the *Journal* last week.

MEETING Mr. Farman, of Messrs. Farman and Co., of Paris he informed us that they are about to open a London *dépôt* at 100 to 104, Long Acre, W.C., where a large stock of cars, for which they hold the agency, will be kept on hand.

AMONG the many English visitors to the show last week were Mr. and Mrs. Kennard, of Market Harboro', who have, we hear, ordered a "chainless" car.

MR. JOHNSON, the secretary of the Automobile Club, was among those who visited Paris last week. His visit was, however, of the briefest. Reaching the capital about 11.30 a.m., a short spin in a 8-h.p. Panhard car was first indulged in. In the afternoon he spent some time at the A.C.F. headquarters, followed by an hour or so at the exhibition. At 7 p.m. the same evening Mr. Johnson was on his way back to London.

A VEHICLE which has come in for a large amount of inspection at the hands of visitors, is the bank or commissionaire's wagon, to be seen on the stand of the Decauville Company. It is like a sort of small omnibus, the inside being fitted with cash drawers, lockers, etc. An automobile with strong boxes is certainly an original idea.

MOST of the English visitors to the show have eagerly sought the stand of the Serpollet Company to inspect the car built to the order of King Edward the Seventh which has been stated right and left as being on view. They have, however, all been doomed to disappointment, for, as a matter of fact, the Royal car as yet only exists in the drawing office. It is, however, a fact that the Serpollet Company are building a car for His Majesty; it is hoped that the vehicle will be completed within the next three months, and it is possible that it will be on view at the Agricultural Hall in May next.

FASHIONABLE florists in New York are using expensively decorated automobiles to deliver their goods.

THE A.C.G.B.I. is still considering the acquisition of suitable premises for a *garage*.

THE Marquis of Hertford was present at the recent automobile demonstration at Warwick.

WHEN a man with a new automobile first meets his friends he holds his breath while they proceed to examine the interior workings of the vehicle and its mechanism.

THE Georges Richard 8 h.p. "Limousine" car illustrated on another page is known in this country as the "Prince," the agents being the Automobile Manufacturing Company, of Long Acre, W.C.

WHEN the motor comes into its own the sight of overloaded horses driven and urged on by a brutal or careless driver, straining every muscle and nerve to move their loads up stiff, hard gradients on a greasy surface, will be relegated to the past.

THE "York" car is the name given to a new light motor-car introduced here by the British and Colonial Motor-Car Company, Ltd. It can be fitted with a 5 h.p. De Dion or a 6 h.p. Aster motor at the option of the purchaser. Electric ignition is fitted, and three speeds forward and a reverse available.

A CYCLE and motor-car exhibition was opened at Liverpool on Tuesday. Among those exhibiting motor-cars are Mr. William Lea, of Birkenhead, who has a big display, including a number of Benz-type cars, a Progress voiturette, a Decauville voiturette, a De Dion tricycle, a Butler tricycle, and a Werner bicycle. The Liverpool Motor-Car and Motor-Cycle Company display a Perfecta quadricycle, a Marot-Gardon voiturette, and motor accessories and fittings. The Locomobile Company show their well-known light steam car; Mr. W. Johnson, Wavertree, a Dechamps and Victoria; Mr. Robert Crabtree, Birkenhead, a Star motor-car; Messrs. R. Hardie and Co., Liverpool, a Singer motor-bicycle, etc.

MOTOR-CAR RACE TRACK CONSTRUCTION.

THE recent motor-track races in the United States have demonstrated in a very conclusive manner that the ordinary race track, especially the short track of an oval form, is ill adapted to automobile racing. In the races at Guttenberg, for instance, the contestants had to slow down the speed of their vehicles when approaching the end of the track, and make the turn at a lessened rate, greatly reducing their average speed. The end curves of these tracks are of such a short radius, and the momentum of an automobile racer when going at its maximum is so great, that there is imminent danger of overturning, unless the speed be reduced at these places. One of the contestants in the Guttenberg races sought to balance the

racing car the driver may considerably vary the distribution of weight by leaning to one side, but this expedient is practically inapplicable to racing automobiles, as the operator has to keep at his levers, and, besides, a little displacement of the weight of the operator is of less importance here on account of the heavy weight of the motor-car. The tread of the automobile racer is usually the standard 4 ft. 8 ins. of the common vehicle, but in the case of some of the lighter machines it is even less. With the same supporting base as the racing car, less favourable distribution of weight, and a much higher speed, it is evident that the racing automobile requires a specially-constructed track to show to the best advantage. Such tracks must have a contour of at least one mile, be of a circular form, and be banked to counteract the influence of the centrifugal force. In laying out such tracks, with the proper slope of bank, a speed of from 60 to 75 miles an hour may be attained with reasonable safety.

THE NAPIER 9 H.P. DELIVERY VAN.

moment of the centrifugal force, by having his companion stand on the inner step, and holding himself on the seat by the handles of the dash, and leaning far out from the vehicle on the inner side, when the curve was being rounded. This proceeding, although effective, as far as the overturning tendency of the vehicle is concerned, does not prevent the wheels from slipping sideways, and is at best but an imperfect expedient, which will serve in the absence of something better.

It is well known that ordinary racing-cars give considerable trouble from side-skidding when provided with iron tires, but the greater adhesion of rubber overcomes this difficulty. But in automobile racing we have to figure with much higher speeds and greater weights than those encountered in horse racing, and the tendency to side-skidding is thereby so much increased that even the superior adhesion of rubber cannot prevent it.

Concerning the overturning tendency, it may be said, states the *Horseless Age*, that it is equally affected by increased speed. Other factors which influence this tendency are the distribution of the weight of the car, the height from the ground of the centre of gravity, and the tread of the vehicle. In a light horse-

THE NAPIER 9 H.P. DELIVERY VAN.

IN addition to pleasure cars the Motor Power Company, Ltd., are now devoting attention to the construction of delivery vans and public service cars, and the illustration given above depicts the first van they have turned out. The frame of the vehicle is of the standard type; it is fitted with a 9 h.p. Napier engine, and will carry loads up to 30 cwt. In view of the necessity of motor-carriages running thousands of miles without having to renew bearings, etc., special attention has been paid to the gears and bearings, they being of strong construction.

THE last run of the members of the Long Island Automobile Club, of Brooklyn, U.S.A., was seriously interfered with by the weather. Only five cars materialised, and the drivers of these did not care to proceed further than Jamaica, although the original terminus was Bayshore, over forty miles from Brooklyn.

THE ALLARD PETROLEUM-SPIRIT MOTOR.

OUR Midland representative had a short run on an Allard car last week, and was agreeably surprised at the advance in motor construction that this firm has made during the past eighteen months. The car in question is a light voiturette to seat two passengers and a driver. It is belt-driven, $4\frac{1}{2}$ h.p., has two speeds, electric ignition, improved spray carburettor, and a special form of water circulation, doing away with the pump. The car itself is of a very neat design, and has a long wheel base. Messrs. Allard and Co. have been experimenting with motors for a considerable time, and have overcome most of the difficulties that beset them, such as excessive noise,

THE ALLARD $4\frac{1}{2}$ H.P. WATER-COOLED MOTOR.

vibration, and smoke. These were quite unnoticeable in our representative's short spin, and to give some idea of the power of the motor, it may be mentioned that the car was able to get up a gradient of about one in eighteen on the top speed, with two passengers aboard.

THE first annual dinner of the Yorkshire Automobile Club, which was recently postponed, will be held on Thursday next at the Hotel Metropole, King Street, Leeds.

AT the New York motor-car show, one of the exhibitors sprung the word "automotourette" upon the public. The wonder is that the public did not spring upon him in return. That would have been a mild punishment indeed.

IN answer to an inquiry from the French Government, the Secretary of the United States Treasury has announced that horseless carriages, or automobiles, or parts thereof, imported into the United States, will be subject to duty at the rate of 45 per cent. *ad valorem*, "as articles or wares composed wholly or in part of metal, under paragraph one hundred and ninety-three of the Act of July 24, 1897."

CORRESPONDENCE.

MOTOR-CARS FOR MEDICAL MEN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have noticed for some time past in your columns letters under the above title.

I am a medical man practising in Norfolk and Suffolk. Up to three years ago I kept in the summer two horses and often during the winter three. Every year I had to part with one of them and buy another, losing a good deal of money over the transaction; in fact, I found the hay-motor a great worry and a very great expense. Not being a judge of horseflesh I was duped by dealers and grooms. I then resolved to go in for a motor. I was unlucky in my first choice, for, believing implicitly in advertisements and agents' statements, I invested in a car which in a few months cost me £40 in remedying defects, faulty workmanship, and adding necessary improvements. Then, for spring, summer, and autumn, I found that I had a very nice little carriage on which I could depend. At the same time, for winter use over stony, muddy country roads, it was absolutely useless; so after two seasons I sold it. In the meantime, I had purchased a Beeston trike $2\frac{1}{2}$ h.p.

Now I have been using a trike for the last two years, and can only come to the conclusion that, for a medical man, there is not a more expensive, more unreliable, more worrying means of locomotion than a motor-tricycle. I first of all did away with that constant source of annoyance or bad language the De Dion contact breaker; when the roads have been covered with mud I have dismounted times without number to clean the platinum points or readjust the trembler. I now use the Beeston contact breaker and never look at it from one year's end to another, it is perfect and never gives any trouble. Then I discarded dry cells—they are too short-lived, too unreliable and expensive. I now use what I consider the best accumulators in the market—I have tried several—Van Raden's glass woven. Finally I dispensed with the compression tap. I do not use any lever to raise the exhaust, for I cannot see why I should flood my combustion chamber with the heated products of combustion. In its place I have devised a valve very similar to the additional valve fitted at the back of the Benz Ideal cylinder. I have placed this where the ignition plug was fitted—to my mind a very unsuitable place, by far too hot for the plug—and have fitted mine at the head of cylinder, where the porcelain is more efficiently cooled and therefore less liable to crack. By means of a lever I depress the valve and so release the compression, then allow valve to work, and in my opinion I have increased the h.p. of my motor, in the same way that the h.p. of the Benz was improved. Besides that, by continually sucking in cold air it helps to keep the engine cool.

I am now the proud owner of a Wolseley voiturette. It is the ideal medical man's carriage, every detail having been well thought out. The engine is very powerful, easily get-at-able, and simple in construction.—Yours truly,

EBER CAUDWELL, M.R.C.S., L.R.C.P.

THE GENESIS OF THE MOTOR-CAR

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I venture one or two corrections respecting the interesting article in last week's issue? I will not attempt to dispute the honour of the unknown Augsburg genius, although, I believe, it has generally been understood that Cugnot was the first builder of a steam-propelled vehicle of any description, but according to Mr. Fletcher's exhaustive history, "Steam Locomotion on Common Roads," these facts appear conclusive. (1) Sir Isaac Newton does not seem to have actually built a carriage, it was only a suggestion. (2) Murdock was not only discouraged by Watt (who was much annoyed by his experiments), but was induced by him to abandon them. There is no positive evidence to prove that Watt knew anything of the carriage constructed by Murdock until after its completion, which was only a model, and is now in the Birmingham Art Gallery. (See page 32, etc., of the above work, also Smiles' "Men

of Invention and Industry," also Muirhead's "Life of Watt." Murdock had no doubt heard of his employers' proposed steam carriage scheme (which, by the way, seems never to have got outside the works), and doubtless thought he would do a little experimenting on his own account. (3) With all due respect, I absolutely deny that Sir Goldsworthy Gurney's efforts deserve the remark—"to whom more than any other the automobile is due." He was successful, I grant, but far less so than Hancock, who did wonders without the advantages of Sir Goldsworthy Gurney's position, influence, and capital (see Young and Holley's "Economy of Steam on Common Roads," published 1860, pages 190 and 193. Also Fletcher, page 97, etc.). (4) The accident to which reference is made did not occur to one of Gurney's carriages, but to one of Mr. Scott Russell's (see Young and Holley as before; also Mr. Fletcher, page 136; and likewise the *Mechanic's Magazine* of 1834). (5) It is a little severe on our English engineers to state "it was not until the early seventies that the automobile began to assume the form to which we are gradually becoming accustomed. What are we to say about Mr. Ricketts' clever little carriages built for the Marquis of Stafford and the Earl of Caithness, 1858, weight 30 cwt., with ability to carry four persons besides the driver at ten miles an hour? This compares fairly well, I think, with our present Panhard carriages. Again, what about Lough and Messenger's steam carriage, 1858, weight 8 cwt. only, and speed fifteen miles an hour, with six miles an hour up grades of one in twenty? I think our Continental friends cannot beat this at the above date.

I might multiply instances, but I forbear, and I must hope your generosity will pardon this rather lengthy letter, for which I trust you will forgive me for troubling you.

Yours faithfully,
PRECURSOR.

THE DE DION VOITURETTE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to the query of Mr. Augustus Kent, in your issue of last week, if your correspondent would care to send me his address, I should be only too pleased to give him all the help I can in connection with his voiturette. I have had a few through my hands, and I have never encountered any serious defects. I have found that the pumps give little trouble, and as regards the clutches not gripping properly this is probably only a matter of adjustment.

I am, however, prepared to admit that this adjustment would give an unmechanical man considerable trouble.

Yours truly,
TUBULOUS.

A SUBSTITUTE FOR PETROL.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am sorry not sooner to have seen the inquiry of your correspondent "W. W. H." in the issue of the 12th ult. There is no car except the Gobron-Brillié which will run indiscriminately on alcohol (pure or mixed with benzole) or petrol; all other cars require an alteration of the carburettor. The Gobron-Brillié engine works with a positive feed which replaces this litigious accessory.

Were it not for the heavy duty on alcohol there is no doubt this would soon prove a strong competitor to petrol, with the additional advantage of being a home product competing with a foreign import.—Yours truly,
W. T. PRETTY.

BURSTING OF IGNITION TUBES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with interest the letter from Mr. W. R. Youngs in your last issue, in which he mentions having driven a car 37,000 miles inside two years. I am afraid he is too modest in saying he is not a motor expert, as anyone who can use a car for this distance and never require a new platinum tube must have some very particular knowledge.

I would like to know how often he has had to replace the brasses in his bearings, the chains and the tires, as I have never

heard of anyone who has had such a tremendous road experience in such a short time. An answer on this point I am sure would be most interesting to many of your readers as it will to myself.

Yours faithfully,
J. HOWARD MACDONALD.

THE EXCELSIOR MOTOR-BICYCLE.

STILL another motor-bicycle to make its appearance on the market is the Excelsior, built by Messrs. Bayliss, Thomas, and Co., Ltd., of Coventry, and of which an illustration is given herewith. The machine is an ordinary standard pattern bicycle, but built of stronger gauge tubing. The weight, complete with motor, tank, battery, carburettor, etc., is under 70lbs. The power is furnished by a 1½ h.p. petrol motor, with electric ignition. Petrol sufficient for a 90-mile run can be carried, while the highest speed obtainable is 30 miles per hour. The motor, being fixed at a low point of the frame, and in a central position, is claimed to run very steadily. There is a minimum of vibration, as the motor runs in the same direction as that in which the bicycle is travelling. By simply detaching the driving belt, the

bicycle can be ridden independently of the motor. Further, it is only necessary to detach three clips to strip the cycle entirely and re-convert it into an ordinary safety.

THE death is announced of Baron Rogniat, a gentleman well known in French motoring circles.

A PHOTOGRAPHIC competition is being organised by the Automobile Club de Nice for the 10th April next.

To prevent racing the Long Island Automobile Club has announced that any competitor in its endurance run in March next who exceeds fifteen miles an hour will be disqualified.

THE postmaster of Worcester, Mass., U.S.A., is anxious to inaugurate a service of motor vehicles for mail collecting purposes. They would, he considers, permit of quicker delivery of all city mail matter.

ONE of the wreaths sent to Windsor on the occasion of the Queen's funeral was from the A. C. G. B. I. This took the form of a wheel with outstretched wings attached to the axle, and bore the inscription "A token of the profound grief of the members of the Automobile Club of Great Britain and Ireland."

ON the occasion of a fancy dress ball given at Delmonico's, in New York, the prize for the most original costume was given to a "flame-coloured automobile costume, lighted from head to foot with electric lights, a brilliant searchlight crowning the head of the fair wearer." Just how this description covers an "automobile costume" we have been unable to discover.

THE KRIEGER ELECTRICAL VEHICLES.

WE are this week able to illustrate two of the many types of electrical vehicles built by the Compagnie Parisienne des Voitures Electriques, of 45, Boulevard Hausmann, Paris, who control the rights in the Krieger system. The illustrations (Figs. 3 and 4), show respectively a four-seated brougham and a four-seated victoria. As is already fairly well known, the principal feature of the Krieger cars is the employment of two electric motors connected by spur gearing one to each of the front road wheels, which are thus used both for driving and steering. The motors are suspended by springs from the fore-carriage in such a way that no jerking is felt on starting. The motors, which are interchangeable and readily detachable, are entirely enclosed, so that no dust or dirt can get into the working parts. The battery of accumulators is divided into two groups. Its weight is about 11½ cwt. and its capacity, on one charge, fifty-six miles at an average speed of 11½ miles per hour. The controller, which is mounted on the steering standard, is adapted to take eleven different positions, viz.: stop, start, five speeds forward, reverse motion, electrical brake, and battery recuperation (two). All parts of the controller switch can be readily inspected and cleaned, it being enclosed in a detachable cylindrical envelope. In addition to the electrical brake, band brakes on the rear wheel hubs are provided. The frame of the vehicles is built

FIGS. 1 AND 2.—ELEVATION AND PLAN OF FORE-CARRIAGE.

up of wood and steel and is spring suspended on the axles. The wooden road wheels are fitted with pneumatic or solid rubber tires as desired. The two cars illustrated weigh complete between 28 and 29 cwt., and can attain a maximum speed of 15½ miles per hour.

AN automobile school for ladies is to be opened at Chicago, Ill.

THE Berkshire County Council has given its support to the movement for numbering motor-cars.

MR. ALFRED HARMSWORTH, who, as already chronicled in these columns, is in the United States, has added a Locomobile to his automobile stud. It is one of the No. 05 style.

THE English Motor Club's run to Farnham takes place to-day (Saturday, the 9th inst.). The start will take place at 1.30 p.m. from the Westminster Bridge end of the Embankment.

IN the coming races at Nice one of the 40 h.p. Daimler cars will be fitted with special anti-skidding tires known as the Chameroir, of which we shall have more to say in a later issue.

A COMPANY has been formed in Italy to organise motor-omnibus services between Pavie-Albaredo-Broni-Stradella-Sainte-Marie-della-Verna, fifty-five miles; between Rivanaz-zano-Godiasco-Bagnaria-Varzi, twenty miles; and between Pavie-Motta-Belgioioso-Torre-de-Negri-S. Zenone-Pieve-Porto-Morone, twenty-five miles. The cars for the service are said to have been ordered in France.

FALLING in line with the picture postcard craze on the Continent, *Le Vélo* has lately issued a collection of postcards illustrating notable cyclists and *chauffeurs*. The automobile series, a set of which has been sent us, including such well-known motorists as Baras, Béconnais, Charron, Girardot, Gilles Hourgières, René de Knyff, Marcellin, Osmont, Teste, and Velghe.

MOTOR-CAR CONSTRUCTION AND CONSTRUCTORS.

AUTOMOBILE construction is the latest development in mechanical engineering. It is also the most important development that has taken place for many years, for it demands great skill on the part of the constructor, and its consequences are obviously of the most far-reaching character. When the great revival in the subject of transportation upon common roads commenced a few years ago many people held the view that the construction of a motor-car was a simple matter, and that to make a steam wagon all that was necessary was to take a boiler and engine, put them on road wheels, transmit the power, and there you are. Some that held this view attempted to put it into practice, with the result, after spending their thought, and their money—or some one else's—that their views had to undergo a violent change, and they were forced to admit to themselves that there was “a good deal more in it” than they had imagined.

Some were, by force of circumstances, unable to proceed further, but others were able to utilise their experiences for fresh trials, and the acquisition of further knowledge, that will advance step by step—slowly, yet surely—to ultimate practical and commercial success. There are many courses open to the engineer who starts with an accurate and extensive knowledge, not only of pure physical science, but also with an up-to-date familiarity with methods of mechanical construction; and to one who is not so equipped at the start, the way is likely to be rough indeed, and many expensive and bitter lessons will have to be learned, which might have been either avoided or assimilated in a nicer way by a more liberal preliminary training and mental equipment.

“I say there are many courses open,” remarks Mr. Thomas Clarkson, M.E., in the *Horseless Age*. “First, he may decide whether to go in for steam, petrol, or electricity, and it is to be hoped that he is not tempted to try other possible fields, unless his financial resources are practically unlimited. Each of the three general classes of motor-cars may be subdivided further. Thus the steam class may be turned into burner, boiler, and engine construction, as well as transmission gears; the burner being put first, as it has proved to be the most difficult and refractory to deal with satisfactorily. In petrol vehicles the engineering is mainly confined to the internal combustion engine, the carburettor, and the transmission gear. In electric vehicles there are but two features, namely, the motor and the battery, that specially call for engineering skill upon this class of carriage. Besides the above specific divisions, there are the general features of wheel and tire construction; framing, steering, braking, suspension, distribution of load, and the object, or purpose, for which a particular vehicle is intended to be used. All of the above considerations are practically independent of the work of the coach builder—whose art is properly to be expended in suitably encasing, or clothing, the vital organs of propulsion with a pleasant exterior that, other things being equal, will considerably assist to sell the vehicles.

It will be wise for the automobile engineer who is limited in his financial or technical resources to take some type of motor that is made, as a standard, expend himself in applying it to a vehicle in the best way, without concerning himself or assuming direct responsibility for the working of the motor, but giving his special attention to the style of vehicle, in relation to its intended use, and in arranging the position of the vitals in the most suitable and convenient manner. There are many small details about a car in which considerable improvement can be made, and it is generally better to concentrate upon these than to deal with the more serious and important matters of vital construction, which had better be left to those best qualified by experience and cash to deal with.

Before the new industry can settle down to regular successful work, it is necessary to arrive at something like a fixity of type of each important part of construction. At the present time there is no fixed type of steam boiler for heavy motor-wagons. It is yet too soon. Some makers use the ordinary vertical fire-

tube construction. Others are trying boilers of the water-tube type in several varieties, and others, again, have adopted, or are experimenting with, the flash type of generator. It is reasonable to suppose that there must be some best type of boiler for this special purpose, but the experience gained so far is insufficient to determine which, if any, of those at present in use is to be the fittest survival. It is remarkable how generally similar in type are railway locomotive boilers all over the world. It is scarcely to be expected that the same degree of uniformity will ever be obtained in the case of road locomotives, for the reason that there will be such varieties in the classes and types of vehicles. Still some degree of uniformity will doubtless be obtained in each of the several classes.

There is but one rule as to the quality of everything pertaining to the generation, the transmission, and the utilisation of power upon a motor-car, namely, that only the best is good enough. There is nothing that can be devised by the mechanician, or supplied by the metallurgist, that is too good for the purpose. As greater knowledge and experience is obtained in the proper-

tensile strain of the toughest steel wire. This is clearly pre-eminently suitable for the construction of the flying machine in which it is used, and one of the constant endeavours of the automobile constructor must be to improve the suitability of the materials used for each part, by a careful testing of every new material that is produced.

The constructor has many difficulties to overcome before one ideal carriage can be supplied to the public at an accessible price, and in addition to the technical difficulties, which are in themselves quite sufficient, it is to be feared that he is not infrequently loaded with other difficulties that tend considerably to reduce his efficiency as a developing and inventing machine. One of the chief non-technical difficulties relates to the question of finance. When the worker is fortunate in having ample financial support from others, he must continually bear in mind that he is not on a philanthropic expedition into the domains of pure science, but that he is expected to lead them to the wealthy spots and to peg out—by patents—as much of it as possible. He will so often find that others have been over the same territory

FIG. 3.—THE KRIEGER ELECTRICAL BROUGHAM. (See opposite page.)

ties and treatment of the various alloys of steel, the automobile constructor may expect to be supplied with a more suitable material for many important parts, giving greater tenacity and hardness where needed, with reduced weight and reduced liability to fracture. We may not hope that these materials of construction will ever bear even a slight comparison to the pre-eminent suitability of the materials designed and used in the construction of organic mechanisms, but these teach us that there is for each case and condition some specially suitable material, and it is an interesting fact that most, if not all, of the natural organic materials have been demonstrated to be much superior in strength and lightness to anything produced by the metallurgist, who supplies all (except the wood, leather, and rubber) that enters into automobile construction. A careful investigation of this point was made nearly twenty years ago by Prof. Osborne Reynolds. His results were startling, for it was conclusively demonstrated that a piece of quill taken from a feather will bear, in proportion to its weight, seven times the

before, and have staked out good areas, and all this penetration and judgment is needed to perceive a good thing that may have been overlooked by many others. Exploring a new country must always be expensive, and much time and labour are necessary to find out its best parts, so that patience and plenty of it is a great help in the backers. Unfortunately one of the common failings of the capitalist is impatience, and if the results he wants are not realised in what he considers a reasonable time, he is likely to prove disagreeable. Great tact and judgment are, therefore, necessary in dealing with this difficulty, and the pioneer will be careful not to put an undue strain upon a weak member.

If a man is concentrating all his faculties upon a diligent search for profitable improvements, it is manifestly to the advantage of all concerned that his backers see to it that he is protected against the attacks of hostile parties, whose ignorance, jealousy, and unprogressiveness would otherwise impede or even stop his work altogether. It would seem to be an elementary proposition

that the employer of an expert should seek to get the most out of him, and that one of the best ways to this end is to see to it that the conditions under which his work has to be done are made and kept as comfortable as circumstances will permit—for otherwise his efficiency as an inventive machine is liable to be greatly impaired. That this elementary principle is not universally recognised is only too true, and employers become angry and impatient at what seems to them unaccountable and unreasonable delay.

In every case the experimental and new work should be kept separate and distinct from the commercial. This is an old truth, yet it seems to need continual repetition, for the mistake is still often made, and always with the same results of lost money, time, and temper. As already pointed out, there is plenty of work for the improve, and will continue to be for years. It must not be expected that a car built to fully comply with any specification will leave nothing more to be desired, for as soon as a vehicle is finished and tested, its designer can at once see possible improvements, and it will often be the wisest

HERE AND THERE.

—88—
ACCORDING to the *New Liberal Review*, "the automobile is the vehicle of the future; it will rival the railway locomotive in usefulness."

MR. ROGER FULLER has, we hear, just received delivery of his 16 h.p. Napier car, which is now in the carriage builder's hands.

WE believe that the executive council of the County Councils' Association will consider the recent letter of the Automobile Club at their next meeting.

AT the Manchester Assizes this week it was intimated that in the case of Foster and another v. The Daimler Motor Company, Limited, the record had been withdrawn upon terms.

THE more the motor vehicle industry is examined in its various aspects, the more its future impresses observers as certain to grow to good proportions.

FIG. 4.—THE KRIEGER ELECTRICAL VICTORIA. (See page 830.)

policy to make another entire and even a third, before placing it on the market. This needs grit on the part of the backer, and if he has not got it, he is not fit for the business.

THE seeker after the perfect vehicle may not succeed, but his failure is never due to lack of application

MR. W. R. McTAGGART, 102, Grafton Street, Dublin, has been appointed agent in Ireland for the sale of the "Argyll" voiturette.

MR. W. O. SPILLER, of Bassett, near Southampton, has a repair shop practically on the London road, and gives personal attention to automobile repairs.

THE Long Island farmers are so terrorised by the flying visits of the "White Ghost" car of Mr. W. K. Vanderbilt, jun., that they are reported to be petitioning the Legislature to pass a bill giving the county supervisors power to limit the speed of motor-cars on all roads within their jurisdiction.

AT the forthcoming motor-car show in Chicago, it is intended, if sufficient space can be found available, to inaugurate a series of lectures on motor-car topics, and to secure the best talent available for the purpose.

AT a meeting of the Sanitary Institute at the Parkes Museum, Margaret Street, W., on Wednesday next, Mr. Thomas Blashill, F.R.I.B.A., will open a discussion on the state of our streets. Sir Alexander R. Binnie, M.I.C.E., will take the chair, and tickets for the admission of visitors may be had on application.

IN connection with the Liverpool Cycle and Motor Exhibition a motor-car trial took place on Wednesday, eight or ten motor-cars leaving St. George's Hall during the afternoon for a trial spin as far as Ormskirk and back. Under the conditions this is a fairly thorough trial, for the roads, once the granite setts of Liverpool were left behind, were very heavy with snow and slush. Each car was accompanied by an observer.

THE CORRE VOITURETTE.

ALTHOUGH in this country the term *voiturette* is held to mean a light car capable of seating two, or at most three, persons, the popularity of the "tonneau" type of carriage body in motoring circles in France at the present time is leading motor builders in that country to fit "tonneau" bodies to *voiturette* frames. The accompanying illustration (Fig. 1) shows a vehicle of this kind lately put on the market by L'Agence Industrielle d'Automobiles of Levallois-Perret, near Paris. In general arrangement the car is practically identical with the well-known Renault vehicles. It is propelled by a De Dion water-cooled single vertical cylinder engine of 3 h.p. The engine is suspended under a bonnet in the fore part of a tubular frame. The circulation of the cooling water is maintained without the use of a pump, the water tank being located directly above the motor, a radiating coil being contrived around the outside of the bonnet.

Three speeds ranging up to 34 kilometres per hour are provided, the motor driving through a friction clutch, a short shaft carrying the change speed pinions, any one of which can be made to mesh with corresponding spur wheels on a long parallel shaft. The latter, which is provided with universal joints, transmits the power direct to the rear live axle, through bevel gearing. Steering is controlled by a hand wheel or bar as desired, while the cycle-type wheels are shod with Michelin pneumatic tires. Ample brake power is provided; the pedal controlling the friction clutch is also connected up to a band brake on the transmission shaft, while a hand lever at the side actuates band brakes working on drums attached to the hubs of each of the rear wheels. As will be seen, the little car has an attractive appearance, and should meet with a large demand. M. Corre, the director of the company, informs us that they are also making a similar vehicle, the body of which is made in the form of a small delivery van for light parcels, the chest taking the place of the rear seats. A vehicle of the latter type took part in the recent *poids légers* competition in Paris.

A COMPANY has just been registered in Jersey City, U.S.A., with a capital of £50,000, to be known as the Forest Automobile Company.

A SEVERE test of petrol cars was made by the Electric Vehicle Company of Hartford, Conn., U.S.A., last month under the direction of Mr. Hiram Maxim, the company's chief engineer. The plan for testing the capabilities of the vehicles, which took place between Hartford and Springfield, was managed in a novel manner. Ten trips to Springfield and back were made without stopping the motor once. There was about three inches of snow on the ground, and the temperature varied from twelve degrees above to two degrees below zero. The start was made at half-past six o'clock in the morning, and the finish was at eleven o'clock at night. The fastest time was made by Mr. Maxim on his second trip, when he covered the distance from the company's works to Springfield in one hour and ten minutes, a distance of twenty-one miles. The last three trips, a total of one hundred and sixty-two miles, were made at the rate of twenty miles an hour. The only serious accident was the cutting of a tire by the sharp ice, but the engine was kept running while the tire was being replaced.

LESSONS OF THE RACING CAR.

WITH the growing frequency of automobile speed contests the question arises whether their sole object is to afford excitement to the public, or whether they may not also further the cause of practical automobile manufacture, by uncovering deficiencies in existing types and bringing to the fore those types which have attained nearest to perfection. The latter has always been claimed to be the object of the road races in France, and when several months ago a number of the departmental authorities enacted rules forbidding road racing in the territory under their jurisdiction, the alarm was at once sounded in the Parisian technical press that this legislation would be the death-knell of French supremacy in the manufacture of motor-cars. It was contended that road races had been the means of bringing the motor-car to the point of perfection it has now reached, and that to further improve such vehicles road races are absolutely necessary.

If speed is the only object aimed at regardless of safety, and if superiority in speed necessarily signifies superiority in a general sense, then we must admit, remarks the *Horseless Age*, that the contentions of the French *chasseurs* are well founded; for without the many and well-patronised road races held in France during recent years, it would hardly have been possible to develop machines capable of making a mean of 50 miles an hour in a continuous run of several hundred miles. It must be admitted,

therefore, that the present advanced state of the French racing automobile is the result of these contests. But the racing machine itself can hardly be expected to give rise to an extensive industry, and the value of racers in furthering the construction of motor-vehicles can only be proved if it is shown that conclusions may be drawn from these races which may be applied in the design of vehicles for every-day use. The great differences in the requirements of racing vehicles and vehicles for ordinary use make it extremely difficult, if

THE CORRE VOITURETTE WITH TONNEAU BODY.

not impossible, to apply the results obtained in the operation of the one to the perfecting of the other. The only requirement demanded of racing machines is speed, and some degree of safety for the operator. Cost and maintenance appear to be of no weight, if one can judge by the fabulous prices that have been paid for some of the winning machines of French contests. Comfort is a consideration that can be dispensed with for a few hours—especially if it is a barrier in the road to glory.

While there are thus fundamental differences between racing and ordinary vehicles, it cannot be denied that in some respects the problems encountered in the construction of these two types are similar, being simply more difficult in the one case than in the other. As an example, we mention stability. Motor-cars, on account of their reduced length, as compared with a horse and horse vehicle, are capable of being turned at a high rate of speed. Now, unless the car has a low centre of gravity, and a liberal tread and wheel base, accidents are liable to result if the operator inadvertently tries to make a sharp turn when going at a high speed. Such false manoeuvres are sometimes made with a view of avoiding obstacles in the road, while in other instances they are entirely due to absent-mindedness. The centrifugal force acting on a vehicle in turning a curve tends to slide the rear wheels, and to overturn it. This force increases with the square of the speed, and its action is, therefore, of very

much greater consequence in racing machines, particularly track racers, than in vehicles which only run at moderate speeds. It is for this reason that all the most successful types of racing machines have a low centre of gravity, although equipped with immense motors, transmission gears, and storage tanks. The means employed by the designers in order to bring down the centre of gravity might, therefore, be studied with advantage by builders of ordinary automobiles, who desire to make their vehicles low and stable.

MOTOR-BICYCLES.

At the Society of Arts, on Wednesday, Mr. Joseph Pennell read a paper on "Some Experiences of Motor-Bicycles." Naturally much of the paper was familiar to those who recently heard Mr. Pennell on the same subject at the Automobile Club. The following summary, however, will be of general interest.

The motor industry is in exactly the same condition that the cycle trade was thirty years ago—it is all experimental—all in the future; and though the manufacturer of cycles was hampered by the expert, the journalist, and the racing man, the maker of motors is hampered by these and a legion more—the electrician, the county councillor, the engineer, the company promoter, the carriage builder—the question of cash, the question of caste, and the question of speed. The beauty of the cycle is its simplicity, compactness, lightness, cheapness. The terror of the motor is its complication, bulk, weight, expense. After the worst smash we can put the bicycle on our shoulder and trudge off with the remains—we must take a skilled engineer along on a motor-car to repair the slightest damage, or guard the wreck while we hunt up a team to drag it away, if anything serious happens. To fall off a bicycle is a fine art, to fall out of a motor-car is ignominious unless fatal. But if one could have a motor-bicycle that would be another thing—a machine, light as an ordinary safety, yet swift as the fastest train, a machine to take one up hills without work, and against the wind with delight, and bring one to the end of a long day's ride refreshed, that would be the ideal motor, the one I am looking for, and sometimes think I have nearly found, but between perfection and the present state there is a great gulf fixed. Once you have learned the cycle—though few do really learn to ride it—all is easy, but the most expert are never sure of the simplest motor, and until the motor-bicycle is far more simple than at present, the safety will still drag on. I have no intention of giving a history of the invention of motor-bicycles. I will only say that of Daimler, 1885, according to Mr. Beaumont, is generally called the first, though numerous steam bicycles and other self-propelled machines were spasmodically made at various times before. Probably there will be the same confusion as in the case of the safety, and certainly the Starley of motor-cycles has not yet "set the fashion to the world." The Daimler was in theory rather like some modern machines, but whether this or any of the others he refers to will run, Mr. Beaumont in his monumental treatise on Motor-Vehicles and Motors never explains. Pages are given to theory and construction, but only one line to results. The next is Wolfmüller's, 1895, then De Dion put his motor on a bicycle frame without pedals, and seemed overcome at what he had done, and ceased to do so. Messrs. Shaw and Son, and Baines have taken up this idea, and I learn from one expert that he has actually ridden the former a few miles. The Werner is built like the common safety, though somewhat longer in the wheel base, with a greatly strengthened frame. But it has an iron bracket over the front wheel, to which is bolted firmly a little engine of the well-known De Dion type, nominally $1\frac{1}{2}$ horse-power, but I wish it and all others could be tested. On almost all forms of motor-cycles, except the Werner and the Century Tandem, the engine is either underneath or behind the driver. Save the Werner and Lemaudiere, I have never seen any motor-cycles on the road, and save the Werner, I have never heard of one that has been ridden 100 miles straight away, and until I have done at least that distance, or heard of some one else who has, I prefer to say nothing about any machine from the practical standpoint.

After describing his first trip on a motor-bicycle Mr. Pennell went on:—I live in a flat. Although a motor-bicycle and three ordinary machines of my own, and frequently as many more belonging to people living in the same house, are stored in a single room, it would be impossible to get the most compact form of motor-tricycle into that room. Therefore a stable must be hired, or stabling, somewhere outside. This alone, with its attendant expense, will prevent vast numbers of people from taking up any form of motor except the bicycle. Then I found that, if I did not wish to ride the bicycle to my own door, I might either put it on a cab, wheel it by hand, or pedal it like an ordinary machine, while I could take it in the train at the same rate as the safety. And scarcely any of these things could I do with any other form of motor. This machine has broken down. Instead of hiring a horse, as I had been obliged to with my quadricycle, to get it to the nearest station, I threw the motor completely out of gear, and on one occasion pedalled the bicycle without hard work for twenty-five miles. To the critic these may seem merely the advantages of disadvantages and no proof that the motor-bicycle is worth anything. But they had considerable weight with me, for I am not a practical engineer. I see no fun in sitting by the roadside tinkering at a repair for hours. I should never think of mending even a puncture if I could get somebody

else to do it for me, and a puncture is almost the smallest evil that can happen to a motor. And I did want a motor that I could keep at home in the busiest part of London. So I went over to Paris and bought a Werner bicycle, and I made up my mind to give two weeks at least of my time to it, and if possible to make a long tour on it.

On the machine Mr. Pennell made his venturesome ride over the Alps, and his suggestions or reflections after that event were perhaps one of the most useful sections of the paper:—A large number of minor improvements should, and probably will, be made in the very near future. The tires should be thicker to prevent punctures, and should have some sort of non-slipping bands or corrugations on them. The bottom bracket is neither high enough from the ground to keep the pedals from hitting stones, nor are the bearings strong enough to stand the enormous strain of starting. The mudguards are not large enough. Otherwise the bicycle part of the machine seems good and reliable, mine having stood the severe test of miles of bad stone paving, rough roads, loose surface, and deep mud, and only requiring adjustment in the head and bearings. There should be a larger reservoir for petrol, and a better means of lubricating the motor. There should also be some sort of a chimney and float in the carburettor, as in the De Dion, or else an automatic or float-feed carburettor. The present one is ingenious, but you cannot tell whether it is full or empty, especially on a bad road, except by the running of the machine. Another matter requires instant attention: the driver should be able to set the motor in motion before starting the machine. With such a device one could start up on any hill. The machine will not be entirely satisfactory until this is done. The machine is a good luggage carriage, as I took on both tours two tool bags, a spare battery, at times half a gallon of petrol and a quart of lubricating oil, a leather suit, a large bag containing a complete change, and sketching traps—weighing in all about 30 lb. I do not think the machine runs much faster without the luggage than with it.

BRITISH MOTOR TRACTION COMPANY v. THE LONDON AUTOCAR COMPANY.

IN the Chancery Division of the High Court of Justice on Friday last week, Mr. Justice Farwell made an order, the defendants not opposing, restraining the defendants from infringing the patent of the plaintiff company during the continuance of the patent. His Lordship also ordered an enquiry as to the damage sustained by the plaintiffs, and for the delivery up of all the infringing articles.

MR. E. W. MARRIOTT, of Hereford and Leominster, stocks petrol at both his depôts.

THE annual general meeting of the Automobile Club will be held on the 28th inst. The total membership is now 710.

AT a meeting of the Mid-European Motor-Car Club, to be held in Berlin on the 11th inst., Herr R. Conrad will read a paper on "Electrical Motor-Cars."

WE hear that Mr. T. Guy Lewin is contemplating a record run from Land's End to John o' Groat's on a Motor Manufacturing Company's Miniature Panhard car.

AT a meeting of German motor-vehicle manufacturers held at Eisenach, the formation of an association to defend their interests was decided upon. The Society will be known as the Verband Deutscher Motorfahrzeug Industrieller. Herr Fischer, of the German Daimler Company, was elected first president.

THANKS to the efforts of the Municipal Art Association to stop the clanging of gongs on public vehicles in the streets of Chicago, the first move in that direction has been made by the owner of a number of motor cabs, on which the clanging gong hitherto used will be supplanted by a set of musical chimes.

SHOULD sufficient motor-vehicles be promised, a demonstration for the benefit of Essex County Councillors will be held on the 19th at Chelmsford. Should this take place, the High Sheriff of the county and General Sir William Gatacre, K.C.B., who are patrons of Mr. Shrapnell Smith's lecture, will probably be among the observers.

IN view of the many motor-bicycles lately put on the market, an American writer remarks that it is plain that the disposal of the motor is the chief problem awaiting a solution at the hands of motor bicycle designers and makers. While motor-tricycles and quads present a nearly uniform appearance, owing, of course, to the greater facilities offered for the disposal of the engine, carburettor, etc., as well as to these machines having passed the experimental stage, the bicycles differ widely. The frame is, of course, utilised by nearly every maker for the purpose of disposing of as much of the motor as possible, but the arrangement is rarely the same in any two machines.

THE Motor-Car Journal.

Vol. II.]

LONDON, SATURDAY, FEBRUARY 16, 1901.

[No. 102.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE usual monthly dinner of the Automobile Club was held on Wednesday evening last, and there was a large attendance of members and the trade. The great dining hall proving too small, an overflow party, under the chairmanship of Mr. Staplee Firth, being formed in another room. Mr. Roger Wallace, K.C., presided, and was supported by Lord Kingsburgh, Mr. Mark Mayhew, L.C.C., and others. After dinner an adjournment was made to the club room, which was crowded to its utmost capacity. The reason for such an abnormal attendance was the knowledge that Mr. Mayhew would read a paper on the "Difficulties in connection with the proposed 1,200 miles." For some time rumours had been rife in the automobile world that there was a probability of the trials falling through, the reasons adduced being the County Councils' agitation, and the determination of the Club to in no way countenance illegal speeds on the road. Hence the interest shown.

Five Minute Speeches.

THE chairman at the outset stated that, as the time at their disposal was short, the speeches would be limited to a duration of five minutes each. The first speaker was the Lord Justice Clerk, and the keynote of the evening was struck, amidst applause, by the statement that the 1,000-Miles Trial had been so successful that there was no need for a second, and he thought that by a hearty support of the "Glasgow week" manufacturers would obtain all the publicity and demonstrations desired. He suggested that the meeting-place for the cars should be Glasgow, the various visitors reaching that city from whichever direction they liked. Other speakers followed, more or less in the same strain, Mr. Gretton suggesting both the Irish tour and the week in Glasgow, the cars being driven to Bristol, then conveyed by sea to Waterford, a short tour—say 600 miles—in Ireland, then re-crossing to Stanraer. Mr. Meeredy made a most eloquent appeal in favour of the sister isle, instancing as an example of its bewitching beauty the fact of an English visitor to a seaside resort, intending to stay for a few days, remaining there for many years.

The Consensus of Opinion.

THE discussion was of a high order and the "five minute rule" induced speakers to condense their remarks. No voting was taken as the subject is one for the Club Committee, and the object of the meeting was for the purpose of gauging the opinion of the trade generally. We should imagine ourselves there is no doubt that there will be unanimous support in favour of the Glasgow week, and we shall look forward to very important results following the trials in the Scottish City. Regarding Ireland, we imagine, from the feelings expressed, that a tour will be arranged in that country, possibly, but informally, in connection with the Northern trials. The 600 miles route mapped out by Mr. Meeredy is through the

prettiest scenery in Ireland, and such a tour, we are convinced, would be one of the most popular ever arranged by the Automobile Club.

Petroleum Spirit Wagons for Heavy Haulage.

DURING the past few days a heavy petroleum-spirit van has been seen wending its way in the traffic of London. Inquiries have elicited the fact that it is one of the latest productions of the Daimler Motor Car Company, Limited. It is driven by a 22 h.p. four-cylinder motor, and is capable of carrying two tons and a-half. The weight of the van with heavy wooden hood complete is two tons. No chains are used, the transmission being by toothed gearing throughout, giving four speeds of two, six, eight, and ten miles per hour. The other day the vehicle was experimentally tried for the transport of a load, weighing 2½ tons, of barrels of beer from a brewery in East Smithfield, E.C., to Bromley in Kent. With horse-traction this work forms employment for four horses and three men for a day of nine hours. It was not till late in the afternoon that the motor-vehicle turned up to carry through the experiment, and notwithstanding the great load the journey to Bromley was made in 1 hour 7 min., and this despite the heavy traffic met with until the suburbs were reached. The car was immediately unloaded and re-loaded with empties, the return journey being made in 1 hour 15 min. We are not surprised to hear that all interested in the experiment were more than satisfied with the result.

A Big Loss.

It was only the other week that M. Meyer, of Enghien, a well-known French *chauffeur*, gave a dinner to a small circle of friends as a kind of christening ceremony to the new 50 h.p. car which he has had built in order to take part in the race meeting at Pau, and which he named the "Capricieuse." On Tuesday of last week M. Meyer left Paris with his car for Pau. Near Poitiers the unpleasant discovery was made that the back part of the car was on fire. Naturally steps were immediately taken to put out the conflagration, but the fire had got too strong a hold, and the vehicle was entirely destroyed. M. Meyer's loss is not confined to the car, which cost, it is said, £2,800, but in one of the receptacles in the vehicle were £80 in banknotes, which were also destroyed, as was also a large quantity of clothing and personal effects. The remains of the car have since been despatched to Paris by rail. Unfortunately, we have not yet been able to glean any reliable information as to the cause of the fire.

To Manufacturers.

THE Committee of the Automobile Club request us to state for the information of manufacturers and sellers of motor vehicles that, if they have not already signed the memorial which is to be forwarded to the Local Government Board and the County Councils throughout England and Wales, they should do so at once, as it is proposed to deal with this memorial with-

out delay. Copies of the memorial can be obtained on application to the Secretary, 4, Whitehall Court, London, S.W. It is very desirable that this memorial should be presented at an early date; hence the urgency of the matter.

Motor Watering Cart for Kensington.

A FORTNIGHT ago we reported upon the offer of the Thornycroft Steam Carriage Company to supply a steam-propelled street cleaning and watering machine to the Kensington Borough Council for £725. The matter has now been considered by the Council, who have decided by a large majority to order the machine specified on the condition that the company work the machine in the borough for a month, free of cost to the Council, and to their satisfaction before purchase; and that the company enter into a contract to keep the machine in repair for a period of ten years for the sum of £72 per annum, that sum being 10 per cent. of the initial cost of the machine. In the course of the discussion, the Surveyor said that in the Strand district, where a similar machine was at work, a saving of £174 was anticipated on the year's working. Alderman Frye and Major Isaacs told of the excellent work being done in the Strand and Chelsea districts, and Alderman Robinson said that the Holborn Council were also purchasing one. Alderman Campbell, L.C.C., was the only member of the Council who spoke against the purchase of the vehicle.

The Ignition Trouble.

MR. CHARLES E. DURYEA, of Reading, Pa., writing on the subject of the ignition of the explosive charge in petroleum-spirit motors, remarks that faulty connections were formerly a large part of our trouble, but this "we have largely wiped out by dropping batteries entirely, which does away with the need of switches and binding screws. We now use a mechanical generator with one brush grounded, a flexible terminal spark coil with one terminal attached to the other generator brush and the other terminal to the sparking plug. The sparking plugs are all connected by single bare wire. Connections are made with the plugs by spring fastenings, which never rattle loose, but rattle enough to keep themselves polished and bright. This arrangement secures a certainty of ignition such as we never attained with batteries or with the combination system. It has absolutely nothing to worry about, for it stops when the motor stops and starts likewise. The flexible terminals are much safer than binding screws, although they do occasionally vibrate and break, while the bare connecting wire can be readily seen, and if it breaks is not held in place in a most disagreeable and deceptive manner by the insulation. Any sparking plug can be instantly detached from the spring connection and tested for leakage. This arrangement makes by far the most satisfactory sparking device we have yet tried."

Demonstrations for County Councillors.

THE Automobile Club's educational campaign in the Eastern Counties is now in progress. On Friday, the 15th inst., demonstrations were to be held at the Royal Hotel, Lowestoft, from 9 a.m. to 1 p.m., and at the Market Square, Beccles, from 2.30 p.m. to 4 p.m.; to-day (Saturday), the 16th, at the Great White Horse Hotel, Ipswich, from 2 p.m. to 4 p.m.; and on Monday next at the same place from 9 a.m. to 1 p.m., and from 2 p.m. to 4 p.m. The Roads Committee of the Essex County Council are similarly invited to attend a demonstration of motor-vehicles, which is to be given for their benefit, and for the education of other members of the Essex County Council, at Chelmsford, on Tuesday, the 19th inst., at the Saracen's Head Hotel, from 3 p.m. The committee of the Automobile Club are of opinion that it is impossible that any unprejudiced person who has been driven on a motor-vehicle can recommend the reduction of the limit of speed on the open road to ten miles per hour. It is hoped that county councillors will do their duty towards a movement—which has been highly encouraged on the Continent—by taking full advantage of the opportunities referred to.

Missions by Motor.

DURING the recent Simultaneous Mission, organised by the Free Church Council in London, a quartette of motor-cars was employed to advertise the meetings in different localities. A Chicago evangelist, Mr. J. D. Taylor, is going still further and is organising a missionary band to go through the United States on "miniature battleships constructed on the automobile plan." Seeing the popularity of open air missions in many places and also the extent to which wayside propaganda of every kind has developed, there is no reason why automobiles could not be usefully introduced into the work; although we are afraid the plan of the Chicago evangelist is much too ambitious for the twentieth century, which is still very young.

Technical Training.

THE growing popularity of the automobile, and the avenue it opens up for employment, should lead to the institution of courses of instruction in its management at some of our technical institutes in the near future; and not only in its management, but also in its general construction and arrangement. Every owner of a motor-car must take some interest in its parts, and hence the opening there soon will be for such classes as we have indicated.

Motor-Cars for Commercial Men.

A FEW days since we were pleased to meet in a provincial town, a commercial traveller who uses a very smart looking motor-vehicle. The body, which is similar to a brougham, carries all his samples, and the seat in front is protected by a hood. We understand the car was built by the Daimler Company. To commercial gentlemen who have to visit small towns where the train service is bad, such a vehicle must be an inestimable boon, and we imagine the time is not far distant when they will be quite common objects on our roads.

Voiturettes.

As might naturally be expected, the boom in voiturettes in France has considerably affected the sale of other types of automobiles, the greatest sufferers in this respect being the motor-cycle and what one may term the low-powered big carriage. The motor-tricycle is an excellent machine for the man who is not afraid of being bumped about a little, and it undoubtedly affords the most economical means of motoring, but it is absolutely devoid of comfort, and, moreover, it permits of no companionship. The motor-quadracycle overcomes the latter disadvantage, but driver and passenger are too awkwardly placed to permit of their conversing with any degree of comfort. To-day, therefore, the inclination of the less-wealthy class of automobilists is to wait until they can afford to purchase a voiturette, and the sale of motor-cycles has consequently dropped enormously. I do not suppose, says our Paris correspondent, that one-half the number of machines are now being put into circulation as compared with the sales of a year and a-half ago. With the decrease in demand there comes naturally the diminution in price, and the motor-cycle quotation has decreased fully 15 per cent. during the last eighteen months. The figures obtained for second-hand machines have also shrunk to an astonishing extent, and it is by no means uncommon to find examples of the earlier types in very fair condition priced at £12 to £15. A week ago, at the *Hôtel des Ventes*, or public sale rooms, a capital motor-tricycle was disposed of for 340 francs, and among the dealers similar prices are current. As for the other type of automobile which has been hard hit by the popularity of the voiturette, that is the large comfortable vehicle fitted with an engine developing only some 6 h.p., one finds that its hold upon the public has been diminished to an astonishing extent. And obviously the public is quite right, for the voiturette is infinitely cheaper all round than the larger type, and if less imposing in appearance is, at least, equally as serviceable. So then, the buyer who cannot afford a really powerful vehicle

prefers to buy a voiturette where formerly he would have purchased a low-powered carriage. As in the case of the motor-cycle the price of the low-powered car has suffered considerably, indeed, the drop in the market value of one of the best known types is so serious, and it arrived with such suddenness, that many speculative buyers find themselves to-day in a tight corner. And all this is due to the coming of the voiturette.

Prejudice in Cambridge.

THERE is need for further education in the Eastern Counties, judging by the attitude of the Cambridge County Council. The resolution of the Berkshire Council with regard to the numbering of cars came before it the other day, when Councillor Howard proposed and Councillor Williams seconded that no action be taken in the matter—a very modest and sensible suggestion in view of the fact that a conference is in course of arrangement on the subject and that practical object lessons are now being offered in order to educate councillors with regard to automobiles generally. But an amendment was submitted supporting the Berkshire proposal and this was carried by ten votes to three, so that Cambridge can now be added to the list of prejudiced county authorities.

A Coming Revolution.

GIVEN a city with only motor-vehicles on its streets, suggests an American contemporary, and at once the street cleaning department could almost go out of business. Under such conditions enough could be saved in the street cleaning and street repairing departments of a city like Liverpool to endow several institutions for public learning. Of course, such an ideal city must be only for the distant future, but when it does come the present wear and tear on city pavements and the accumulation of dirt and filth in the thoroughfares will all naturally be eliminated from the question or reduced to such a small factor that will hardly deserve more than ordinary mention. Certainly the adoption of mechanical traffic on our streets and the development of motive power for collecting street garbage and also for the distribution of water will revolutionise many departments of municipal life.

Watering Motor-Cars.

LAST week we referred to the interest which the Works Committee of the Islington Borough Council was taking in a man who took water from a horse-trough to replenish the supply in the boiler of his steam-trolley. It appears that they decided to recommend the council to prosecute the offender and thus give a little irritation to those who are concerned in the development of steam propelled carriages, whether for heavy or passenger traffic. Fortunately the council did not take the same view of the matter as the wisacres on the Works Committee, and an amendment to refer the subject back far further and more reasonable consideration was carried almost unanimously.

Motor-Vehicle Competition.

THE motor-vehicle competition held in connection with the Liverpool Cycle and Motor Show successfully demonstrated the reliability of motor-cars. Professor Hele-Shaw was the judge, and there were nine petrol and two steam cars in the test run to Ormskirk and back, while the half-frozen snow covering the roads made the going about as bad as it could be. In arriving at the awards, marks were given for the following nine points: Prime cost, construction, handiness in preparation for start, starting and stopping (efficiency of brake), ease with which gear can be changed, amount of attention to motor required on the part of the driver, noise of motor running light, consumption of fuel and water, and accessibility for repairs in case of breakdowns. The awards were as follows:—Class 1, motor-tricycles and quads: Gold medal, De Dion and Bouton motor-tricycle, exhibited by Messrs. Robinson and Price, ridden by Mr. C.

Edge; silver medal, motor-quad, entered by Mr. Neason, and ridden by Mr. Beardwood; bronze medal, motor tricycle, entered and driven by Mr. Neason. Class 2: Gold medal, De Dion and Bouton voiturette, entered by Messrs. Robinson and Price, driven by Mr. C. Jarrott; silver medals to the Locomobile exhibited by the Locomobile Company, driven by Mr. Ginder, the Benz motor-car, exhibited by Mr. Wm. Lea, driven by Mr. E. J. Coles, and the Decauville voiturette, exhibited by Mr. Wm. Lea, and driven by Mr. Archibald Ford; bronze medals: Ariel voiturette, exhibited by Mr. Neason, driven by Mr. J. W. Stocks; Deschamps victoria, exhibited and driven by Mr. Wm. Johnson; and Liver voiturette, exhibited by Mr. Wm. Lea, driven by Mr. Riding.

A REMINISCENCE OF THE SOUTHEAST RUN.

Photo by

(Mr. R. E. Buttemer.)

A Chief Constable goes Motoring.

THE correspondence started by the Marquis of Granby should prove a useful factor in acquainting the public with some of the points which can be urged in favour of automobiles and motorists alike. One of the latest contributors is Mr. R. H. Wyeth, an American gentleman residing in England, whose love of horses commenced when at seven years of age he was riding and driving them in the eastern part of the United States and on the plains of Montana. Mr. Wyeth relates an interesting incident showing that all motorists are not to be regarded as the Marquis would describe them—inconsiderate, unreasonable persons. "Returning from Birmingham to Leamington on my car last summer," says Mr. Wyeth, "I heard the noise of a fast-trotting horse that kept behind for some time. Then I heard a voice asking me if I would slow up and allow the horse to keep pace beside my car. I complied instantly, and saw a stylish dog-cart driven by a gentleman in uniform accompanied by a policeman. He continued thus for a mile or so, then requested to be allowed to drive in front to accustom his horse to a car overtaking him. After about a mile more he reined in his horse, and, after thanking me, fell behind, and I continued my journey at the original pace. This action was so unusual that I inquired afterwards as to such a person's identity, and was told it was Captain Brinkley, chief constable of Warwickshire, who will, no doubt, recollect the incident."

Variety in Gongs.

ALREADY a new difficulty has arisen in cities where automobiles are employed for various public purposes, as well as being used in large numbers by the ordinary business public. The motor-ambulance is a desirable institution, and the motor-fire-engine will, in time, be regarded as a necessity. But how will these secure the preference in the ordinary traffic which their work demands, unless some distinctive form of gong or bell is adopted? The matter is one that should not be overlooked by makers of motor-horns, etc.

THE ENGLISH MOTOR CLUB RUN TO FARNHAM.

THE start was arranged to take place at 1.30 p.m. on Saturday last from the Thames Embankment. At 1.25 p.m. there were only four motor-vehicles to be seen. A Petit Duc Mors, a Mayfair voiturette, Mr. Cappelen driving, young Mr. Cusins on a motor-tricycle, and the writer on a Renault voiturette, his eldest son being the only passenger, the luggage occupying the spider seats. As the clock struck the half hour the start was made, the Mayfair leading. The traffic was thick, the roads filthy, and the weather dull and cheerless. The few vehicles in the run kept together and made the most direct route for Putney Bridge. After passing the Bridge, the one and only tricycle took the lead, the Renault next, and after that the Mayfair, the Petit Duc not being in sight. After taking the up grade of the hill and running into Kingston, the tricycle turned round, as its rider decided to return. The Renault car wended its way towards Thames Ditton, and just before the Angel was reached, a 6 h.p. Panhard, owned by Mr. I. Von Laer, was passed.

After stopping ten minutes, we left at 2.45, the Panhard leaving a few minutes later. At Ripley we stopped at the Talbot to order dinner for mid-day, on Sunday, but were off again

wishing to keep close to the other car. On the top photos were taken, and on running down the hill into Guildford snow drifts were charged. Unfortunately, close to the hospital, the solid driving tires of the Panhard car both came off, so the Renault went on in solitary and muddy state through Guildford to Ripley, arriving at the Talbot at 12.5. Half way through dinner the hum of a motor was heard, and a moment later Mr. and Mrs. Edge and Mr. Jarrott came in on the Napier; and a quarter of an hour later Mr. Napier appeared on a bicycle.

After dinner we returned to town, the Renault leaving first at 2.30 and arriving at Cricklewood after an uneventful run at 4.55 p.m. The trip was most enjoyable notwithstanding the weather.

G. D. BARNES.

THE M.M.C. 12 H.P. CABRIOLET.

WE are this week able to give an illustration of the handsome 12 h.p. car exhibited by the Motor Manufacturing Company, Limited, at the Crystal Palace in December last. It is known as a double cabriolet, and is driven by a 12 h.p. four-cylinder engine fitted with both tube and electric ignition. Lubrication to all engine parts is effected by a force pump carried on the inside of the dashboard; all other frictional parts except the sprocket shaft are lubricated by

THE M.M.C. 12 H.P. CABRIOLET.

in five minutes, and were soon passing through Guildford. The run up to the top of the Hog's Back was taken at good speed, the middle speed, 6½ miles an hour, being only used on the top of the Back; the view was, as usual, grand, but rather varied, as snow increased the grandeur of the landscape. The road surface was, however, soft with sand and snow, the drifts being very deep in places. Notwithstanding this the little car pulled well and did eleven miles an hour average through it all, and ran into the Bush Hotel yard, at Farnham, as the clock struck five. A few minutes before six the Panhard arrived (by the way, the Mayfair did not intend going beyond Ditton), punctually. At seven dinner was served to the party of five. After the repast Mr. Von Laer invited the writer to take a seat on his Panhard for a run to Aldershot, of which advantage was taken, and a most enjoyable ride it was. The return journey was somewhat uncanny, it being very dark and the car only having candle lamps and a colza oil one at the head.

The return journey was commenced at 10.30 a.m. on Sunday, the Panhard leading, but being a low-powered car and carrying the driver and three passengers and luggage, it could only travel slowly up the long rise; the little Renault therefore did the same as regards pace, and crawled up the rise on lowest speed,

grease cups, also carried on the dashboard. Gravity feed is adopted for both lamps and carburettor, the lamp tank with the battery box being also set in the rear of the dashboard. Four sparking coils and the petrol tank are placed under the front seat. The water tank, of a capacity of twelve gallons, is carried at the rear of the frame, the circulating pump being driven by a friction wheel off the fly wheel. The front panel of the motor bonnet is made to take a duplex pyramidal set of radiators: the gear is constructed to give four speeds up to 35 miles per hour and reverse.

With regard to the outward appearance of the car, the whole of the side panels and top of the motor bonnet, together with all visible metal parts, are electro-plated, setting off the body in a striking manner. The panels of the body are of aluminium, finished in pale heliotrope and gold lined. There has hitherto been some difficulty in obtaining access to the rear seats of cars of this type, but in this vehicle the difficulty has been overcome in a very ingenious manner. The left half of the back of the seat is made to open as a door, and by a simple arrangement of levers the corresponding half of the back seat is caused to rise vertically, giving a fair way to the back seats of the vehicle, and locking the door irrespective of the handle latch.

The French Motor-Car Exhibition.

(From our Own Correspondent. Continued from page 825.)

FIG. 1.—THE 12 H.P. SERPOLLET STEAM CAR.

Cliché de

[Le Chauffeur.]

ENGLISH visitors at once noticed upon the stand of the Gardner-Serpollet Company, Rue de Stendhal, Paris, a framed illustration of the 9 h.p. car now in course of construction for King Edward VII. It is a beautifully designed carriage, and when finished will assuredly do credit to the constructors. A very original vehicle was an 8 h.p. with body by Jeantaud. Between the driver's seat and the splashboard, upon a slightly higher level than the bottom boards of the car, are placed a couple of seats back to back—as those upon an Irish jaunting car. The occupants of these seats place their feet upon an extension of the ordinary step. Rising from the splashboard is a glass screen, and covering all is a hood which can be closed when desired. A couple of small 5 h.p. cars call for no special notice, but the beautiful 9 h.p. landaulet, the carriage work of which has been done by Kellner, must not be overlooked. This car is painted in dark blue, with yellow wheels, and is fitted with a closing hood. The remaining vehicle exhibited was built upon one of the new 6 h.p. frames, Renault being responsible for the rather original carriage work. No important changes have been effected in the mechanism of these cars.

Both L'Electromotion, 50, Avenue Montaigne, and the Cleveland Company, 61, Boulevard Haussman, Paris, made extensive shows of electric vehicles, and upon their stands one found mail phaetons, coupés, broughams, and victorias, all specially designed and constructed for town work. In every instance the carriage work was irreproachable.

English visitors quickly found their way to the stand of MM. A. Darracq et Cie., Quai de Suresnes, Suresnes (Seine), for the fame of this firm's new light carriage has gone out through the land. Right in the centre of the exhibit, and holding the place of honour, was Marcellin's car, just as it came off the road on the opening day of the Salon after accomplishing a tour of some four thousand kilometres. Muddy and woebegone it undoubtedly was in appearance, but otherwise the twelve days' rough work had left no trace upon the car. No fewer than six *tonneau*-shaped wagonettes found place upon M. Darracq's stand, and undoubtedly the public regard this as the most practical type of body for a carriage. There was also a three-seated "spider" and a dainty coupé, with folding hood by Belvalette. This latter carriage was particularly smart. A chassis permitted intending purchasers to

study the internal mechanism of the car, and judging by the crowds regularly surrounding this frame the opportunity was gladly taken advantage of. The exhibition was completed by a number of tricycles and quadricycles, among the former a machine fitted with a De Dion provided with a water-jacketed cylinder head and a cleverly-disposed radiator, calling for attention. One should also remark the quadricycle driven by a water-cooled Aster engine, and carrying a speed change gear.

Messrs. H. Brulé and Co., of Rue Boinod, Paris, exhibited the cars illustrated in Figs. 2 and 3. As will be seen they have seating

FIG. 2.—THE BRULÉ 6 H.P. VIS-À-VIS.

accommodation for four persons. Any type of carriage body can, however, be fitted, as the motor and transmission gear are mounted on an independent frame of channel steel, suspended by springs both at the front and rear, on the axles. To deal first with the engine, which is stated to develop 6 h.p., this is located at the rear end of the frame; it comprises two cylinders, the cranks, which are enclosed

FIG. 3.—THE BRULÉ 6 H.P. PHAETON.

in an oil-containing case, being set at an angle of 180 degs. to each other. The cylinders are water-jacketed and the ignition is electrical, the sparking plugs being fitted in such a way that they can be readily removed. The carburettor is of the constant-level type and is so arranged that the driver can see at a glance how much petrol it contains. Suitable handles are fitted within convenient reach of the driver, by means of which the quantity of both air and spirit allowed to pass into the carburettor can be regulated. Like all modern motors, the Brulé engine is also fitted with an automatic governor, which, when the speed of the engine becomes too great, so acts on the admission valve as to diminish or cut off the supply of carburetted air to the explosion chamber. Coming now to the transmission mechanism, the change-speed gear, which consists of a train of spur wheels, is adapted to give three

forward speeds, ranging up to 35 kilometres per hour, and a reverse motion. The motor drives, through a progressive friction clutch, a short shaft fitted with the variable speed gear above referred to. Any one of the spur wheels of this gear can be made to mesh with corresponding pinions of the differential shaft from which, to the rear axle, the power is transmitted by the usual sprocket wheels and chains. Steering is controlled by an inclined hand wheel, the front wheels being mounted on the customary short vertical pivots. Ample brake power is provided, there being cord brakes acting on drums attached to the hubs of each of the rear wheels and operated conjointly with the friction clutch, by means of which the engine can be thrown out instantly from the transmission gear. Pneumatic tires are usually fitted, while a choice of wood or cycle-type wheels is left to the purchaser.

The exhibits of M.M. Boyer et Cie., Avenue de la Grande Armée, Paris, consisted of a couple of small *tonneau* cars (Figs. 4 and 5), and a couple of cabs, the power in two instances being furnished by 6 h.p. water-cooled Aster engines, and on the remaining vehicles by Buchet motors. Ordinary cog-wheel gearing is utilised for the transmission of power. The cab, which is a particularly smart and serviceable carriage, is driven from the

FIGS. 4 & 5.—ELEVATION AND PLAN OF BOYER TONNEAU VOITURETTE.

inside, and a small "spider" seat at the back gives accommodation to the engineer. It weighs about five hundred kilogrammes. Upon this stand were also to be found a number of motor-cycles, but, apart from a large racing machine, none present any particular interest. This cycle carries a two-cylinder 12 h.p. Buchet engine, but, air-cooled as it is, one would have misgivings as to its ability to run for any considerable length of time without overheating.

A neat little vehicle was that exhibited by La Société Anonyme des Automobiles Louis Ravel, Neuilly sur Seine, its special features being the method of direct transmission adopted by the constructors. The 5 h.p. engine is of the two-cylinder V type and it is water-cooled. Two forward and one reverse speeds are provided, and the gear, etc., being cased in are effectively protected from dust and dirt. In appearance it was one of the smartest cars in the show.

Three examples of the Krebs voiturette were to be found upon the stand of Messrs. Clément, Quai Michelet, Levallois-Perret (Seine), but they presented no new features excepting that one of them was fitted with a phaeton instead of the ordinary two-seated body. One of the new type De Dion tricycles also found place

upon this stand, and the rest of the firm's exhibition was made up of a couple of De Dion voituresses and a number of cycles.

A very ingeniously-designed voituress was that constructed and exhibited by M. Charles Latil, Marseilles (Bouches du Rhône). A $3\frac{1}{2}$ h.p. Aster engine, placed very similarly to the usual arrangement of the back axle of a motor-cycle, and provided with a speed change gear and a friction clutch, is attached to the front of a small carriage, and there is the voituress—simplicity itself! And ever since the long journey from Marseilles to Paris and back (1,063 miles) made by M. Latil in the depth of winter on his little car, the effectiveness of the system cannot be questioned.

M.M. Bertrand et Cie., 148, Avenue Malakoff, Paris, showed two exceptionally attractive small cars, the one fitted with a $6\frac{1}{2}$ h.p. water-cooled Aster, and the other with a $4\frac{1}{2}$ h.p. de Dion. The former carriage is designed to accommodate four persons all facing forward, and the latter is of the *tonneau* type. Built low with long wheel base, the Bertrand car looks as stable as it is stylish. The transmission is effected by means of a long belt from the motor in front to the differential shaft, upon which are found three pulleys. One of these is loose and the other two

of the new Blériot lamps, said to throw a light of over 300 yards. Then came a 16 h.p. fitted with a *tonneau* body built by Rothschild, and designed to carry four or six persons as may be desired, there being a couple of additional seats ready for fixing in the well of the car at a moment's notice. A similar system is employed in the case of a 10 h.p. car, and two other vehicles of this power are a four-seated *tonneau* and a two-seated racer. This brings us to the new 10 h.p. *chassis*, and it was upon this that the real interest was centred, for seldom has a more beautiful piece of work, or one containing more novel features, been shown. Carried in front is the motor of the four-cylinder vertical type. It is air cooled, excepting the cylinder heads, which are water-jacketed. The ignition is effected by the same *tampers* in the explosion chambers as formerly used, but instead of the electric current being produced by a dynamo or taken from accumulators, as of old, it is generated by a magneto machine patented and constructed by the Mors Company. This machine is rotary in action, and resembles the Simms-Bosch magneto in appearance. No arrangement for changing the point of firing is provided, but the speed of the motor car be increased or decreased by an accelerator or moderator, both of which act upon the admission of gas. The accelerator is in the form of a foot-pedal, and by its use the speed of the motor can be increased from the normal 900 to 1,100 revolutions. The moderator is found upon the steering wheel, which is carried upon a sloping pillar. The action of the governor upon the admission of gas has the effect of marvellously reducing the cost of running, which, in

FIGS. 6 AND 7.—ELEVATION AND PLAN OF TURGAN-FOY TONNEAU VOITURESS (See issue Feb. 2, page 808).

give the fast and slow speed respectively. A reverse gear is also provided. A lever placed upon the sloping pillar of the wheel steering actuates the speeds, while one hand brake and a couple of pedal brakes render the vehicle under perfect control. The weight is 380 kilogrammes, and the price £200. M.M. Bertrand et Cie. would appear to have got hold of a capital little car singularly devoid of anything approaching complication in its mechanism.

From the opening day of the Salon no exhibits secured more attention from the public than those of La Société Anonyme d'Electricité et d'Automobiles Mors, Grenelle, Paris, and judging by the continually crowded condition of the stand the company should be well satisfied with the result of the exhibition. The most powerful car shown was the so-called 24 h.p. upon which M. Levegh last year won the mile race at Nice, Bordeaux-Périgueux, and Paris-Toulouse. It carries in front one

FIG. 8.—THE MORS 10.-H.P. CAR.

the case of the Mors vehicle, was formerly somewhat high. Above each induction valve is placed a small valve, maintained in place by a spring carried in the centre of a cup on the top of each cylinder. In the event of an induction valve hanging up, a drop of petrol in the cup and a pressure of the small spring will promptly overcome the difficulty. Another feature is the simplicity with which the nipple of the carburettor can be removed and cleaned if necessary, although by reason of the preliminary cleansing of the petrol in a metal screen this is an operation seldom, if ever, necessary. An additional point to be noted is the system of dividing the exhaust so that it enters into the silencer from opposite sides, thus killing itself, so to speak. The axles are very low and the mechanism is so placed as to give the greatest stability to the car. The controlling levers are placed to the driver's right hand, in a similar position to those of the larger types of Mors vehicles. The price of the motor and frame is £520, while for an extra £60 a complete *tonneau* can be purchased. An 8 h.p. delivery van and three 6 h.p. *tonneaux* completed the list of the Société Mors' exhibits.

La Société des Voitures Automobiles "La Petite Livraison," Rue Laferrière, Paris, showed a couple of four-seated cars of the *tonneau* type. The first of these was provided with two forward and one reverse speeds, the transmission being effected by belts. Placed well up from the frame, the carriage body can be easily and speedily removed and replaced by another when occasion demands. The second vehicle was of similar construction, but is

fitted with spur wheel transmission. In both instances the power is supplied by a single cylinder vertical motor fitted with two fly-wheels and developing 6 h.p. A Longuemare carburettor is used.

A stand which attracted much attention was that of Messrs. Cottureau and Co., of Dijon, which comprised both gear and belt driven cars. First we inspected an example of the 5 h.p. voiturette, but as this car has already been described in these columns (see *Motor Car Journal*, September 22nd, 1900), no lengthy description at this time is necessary. It was with pride that Messrs. Cottureau pointed out to us the features of the 7 h.p. *tonneau* they are now building, and of which illustrations are given in Figs. 9, 10. As will be seen, the vehicle has an attractive appearance; it has a frame constructed of tubular steel, spring suspended at both front and rear on the axles. A leading feature in the car under notice is the engine. This is of the two-cylinder type, the two cylinders being set V-fashion under a perforated bonnet in the fore part of the frame. The valve chambers are located on the top end of the cylinder. The latter is provided with radiating ribs, while the valves and explosion chamber are surrounded by a water-jacket, circulation being maintained

FIGS. 9 AND 10.—ELEVATION AND PLAN OF COTTEURAU TONNEAU VOITURETTE.

by a small pump. A radiating coil is also fitted. The cylinders are 85mm. in diameter, and the stroke is 105mm. Running at a speed of 1,000 revolutions per minute, the engine develops 7 h.p. The ignition is electrical, while a carburettor of the Longuemare type is fitted. As far as the differential shaft the transmission mechanism is very much on the lines of that adopted in the Panhard cars. Three speeds forward and a reverse motion are available. The motor shaft carries at its outward end one-half of a friction clutch, the other portion of which is mounted on the end of the variable gear shaft, in line with the engine shaft. The variable gear consists of a train of spur wheels, any one of which can be made to mesh with corresponding pinions on a short parallel shaft which conveys the power by bevel gear to an intermediary shaft at right angles. The variable speed gear is enclosed in an aluminium oil-containing case fitted with a detachable cover to give ready access to the gear. From the intermediary shaft the power is conveyed to the rear axle, which is provided with a differential gear, by a single chain; this axle is also so mounted that it can be moved backwards or forwards within certain limits to allow of the regulation of the tension of

the driving chain. A foot pedal actuates a band brake on the transverse intermediary shaft, while a hand lever at the side actuates a similar brake on the differential axle. The exhaust silencer is of large dimensions and is located right in the rear of the frame. Steering is controlled by an inclined bar on which the electric current interrupter is mounted. Wheels of the cycle type are generally fitted, but wooden ones can be substituted if desired, and these are shod with pneumatics. The little car weighs, with petrol, etc., ready to start, about 9½ cwt. With its 7 h.p. engine it is claimed that the vehicle will mount any hill, and on the level attain a speed of 25 miles per hour. The firm also showed a Benz-like vehicle carrying a 3½ h.p. motor. It is interesting to note that Messrs. Cottureau make a special four-cylinder 10 h.p. racing car which comes within the 400 kilogramme limit imposed by the "A.C.F.," and which can average a kilomètre per minute under anything like favourable conditions.

L'Automobile Industrielle, Rue Chauveau-Lagarde, Paris, are constructors of automobiles built on the David-Bourgeois system. Only a couple of petrol carriages were shown at the Salon, and both of these were fitted with a 16 h.p. motor. This engine is of the four-cylinder vertical type and differs from the majority of light oil motors by the mechanical command of all the valves, notably those of admission, and by the automatic regulation, which proportions the force developed to the effort required in allowing two, three, or four cylinders to operate. By this system the fuel consumed is only half a litre per horse-power per hour. The motor is provided with a water-jacket, and the water circulation is assured by the employment of a rotary pump. Tube or electric ignition can be fitted as desired, and the firm have also constructed a rotary-magneto machine, which will be placed upon the new type of cars. A 8 h.p. two-cylinder vertical motor fitted with the mechanism necessary to drive this new magneto was exhibited, but the machine itself was not shown. The transmission of power is effected by cog wheels which are always in gear, thus avoiding any noise or shock when speeds are changed. The steering is of the inclined wheel pattern, and the brakes act both forward and backward. Engines developing 12 and 20 h.p. with four cylinders, and 8 h.p. with two cylinders, are also made by the company, and the smaller type motor including flywheel weighs but 170 pounds. An electric brougham with folding hood was also to be seen upon the stand, and the last of the company's exhibits was a wooden four-seated *tonneau* body for an 8 h.p. frame, which, without upholstery, weighs seventy pounds.

The centre of attraction upon the stand of La Société des Anciens Etablissements Audibert et Lavirotte, Monplaisir-Lyons (Rhône), was the big racing car which, with two sister vehicles, will probably be seen competing at Nice this spring. Weighing 1,470 kilogrammes, this car is propelled by a four-cylinder motor developing 32 h.p., and it is said to have attained a speed of 107 kilomètres, or 67 miles, per hour on the level. The transmission is effected by the medium of a friction cone, the peculiarity of which is its metal to metal contact. This cone is placed in the middle of the tubular frame, and two of the forward speeds are contained in one box, while the gear wheels giving the two other speeds are placed in another case. The centre of gravity would appear to be very low and, with its long wheel base and pointed motor casing, the vehicle has a distinctly racy appearance. Unlike the arrangement of the company's ordinary cars, the speeds are controlled by a lever placed at the driver's right hand. The next carriage noticed was a white four-seated *tonneau* carrying a 7½-h.p. motor. Here the change of speeds is effected by means of a second wheel placed just below that commanding the steering. Then one found a 12-h.p. four-seated double phaeton upholstered in red leather. A 16-h.p. phaeton, fitted with a hood over the front seat, completed the list of cars shown, but an open gear case, exposing the system of cog wheels in use by the company, was of interest to visitors with a taste for mechanics. MM. Audibert et Lavirotte propose to supersede the leather belt now used upon their vehicles for the transmission of power by a metal band, and this innovation will be placed upon all the cars now coming through the works.

La Société Lyonnaise de Construction d'Automobiles Rochet-Schneider, Lyons (Rhône), showed a number of their well-known vehicles. The car is propelled by a four-cylinder vertical engine

placed in the fore part of the frame. Four speeds and a reverse are secured by means of the usual cog-wheel gearing, an exceptionally large friction cone being used to transmit the propulsive power. A conveniently placed indicator permits the driver to see at a glance whether or not the water circulation is working satisfactorily. Inclined wheel steering is the system adopted upon this car. It is interesting to learn that the company are experimenting with a system of magneto-electric ignition, although none of the cars exhibited are provided with the apparatus. The new system will be one of the features of this season's cars should the experiments prove as successful as it is anticipated they will do.

(To be continued.)

ROAD WHEELS FOR MOTOR-CARS.

MUCH has been said and written concerning the relative advantages of wood and wire wheels for motor cars, and the question seems to be as far from solution now as ever, if uniformity of practice is an indication of the established superiority of one of several alternative methods of construction. Considerable experience has been gained in the matter of wheels since the beginning of the automobile movement, and if the teachings of this experience are brought to bear upon the question of wood or wire wheels it is reduced to rather narrow limits. Nobody probably would suggest wood wheels for motor-cycles, while for road vehicles and, above all, heavy delivery waggons and trucks, the wood wheel has proved superior to any form of wire wheel. Many builders of heavier vehicles started out by using wood wheels, but of those who originally used wire wheels exclusively a number have since changed over to wood wheels, for all but the lightest types, among others the firm of Peugeot, in France, and Riker, in America. The only class of vehicles in which there can be a question as to the better adaptation of wood or wire wheels is the light voiturette class, and for the comparatively light work for which these vehicles are intended there is probably not much choice between the two.

THE Automobile Club of America has followed the example of the A.C.G.B.I. by issuing *Automobile Club Notes* to its members.

A RACE for motor-cars, the motors of which are operated by alcohol, is to be run off between Paris and Roubaix on the 8th April under the auspices of the Automobile Club de France.

MESSRS. WALKER AND HUTTON, electrical engineers, Huntriss Row, Scarborough, have obtained a licence from the Hackney Carriage Committee of the Scarborough Town Council to run a service of motor-omnibuses in the borough.

A COMPANY has just been formed to organise a service of motor omnibuses in the province of Cremona, Italy, between Cremona-Casalbuttano-Casalmovano-Soncino, twenty-three miles, and Cremona-Gadesco-Cicognolo-Pialena, nineteen miles.

SIR J. H. A. MACDONALD, Lord Justice Clerk of Scotland, and a well-known motorist, who commands the Forth Volunteer Infantry Brigade, read a paper last week before the Royal United Service Institution on "Infantry in a new century." He urged the need of drastic army reform, and of reorganising our whole system of training, casting out of it what was inapplicable to the conditions of warfare which now existed.

THE motor-car occupies at the beginning of the twentieth century about the same position in the engineering world that the steam engine did at the commencement of the nineteenth century; the problem of mechanical road locomotion is to-day the one of most far reaching importance in the entire domain of mechanical engineering. Yet advances in the perfecting of the motor-car will be more rapid in the coming years than progress in steam engineering was in the early years of the last century, as progression in engineering matters has always been geometrical. With the extension of automobilism, too, every little town will soon possess a store where everything required by the motor-car will be kept in stock, and near at hand there will nearly always be a specialist in motor-cars who can be secured to replace a broken part.

THE BOUDEVILLE ELECTRIC IGNITION AND CYLINDER-COOLING SYSTEM.

M. BOUDEVILLE, of Anet (Eure-et-Loire), France, has lately devised a new arrangement for igniting the explosive charge in petrol motors. In the new system (Figs. 1, 2, 3 and 4) the current is generated by a magneto machine, the armature of which is stationary, and the field or permanent magnet is attached to the fly-wheel of the motor. The magnet is in two halves *B*, and is placed inside the rim of the fly-wheel *A*. The armature consists of the two coils *C*, wound on an iron core. The terminals of the coils are connected to the electrodes *E* and *E'* in the valve chamber, and the contact points are constantly fanned by the incoming charge, which takes the direction pointed out by the arrows in the figure. The movable electrode *E* is operated mechanically from the crank-shaft. The cover plate *I* gives easy access to the contacts.

The cooling arrangement adopted by M. Boudeville is also shown. The cylinder is provided with spiral flanges *L L*, and

FIGS. 1 TO 4.

over these flanges there is a tubular casing. The spiral groove between the flanges is in communication with the crank casing through the passage *I*, and the pumping action of the piston is claimed to force the air from the crank casing through this groove, thereby keeping the cylinder walls cool.

THE Cycle and Motor Company, Ltd., of Dublin, are sole agents in their district for the Gladiator voiturettes.

THE Universal Motor Conveyances and Motor Appliances Co., Ltd., has been registered by Mr. F. W. Mackie, 15, Balham Grove, S.W., with a capital of £100, to carry on the business of motor-vehicle manufacturers, etc.

MESSRS. JAMES AND BROWNE have removed from Buckingham Palace Road to more extensive premises at 78a, Queen Street, Hammersmith, where they have every convenience for repairs to, and storage of motor-vehicles.

SIR FREDERICK BRAMWELL, Mr. Thornycroft, and Mr. Worby Beaumont were among the speakers in the discussion that followed the reading of Mr. Pennell's paper at the Society of Arts last week. Major H. C. L. Holden was in the chair.

A FEW days ago a motor-car belonging to Earl Russell, and driven by Mr. Moyse, engineer, ran into a miller's cart at Maidenhead, forcing both horse and cart into the ditch. The motor was damaged, but the cart, horse and drivers escaped injury.

THE Haynes-Apperson Company, Kokomo, Ind., have sent us a copy of the fourth annual catalogue, describing the two-seated, four-seated and six-seated vehicles of their manufacture. This company claims to be the oldest manufacturer of motor vehicles in the United States, having been established in 1894. The catalogue calls attention to the excellent balance, flexibility and ample power of their two-cylinder engines, the durability of their cars under the severest road service, and the ease of repair. Among the testimonials printed is one from Earl Russell.

CORRESPONDENCE.

WATER-COOLED HEADS FOR MOTORS OF MOTOR-TRICYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—You were recently good enough to allow me to make some suggestions with regard to motor-tricycles in your columns, and I therefore venture to ask for a little space to give the results of my recent experience with a water-cooled head, which has been so satisfactory that it may perhaps be of interest to some of your tricycling readers. I have always been rather dubious of the advantages of water-cooled heads as applied to tricycles, partly because I have never been much troubled by overheated motors, but chiefly on account of the trouble and expense of fitting them, and because I understood that a large and heavy water tank was a necessity. I find, however, after a practical trial, that the drawbacks are inconsiderable, while the advantages are much greater than I had supposed. The head I tried was obtained from the London Autocar Company, and I am able to recommend it as possessing many advantages. In the first place, it can be fitted to a De Dion motor without any alteration whatever, using the same valves, compression tap, etc.; secondly, it has plenty of water space and the water enters just where the heat is greatest, viz., over the exhaust valve seat, and, lastly, the outer walls of the water jacket have radiating plates, which carry off a good deal of heat. One small defect may be noted, viz., that the nipple of the uptake water pipe does not quite clear the compression tap rod.

The amount of water necessary appears to me to have been much over-estimated. The tank I am now using is only 12 in. by 4 in., and the whole amount of water in circulation is only three pints (the motor being $2\frac{1}{4}$ h.p.). It will be found to be impossible to make the water boil, at all events in cold weather. The tank is fixed 1 ft. above the head by two stays secured to the latter by the nuts on the pillars, and is also clipped to the petrol tank; but I am now fitting a small cooling coil under the left-hand axle sleeve, reducing the tank, so that it will only hold two pints, and clipping it to the saddle pillar. The tank and coil can be easily cut out of sheet zinc and soldered. For the connecting pipes I have used rubber ($\frac{3}{4}$ in. for the uptake and $\frac{1}{2}$ in. bore for the down-take), and these seem to stand the action of boiling water very well. The circulation, which can be easily tested by connecting the pipes to an open tank, is remarkably quick. The additional weight is really inconsiderable; the extra weight of the head is about 2 lb.; tank (zinc) and pipes (rubber) 2 lb., coil 3 lb. and water 3 lb.

The effect on my tricycle has been to increase its hill-climbing power quite one-third, and its average speed about two miles an hour. With this head a $2\frac{1}{4}$ h.p. tricycle, of medium gear, will average eighteen miles over almost any roads and take any hill; and this being so, I really cannot see the necessity for machines of 3 h.p. and over. Yet the $2\frac{1}{4}$ h.p. model is generally thought to be quite out of date. In my humble opinion, it is the highly-powered tricycle and the leviathan car which cause the public to be apprehensive as to the future of automobilism. Another advantage of the water-cooled head is that a tricycle thus equipped could easily be used as a stationary engine for driving a lathe or a small circular saw, by fixing the axle firmly on a frame and driving by the pedal chain on to a countershaft. I ran my machine experimentally in this position for half an hour, with the result that the water in the tank boiled very fast and the cylinder walls became very hot, but as long as the gear case was well supplied with oil the compression was good and the power quite satisfactory. My tricycle has done all my work this winter, and done it well; whilst its colleague—a voiturette—has never been out, owing to the bad roads and worse weather. On the coldest days I have been able to keep my feet warm by wearing long rubber boots, reaching to the knee, with two pairs of socks. Before adopting this kind of footgear I always found tricycling in winter rather chilly.

Yours truly, W. E. TESCHEMAKER.

MOTORISTS AND SPEED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Motorists are, I suppose, always endeavouring to win over "outsiders" to their ranks, and many of them (I for one), when hearing a remark made as to the rude and dangerous manner in which motor-cars are driven along the roads, reply that it is only a few selfish motorists who, by driving in a dangerous and discourteous manner, are raising enmity against automobilists in general. I have myself seen and heard of several instances, one of which I will quote. On Friday last, in the snow, the driver of a motor-car, when ascending a slight gradient, held straight on in the centre of the road, forcing a small pony-cart into the footpath in order to avoid leaving the middle of the road himself. Had the driver of the pony-cart been driving a larger vehicle he would have held on in the middle of the road too, and given the motorist a lesson in civility. I should have done exactly the same. But I told him that this was an exception to the general rule. The other day, however, I left the current issue of *The Motor-Car Journal* lying on a chair, and a person to whom I have frequently used this argument picked it up. On page 821 there is a paragraph entitled "The Virtue of Modesty." Having read this he remarked that he noticed that, in spite of what I had said, motorists appear to be proud of travelling at a speed which, even if very much exaggerated, must have been dangerous, and of having the wit (?) to deny the fact in court, immediately afterwards boasting of both achievements, other motorists looking on and not objecting to it. Even Mr. Vanderbilt's system is better; he at least is straightforward, and my friend made no comment about him. Another question often asked is, "Why does not the Automobile Club adhere to its rules, and expel members who break the laws as to speed?" I believe no member of the Club has ever been expelled yet, and if they were to do so I am afraid the Automobile Club would soon become a very small body which, would again mean ruin to the cause of automobilism in this country, seeing how hard the Automobile Club work. But why don't they, seeing how absolutely useless the clause referred to is, cut it out altogether, and then questions which cannot now be answered could not be asked, and so, much harm to automobilism avoided. Anyway, why cannot motorists control their craving for speed for a little while they would then be much more likely to gain what they want, and make automobilism popular; at present there is very little chance of it.—Yours truly, A. W. P.

BURSTING OF IGNITION TUBES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to Mr. J. H. Macdonald's letter in your last issue I may say that as the correspondence had been concerned with ignition tubes, I did not introduce other troubles with regard to tires, chains, brasses, sprockets, gears, etc., subjects so familiar to all motorists. Although it may be that I have been favoured in this direction, I am still driving with the same sprockets as were originally fitted to the car. I have used Brampton's block chains, and have now the fourth set in use. The original gear is still in fair condition. The countershaft and clutch shaft has had to be renewed, and once I had to renew the main bearings. With regard to tires I have had more difficulty; the first set was not at all satisfactory, and the second set, another make, was even worse. I am now using the tires supplied by the Sirdar Rubber Company, which are wearing well. It should perhaps, be added that I have personally done all the cleaning, lubricating, and other work required in the management of the car.

Yours truly,

W. R. YOUNGS.

MOTOR-BICYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If any motor-bicycle fancier has tested the Excelsior and the Minerva, and has decided which he deems the preferable, or what other motor-bicycle he considers more eligible than them, I think his views thereon, if printed in *The Motor-Car Journal* at the present time, would command great attention from many cyclists anxious to try the motor-cycle.—Yours truly, J.

THE "SUNBEAM" MOTOR-CAR.

IT has been known for some time that Messrs. John Marston, Ltd., of the Sunbeam Cycle Works, Wolverhampton, have been at work on the construction of a motor-car, and this week we are able to publish an illustration of the "Sunbeam" two-seated vehicle. The frame of the car is built of channel steel. The motive power is supplied by a 4-h.p. horizontal petroleum engine. The ignition is electrical, a small lever placed conveniently to the driver retarding or advancing the sparking. The contact maker is so located as to be out of the reach of oil and dirt. The water circulation is by gravity, no pump being employed. Power is transmitted from the motor to the driving wheels by belts. Two forward speeds and one reverse are fitted, the necessary changes being effected by pulleys acting on a second shaft and connected with the live axle of the rear road wheels by two gear wheels enclosed in a differential gear box. The cylinder and main bearings are lubricated from a sight feed box fixed on the dash board in view of the driver. Ample brake power is provided, there being a band brake operated by a foot lever for ordinary use, and an emergency brake having powerful hand lever and acting direct on the driving wheel tires. Either side of the band brake can be adjusted so that an even pressure is always obtained. The road wheels are of wood, 28 in. in diameter at the front and 30 in. at the rear, all being shod with solid rubber tires. Steering is controlled by a tiller or hand wheel, as desired. The body is adapted to seat two persons and to give plenty of luggage room. The car measures 7 ft. by 4 ft. 9 in., and weighs complete about 10 cwt.

THE "SUNBEAM" MOTOR-CAR.

A TOUR of France for electric vehicles is, it is reported, being organised by *L'Auto-Velo*.

MR. CHARLES FRISWELL will sell by auction on Tuesday next the second portion of the stock of the Automobile Association. Catalogues can now be obtained.

MR. ARCHIBALD FORD, the secretary of the Motor-Car Company, Limited, has been appointed manager to Mr. William Lea at his recently opened dépôt in Berry Street, Bold Street, Liverpool.

THE Milwaukee Automobile Company, of Milwaukee, Wis., which for six months has been experimenting to ascertain the value of steam automobiles for carrying much heavier loads than have formerly been attempted in America, has finally completed a large steam lorry. The load which the truck is capable of carrying is from 2,000 to 3,000 pounds. A noticeable feature is that which permits several types of body on one frame, so that it can readily be adjusted to various kinds of loads; while the adoption of rubber tires is another innovation in heavy truck work. The new truck, in the course of the experiments made with it, was run through the snow, and the result was more than satisfactory.

THE RESTRICTIONS OF SPEED LIMITS.

WE believe that in the majority of those cases, now so frequent where demand is made, that the speed of motor-cars be restricted by legal enactment, the main purpose of our opponents is to prevent those vehicles from frightening horses. This, of course, is not the case in large cities, where automobiles are by this time so common that the horses, seasoned already beyond the point of being startled by merely novel sights and sounds, rarely take notice of the new vehicles. But there are not as yet many cities of which this is true, and except in isolated cases we have not reached the point where our urban *chauffeurs* are willing to charge through the streets at more than tram-car speed, scattering pedestrians and endangering other vehicles for the sake of the agreeable diversion thus afforded.

It therefore happens that, while instances are reported every now and then in which the disregard of the public's rights, shown by some few individuals, has brought forward proposals of speed limits covering all, yet these cases are comparatively few in comparison with the number of pedestrians and motor vehicles involved;

while, on that basis of reckoning, much the more numerous protest comes from the small towns where motor-cars are rarely seen, and in which they are still more rarely owned. In these latter cases the disturber of rural tranquillity is usually the property of one of "them city fellers"; and the man with the hoe, whose placid nag never saw either a purple cow or a tram-car not unnaturally views the advent of the "devil wagon," leaving a column of dust in its wake and

impairing the "permanent psychic equipment" of his beast, as a noxious invasion to be resisted by all available means.

Now, it is to be granted at once that it is quite possible to run a motor-car too fast, even on an open road, for the safety of the occasional other vehicles to be met with. Moreover, the temptation to run too fast, given a fairly good road, is much greater in this case than in the city, because of the greater distances, the absence of cross streets and the fewer teams. But although the temptation is greater, it is a distinct misfortune that it should be yielded to. Driving at a speed which is made reckless or inconsiderate by the attendant conditions is not less reprehensible in the country than in the city, and it can do quite as much to damage the prestige and check the progress of the motor vehicle.

Again, it may very likely be true that a horse is frightened more by the rush of a vehicle past him at high speed than when a policy of delay is adopted. This does not appear to be proved, however; and some motorists claim that their experience has been directly the contrary, arguing that they get well past the horse before his terror has time to develop. Whichever course a rider has found to frighten the animal less he should feel morally

bound to pursue in all cases where the horse shows alarm. It is well enough in towns to say that the timidity of the horse is notorious, and that he who drives one takes his own chances. Town horses are not so easily frightened. But the fact remains that the horse is our almost universal beast of burden. Many people could not discard him if they would, and if they did they would not be able to manage a motor-vehicle. The horse is with us of necessity more than of choice, and while the motor-vehicle owner may pity the horse owner, he is yet bound to treat him with reasonable consideration.

The point we wish to make, however, is, states the *Horseless Age*, the futility of a legal speed limit on motor-carriages as a preventive of horse runaways. Who, to begin with, is prepared to say that the equine species will usually take fright at a motor-car driven, let us say, at 15 miles per hour, but will not take fright at one driven at a 10-mile gait? And if this, or something equivalent, were asserted, what would be done with the intermediate speeds? It is a fact that in a large number of the runaways that occur, especially in the country, the blame lies with the driver of the animal, who is giving more attention to the motor-carriage than to his horse. Certainly a reduction in the former's speed would not diminish the number of "accidents" such as these.

In very many cases the horse will take fright even at a standing automobile with quiescent machinery. In a case reported not long ago, the motorist stopped on approaching a horse vehicle, and the driver of the latter got out and held the animal's head, telling the motorist to go ahead. This was cautiously done, but the horse escaped control, turned half around, and overturned the trap with fatal results to one of the occupants. And yet this same town, as the direct result of that occurrence, is agitating the subject of a speed limit!

Considered simply as a preventive of runaways, a speed limit is certainly as crude a device as could well be imagined. In its least unreasonable form it should be drawn so to regulate speed only when passing a horse vehicle, and we think it should be considered rather as a standard by which to fix responsibility than as a preventive. Thus, if a horse runs away when an automobile is passing at a rate of no more than ten miles an hour, the inference is reasonable that the blame rests on the horse or on its driver, whereas a runaway due to a higher speed might be charged against the motor-car. Under such a law prosecutions would hardly be made where no accident resulted from a speed above the legal limit, and in that way the law would automatically become a dead letter when no longer required.

AN enterprising Philadelphia newspaper offers to give to the reader who comes nearest to guessing the attendance at an automobile show a 750 dol. vehicle.

ST. VALENTINE has, according to pictured representation, resigned wings for motors; but somehow Cupid and a carburettor do not seem to have an affinity.

MR. JOSEPH PENNELL, who seems to have made the subject of motor-cycling his own, starts off, within the next fortnight, on a long continental trip. He has had a new Werner bicycle built and hopes to average from 150 to 200 miles a day on it. Particulars of the trip are promised for our columns.

SOME excitement was caused in Colchester, on Tuesday, by the vagaries of the motor-van belonging to Messrs. Hyam. Whilst descending the hill opposite the Board School, the vehicle went on a "circular tour," and after describing a figure of eight, finished up by violently colliding with a lamp-post, and smashing the glass in the lantern. Skidding troubles again!

MR. P. L. RENOUF delivered a lecture on Friday last week to the members of the Coventry Technical Institute Engineering Society on "Ball Bearings." The various points and problems in connection with the use of ball bearings were ably treated, and the lecture was illustrated by a series of diagrams and drawings thrown upon a screen of the various kinds of ball bearings which have been introduced.

THE TERROT COMBUSTION-CHAMBER COOLING DEVICE.

REFERENCE has already been made in these columns to the simple yet ingenious device introduced by M. C. Terrot, of Rue André Colomban, Dijon, France. We are this week able to give an illustration of the arrangement, which is one of those very simple things which make one wonder why it was not thought of before. The leading idea is to provide some escape for the air in the crank case, as with each movement of the piston the air undergoes an alternate expansion and contraction which not only heats the motor, but also offers a certain resistance to the piston. This would, of course, be easily overcome by making a hole in the case, at the risk of losing some of the lubricating oil. M. Terrot screws a large section

tube on the top of the case, the tube terminating in a smaller one which is bent so that the open end is directly over the combustion chamber. With each upward movement of the piston cold air is drawn into the case, taking some of the heat from the cylinder. Upon the piston descending the air is forced up into the large section tube, where it expands and cools, and finally issues in a sort of cold blast over the top of the motor. As to the lubricator itself, it is attached to another tube forming part of the apparatus, and a special arrangement prevents the oil contained in the chamber from being drawn out with the current of air. If the apparatus be as efficient in practice as it is ingenious in theory it should prove a very useful accessory.

THE King of the Belgians paid a surprise visit to the Automobile Exhibition at the Grand Palais, Paris, one day last week.

THE Social Democrats of Chicago are considering a proposition to send their leaders through the country on automobiles, from which they will teach the doctrines of Socialism.

NEXT season at Newport, Lenox, and other fashionable resorts, there is every indication that the motor-car will, remarks an American contemporary, play a prominent part, and will be a more important factor in summer life than it was last year. The reason for this is that more society people are using motor-cars than ever before, and many who at first did not see fit to go in for motoring have seen the great sport there is in it, and have ordered vehicles. People who have given up their private stables in town for automobiles are also to give them up for country work, and those who attend many of the entertainments at Newport next summer will use the automobile exclusively as a means of transportation.

THE 1901 WINTON CAR.

THE Winton Motor Carriage Company of Cleveland, Ohio, have sent us the accompanying illustration of the car they have got out for the 1901 season, and in which several changes have been made, resulting, they state, in greater power, increased fuel supply, reduction in noise, and certainty and ease of control. In the new model the wheels and tires are of uniform size, thus necessitating the use of only one size of tire, viz., 32 x 4 inches. The mud guards are of aluminium, finished to match the body, and the body has been shortened about three inches at the rear. The motor is stated to be of 9 horse power. The method of control and operation of both motor and carriage is the same as hitherto employed, except the inclined steering wheel, which has been substituted for the former steering lever, in order to insure safety and ease in steering. The countershaft, formerly used on the car to drive the rear axle, has been abolished, and the chain now drives direct to the sprocket on the differential on the rear axle. This reduces greatly the friction and number of gears, the remaining gears running in a dust-tight oil-containing case. It is stated that these changes, combined with the action of an entirely new silencer, greatly reduce the noise of operation. The chain is now tightened by moving the rear axle backward by loosening a lock nut on the front end of the reach and lengthening the two distance rods, which now run from each end of the rear axle to the side of the body. The water for cooling the motor is kept in circulation by means of a small rotary pump.

The carburettor is of new design, and is said to be simpler and more efficient in action than the former one. The petrol tank has been increased in size, and now holds eight gallons, this being sufficient for 150 miles on average roads. An additional tank of petrol can be carried in the "touring box" at the front of the car, one part of the box being partitioned off for that purpose. Two sets of primary dry batteries are now supplied, placed in another compartment of the "touring box," and so arranged that, at any time it is desired to place the reserve set of batteries in service, it can be done by simply turning an electric switch.

The brake, operated by a hand lever and acting on the motor countershaft, is said to have been considerably increased in

effectiveness, and there is also provided an emergency brake, operated by a foot lever and acting on the differential on the rear axle. In addition to the car illustrated, the Winton Company are also building a two-seated car equipped with a 15 horse-power motor, and capable of a speed of 40 miles an hour, and also a special racing car of even greater power and speed.

THE Dutch Automobile Club held its annual meeting in Amsterdam a few days ago, when a committee was appointed to organise an automobile tour in Holland during the coming summer.

SAFETY WITH PETROL.

ON Wednesday afternoon an interesting demonstration of a new safety petrol can, which Messrs. Henze and Company are introducing, was given at the Stamford Hill Cycle Track. The main principle of the invention is applicable to lamps, barrels, and everything in which spirit of an inflammable character is stored. A pipe A, pierced with holes, extends from the mouth to the bottom of the can or barrel. Round the pipe A is a tube B of fine wire gauze. The idea adopted is that of the Davy miner's lamp, no flame being able to penetrate through the gauze to the petrol in the can and cause an explosion. Another feature of the patent is to be found in the cork or plug. The latter is hollow, and is closed by a brass cap, held in place by a solder which melts at a temperature of less than 70 degs. Celcius.

Thus, should the building in which petrol in these cans was stored catch fire, the heat would melt the solder and loosen the cap, and so allow any gas generated from the petrol to pass away before it could ignite or cause the can to explode.

There is no doubt as to the effective nature of the protection thus afforded. A petrol can fitted with the invention was dipped in benzine, which was ignited, the flame reaching the top of the can and extending to the contents. Similar experiments with a petrol tank half filled with petroleum spirit confirmed the value of the idea, and then a display was given with a large cask which seemed to conclusively prove that Messrs. Henze and Co. have a patent which is calculated to give safety to all vessels in which inflammable spirit is kept or stored. The cask was reared on a light wooden structure, and filled with petrol, a quantity being also poured over the exterior. The plug having been applied, the wood was ignited. As the heat became more intense the spectators would not have been surprised to have heard an explosion; instead of that, however, the plug was merely blown into the air, falling within a few feet of the cask. The contents then flared up, the flame ascending in a candle light form. By the application of a cloth the fire was easily put out. There is no doubt that the application of the idea to petrol cans and tanks will materially add to the safety of the automobile without increasing the cost to any great extent. We are informed that the fitting of a tube—which can be applied to old casks and cans as well as new ones—adds 10 per cent. to the cost of a large cask.

THE motor industry in Belgium is growing apace. During the past year, 155 motor-cars and 11 motor-cycles, were exported from the country, the value of the same amounting to £27,100. The imports during the same period comprised 69 motor-cars and 43 motor-cycles valued at £10,450.

THE Lincolnshire Automobile Club will hold a dinner at Lincoln on the 16th inst. The Mayor of Lincoln (Councillor C. W. Pennell) is chairman of the council for the year, and Mr. W. S. White, chairman of the Lincoln Motor 'Bus Company, Ltd., is the vice-chairman.

It is understood that the Paris-Berlin Race will probably take place on Thursday, Friday and Saturday, 4th, 5th and 6th July. There will be a tourist class in connection with the race. It is hoped that vehicles will be entered in the tourist class of this race by some of the principal manufacturing firms of this country.

THE NESSELSDORF PETROLEUM-SPIRIT CAR.

HEREWITH we are able to illustrate the 1901 model of the motor-cars turned out by the Nesselldorf Wagenbau-Fabriks Gesellschaft, of Nesselldorf, Austria, and of which an example was on view at the recent exhibition in Paris. The company have been building motor-cars for about three years, and their latest type comprises several improvements. To deal first with the motor this is of the horizontal two-cylinder type, the cylinders being so arranged that the piston rods work on to a central crank shaft. The engine is normally rated at 9 h.p., but at 1,000 revolutions per minute develops fully 10 h.p. The

FIG. 1. —GENERAL VIEW OF CAR.

ignition is effected by a Simms-Bosch magneto-electric device, while the water circulation for the cooling of the cylinders is effected by a pump, a radiating coil being also provided in the fore part of the frame.

As regards the transmission, we may here mention that four speeds forward and a reverse motion are provided. The engine is located in the rear part of the frame, the crank shaft carrying at one end a friction clutch operated by a foot pedal. The train of movable gear wheels is carried on a shaft forming, when the clutch is in, an extension of the crank shaft, and any one of the gear wheels can be brought into mesh with corresponding pinions on a differential countershaft, the clutch being, of course, first disengaged. From the countershaft the usual pair of sprockets and roller chains convey the power to the rear road wheels, and

FIG. 2. THE STEERING CONNECTIONS.

from Fig. 1 it will be noticed that the chains are entirely enclosed in a gear case, as is also the change speed gear.

Steering is controlled by an inclined hand-wheel which is connected with the front road wheels in a special way (see Fig. 2). The arrangement, which the company has patented, is claimed to secure the following advantages: (1) The deflection from the normal position of the steering wheels in turning a curve is always theoretically correct; (2) the shocks of the road are not transmitted to the hand of the conductor. The design

and mode of operation of the gear will be easily understood from Fig. 2. The vertical spindles A and B are connected, through the intermediary of the arms AA and BB, to the rods C. The other extremities of these rods carry rollers sliding in two slots in the disc E, one of which is located on the upper and one on the under side of the disc. The slots have the form of spirals, and are laid out in such a manner that the deflection of the wheels always corresponds to the theoretical requirements. A foot-pedal actuates a band brake on the differential shaft, while there are also band brakes operated by a hand-lever on drums attached to the hubs of each of the rear wheels. The frame is built up of channel steel, and is entirely independent of the body, which can be of any desired form. Another feature to which attention may be drawn is that the body is hinged at the rear, so that by unfastening two bolts it can be tilted up, giving access to the motor and all the working parts. The water and petrol tanks are located in the bonnet in the fore part of the frame. Wooden wheels are fitted, and these are shod with 90 mm. pneumatic tires. The road wheels, as well as all the bearings, run on double ball bearings; the car complete weighs about 14 cwt., and can attain a speed, on good roads, of forty miles per hour.

HERE AND THERE.

THE voluntary winding up of the London Electric Omnibus Company is announced.

THE New Montreal Automobile Company has been formed at Montreal, Canada. The capital is £50,000.

THE use of motor-driven cars for the collection of the mails in certain portions of Boston (U.S.A.) postal district is to be inaugurated about March 1st.

WE hear that the Bowden wire is being adopted on a car in course of construction in London for advancing the sparking, regulating the carburation, changing the speed gear, etc.

THE Police Commissioners of Hartford, Conn., have placed a contract with the Electric Vehicle Company, of that town, for an electric patrol wagon. A charging station will be placed in the police headquarters, and one set of batteries will be charged while the other is in use, and the change from one set to the other can be made in a few minutes. Thus the wagon will constantly be supplied with power. The wagon is modelled after the standard horse patrol wagons in use in New York. The vehicle will be completely equipped with such medical and surgical appliances as are needed in emergencies, and it has several novel features. Two seats, each accommodating five persons and running the entire length on the inside, are supported in a manner that permits them to be dropped at will against the sides, leaving the inside space entirely free. Wire screens will be provided for the sides and across the front of the body, and across them will be stretched curtains which can be raised or lowered at will. The vehicle will have a mileage capacity on one charge of the batteries of twenty-five, and will have a speed of eleven miles per hour.

EVEN worse than the wretched prejudice of some English county councils is the attitude of the Madison (New Jersey) Borough Council, which has passed an ordinance restricting the use of motor-vehicles. The ordinance provides that no person using an automobile shall cause the same to be driven or propelled through the streets of Madison at a rate of speed greater than eight miles an hour. It is also provided that every such vehicle shall be provided with a lamp of sufficient illuminating power as to be plainly seen 100 yards, which lamp shall be lighted between one hour after sunset and sunrise. A suitable alarm bell or gong must also be carried, which shall be rung fifty feet from every street crossing or corner, and the bell must be of such volume that it may be heard for a distance of 100 feet. A maximum fine of 25dols. or imprisonment of thirty days in gaol is provided for a violation of any provision of the ordinance, the minimum penalty being 10dols. or five days in gaol. Why trouble about the fine? Surely the motorist should be put in "durance vile" at once.

AUCTION SALE.

AS briefly announced in our columns last week, Mr. Charles Friswell held an auction sale of the stock of the Automobile Association on the premises in Prince's Road, Holland Park, W., on the 7th inst. The following prices were realised:—

Lot.		£	s.	d.
4.	Basket trailer	3	0	0
5.	Front attachment for tricycle	4	0	0
6.	Basket trailer	3	0	0
6.*	De Dion tricycle	22	0	0
10.	5-h.p. Lynx Duc, incomplete and unfinished	50	0	0
14.	Mors dog-cart, second-hand	95	0	0
15.	3½-h.p. Star phaeton	90	0	0
16.	Mors dog-cart	95	0	0
17.	Mors petit duc	110	0	0
18.	6-h.p. Cambier duc, second hand, in good condition	65	0	0
22.*	Orient express	95	0	0
24.	De Dion (Cudell) quad	35	0	0
25.	3½-h.p. De Dion voiturette	125	0	0
28.	6-h.p. Vallee car, second hand, no seat, and in dirty condition	32	0	0
30.	Van body	3	0	0
32.	4 h.p. Tourist car, frame and wheels only	10	0	0
33.	Single cylinder air-cooled motor Auto-motette, in pieces	14	10	0
35.	4 h.p. Tourist car, dirty and incomplete	15	0	0
36*.	Orient express	85	0	0
38.	8 h.p. Mors Dog-cart	85	0	0
38.*	Mors dog-cart	138	0	0
39.	4 h.p. Tourist car	50	0	0
43.	Lynx carriage with motor pulleys, wheels with pneumatic tires, incomplete and dirty	12	0	0
44.	Small delivery car to attach to back of trike	3	5	0
45.	Hillé tricycle	18	0	0
49.	Barriere tricycle, soiled	30	0	0
50.	Hillé tricycle, soiled	15	0	0
Total		£1,305	15	0

MOTOR-CARS AT THE EDINBURGH CYCLE SHOW.

THE fifth annual show promoted by the Edinburgh Cycle Trade Association was opened in the Waverley Market on Friday last week. A fair number of motor-cars and cycles are on exhibition. The Scottish Motor Company, Limited, Edinburgh, show three Daimler vehicles and a Benz car. The Hozier Engineering Company, of Glasgow, stage two of their Argyll voiturettes. One is of the ordinary type with De Dion water-cooled engine developing 3½ h.p., with electric ignition. The other car is a new departure for this firm, being fitted with a Simms 3½ h.p. engine, with the Simms-Bosch electro-magnetic ignition. A third vehicle was expected at the time of our call—a voiturette built to carry four, and fitted with a 5 h.p. De Dion engine and Daimler pattern silencer. The Caledonian Motor-car and Cycle Company, Limited, of Aberdeen, display a handsome car in grey and blue—a Parisian Daimler phaeton to carry four persons, having four speeds. Beside it stands a 6 h.p. Canstatt-Daimler wagonette built to carry ten and driver. Another Canstatt-Daimler is specially fitted for country residence use. It is designated the Caledonian sporting car, and has accommodation for two persons in front and four behind. A Pieper voiturette of most recent design completes this exhibit. A new departure is the Sunbeam voiturette exhibited by John Marston, Ltd., Wolverhampton, a description of which we publish on another page of the present issue. Mr. Wm. McLean, Glasgow, shows one of the well-known Darracq voiturettes to seat four. A neat specimen of the Progress voiturette is exhibited by Mr. R. Kilgour, who is Edinburgh agent for the firm. It is an attractive little vehicle, and carries four persons with ease and comfort. Stirling's Motor-Carriages, Ltd., Glasgow, show their new 5 h.p. water-cooled voiturette, to seat four. There is also a magnificent New Stirling Victoria de Luxe with 7 h.p. four-cylinder motor, to seat four; a No. 2 of similar design, 5 h.p.; a new Stirling tonneau, 5 h.p., for four persons; and a delivery van, 5 h.p., to carry 5 cwt. and driver. Mr. T. Roland Outhwaite exhibits a number of up-to-date Daimler cars, also several Ariel motor-tricycles and quads. The Motor Manufacturing Company, through their representative, Mr. Love, intended to have a big display of vehicles, but at the time of our call a well-used car was the only one visible. Motor-tricycles and bicycles are also shown by a number of other firms.

THE PROPOSED 1,200 MILES TRIAL.

I HAVE been asked by the committee of this Club to read a paper here to-night in connection with the proposed 1,200 Miles Trial. The difficulty which is troubling us is, that the Club has taken a public stand as a body of men who desire and intend to uphold the law: that owing to its recent circular to members of the County Councils the Club is undoubtedly becoming recognised by the public as a law-abiding and serious authority; and that it is therefore impossible that any Trial should be held under the auspices of the Club in which speed in excess of the legal limit is permitted.

We are therefore brought face to face with two questions:—

1. Can the proposed 1,200 Miles Trial be so organised that the speed of vehicles taking part in it shall not exceed twelve miles an hour.
2. Shall the 1,200 Miles Trial or its equivalent be held outside Great Britain?

It has been suggested that an observer should be carried on each car whose duty it should be to prevent the driver from covering a mile in less than five minutes. This plan was adopted on the occasion of the fifty miles Trial in 1899, with the result that vehicles were driven at an ordinary speed until they arrived at a milestone, and then were kept standing there until the expiration of five minutes. It would be necessary that the vehicles should be started at intervals of at least one minute as otherwise they would be running in close order in a cloud of dust.

The second proposal is, that there should be a leading carriage, and that vehicles should be required to keep behind this leading carriage, by which the speed would be regulated. This again would entail a long procession of carriages driven in a dust-storm, and although such a cavalcade might be imagined to be impressive I believe it would do more harm to automobilism than anything else, as the vehicles and their occupants would have so disreputable an appearance owing to the dust.

I am inclined to believe that it is impossible to organise an effective or satisfactory Trial in this country so long as the experimental limit of twelve miles an hour exists as law.

I now pass on to the second question—Shall the 1,200 Miles Trial or its equivalent be held outside Great Britain? I am inclined to think that nothing would go further towards obtaining the alteration of the law than that this Club should arrange that the 1,200 Miles Trial should be held outside this Kingdom, and that it should be made known to the public, and especially to hotel keepers and others who would be losers financially, that the reason for this decision is that automobilism is not allowed in this country the freedom and encouragement which it obtains abroad, and therefore it has been decided that until the law is altered in this respect the road trials which are indispensable for the advancement of the movement, and which are impossible so long as the present absurd legal limit of twelve miles an hour obtains in this country, shall be held abroad. Two objections, however, present themselves to the suggestion that the trial should be held abroad. The first is the expense of the transport of vehicles across the Channel, and the second that a Trial held in a foreign country cannot influence the people of this country so much as a Trial held at home. As regards the first objection, I believe it will be found that the vehicles may be transported across the Channel very reasonably when a large number of vehicles are to be carried at one and the same time. The cost of transport would not probably exceed £2 per vehicle for the return journey. I am inclined to the opinion that if the Trial were held abroad and the motor-vehicles taking part in it were afterwards exhibited in London, intending purchasers of motor-vehicles would obtain a copy of the records of the vehicles made during the Trial, and would visit the exhibition to see the vehicles.

Now to turn to the advantages of a Trial being held abroad—I have already dealt with one, viz.: that I believe when the public, and especially hotel keepers and others financially interested, realise that the legal limit of twelve miles an hour, and the obstinate attitude of some county councillors and others towards automobilism, are driving automobilists out of the country, and some two or three thousand pounds are being spent abroad which otherwise would have been spent in this country, there will be a strong feeling that a law which has so disastrous an effect should be altered. I believe, too, that if the decision of the Club on this matter were made public at once, that considerable agitation might be excited against the re-election of county councillors who have endeavoured to bring in further restrictive measures in respect of the use of motor-vehicles.

I believe that if the Trial were held in, let us say France, and were open to French automobilists, it would have a very marked effect on the manufacture of English motor-vehicles. What is more, it would have the effect of thoroughly acquainting our English manufacturers with the construction and capabilities of the latest foreign motor-vehicles, and I think that the result would be that we should see shortly on the English market vehicles of British manufacture of up-to-date pattern, which otherwise we might not have seen for another eighteen months or two years. Some of the vehicles made in this country would greatly surprise the French *chauffeurs* by the excellence of their manufacture and the reliability of their running. English-made carriages have been bought by foreigners in small numbers,

* Extracts from a paper read before the Automobile Club of Great Britain and Ireland and invited representatives of manufacturers and sellers of Motor-Vehicles, by Mr. Mark Mayhew, L.C.C., on February 13th.

but there is no reason why carriages of English manufacture should not find a ready market abroad, and the result of the Trial being held abroad would tend to the result which we are all so anxious to see, viz.: instead of good British gold going into foreign countries for the purchase of automobiles and parts to the tune of some quarter of a million a year, we should see carriages of British manufacture sold abroad and foreign money coming into this country for the purpose of their purchase.

When the Club secretary was in Dublin in connection with the formation of the Irish Automobile Club, he inquired what would be the attitude of the Irish authorities if the 1,200 Miles Trial were to be held in Ireland. He was advised that if the county councillors throughout Ireland were properly approached and if it were pointed out to them that the holding of the Trial in Ireland would mean the bringing into Ireland of a considerable sum of money, it was probable that the trial would meet with the hearty approval of the Irish county councillors, and that they would assist it in every way.

There might be difficulty in obtaining hotel accommodation during August and September, but probably this could be overcome if orders were given in advance, and the only other difficulty would be the storage of vehicles, and that could be overcome by each vehicle having on board a waterproof cover under which it might stand during the night.

The promoters of the Irish Automobile Club were of the opinion that if the Trial were held in Ireland it would be found that the number of buyers of motor-vehicles in that country would increase, and that a good trade would be established there, and several letters have been received by the Club in connection with this proposal from, among others, Captain Langrishe, Dr. Colohan, Mr. R. J. Mccredy, Dr. Pryce Peacock, the Clerk to the Glenties Rural District Offices, and the Clerk to the Ballyvaughan District Council.

I now turn to another suggestion for a Trial abroad. You are doubtless all aware that the Gordon-Bennett race is to be run from Paris to Bordeaux on Wednesday, 29th May, which is the Wednesday after Whit Monday. On the same day there is to be another race, that is to say, a race open to all motor-vehicles from Paris to Bordeaux, starting about half an hour or three-quarters of an hour after the start for the Gordon-Bennett race. It is thought probable that a great many motorists in this country would like to see the finish of the Gordon-Bennett race, as this country is to be represented by three out of the five vehicles which have been entered. There cannot be the slightest doubt that those who are at Bordeaux on the morning of Wednesday, 29th May, will have a very exciting time in watching the arrival of the racing carriages. As the race is to take place at Whitsuntide, it is also probable that many automobilists in this country could spare the time to go to Bordeaux. The proposal which I now submit is that there should be a 1,000 Miles Trial from London to Bordeaux and back. I reckon that this could well be done in thirteen days, which would include two Sundays and a Bank Holiday; therefore only ten working days would be absorbed. Starting on Thursday, 23rd May, the trial carriages might run to Southampton (say eighty miles) and be shipped by special boat to Havre.

Friday, May 24th, Havre to Paris, 130 miles.

Saturday, May 25th, Paris to Tours, 145 miles.

Sunday, May 26th, rest at Tours.

Monday, May 27th, Tours to Angoulême, 135 miles.

Tuesday, May 28th, Angoulême to Bordeaux, 87 miles.

Wednesday, May 29th, Bordeaux, procession to line the route near the finish of the Gordon-Bennett race. An exhibition of the carriages in the evening, *files*, etc.

Thursday, May 30th, Bordeaux to Angoulême, 87 miles.

Friday, May 31st, Angoulême to Tours, 135 miles.

Saturday, June 1st, Tours to Paris, 145 miles.

Sunday, June 2nd, rest at Paris.

Monday, June 3rd, Paris to Havre, 130 miles.

Tuesday, June 4th, Southampton to London, 80 miles.

The objection to this arrangement which has not already been dealt with is the shortness of the notice, as the Trial would be taking place within a little more than three months of this date, but it appears to be probable that the majority of manufacturers will have their new types of carriages ready by that date. There can be no doubt that a great many French carriages would be entered, and that many amateur French *chauffeurs* would run from Paris on the Sunday and join the trial at Tours and run on to Bordeaux, and probably back to Paris with the trial carriages. There is one considerable advantage in connection with this proposal, and that is that although the distance covered would be about 1,100 miles, the time occupied would only represent ten business days.

The entrance fee for this trial might well, I think, be a low one, as it is probable that no very extensive arrangements would be necessary. It is thought that the authorities in Havre, Paris, Bordeaux, Tours, Angoulême would gladly give storage place free of cost for the trial vehicles, in view of the money which would be brought into their towns by those taking part in the trials. This, however, at present is only a surmise.

Another proposal is that instead of the 1,200-Miles Trial this Club should organise a trial in connection with the tourist section of the Paris-Berlin race. This proposal has many advantages, as it would be the means of bringing British vehicles before the inhabitants of not only the French, but the Belgian and German towns. The Paris-Berlin race is to take place on the 4th, 5th, and 6th of July. It must not be forgotten that in connection with either of these events—the Paris-Bordeaux or

the Paris-Berlin—a considerable amount of attention will be drawn to the events by the Press, and that the English Press would be probably only too glad to publish the results of the trials of carriages entered by British manufacturers and agents.

If it be decided that instead of the proposed 1,200 Miles Trial a trial should be held from London to Bordeaux or from Paris to Berlin, I think the value of a display at the Glasgow Exhibition must not be forgotten, and would suggest that in such case there should still be the proposed automobile week at the Glasgow Exhibition in September during the Engineering Congress which is to be held in Glasgow. I would suggest, to avoid the possibility of the Club being accused of permitting high speeds, there should be no organised tour from Glasgow to London or from London to Glasgow, but that automobilists should be invited to meet at Glasgow and that during the week there should be daily trials, starting and finishing at the Glasgow Exhibition, of say 100 miles. The gentlemen attending the Engineering Congress would probably consent to act as observers on the cars during these trials. If a hundred miles per day were run we should have a total of 600 miles for the week, and it is thought that the Glasgow Exhibition authorities would offer medals for the vehicles making the best performances in their respective classes. The results of each day's run might be displayed by means of a lantern on a screen, in the grounds of the Glasgow Exhibition every night, and every possible means should be used to attract the attention of the public to these trials and the vehicles taking part in them.

I would suggest that speakers in the discussion should summarise their opinions on the following questions with which I have dealt in this paper.

1. Whether it is desirable that a 1,200 Miles Trial should be held in England taking into consideration that the speed must at no point exceed twelve miles per hour.
2. If it be desirable, what steps should be taken to prevent the legal speed limit being exceeded.
3. If it be not desirable, which of the three following proposals should be adopted:—
(a) A Trial in Ireland.
(b) A Trial from London to Bordeaux and back.
(c) The London-Paris-Berlin Trial.
4. Whether they are in favour of the automobile week in Glasgow.

In conclusion I should like to state that the matters put forward in this paper have not been discussed by the Club Committee. The proposals are therefore not made by the Club Committee, but I hope I have carried out the wish of the Club Committee in reading a Paper which will arouse discussion, the fruits of which may be useful to the Club Committee in arriving at a decision in the matter.

PENNINGTON AND BAINES—MEETING OF CREDITORS.

A receiving order was made on the 16th ult., on the petition of creditors, against Edward Joel Pennington and William Baines the elder, described as engineers, trading as Pennington and Baines, late of 40, Holborn-viaduct and 5 and 6, Great Winchester Street, E.C., also lately carrying on business at the Hotel Great Central, Marylebone Road. At the first meeting of creditors, held on Wednesday before Mr. A. H. Wildy, official receiver, it was reported that no statement of affairs had been filed and the debtors had not surrendered for preliminary examination. Proofs for £725 having been dealt with, the meeting was adjourned for a fortnight in consequence of the absence of a quorum of creditors.

ALLEGED THEFT OF A MOTOR-CAR HORN.

ARTHUR PARITT was charged at the Surrey County Bench with stealing from a yard at the Railway Tavern, Barnes, from off a motor-car, a nickel-plated alarm horn.—John Lawn, a fly and cab proprietor, of 21, Elm Grove Road, Barnes, stated that the previous day a gentleman left a motor-car at his yard, as it was broken down. The horn produced was attached to it.—The police asked for a remand, and after a private consultation the Bench remanded prisoner.

THE advantages of speed, sustained and absolutely controllable, without fatigue, or liability to trouble by an adverse will-power, and of low costs of maintenance and operation, conspire with the pleasure of skilled management in promoting the introduction of the motor-car. With double the speed available that can be obtained, even for a short run, with the hay motor, with power of maintaining a speed only limited by the condition of the road and the will of the driver, and with costs of "upkeep" a fraction of those for equal horse-power, and comfort and convenience, we may reasonably expect that only a short time will elapse before the use of the motor-car in all commerce and all pleasure travel on the highways will become general, perhaps universal. Now that a fair beginning has been made, it may be expected that it will become an effective agent in the promotion of the construction of good roads, while the improvement of the road will react in promotion of the better and more sanitary system of locomotion and transportation.

THE Motor-Car Journal.

Vol. II.]

LONDON, SATURDAY, FEBRUARY 23, 1901.

[No. 103.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

IN a recent issue we were able to announce that as a result of his experience with the car at Homburg last summer, His Majesty King Edward VII. had placed an order with the Gardner-Serpollet Company, Paris, for a 9-h.p. steam-vehicle. We are this week able to give an illustration of the car which is at present in course of construction for our Royal automobilist; it will be of the company's latest design, and, as will be seen from page 855, takes the form of the phaeton. Several of the dailies have this week given publicity to a report that the King intends to drive about London a good deal in an automobile during the present season. If this proves true, the example thus set will undoubtedly give a big fillip to the motor movement in Great Britain.

Automobilists and the County Council.

THE coming County Council elections do not seem to be causing the same concern to the public as in previous years, and for this lack of interest there are no doubt varied reasons. To automobilists the results of the many contests would be of sufficient importance for all to use whatever influence they may have in support of those candidates who are not hostile to the industry. A leading member of the Automobile Club and one of the most popular owners is Mr. Mark Mayhew, Progressive candidate for Wandsworth. This gentleman has no doubt been to an extent responsible for the fact that the London County Council has stood almost alone amongst the county councils in refraining from passing hostile resolutions. Mr. Mayhew does not appeal to fellow automobilists for support on party lines, but as a representative automobilist and to ascertain as delegate to the Automobile Club, of which he is a member of the committee. Those who can spare the time and will loan their cars will oblige by communicating to Scio, Putney Heath, S.W. Mr. Mayhew anticipates a stiff fight, and all help will be welcomed.

The Demonstration in East Suffolk.

AT the invitation of the committee of the Automobile Club the members of the East Suffolk County Council were accorded a practical illustration of the speed and capabilities of motor-cars on Friday last week. The first trial of the series took place from Lowestoft, and, notwithstanding that the rutty roads of East Suffolk were covered with snow, was eminently successful. The vehicles used were Mr. Harmsworth's 12 h.p. Panhard, driven by Mr. Lancaster, the owner's *mécanicien*, with whom was Mr. C. Johnson, the secretary of the Club, and Mr. J. R. Hargraves, J.P., a member who had travelled from Yorkshire with an 18 h.p. Daimler of the latest type. At Lowestoft several members of the East Suffolk County Council, who are also Lowestoft Borough Councillors, and County Justices were taken on board, and a run was made out to the Yarmouth road. Here a mile was knocked off in six minutes or at the rate of ten miles an

hour, and this was voted slow by the guests. When the car was going at a good speed a sharp pull up was necessitated by a cart getting in the way, and the perfect control of the vehicle proved very impressive to the Councillors. In the afternoon the Panhard car ran to Beccles and Halesworth, where other East Suffolk County Councillors were picked up, and they, too, were evidently satisfied.

At Ipswich.

THE next centre of instruction was Ipswich, and on Saturday, about one o'clock, there arrived at the Great White Horse Hotel a motor-car—the 12 h.p. Panhard—covered with mud and “slush.” More cars would have been seen if members of the Roads and Bridges Committee had accepted the invitation to take trial trips. Mr. George Fiske, of Bramford, was the only member of the County Road Authority who took a trip on Saturday, but on Monday a number of members were taken aboard, the gentlemen in question afterwards acknowledging the satisfactory results attained by the trials.

In London.

IN consequence of the meeting of the Executive Council of the County Councils Association having been altered from Wednesday, the 27th inst., to Thursday, 21st inst., arrangements were made by which a conference with the Club Committee and demonstrations took place at the Automobile Club on Wednesday last, for the convenience of those members of the Executive Committee of the County Councils Association and chairmen and clerks of County Councils who may not be unable to attend on the 26th inst. At eleven o'clock on Wednesday morning the following cars were driven up to the front of the Club's premises in Whitehall Court:—Mr. H. Edmund's Daimler “Antona”; the same gentleman's Daimler, “Rhoda”; Mr. E. Manville's Daimler; Mr. Frank Butler's Panhard; the Hon. C. S. Rolls' Locomobile; Mr. W. J. Peall's Daimler; Mr. A. Harmsworth's Panhard; Mr. E. Estcourt's Daimler; Mr. E. Owers' Daimler; Mr. Richardson's Daimler; Mr. Van Toll's Daimler; Mr. Cordingley's M.M.C. Panhard, and two other steam cars. A little later Mr. Edge's Napier arrived, having driven over from Chelmsford after taking part in a demonstration there the previous day. For some reason or other, however, the county councillors did not turn up at the appointed rendezvous. The alteration of the date involved a double duty on the part of the members of the Automobile Club, who provided cars, as the original date still holds good for the demonstration to Chief Constables and the reading of the Marquis de Chasseloup-Laubat's paper on the 26th inst. In the afternoon Lord Lichfield, a member of the Staffordshire County Council, Mr. E. E. Dymond, a member of the Bedfordshire County Council, and Mr. Matt. F. Blakiston, clerk to the Staffordshire County Council, attended at the Club, and held an informal conference with some members of the committee. The Club committee being anxious that members of the County Council Association who are now in London should have drives on motor-vehicles, letters were sent to the office of the Association, informing them that if they would take drives on Thursday afternoon or Friday, endeavours would be made to have motor vehicles ready for them.

A Solution of the Brake Question.

THE following story has at least the merit of veracity:—A medical man, who recently adopted a motor-car in his practice, began by taking it on tour in the Northern counties. One afternoon found him in the neighbourhood of Scarborough on a by-road that miserably failed to fulfil the promise of the map. After climbing some fearful hills, the road getting worse and worse, a wayside public-house came in sight, and he inquired as to the road beyond. "There's a wuss hill on there," said mine host; "ye'll want t' powny." Inquiry elicited that the hill in question was a steep *down* grade, and that "t' powny" was kept for the purpose of harnessing *behind* any cart that passed, and retarding its descent. Not yet experienced concerning the brake capacity of his new car, the medico cautiously decided to do in Rome as Rome does, the pony was produced and harnessed by a rope to the rear axle, and in this manner the procession descended the hill in safety! It is a pity that no photographic record of the event appears to have been taken.

"Chauffeur" and "Chasseur."

WE are this week able to reproduce a photo, kindly furnished us by Mr. E. Kennard, J.P., of Baron André de Neufleze, son of the well-known Paris banker, who has journeyed to Market Harboro' to finish the hunting season. In addition to his horses he has brought with him two motor

tricycles—one a 3½ h.p. water-cooled De Dion—upon which on "off days" he delights to ride. Besides being at home in both saddles Monsieur le Baron is his own *mécanicien*, having served an apprenticeship of some months in a French works. Mr. de Neufleze, owing to his charming manner, has become most popular in the fashionable hunting centre, which shows that the absurd prejudice against the new locomotion is rapidly dying out.

Prejudice Waning.

WE are pleased to reproduce the photo, for it is an excellent proof as to how horse-men and owners of horseless cars, as the utility of the latter is daily made more apparent, can become the best of friends. A well-known Melton man, recently returned from South Africa, finds his Panhard "the best covert hack in the shires," and Lord Harrington's reputation as a sportsman and Master of the Foxhounds has not suffered from

his becoming an ardent automobilist. "Sir Charles," of 1,000 Miles Trial fame, may also often be seen attending Midland shire meets, being driven from Harboro' by Mrs. Kennard.

American Motor-cars for the Australian Postal Service.

THE Winton Motor Vehicle Company, of Cleveland, U.S.A., has just despatched to Sydney, Australia, three motor-vehicles, which are the first of their kind to be sent to the Antipodes. On the sides of each of the vehicles appears the coat-of-arms of Great Britain, surmounted by the letters "E. R.," and beneath is the legend "General Post-office." When the order was originally received by the Winton Company the specifications set forth that the letters on the sides of the vehicles should be "V.R.," but the passing away of Queen Victoria and the accession of her son necessitated the change. Thus it happens, remarks the *Motor World*, that the Winton carriage is the first one built for King Edward VII. The conveyance weighs 1,700 lbs., has a 9 h.p. engine, and can run sixteen miles an hour. The cost of the cars is £240 each. They will carry from 800 to 1,000 lbs. of mail each. The vans are finished in maroon, olive green and black, with red wheels. The Winton Company is said to be negotiating for the sale of a number of similar motor-vehicles to be used in the London mail delivery system.

Foot-Warmers.

THE question of foot-warmers is a burning one with automobilists at this season of the year, and an efficient arrangement to this end adds much to the comfort of driving. In cars where the cooling water is permitted to boil, a rubber pipe from the steam exit led to a copper vessel fixed on the footboard is a most satisfactory device; but where an ordinary foot-warmer is employed its efficiency may be much increased by using acetate of soda for filling it instead of water. The crystals contain about 40 per cent. of water, and if a sufficient quantity of them to fill the warmer is heated with half a pint or so of additional water, till they melt in their own water of crystallisation, the solution will boil at nearly 250deg. F., and will remain hot much longer than plain water. The solution crystallises on cooling, and the warmer must be reheated by placing it on the kitchen range; hence the pattern with flat base and aperture at the top is most suitable. Though an old method for railway foot-warmers, this may be new to some readers.

Professionals and Motor-cars.

WE have frequently referred to the increasing attention which members of the theatrical profession are devoting to the motor-car. To the list of "professional" motor enthusiasts must be added the names of Miss Maggie May, Miss Maude Durrell, and Miss Snodon, who have lately been disporting themselves on an Orient Express car at Bournemouth. The ladies in question are members of the "San Toy" Touring Company, and, judging from the photo reproduced in a recent issue of the *Sketch*, they appear to be favourably impressed with the modern means of locomotion.

Motor-Car Services and the Housing Problem.

MUCH attention has been devoted during the week to the part the motor-car is to play in the Housing Problem in London. The subject has arisen as a result of a letter written by the Hon. A. J. Balfour to the Rev. F. Herbert Stead, the warden of the Browning Settlement, Walworth, in regard to the paper on "Improved Means of Locomotion as a cure for the Housing Difficulties of London," which Mr. Charles Booth read at conferences recently convened in Walworth and Westminster. Mr. Balfour in his letter stated that "trams, railways, and 'tubes' by no means exhaust the catalogue of possible improvements in transit. What I should like to see carefully thought out by competent authorities would be a system of radiating thoroughfares, confined to rapid (say fifteen miles an hour) or over

traffic, and with a surface designed, not for carts or horses, but for some kind of autocar propulsion. In such a thoroughfare there would be none of the monopoly inseparable from trains, the number of people carried could be much larger, the speed much greater, the power of taking them from door to door unique, while there would be none of the friction now caused when the owners of the tram lines break up the public streets. It is, of course, obvious that the present difficulty of locomotion in our streets is almost entirely due to want of differentiation in the traffic. Neither the traffic of cross-streets, nor foot passengers, nor slow-going carts and vehicles, would be permitted to interfere with the equable running of fast motor-cars. There would be no danger and no block. No doubt the cost would be great, but it would be incomparably less than that of any of the means of locomotion suggested by Mr. Charles Booth. The upkeep would be small; there would be no terminal charges; no great areas would have to be cleared, as in the case of railways, for stations and sidings; the rolling stock would be provided by the public to suit its own needs; and as the causeway would be connected at intervals with the ordinary road and street system of the district, and would melt into that system at either end, every village in which there were enough residents who had to be in London at a fixed hour every day could have a motor of its own."

A sad Fatality.

DURING the severe frost of last week a party of ladies and gentlemen were skating on Loch Airthrey, when suddenly, without a sound of warning, the ice cracked and a large number of skaters were immersed. All managed to escape except a young lady, who was seen in difficulties. Mr. Fred Pullar immediately went to the rescue, with the unfortunate result that both were drowned. Mr. Pullar, who was the only son of his parents, was extremely popular, and was pioneer motorist in his district. He had been visiting the exhibition at Edinburgh only two days before his death, and he mentioned he was expecting the delivery of a new 10 h.p. Mo-car. Great sympathy is felt for Mr. Pullar's parents in their sad bereavement.

Why do we Buy French Cars?

THE remarkable reduction in prices of the best French vehicles has caused some anxiety in English manufacturing circles, which, so far as it is stimulating, can be productive of nothing but good. It is true that the French makers are for the most part ahead of us, but this is due largely to what may be classified as accidental causes, not the least among them being the few years' start they have had, and the repressive insular legislation that has given it them. A valuable privilege that this has entailed has been the power to set the fashion in automobile circles elsewhere, to an extent that has hardly been allowed for by economic theorists on the subject. The forthcoming opportunities for British makers to compete with French on their own ground may, or may not, do something to change all that; but, in any case, it will, in this country, be the utilitarian rather than the sporting or fashionable purchaser to whom our manufacturers must eventually look as the mainstay of their trade.

The Real Danger.

THERE does not seem serious reason—accidental causes apart—why the British engineer should fear his French rival, who has failed to make his competition felt in any other branch of engineering, and even in this has hardly shown the business enterprise which circumstances seemed to justify, and without which scientific advance in construction is worthless. But what of those countries which are dangerous and successful rivals in kindred trades? The German car has established a very firm footing here among purchasers of moderate means, and though the extreme badness of American roads has,

oddly enough, conduced to the evolution not of a strong powerful car, but of cars suited chiefly to town work, there can be little doubt that the popular car of the future will be turned out by American methods as soon as design is sufficiently advanced for standardisation. The German manufacturer knows the value of the scientific expert, and the American knows that of the inventor, and encourages him; while both are far more aware than the British maker that their very existence depends on the customer, and spare no pains to reach and to conciliate him.

French Roads.

MR. REGINALD GRANVILLE writes for the benefit of any motorists who may be going to the south of France, that the piece of road from Avignon in the direction of Marseilles is, for about 20 kilometres, very dangerous. The surface of the road looks well, but is composed of mud on the top of chalk. Recently a 12 h.p. car, belonging to and driven by a member of the Automobile Club and containing two other members of the Club, skidded badly on this road and collided with a tree, with the result that one of the members was rendered insensible for some time.

Motoring in the Snow.

THE power of the automobile over the snow has been frequently demonstrated of late, but the photograph published herewith is about as conclusive an evidence of the reliability of the motor-car as could be wished. It depicts Mr. A. Beatson, of Buxton, travelling in his "Renault" car, while the

combination of an automobile and a toboggan is decidedly novel. With the snow a foot deep in most places, Mr. Beatson has been enjoying some exhilarating trips in the Peak district, going up to the Cat and Fiddle and other noted elevations in the locality.

The Edinburgh Motor-Car Service.

NOT only surprise but inconvenience was caused, we are informed, by the sudden stoppage of the cars of the Edinburgh Autocar Company, Limited, on Friday evening of last week. The reasons for the stoppage, we understand, were that there had been some disagreement among the directors, and that Mr. Outhwaite, the general manager, had resigned. Whether this was so or not we do not know, but there appears also to have been some trouble with the drivers, for we have received communications from the men on the subject.

Motor-Cars for Municipal Purposes.

QUICKLY on the heels of the news of the adoption of a motor dust cart by the Kensington Borough Council comes the information that a similar step is about to be made by the Beckenham Urban District Council. This body has just called for tenders for the supply of a motor-wagon for the collection and removal of house refuse and street sweepings, the capacity of the wagon to be not less than 6 cubic yards. No particular motive power is specified, but it is stated that for electrically-propelled wagons, current for charging the cells would be available at the Council's electric light station. A significant paragraph in the notice is that orders for other wagons will in all probability follow if the vehicle proves satisfactory.

Motoring at Southsea.

THE anniversary run to Southsea has borne fruit in stimulating automobilism at that popular seaside resort, and during a recent visit quite a dozen cars were *en vidence*, for the most part locally owned. Among them were a De Dion, a 6 h.p. New Orleans, a Locomobile, three or four Benz cars, as many tricycles, a Marshall, and last but not least a smart new Hurtu recently acquired by Mr. Ellis, the ex-Mayor. The French *mécanicien* of a De Dion voiturette seemed bent on putting the friendly attitude of the authorities to the test, from which so far as we heard he emerged successfully. We hope, however, that the experience of engineers regarding the effect of excessive testing strains will be laid to heart by such drivers.

Another New Gear.

WE have had the pleasure of inspecting a new speed gear of a genuinely variable type, the product of a Portsmouth inventor. Any speed ratio from about three to one (backward) was obtainable without clutches, change gears, or loose pulleys. We understand that the device has been taken up in influential quarters, and is being applied experimentally to a well-known type of car. Further particulars are unavoidably deferred for the present, but an early opportunity of trying the new invention is promised, the results of which should prove interesting to our readers.

Motor-Cars in Warfare.

AS mentioned in our last issue, Lord Kingsburgh recently read a paper on "Infantry in a New Century" at the Royal United Service Institution. Dealing with equipment and transport, the lecturer pointed out how to increase the mobility of infantry by the advantageous use of railways, motor-vehicles, bicycles and horses. We were well provided, he considered, for home defence, in the matter of railways. But in the near future a new development of mobility by road was certain to take a high place, and, in a country so well intersected by good roads as our own, to prove itself to be of very great tactical value. He referred to road motor traction. Motor-vehicles, travelling at the rate of twenty or more miles an hour, would give great facilities for seizing advanced points, holding them while troops were coming up in support, holding on to cover withdrawals, and transferring troops from one part of the front to another as required.

Licence Plates.

THE question of licences is just now one of the principal topics in motoring circles, and, we fear, is likely to be for some time to come. Mr. C. Friswell, in a playful mood, has been picturing in his mind's eye what the future motor-car would look like with all its licence plates attached. Taking the Darracq car as an example, Mr. Friswell can see it, in his dreaming, bearing the following plates:—

Licence for the carburettor, granted by the British Motor Traction Company.
Licence for the tires, granted by the Dunlop Company.

Licence for using the car, granted by the sole agents for England—the Automobile Manufacturing Company.

Licence for back axle, granted by the proprietors, Brown Brothers.

Licence by the governing authorities, No. 1,210.

And just one or two others that may crop up before the end of the year. Mr. Friswell concludes, sarcastically, "When these patents are out, the space might be taken by advertisers, such as 'Pears Soap,' as it would be a pity to disfigure the carriage after the eye had got accustomed to seeing it with these plates affixed."

A Motor 'Bus Service at Hemel Hempstead.

SOME weeks ago we were informed that arrangements were in hand for the starting of a motor-'bus service between Hemel Hempstead (Berks) and Boxmoor Railway Station. We are now able to report that the Hemel Hempstead Motor Car Company has got to work, the service being inaugurated on Monday, the 11th inst., the Mayor of Hemel Hempstead making the first journey in the motor-'bus, which has been aptly named the "Pilot." At present only one car—a Daimler with covered 'bus top—is employed on the service, but should it meet with the support it deserves other cars will be put on. The departure is due to the enterprise of Messrs. Pensel and Wilson, who have our best wishes for success.

The Yorkshire Automobile Club.

OVER fifty gentlemen attended the first annual dinner of the Yorkshire Automobile Club, which was held in Leeds on Thursday of last week. In the absence of the president, Dr. F. Farrow, of Cleckheaton, presided, and was supported by Mr. C. Johnson (secretary of the Automobile Club of Great Britain), Mr. Harrison Benn, Mr. A. Farnell, Dr. Thresh, Mr. A. W. Dougill, Dr. H. A. Allbutt, Mr. R. Winn, Mr. G. L. Benbough, Mr. J. E. Tuke, Mr. J. Chippendale, Mr. T. James, D.L., Mr. J. G. Harper, Mr. J. Cooke, Mr. L. Hey (hon. treasurer), and Mr. A. I. Greenwood (hon. secretary). In submitting the toast of "King Edward VII.," the chairman said that although the King had yet to be tried as a monarch, he had passed through an apprenticeship which gave every good promise for the future. He had taken some interest in our movement, and for about twelve months had been an owner of motor-cars. Queen Victoria had her horses broken in to motor-cars, and that was far more sensible than doing as some magistrates and county councillors did when they took out untrained horses, and got into a panic immediately they saw a motor-car. Mr. C. Johnson, secretary of the Automobile Club, gave the health of the chairman, who, he remarked, drove a motor-car before it was legal to do so, and as he drove one for the purposes of his profession they could not have a more valuable pioneer of automobilism. To those who contended that motor-cars were a danger to the public he would point out that even bicycles were so considered when they first appeared, and the fact that horses grew fidgety at the sight of a motor-car was no objection to the motor-car, but was rather an indication that the horse required breaking in to it. The really dangerous element in a vehicle was not in the speed, but in its incapacity to pull up. That was what they wished to impress on county councillors who wanted to reduce the speed limit of motor-cars to ten miles an hour. The Chairman, in responding, said the Club was making satisfactory progress. His first ride on a motor-car was in 1894—two years before the Act was passed in England. His early experiences brought him into collision, first with a brick wall, and afterwards with a steam car: "but these," he added, "are only little incidents such as beset the first steps in any sort of pastime." Mr. A. Dougill proposed "The Yorkshire Automobile Club," remarking that although that was only their first dinner they had already some thirty members, with an immediate promise of more. Dr. Thresh, in replying to the toast of "The Visitors," recalled having ridden between Wakefield and Bradford on a steam car, weighing about six tons, built by Sir Titus Salt. That was about thirty years ago, and the pace was six miles an hour.

King Edward the Seventh's Steam-Car.

THE 9 H.P. SERPOLLET STEAM-CAR IN COURSE OF CONSTRUCTION FOR KING EDWARD VII. (see page 851).

COUNTY COUNCILS AND THE SPEED OF MOTOR-CARS.

EAST SUFFOLK.

AT a meeting of the Roads and Bridges Committee of the East Suffolk County Council, at Ipswich, on Tuesday, Rev. J. F. A. Hervey presiding, the clerk (Mr. A. Townshend Cobbold) submitted a resolution of the Berks County Council, dated October 30th last, asking County Councils to co-operate with that Council in drawing the attention of the Home Secretary to the way in which motor-cars now traverse the roads, and suggesting that every car should be numbered and registered, and should be obliged to stop when signalled to do so. The Clerk further presented circulars from the Automobile Club, enclosing a copy of a letter which they have addressed to every County Councillor in England and Wales, and copy of the warning sent to the members of the Club and other motor drivers. Lord Rendlesham wrote, saying, with respect to the subject on the agenda, as to motor-cars:—"No doubt they will be very largely used in the future as they become less expensive. Carriages are allowed to drive 12 miles an hour without being interfered with; therefore, it seems to me absurd to wish to limit the speed of motors to ten. It might be advisable for the driver to have a certificate of efficiency from the Board of Trade." The Clerk had also received the following telegram from the secretary of the Automobile Club:—"Permit me to thank members of Road Committee who took drives on automobiles, and humbly express hope that Roads Committee will this day recommend that Councils should, in name of progress and fairness, protest against the proposed ten-mile-an-hour limit as absurd, and that the proposed numbering question should be postponed for six months, in order to ascertain from the police what, if any, complaints there now are of motorists failing to stop when signalled by drivers of restive horses."

Rev. C. J. Steward said that in accordance with the terms of the Berks County Council resolution, he should move that every motor-car shall in future carry a number in front and a number behind. Col. Ward observed that he saw no real reason at all why the owners and drivers of motor-cars should be compelled to carry numbers in a conspicuous place upon their vehicles. He was sure everybody would object to carrying a number on their private dog-cart or carriage. Mr. Mobbs considered it would be unwise of the Committee to go out of their way to compel owners to place numbers on their cars. He had himself a little prejudice against motor-cars in the past, but he must confess that that prejudice was disappearing. He had the pleasure of riding in two of these cars on the previous Friday, and had it been a fine day he believed it would have been the most enjoyable ride he had ever experienced. He was greatly struck by the control exercised by the driver over the car, and was pleased to find that the horses took but very little notice of them. Indeed, they must have passed something like a hundred horses, and of that number only one was particularly frightened. He did not think any restrictions of the kind suggested should be imposed. Rev. C. J. Steward explained that in proposing that motor-cars should be numbered, he thought restrictions as to speed should be done away with. He saw no reason why a man should not drive at twenty, thirty, forty, or fifty miles an hour, provided that the road was clear of traffic, and he was not involving danger to the public. He considered it was a motorist's duty when approaching a horse to slacken speed immediately, and go slowly past, in case the animal might be frightened. It was desirable that every motor-car driver should be certificated by the Board of Trade, and in the event of being summoned for furious driving he should be fined and have his certificate endorsed; if the certificate was endorsed three times it should be cancelled. Mr. Rackham agreed that all drivers of motor-cars should be licensed. The motion was carried by eleven votes to two, and it was also decided, without dissent, to recommend that all drivers of motor-cars should be registered, and should be obliged to stop when signalled to do so.

In regard to the question of speed limit, the Chairman said he agreed with Lord Rendlesham that it would be very unwise to attempt to reduce the present limit. Mr. Fiske observed that his experience of motor-cars during the last day or two was very pleasant, and in good weather and on a clear road he should not have the slightest objection to being driven at twenty miles an hour. Colonel Bixton moved that the Committee recommend that No. 2 sub-section of Article 4 of "The Light Locomotives on Highways Order, 1896," which provided, "Every person driving or in charge of a light locomotive, when used on any highway, shall not, under any circumstances, drive the light locomotive at a greater speed than twelve miles an hour. If the weight unladen of the light locomotive is $1\frac{1}{2}$ tons, and does not exceed 2 tons, he shall not drive the same at a greater speed than eight miles an hour, or if such weight exceeds two tons at a greater speed than five miles an hour," be deleted from the present regulations. The motion was seconded, and carried without dissent.

KENT.

The Kent County Council, at their meeting on Wednesday passed a resolution to the effect that they do not consider twelve miles an hour an excessive speed at which to drive a motor-carriage along a public highway.

CORRESPONDENCE.

MOTOR-CARS FOR MEDICAL MEN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with much interest the letters on this subject, and would like to call attention to one or two points in the discussion. Firstly, there is a great difference between the concrete and abstract; for instance, there is no doubt but that motor-cars are the ideal means of locomotion for medical men in the abstract, but when one comes to the concrete, and asks which motor-car is a perfect one for medical work, it is quite another story. I bought an International Benz in November, 1898, and have been driving it ever since. On the whole it has done very well; it has travelled over 13,000 miles on vile roads and in all weathers; I constantly go 25 miles a day, and sometimes over 30 miles, with comparative ease; that is, the car is quicker than a horse, more convenient, and probably causes less anxiety, but now and then an ordinary civilised vocabulary is not equal to express one's feelings! I think I have had everything go wrong with my car that can go wrong. Much, of course, was due to my own ignorance; at the same time a good deal was not, but to the poor material and workmanship. And the repairs and replacements! The original chains only ran me a few months. I bought a new pair at five guineas, which also only lasted a short time. I now have Brampton's at half the price, lasting double the time. The first tires also came off after a few months' running. I had Connolly's fitted on all four wheels; after a year these split up, and two had to be replaced, Connollys making no reduction for the first bad tire. I have a hood to my car, for which I was charged £15; it was made of American cloth and flannelette, and simply rotted away in a year. I was told I could have a new one for £12! A back axle broke; I had to pay £7 15s. for a new one, also £1 5s. for a front spindle, and so on *ad nauseam*.

Still, I now get all my replacements from Hewetsons, who are most prompt and obliging; and, in spite of all, I would not go back to horses, but would see that I got a strongly-built car, and especially that there should be a possibility of getting parts and replacements without annoying and expensive delays. I thought, of course, that all the little annoyances "on the road" were due to my having only a small £200 car, and I must confess it was a great delight to me to read, in one of your contemporaries, the experiences in a car called "Sir Charles" (with a large number of adjectives attached). The troubles of a small car fade into insignificance beside those of the "great and good," etc., Sir Charles!

To conclude, for a medical man for whose work two or more horses are necessary, who has a natural aptitude for machinery, or who will keep a *mecanicien*, a really good motor is the thing

above all others, but he need not think then even that he will escape worries; these come with everything, but mostly with horses and coachmen.—Yours truly,

A. CHARPENTIER, M.D.

P.S.—My total expenses for the car are about £50 a year.

THE HOUSING PROBLEM.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The scheme put forward by the Right Hon. Arthur Balfour, in his letter which appeared in the dailies on Friday last week, with reference to the use of motor-carriages for public service, has already to a great extent been put into practical shape in various parts of the country. We have made and supplied over 110 motor-vehicles for this purpose to 42 different undertakings. They are mostly used to connect villages with large towns and railway stations; they are, in fact, taking the place of the old carrier cart that has for so many years done necessary and useful work.

The most complete services of the kind, however, exist in Bournemouth and Edinburgh. In the former town one undertaking runs fourteen cars entirely for public service, and recently, in a heavy snowfall, continued running when all horse drawn carriages had to be withdrawn from the roads; but there is another service which approaches nearer to the use to which motor-vehicles can be put suggested by Mr. Balfour. The owners of an estate in the neighbourhood of Bournemouth, called the Canford Cliffs Estate, have organised a system of motor-carriages from there to the town solely for the convenience of their tenants. In Edinburgh the service is run in direct opposition to the corporation tramcar service, which, according to local opinion, is not so reliable as the motor-carriage in regard to time and speed.

London has not yet taken this movement up to any great extent; but we are building motor carriages for two services, one in the north of London, and the other in the south. We understand these are intended to be run between local outlying places and not to the centre of London.—Yours truly,

JOHN H. GRETTON,

Chairman Motor Manufacturing Company, Limited.

THE annual general meeting of the Automobile Club is fixed to take place on Thursday next, the 28th inst.

THE Hozier Engineering Company, Ltd., have appointed Mr. Harold Smith, Colne, Lancashire, their agent for the sale of "Argyll" voituresses in Manchester and East Lancashire, and the southern part of Yorkshire.

MOTORISTS in the Clapham district requiring repairs to their cars will find Mr. Arthur Bills, of 320, Clapham Road, S.W., well equipped for the purpose. Mr. Bills has also a large riding track, on which would-be motor-cyclists could practise riding.

COLONEL JOHN JACOB ASTOR has offered to place at the disposal of the Automobile Club of America, free of all expense, the Maples, an old estate once belonging to the Champlain family, but now a part of Colonel Astor's Ferncliffe, situated on the road between York and Albany. The old mansion is to be fitted up in the most thorough fashion for the requirements of the Club.

MESSRS. RENAULT FRERES, of Billancourt, Paris, write to inform us that since the date of the contract (August 30th, 1900), under which they conceded to the Roadway Autocar Company the exclusive selling rights for their cars in Great Britain and the Colonies, they have stipulated in all their contracts with other firms that the cars purchased by them must not be sold in Great Britain either directly or indirectly.

A CYCLE and motor-car show was held at Northampton last week, at which Mr. J. Grose exhibited a $2\frac{3}{4}$ h.p. quad, with water-cooled head. There was also a motor dogcart built entirely at Northampton, to the order of Mr. J. Harrison. Other exhibits included a Mayfair voituress, and a New Orleans voituress. Messrs. Coley and Co., showed a Singer motor-bicycle, while a Humber motor tricycle was staged on the stand of Mr. A. E. Richardson.

THE FRENCH MOTOR-CAR EXHIBITION.

(From Our Own Correspondent.)

(Continued from page 843.)

THE carriages exhibited by the Société des Anciens Etablissements Panhard et Levassor were eleven in number, seven of these finding space on stand number 33, and the remainder in the heavy vehicle section of the exhibition. As these latter cars do not greatly interest the majority of automobile men, I do not propose to treat them in detail, but will merely signal the presence of an extremely large vehicle fitted

FIG. 1.—THE NEW PANHARD 7 H.P. LIGHT CAR.

with a 12 h.p. motor and designed to carry three tons of coal as load. Upon the firm's principal stand the first car to attract attention was a 16 h.p. two-seated carriage, which, by reason of its rather startling colours—light blue lined red—was very much in evidence. The carriage work is by Rothschild, and the two curved seats are partly surrounded by the petrol tank. The new gear, which requires but a single lever to give the forward and reverse motions and four speeds, is fitted, and the twenty-one teeth sprockets bespeak speed. The new springs are fitted to the rear wheels. A pretty 8 h.p. *tonneau* in natural wood by Felber was also shown, and the footboard in front is provided with a small window through which the driver can see the clutch without descending from his seat. Another *tonneau* was by Boulogne, while the third car of this type was a beautiful exhibition of Rothschild's carriage work. Both these cars were fitted with 12 h.p. motors, as was also a four-seated "spider" carriage built by Belvalette. In this latter example the sides and back of the front seat are done in wicker work, the effect being very pretty. For town use the company showed an 8 h.p. *coupe*, with a small seat behind for a servant. The motor is, as usual, carried in front, and the body is placed upon a dropped frame. The driving is effected from inside the *coupe* and the gear box is placed right at the back of the vehicle. The last of the large cars upon the stand was a 12 h.p. carriage designed to carry seven persons. Here the engine is placed under the front seat. Compound tires are fitted, and, as in the case of the *coupe* the body is by Mulbacher. I have reserved mention of the new light carriage until the last, for this is the company's novelty for the season, and upon this an enormous amount of attention was centred. The specimen shown was a four-seated *tonneau*, carrying in front a 5 h.p. two-cylinder vertical motor, but when desired this engine can be replaced by one developing 7 h.p. (Fig. 1). The ignition is electric, the accumulator being carried on the splash board and at the side of the frame just below the foot pedals. Naturally, tube ignition or electric and tube can be fitted just as the client prefers. The pistons work alternately, and the engine weighs about two hundredweight forty-eight pounds. The new gear is employed, and a single lever actuates the three forward speeds and reverse. Another special feature is the placing of the water-circulating pump in the tank itself. The weight of the car is about eleven hundredweight, and it is speeded up to some

twenty miles per hour. The price of the 5 h.p. *tonneau* is £280, while the same car fitted with the 7 h.p. engine comes out at £340, the motors and frames costing respectively £256 and £316. These figures do not include electric ignition.

MM. Léon Lefebvre et Cie., Rue Emile-Allez, Paris, made an excellent show of vehicles built by them on the famous Bolide system (Fig. 2). First of all there were a couple of enormous racing cars, each propelled by a horizontal motor developing thirty h.p. Needless to say that these cars are designed to carry but two persons. The water cooler is divided, a portion being carried on and a portion below the splash board of the vehicle. The controlling levers are placed at the driver's right hand, and a couple of pedals permit of the moderation of speed and the braking of the car. The three most striking successes obtained by this type of car in last year's events were:—Salon-Arles-Salon, first prize, one hundred kilometres in 1h. 20 min.; the last thirty-seven kilometres of this race were covered in 24 min. 44½ sec., or at the rates of ninety kilometres per hour (56¼ miles); Dyghem, near Brussels, first prize, speed ninety-four kilometres per hour (world's record); second prize, speed ninety kilometres per hour; Gaillon, second prize. The price of the motor and frame, including pneumatic tyres, is £1,000. Outside the racing category one found a four-seated phaeton by Rothschild, fitted with a 15 h.p. engine. Then there was a 10 h.p. *tonneau*-shaped carriage, and a small "spider" car fitted with an engine developing 6 h.p. This latter vehicle weighs some 400 kilogrammes, and measures 1m.05 in width, by 1m.35 wheel base. The motor propelling it is of the single cylinder horizontal type, measuring 120 mm. in diameter, and 120 mm. in stroke. The water circulation is effected automatically without employing a pump, and the speed of the engine is nine hundred revolutions per minute. The transmission is by means of a friction cone, commanded by a foot pedal, and by a set of pinion gears enclosed in a case. A single lever is utilised for actuating the three forward and reverse speeds, and in the case of the large cars the steering is of the sloping wheel type. The most striking novelties in connection with all these latest productions of MM. Lefebvre et Cie. are the carburettor, the system of ignition, and the means employed for readily verifying this latter. The first-named is remarkable for its double valve, permitting admission to the motor without changing the carburation, so giving exceptional suppleness to the motor,

FIG. 2.—THE 10 H.P. BOLIDE SPIDER.

and economising considerably the consumption of petrol. Regulating the pulverising types of carburettors has always been a difficulty, but MM. Lefebvre et Cie. claim to have now quite overcome this drawback. Moreover, it is stated that the employment of this type of carburettor suppresses very considerably the noise produced by the exhaust, for one is enabled to admit but the minimum of gas into the cylinders and there explode it—by advancing the ignition—considerably in advance of the opening of the exhaust valves. Turning to the ignition, we find that the ordinary flat spring trembler has been dispensed with, its place being taken by a

spiral spring arrangement somewhat similar to that now in use by the Decauville Company, and described in a recent issue of the *Motor-Car Journal*. The plug used is insulated with mica, and is guaranteed three months' wear. The third novelty is the small apparatus employed for verifying the state of the electric ignition. The method usually adopted is to try the sparking plug in open air by withdrawing the induction valve. But this system is entirely wrong, for the conditions are totally different. When in work there is a very considerable pressure existing in the cylinder, which, with the removal of a valve entirely disappears. Without pressure the spark will often appear quite effective, but subject to some eight or ten pounds of pressure it cannot be produced. Now the "Bolide" apparatus permits of the testing of the sparking plug under conditions approaching those existent during its actual work, and by means of a small glass one can see whether or no the spark is produced as it should be. One can well imagine what a boon such a contrivance is to all automobilists who make use of a vehicle possessing electric ignition. It is small and light, and can be used in connection with no matter what type of sparking plug and no matter what make of tyre pump, for an air pump has naturally to be used to create the necessary pressure. The small model costs twenty francs, the larger one, with pressure gauge and joints for two types of sparking plugs and two makes of air pumps, comes out at seventy-five francs.

Except in the matter of carriage work there was no new feature to be found in the voitures exposed by MM. de Dion et Bouton, Puteaux (Seine). The novelty in this direction was a daintily designed double phaeton fitted with an awning, and somewhat similar in appearance to the small red Peugeot so familiar to Parisians. The other cars shown were a couple of

FIG. 3.—THE DE DION TRICYCLE WITH 2½ H.P. MOTOR WITH WATER-COOLED HEAD.

four-seated carriages, the one fitted with a hood, a hooded car designed to carry two persons, and a light delivery car. Nothing new in all this, but I was given to understand that the firm are busily engaged upon the design of a new *chassis*, in which the motor will be placed in front. Upon the stand there were to be found several examples of motor-tricycles and quadricycles (Figs. 3 and 4), and of the uses to which the firm's motor may be put, apart from the question of horseless vehicles. A handsomely-finished pumping apparatus driven by a water-cooled engine developing 1½ h.p., and a dynamo plant worked by a 3 h.p. motor of the same type, were of special interest to owners of country houses, where so often the light and water questions present serious difficulties. The dynamo is capable of supplying forty sixteen candle-power lamps, and, of course, can equally well be employed for recharging accumulators. A 4½ h.p. water-cooled motor and a complete set of gear for a boat were also exhibited, as well as a number of motor tricycles and quadricycles. In the heavy vehicle class MM. de Dion et Bouton showed some large steam-cars, which attracted considerable attention. The omnibus appeared to be a

very workmanlike and serviceable vehicle, with the steam boiler and engine in the front, and a long omnibus body behind. The van was of the same construction, but the omnibus body was replaced by a flat lorry-like construction with railed sides.

FIG. 4.—THE DE DION QUADRICYCLE WITH CLUTCH AND MOTOR WITH WATER-COOLED HEAD.

Many of these omnibuses are now running in the public service in various towns in Spain, and giving great satisfaction.

Messrs. Henri Lessieux and Co., of Rethel, Ardennes, claim to have been the first to introduce the universal jointed shaft for power transmission in light cars, and they have naturally applied this system to the voiturette they exhibited under the name of the "Ardennaise." The motor is of the two-cylinder V type, and develops 5 h.p. The cylinders are provided with ribs for air cooling and with four culasses, or breeches, two being ribbed, and two cast with water jackets, so that the owner may employ one or the other, according to the conditions under which he is using the vehicle. The change-speed gear operates directly on the rear axle. The steering spindle is inclined, and, if desired, it can be arranged to be kept under tension by a spring, so that, if left to itself, it comes back to the point which keeps the front wheels in a perfectly straight line. The vehicle exhibited took the form of a light *tonneau*.

FIG. 5.—THE RENAULT 5 H.P. COUPE (See issue February 9, p. 824.)

Messrs. E. Delahaye et Cie., Rue du Banquier, Paris, made a big display of cars, but there is no alteration in the mechanism except that 6 h.p. motors are being fitted to their light carriages instead of motors of 5 h.p. as heretofore. A new type of vehicle in the form of a victoria with four seats was staged, as also an elegant *tonneau*-shaped car.

One of the most striking novelties in the Salon was a dainty little voiturette shown under the name of La Mouche by Messrs. Teste, Moret, and Co., of Lyons (Fig. 6). It is fitted with a small De Dion water-cooled motor, and is more or less on quadricycle lines, but is remarkable for its carriage-work. The body is in

FIG. 6.—MESSRS. TESTE, MORET'S, LOUIS XV. VOITURETTE.

Louis Quinze style throughout, heavily gilded, and with decorated panels and lamps to match. The upholstery is in pink satin-plush, and the steering-wheel is padded with the same material. It is, of course, a fanciful creation, and not seriously intended for general use. The ordinary cars of the company, so far as low-priced vehicles go, were well worthy of inspection.

La Compagnie Française de Voitures Electromobiles, Rue Cardinet, Paris, had on view a couple of electrical cars. Originally this concern constructed all their cars on the Bersey system, with the batteries suspended underneath the vehicle, and though this method is still employed on public cabs, it has been found preferable in carriages built for private users to place the batteries in the body of the vehicle. One of the carriages exhibited took the form of a four-wheeled hansom, and was propelled by two motors geared directly on to large spur wheels fixed on the rear road wheels. The other vehicle was fitted with the well-known Doré transmission, consisting of a vertical shaft geared on to the front axle.

The Liberia cars were shown by V. Mathieu, Rue Taitbout, Paris. They are fitted with Aster water-cooled engines in the fore part of the frame. A very powerful light racing car was shown fitted with two coupled Aster 6 h.p. motors. An omnibus or hansom type of vehicle was shown, in which the passengers sat in the rear part, with a glass door and window, the driver and another passenger being provided with a seat in front. A glass front protects them from the weather. This was provided with a 6 h.p. engine. The transmission is similar to the Panhard system, and the change speed, reversing, and clutch are operated by one lever in the same way.

Messrs. J. B. Clément et Cie., Boulevard de Courcelles, Paris, exhibited two cars, a *tonneau* and spider, each weighing 350 kilogs. The firm have modified their old system of double chain transmission by adopting a shaft with friction clutch and a new system of change speed gear, but they still preserve a central chain for transmission from the countershaft to the rear driving axle. The power is supplied by an Aster water-cooled motor. Inclined wheel steering is adopted, all the levers being grouped around the standard in a compact and handy form.

La Maison Parisienne des Voitures Automobiles, Avenue de la Grande Armée, Paris, are no longer confining themselves exclusively to Benz cars, but exhibited a couple of electric vehicles on the B.G.S. system. The company also displayed a couple of Benz vehicles—the one a light car for two persons and the other a small van.

La Compagnie Internationale des Transports Automobiles, Rue de la Victorie, Paris, exhibited, among others, a new combination electrical and petrol vehicle designed by M. Jenatzy. A petrol motor drives a dynamo, which charges a battery of accumulators when the full force of the motor is not employed on the level and on the down grades; when it is necessary to overcome resistance, either uphill or otherwise, the energy stored in the battery is utilised, the dynamo then of course acting as a motor. The car shown was of the Mors racing type fitted with one of the old Mors 6 h.p. motors, but we were informed that this was merely a demonstration, and that the company intend to manufacture their own petrol motors. The dynamo on the motor-shaft has an output of 108 kilowatts, or close upon 14 h.p., so that with the aid of a petrol motor, as much as 20 h.p. can be utilised in case of emergency. The battery of forty-four cells weighs 170 kilogs, and is placed in the body of the car over the rear axle. The capacity of the battery will allow of the car being driven about twenty miles at slow speed in the event of an accident to the petrol motor. The total weight of the car is about a ton.

M. E. Chaboche, Rue Rodier, Paris, exhibited a heavy steam omnibus and wagonette. An interesting novelty, in the shape of a light carriage for two persons, attracted much attention. The boiler at the rear has a heating surface of four mètres, and is fired by paraffin instead of by coke, as in the larger vehicles. The propelling mechanism consists of a two-cylinder horizontal motor of 5 h.p. placed in the forepart of the carriage. Power is transmitted from the motor-shaft to the rear axle by a central chain. The liquid fuel is carried in a cylindrical tank in front of the car, and the consumption of oil is said to be about one pint a kilomètre. The water tank has a capacity sufficient for two hours' running.

M. E. Buchet, of Levallois-Perret (Seine), exhibited several 6 h.p. air-cooler motors, chiefly intended for quadricycles and voiturettes. M. Buchet also displayed several water-cooled motors

FIG. 7.—THE BUCHET 24 H.P. 4-CYLINDER MOTOR.

upon the same system, including one of four cylinders, with the piston rods operating the same crankshaft and developing 24 h.p. for large carriages (Fig. 7).

The Société Française des Automobiles (Gaillardet), Quai de Suresnes (Seine), exhibited one of each of their two standard patterns of vehicles, known as the "Doctoresse," of 6 and 12 h.p. respectively, and of which we hope to give an illustration in an early issue. It may be remarked that the company undertake to carry out all repairs to their cars, from whatever cause the damage may arise, for three years, at an annual cost which will not exceed 300 francs, so that the owner knows that his expenditure will be kept within reasonable limits.

(To be continued.)

THE CORMERY MOTOR AND MOTOR-TRICYCLE.

AMONG the new types of motors recently placed upon the French market, that devised by M. Henri Cormery, of Baugé (M. and L.), deserves special attention, for it contains some distinctly novel features, the system adopted being a remarkably ingenious one. In the construction of petrol motors the four-time, or "Otto" cycle, is that almost invariably adopted, and the employment of valves is universal. The Cormery motor works upon a two-time cycle and possesses no valves. These are the engine's two distinguishing features, and the method employed to arrive at this result is shown in the accompanying drawing. In this sketch (Fig. 2), which illustrates a single cylinder vertical motor constructed upon M. Cormery's system, *a* is the cylinder in which works the piston *b*. The lower side of this piston is elongated, so that its depth is one and a half times its diameter. It is jointed to the connecting rod *c*, which communicates the movement to the crank *d*, carrying two balanced fly-wheels, *e*, *e*. These fly-wheels are confined in a hermetically-sealed crank-chamber *f*, which is provided with a plug *g*, and attached to the side of which is a box *h* containing the usual arrangement of electric ignition. The cylinder *a* is pierced at *i* to permit of the escape of the exhaust and at *k* to allow of the admission of the explosive mixture. Moreover, the cylinder is connected with the crank chamber by means of a tube *l* containing a safety box formed of a number of asbestos washers *m* holding between them the metal netting *n*. This safety box, which should have a diameter of at least double that of the tube connecting the cylinder with the crank chamber, has for objects the prevention of the firing back of the explosive mixture, the filtration of the gas and the prevention of oil in the crank chamber being drawn through into the cylinder. The cylinder head *p* carries an ignition plug *o*, and is fitted with a compression cock *q*. Such is the disposition of the motor; let us now look at its manner of working. The piston *b* being at the lower extremity of its stroke it commences to ascend with the turning of the starting handle. In doing so it uncovers the orifice *k* through which is immediately drawn a supply of gas coming from the carburettor. Having reached the extremity of the upward stroke the piston commences to descend, compressing in the action the gas, which, unable to escape by the orifice *k*, now shut, does so by the tube *l*. By this time the inlet *r* and the outlet *i* are both open, and the explosive mixture entering by the former would escape by the latter were not the

FIG. 1.—THE CORMERY MOTOR-TRICYCLE.

guide *t* so placed upon the piston *b* as to direct the gas upwards towards the explosion chamber *s*. If one considers the passage of the piston before the orifices of the cylinder as *one* time it will be seen that the exhaust is open twice as long as the admission, so considerably diminishing the resistance. The exhaust is then

open during two periods on the down and two periods on the up stroke of the piston, whereas the admission is but open one period each way, and it is by this disposition that the inventor claims to have overcome the great difficulty of the resistance of the exhaust. The characteristics of the engine may thus be summarised:—1. The utilisation of the crank chamber for the aspiration and the partial compression of the explosive mixture. 2. The long piston stroke assuring the utilisation of the expansive force to the best advantage. 3. The realisation in a valveless two-time motor of a normal and useful compression as

FIG. 2.—SECTION OF CORMERY MOTOR.

obtained in the best types of engines working on the four-time cycle. 4. The diminution of the resistance of the exhaust by retaining open the outlet twice as long as that of the admission. 5. The simplicity of construction; no valves with all their complications existing in the engine. 6. The force; for, given equal cylinder diameter and consumption of fuel, this motor develops nearly twice the horse-power of the four-time model. 7. The increase of cooling power secured by the disposition of the exhaust, and the comparatively low rate of speed at which the motor runs, for whereas the engine of similar dimensions revolving upon the "Otto" cycle makes from 1,460 to 2,200 revolutions per minute, this two-time motor only runs at from 650 to 850. The lubrication of M. Cormery's engine is effected by means of a lubricator working under pressure, and from which the oil passes into the cylinder through an orifice placed below the orifice of induction. Fig. 1 depicts one of these motors attached to a tricycle, and this machine has already done some most excellent work. Of course, the system can be equally well applied to water-cooled engines and to motors possessing two or more cylinders, and this quite irrespective of the position of the cylinders. For example, M. Cormery has constructed a motor in which the two cylinders are placed end to end, the explosion being produced by means of a single sparking plug at the moment when the two pistons are most closely approaching one another. The future of this ingeniously contrived engine will be watched with interest, for it marks a departure from the beaten track hitherto followed by constructors of light oil motors.

AN automobile battle of flowers is to take place at Hyeres, in the South of France, on the 28th inst.

ROWLAND HILL, King Street, Coventry, is establishing a very large trade in motor castings, in iron, gun metal, aluminium and phosphor bronze.

OVER twenty County Chief Constables have promised to attend the Automobile Club on Tuesday next, the 26th instant, and it is hoped that members will bring or send their carriages for the demonstration at eleven o'clock on that morning.

THE PAU AUTOMOBILE WEEK.

EVER since the early part of last week the old French town of Pau has been invaded by *chauffeurs* and their cars. The race meeting proper commenced on Friday, the 15th inst., with a course for tourists from Pau to Peyrehorade and back, the distance being 140 kilomètres (87½ miles).

The start was made at 11 a.m., the following being the official return as to the result:—

Prix de la Presse (2 seated cars)—1, Bergeon (10 h.p. De Dietrich), 3h. 30min. 5sec.

Prix du Commerce (2 seated touring cars)—1, Henri Farman (12 h.p. Darracq), 2h. 20min. 30sec.; 2, Lafitte (12 h.p. Panhard), 2h. 58min. 45sec.; 3, Guillemin (12 h.p. Panhard), 3h. 44min. 20sec.

Prix des Cercles (4 seated cars)—1, Rudeaux (12 h.p. Darracq), 2h. 43min. 57sec.

Prix de l'Automobile Club Bearnais (6 seated cars)—1, Bergeon (10 h.p. De Dietrich), 5h. 40min.

Prix de l'Automobile Club (voiturettes)—1, Edmond, 2h. 24min. 17sec.; 2, Marcellin, 2h. 26min. 31sec.; 3, Demester, 2h. 38min.; 4, Oury, 3h. 14min. 20sec.; 5, Cornilleau, 3h.; 6, Cramail, 4h. 27min. 55sec.; 7, De Seeger, 4h. 32min. 40sec.; 8, Fessart, 4h. 44min. 15sec.

Prix du Palmarium (motor-cycles)—1, Cornier (4 h.p.), 4h. 32min. 25sec.

The principal event of the meeting was the Circuit du Sud Ouest, which took place on Sunday over a 340 kilomètre (211 miles) course. The following were the entries:—

Grand Prix de Pau (cars).—1, Lorraine Barrow (Mercedes); 2, Knapp (Daimler); 3, Maurice Farman (Panhard); 4, Henry Meyer (Darracq); 5, Paul Meyan (Panhard); 6, Ribeyrolles (Darracq); 7, Marcellin (Darracq); 8, Charron (Panhard); 9, Gordon-Bennett (Napier); 10, Girardot (Panhard); 11, Bergeon (De Dietrich); 12, Magendie (Mors); 13, Pascault (Mors).

Grand Prix du Palais d'Hiver (voiturettes).—1, Ribeyrolles (Darracq); 2, Marcellin (Darracq); 3, Henri Farman (Darracq); 4, Cottureau (Cottureau); 5, Pinaud Duanip (Boyer); 6, Barras (Boyer); 7, Rudeaux (Darracq); 8, Legrand de Monbel (Boyer); 9, Cornilleau (Decauville); 10, Girardot (Panhard); 11, Schrader (Renault); 12, Oury (Renault); 13, Théry (Decauville); 14, Caillois (Renault); 15, Renault (Renault); 16, Demester (Renault); 17, Edmond (Darracq); 18, Bonneville (Darracq).

Prix du Béarn (motor-cycles).—1, Labadie; 2, Béconnais; 3, H. Loste; 4, Favier; 5, Cormier.

Last year this race was won by M. René de Knyff, in the astonishing time of 4h. 46min. 57sec., but this year the record was beaten by nearly 19min.

Especial interest attached to the race from the fact that one of the competitors was driving a car that is destined to take part on behalf of Germany in the Gordon-Bennett Cup race on May 29th. This was the Daimler-Mercedes car of M. Lorraine Barrow, but owing to the fact of its clutch slipping it retired from the race immediately after the start. The winner proved to be M. Maurice Farman, who completed the course in 4h. 28min. 10sec., or an average of 47 miles an hour. His car was a 24 h.p. Panhard. M. Girardot was second, also on a Panhard, in 5h. 44min. 5sec.; he collided with a sand-bank on the way, and buckled his wheels.

The results of the various races of the day are given below:—

Grand Prix de Pau.—1, Maurice Farman (24 h.p. Panhard), 4h. 28min. 10sec.; 2, Girardot (24 h.p. Panhard), 5h. 44min.; 3, Bergeon (De Dietrich).

Grand Prix du Palais d'Hiver.—1, Henri Farman (12 h.p. Darracq), 5h. 24min. 19sec.; 2, Edmond (12 h.p. Darracq), 5h. 55min. 40sec.; 3, Louis Renault (8 h.p. Renault), 6h. 25min. 10sec.; 4, Oury (4 h.p. Renault) 8h. 7min.

Prix du Béarn.—1, Osmont, 5h. 24min. 35sec.; 2, Gasté, 5h. 52min. 25sec.; 3, Béconnais, 5h. 55min. 50sec.

SEVERAL Glasgow motor-car owners made their journeys to and from the Edinburgh Cycle Show last week *en automobile*.

HERE AND THERE.

THE Duke of Sutherland is one of the latest candidates for membership of the Automobile Club.

"A. W. P." writes that the last sentence in his letter in our last issue should have commenced "And why," etc.

MESSRS. JOHN MARSTON, Ltd., Wolverhampton, have issued a useful book of instructions for the use of purchasers of their Sunbeam car, illustrated in our last issue.

IN the action brought in the Court of Chancery by the Agricultural Hall Company (Limited) against Messrs. Cordingley and Company, judgment was given on Thursday morning in favour of the plaintiffs. Notice of appeal was given.

THE French Automobile Club, to celebrate the closing of the successful Salon d'Automobiles et Cycles last week gave a banquet and theatrical evening, which were attended by all the leading lights in the French automobile world.

It is understood that at the forthcoming annual general meeting of the Cyclists' Touring Club, a proposal will be placed before the members that the privileges of the C.T.C. should be extended to automobilists.

TESTING THE FABRIK EXPLOSIONS-SICHERER GEFÄSSE'S SAFETY PETROL CASK (see page 847 last issue).

AN enterprising person in Chicago is arranging a special motor-bus service for the large department stores, for the transportation not only of their patrons to and from their homes, but of their help to and from their homes. Later he intends arranging a service for the large office buildings, which, at a moderate rate, will convey their occupants from door to door between home and office.

MR. WILLIAM K. VANDERBILT, jun., alarmed by the order of Mr. Clarence Mackay for a 32-h.p. Panhard, is reported to have cabled an order to Paris for a 42-h.p. racer with a possible speed of over 75 miles per hour. The new racer is to be completed by the time Mr. Vanderbilt starts homeward from Europe in the spring, and will be shipped from Paris to New York direct from the makers.

IN Forfar Sheriff Court on Tuesday Sheriff Lee heard evidence in the action in which James Macfarlane, cycle and motor-car dealer, Perth, sued Alexander Ross French, dentist, Forfar, for the sum of £135, being the price of a motor-car said to have been purchased by defendant in June last. The defence was that the purchase of the car had not been concluded, and that the car not being of the description, power, or capacity represented by pursuer, and not being suitable or fit for the purpose for which it was offered or required, the defendant, even if a sale had taken place, was entitled to reject as he had rejected it. Defendant conducted his own case, which, after lasting all day was adjourned.

THE SIZE OF WHEELS.

THE question of the size of the road wheels for motor-cars is one which is attracting considerable attention, and like other questions has two sides. The small wheel is stronger and cheaper. The large wheel rides easier and lasts longer. The manufacturer naturally prefers the small wheel because of its smaller cost. The buyer may be supposed to prefer the easier riding and more costly construction. The small wheel makes the vehicle appear relatively larger, and if the buyer is buying for appearances rather than for utility he will apparently get more for his money by buying a small-wheeled car. For this same reason he will probably select tall and ill-proportioned vehicles rather than long, wide, low, comfortable, and easy riding cars. If, however, he desires the best results he will select a vehicle with large wheels, large tires, long springs, low hung body, long wheel base, and with the passenger seats as far from the forward wheels as may be. He will select the large wheel because it makes less revolutions, does not drop into holes so deeply, does not rise so quickly over obstructions, does not wear out the tires so quickly, nor compress the tires so much to carry a given load. It may be argued that these points are theoretical rather than practical, but the experience of years in two other lines points to this decision.

The foregoing are the opinions of Mr. Charles E. Duryea, who, in an American contemporary, remarks that horse vehicles used all sizes of wheels, but the majority of them are equipped with wheels approximately 4ft. in diameter. The use of elastic tires will permit a somewhat smaller wheel. How much smaller, is the question. In the cycle business wheels were tried of all sizes from 24in. up, and, although 24in. and 26in. wheels were cheaper, lighter, and stronger than larger ones, no argument could persuade the public to accept in quantity any size except 28in. This size carried cycle and rider, a total weight of less than 200 lbs., or an average weight of 100 lbs. per wheel. It would seem to need no argument that if this size is right for cycles (and such was the verdict of the public) a larger size is necessary and right for automobiles, which carry two to ten times as much load per wheel. Either this reasoning is correct or else we must conclude that the public in their verdict of 4-foot wheels, with steel tires for horse vehicles and 28in. wheels, with pneumatic tires for cycles, did not know what was right. If history teaches us anything it certainly indicates that a wheel should be much larger than 28in. for all around motor-vehicle use. Having admitted this, the next question is, how much? The writer's first vehicle used ordinary carriage wheels and his first pneumatic tired machine used 44in. and 48in. wheels. He next used 34in. and 38in., which have been proved by five years of use to be very satisfactory sizes. He next tried 30in. and 34in., but decided that the rear wheels were too small, and on account of this experience are now using 30in. front and 36in. rear.

There is no question but that this combination, coupled with large tires and long springs, makes the easiest riding motor-vehicle yet shown, and it is the writer's opinion that a 36in. wheel is as small as should be used under two or more persons. This wheel is much nearer cycle size than ordinary horse-vehicle wheels, and it is quite probable that larger sizes would show better results. Wheel makers have no difficulty in making their product carry large loads under all conditions when drawn by horses, and there is therefore no reason to believe that automobile wheels cannot do likewise.

THE BENZ MOTOR COUPÉ.

WE are this week able to give an illustration of still another of the many types of cars built by Messrs. Benz and Co., of Mannheim, Germany—a my-lord coupé for five or six persons. The motive power is supplied by a two-cylinder horizontal engine, developing up to 10 h.p. The transmission is on the well-known Benz system, three speeds forward and a reverse motion being provided for. The car can

attain a speed of twenty miles per hour on the level, and ascend gradients of 1 in 5. Usually solid rubber tires are fitted, but these can be substituted by pneumatics if desired. The body is so arranged that it can be quickly converted into an open victoria. The weight is about 1 ton 2 cwt. It is hardly necessary to add that the agents in this country are Messrs. Hewetsons, Limited.

THE BENZ MOTOR-COUPÉ.

THE Competitions Committee of the Automobile Club have agreed to receive a deputation from the Committee of the English Motor Club, to discuss matters in connection with the competition rules of the A.C.G.B.I.

A SALE by auction of a number of De Dion and other motors, 18 motor-tricycles, etc., from the works of Messrs. Paris, Singer and Company, Clapham, S.W., is to be held by Messrs. Fuller, Horsey, Sons and Cassell, on Thursday, March 7th.

At a meeting of the French Automobile Club last week, it was decided that the tourists in the Paris-Berlin race will start on June 25, and the racing section on June 27. The race will be divided into three sections: (1) Paris Aix la Chapelle, (2) Aix la Chapelle-Hanover, and (3) Hanover-Berlin.

A PRACTICAL illustration of the working of a device known as Compin's patent springs was given at the Hotel Cecil last week. The contrivance is intended to supersede the old spiral springs with which nowadays the average carriage-cushion is fitted, the invention being claimed to reduce vibration.

THE Roadway Autocar Company, Limited, of Berners Street, W., will shortly have on hand some powerful Mors cars which they propose to fit with wagonette, char-à-banc, or other bodies suitable for private hire or local service work. They are prepared to co-operate with persons interested in this class of motor service.

THE ROYAL AGRICULTURAL HALL COMPANY,
LIMITED, v. CORDINGLEY.

In the High Court of Justice, Chancery Division, on Tuesday, the 19th inst., before Mr. Justice Byrne, the following case was heard. Mr. Levett, K.C., and Mr. Sebastian appeared for the plaintiffs, Mr. T. Terrell, K.C., and Mr. O. Leigh Clare, M.P., instructed by Mr. Staplees Firth, appeared for the defendant.

Mr. Levett: If your Lordship pleases, the question in this action which your Lordship will have to decide is simply this—what is a cycle? It is rather a curious question for an action. The action is an action without pleadings, and if your Lordship looks at the writ you will see what is claimed. The plaintiffs are the Royal Agricultural Hall Company, and the defendant is one Charles Cordingley. The claim is "for an injunction to restrain the defendant, his servants, tenants, licensees, and agents from showing or exhibiting, and to restrain the defendant from enabling or permitting to be shown for sale or otherwise at the Royal Agricultural Hall, Islington, at any time or times during the period commencing the 9th day of April, 1900, and ending on the 9th day of May, 1900, any goods, articles, or things other than such as are included in the engineering, sanitary, laundry, or motor-car trades, and especially any cycles of any kind or description." Your Lordship notices the times. The only question is now a question of principle. The case arises in this way. Your Lordship heard, in another case, a great deal about the Stanley Show. The Stanley Show have an agreement with the Agricultural Hall. If your Lordship looks at the endorsement of the agreement outside you will find it lasts for seven years, from 1898 right down to 1904. There is a clause in that agreement—

Mr. Terrell: Is it material against me what is in another agreement between other parties?

Mr. Levett: It explains the action.

Mr. Justice Byrne: I have not heard who the parties are.

Mr. Terrell: My client is a man called Cordingley, who has an agreement of his own.

Mr. Levett: It is a material part of my evidence why I had to take this action. It will not affect the question of cycle or no cycle.

Mr. Justice Byrne: Does your client act under the Stanley Show agreement?

Mr. Terrell: No, he has an agreement with the Agricultural Hall Company, and he is sued for a breach of that agreement. What an agreement which the company has with somebody else has to do with it I do not know.

Mr. Justice Byrne: I do not know enough about the circumstances to say yet.

Mr. Levett: Very well, I will go straight to his agreement. It is an agreement on the 27th June, 1899, made between the Royal Agricultural Hall Company and Charles Cordingley [reading from agreement].

Mr. Justice Byrne: Paragraph 5 is important, I suppose?

Mr. Levett: Yes. "The tenant shall use the said premises during the period of tenancy for the purpose of an Engineering, Sanitary, and Laundry Exhibition and Motor-Car Exhibition (hereinafter called 'the said Exhibitions'), and for the purpose of preparing for the said exhibitions, and of clearing away after the close thereof, and for no other purpose or purposes whatsoever, and no goods, articles, or things, other than such as are included in the above-mentioned trades, and especially no cycles of any kind or description are to be shown or exhibited for sale or otherwise, these prohibitions being inserted not by way of an admission that apart from them any such goods, articles, or things might be exhibited even as accessories to the said exhibition, but by way of express notice to the tenant that under no circumstances can such exhibits be allowed." That is pretty clear that he is not to exhibit cycles. Then rider A. comes in at the end of 8. The important one is 10. [Read clause 10.] I think those are all the material sections; it turns on 5 and 10.

Mr. Terrell: 9 deals with motor-cars: 9 will be material with regard to something else.

Mr. Levett: I will read it. [Read clause 9.] In that state of affairs the defendants proceeded to issue a catalogue of their Exhibition. I will first take the outside of the catalogue, "Catalogue of the Automobile Club's Motor-Car Exhibition." The first page advertises "Progress" Motor-Cycles, and the advertisers are the Progress Cycle Company, Limited, Coventry.

Mr. Justice Byrne: It says Stand 90; was this a stand belonging to the defendant?

Mr. Levett: This is the defendant's own catalogue; they run the show.

Mr. Justice Byrne: So they were proposing to exclude these Progress Motor-Cycles.

Mr. Levett: On page 3 there is an index of exhibitors. Each person who is an exhibitor hires a stand from the defendant. On page 6 it is again called a motor-car exhibition. Now we come to look at the different stands. On page 23 we get a catalogue of exhibitors and exhibits. The first one there is no doubt we will agree is a genuine motor-car. If your lordship will turn on your lordship will see motor-cars.

Mr. Justice Byrne: Then you get to a type which gets very much like a motor-cycle. It is a carriage, but it is not much more of a carriage than the Progress cycles.

Mr. Levett: Then passing on to page 57, that is the first one where we get what we complain of. Here we have the Eadie quadricycle. I need not read the description about the Dunlop tires, rims, axles, with which the wheels are fitted. Then there is the "Eadie motor-tricycle, with

'avant train,' for converting into quadricycle. Then "Eadie motor cycle fittings; including ball head, with patent front forks, bottom bracket, with clutch, machined lugs, stay ends, etc." That is the first one we object to. Passing on to page 63, "Sternoline rust preventative for motor-cars and cycles," and the last line of that "Varicus other specialities for autocars, motor-cars, motor-cycles, etc." Passing on to Stand 43 on the same page "These tires are made in all sizes from that for the cycle to that for the largest motor-car." Now Stand 46, on page 65, "The latest pattern Phebus Aster tricycles, with front attachment for quadricycles, 1900." A little lower down you get Gladiator tricycles and quadricycles, "with the latest 1900 improvements." On page 69, Stand 52, "Motor Quad" — that means quadricycle—"2½ genuine Dion engine. Two speed gear. Grappler tires." Passing to page 85, Stand 76, "One Burgess tricycle."

Mr. Justice Byrne: Does your objection extend to the cycles moved by motive power?

Mr. Levett: Yes I am going to define a cycle as that which is or may be moved by pedals—a motor-car has no pedals—anything you can work by your feet.

Mr. Justice Byrne: Then what do you say to those you work with your hands?

Mr. Levett: I think they have gone out of fashion.

Mr. Terrell: I saw one yesterday.

Mr. Justice Byrne: They are not common. They are used by people not able to use their legs.

Mr. Levett: There are none exhibited here.

Mr. Justice Byrne: There was another invented which used the action of an oarsman.

Mr. Levett: I do not see how they can be called cycles. They would not even be velocipedes. I do not know what they would be.

Mr. Justice Byrne: It is only with reference to that particular definition.

Mr. Levett: We define the trade meaning of "cycle" as, "worked by pedals." It is perfectly immaterial whether you add to that a mechanical contrivance and use electricity or oil or whatever it is. The essential difference between a cycle and a motor-car is, one has pedals and one has not.

Mr. Justice Byrne: Those motor-cycles have pedals.

Mr. Levett: Yes. Stand 76, "one Burgess tricycle fitted with 2½ h.p. auto-moto engine with new exhaust valve lift, Clipper tires, band brakes to front wheel and back axle." The last line, "one Burgess fore carriage to convert Burgess tricycle to quadricycle, fitted with Clipper tires." There are some more of these.

Mr. Terrell: You need not go through all of them. I should have thought one instance would have done. Let my friend take the best he has got and try it on that. We are trying a question of principle.

Mr. Levett: We are trying what is a cycle. It is not immaterial to find that in all these advertisements. The cycles come first and the vehicles come later.

Mr. Justice Byrne: Not all of them. Just then I came across another instance: "Tires for heavy cars and light motor-cars."

Mr. Terrell: If the question of priority settles it I am entitled, because they are always called motor-cycles.

Mr. Levett: Take page 93, stand 90, "One motor-tricycle, two quadricycles, and a small motor-car." Page 97, stand 14—that is in the annexe—"Cycle lamps, cycle axles." Below that, stand 16, "Motor-cycle lamp; acetylene motor-cycle lamp accessories." I need not trouble about any more. Will your Lordship look at the last page of all. I say the one in the left hand corner is a motor-car because it is without the pedals. The one half way down the page is a motor-cycle because it has got pedals, and the one at the bottom is a motor-cycle too, because it has got pedals as well. Your Lordship will see the names given on the outside. That motor-car is called a voiturette. The second one is called a tricycle, and the third is called the De Dion motor quadricycle. I think if my friend wishes we will take that as a test case, whether those two are cycles.

Mr. Terrell: I am perfectly entitled to succeed if I succeed on one case.

Mr. Levett: My friend's suggestion reminds me I have omitted to notice that in the schedule there is a clause which makes the agreement with the Stanley Show relevant—the second paragraph of the schedule. [Reading a paragraph.] Having had notice he cannot interfere with what I have given to the Stanley Show. That brings in the Stanley Show agreement, and what the Stanley Show agreement says is this—

Mr. Terrell: I submit that that does not bring in the Stanley Show agreement.

Mr. Levett: I can give evidence what the privileges are.

Mr. Terrell: You have not sued me for that; you have sued me for a simple breach of my agreement in exhibiting cycles.

Mr. Levett: It is a breach of both. I have simply sued you for an injunction to restrain exhibiting cycles during that month.

Mr. Terrell: The question is, have I agreed not to exhibit cycles in the sense in which you use the word. That is all.

Mr. Levett: You may be breaking that clause of the schedule.

Mr. Terrell: The action is not based upon that. The action is based upon the agreement. The affidavits which were used upon the motion and upon which no pleadings were to be delivered are based simply upon the agreement.

Mr. Justice Byrne: Mr. Levett, there will be a difficulty about that. Suppose you had granted a licence to do a certain thing, and you afterwards grant a licence to do something included in that to somebody

else, in that case you could not say that was to prevail over his rights under this agreement.

Mr. Levett: No, I do not think I could. It fixes him with notices of what all the other agreements were, to date. He is not to do anything contrary to any existing agreement.

Mr. Justice Byrne: If that infringes any right you have granted him he could counter claim for damages, because you have not fulfilled your agreement. It would not do for you to render nugatory the whole of his agreement because you had granted to other people certain licences. There is nothing here which says it must be of the same date.

Mr. Levett: In the schedule part of the agreement he has got notice of other agreements, and he cannot object to evidence of what they are.

Mr. Justice Byrne: That is the worst of having no pleadings. Your writ is confined specifically to the things named in the agreement. Is not that really your case? We quite understand, and everybody knows this is a cycle show. You may give evidence, if you like, that there are numerous exhibitors of cycles in the place. Mr. Terrell will not deny that.

Mr. Terrell: All I object to is my agreement being construed by another document to which I am not a party.

Mr. Levett: My friend complains about this. It is the evidence on the motion. (Reading from affidavit.)

Mr. Terrell: Call him now and let him give that evidence.

Mr. Justice Byrne: For what do you want to use the other agreement?

Mr. Levett: To show it is necessary to bring this action to be fair to other tenants.

Mr. Justice Byrne: People would not dispute that. If it is not really a question of your legal rights it does not matter. It is not suggested that this is done maliciously.

Mr. Terrell: Not at all.

Mr. Justice Byrne: It is for the protection of other exhibitors.

Mr. Terrell: Yes. My friend probably stands in this position—we are claiming something and the Stanley Show are claiming the same thing, and he has got to fight somebody.

Mr. Levett: I think now my friend has said that I need hardly read the correspondence.

Mr. Justice Byrne: Is not it a simple question whether they have been advertising things which do not come within their agreement?

Mr. Levett: Whether they have exhibited cycles.

Mr. Terrell: What is the meaning of "cycles of any sort or kind," as used in that agreement—what is the scope of it.

Mr. Levett: Very well. Then the motion came on, and the undertaking was given in those terms.

Mr. Terrell: A motion comes on, and it is agreed between the parties that this should be tried without pleadings and quickly, and to get rid of the motion we gave an undertaking. Is not that all prejudice—reading that?

Mr. Justice Byrne: You may trust me not to be prejudiced in such a way that you cannot displace it.

Mr. Terrell: I do; but we have a case here which ought to be tried in an hour, and we shall be a day.

Mr. Justice Byrne: Tell me what it was; it does not matter.

Mr. Levett: "And the plaintiffs, without prejudice to any question, agreeing that the defendant may exhibit twenty-five, but not any greater number of bicycles and tricycles, at the said Royal Agricultural Hall from the 9th April to the 9th May, 1900. And the defendant also, without prejudice, by his counsel, undertaking not to show or exhibit, or allow to be shown or exhibited, at the said hall during the said period (1). Any greater number of bicycles and tricycles than twenty-five altogether, whether the same shall be propelled by mechanical motors or other mechanical means, and (2) any accessories other than accessories or applicable to motor-cars." That is all the undertaking. On those facts we come to the simple question, has he or not broken his contract? Those are the whole of the facts.

Mr. Terrell: My friend need not call any evidence as to what we actually exhibited in fact, because we agreed that we exhibited all that is stated in that catalogue.

ERNEST AUGUSTUS LAMB, sworn.

Examined by Mr. SEBASTIAN.

I think you have for the last six years been secretary of the Stanley Show Committee?—Yes.

That is a sub-committee of the Stanley Cycling Club?—It is.

The object of that show of the committee is to have an exhibition of cycles and accessories?—It is.

That has taken place for some years past at the Agricultural Hall?—Yes.

I think you are also well acquainted with the different kinds of bicycles and tricycles, however propelled?—Fairly well.

On the 18th April, 1900, you attended at the Agricultural Hall to see what was going on?—I did.

On the 19th April you went there again?—I did.

And on the 20th again?—Yes.

And you saw what was on show on the stalls, and you also saw certain machines?—I did.

Mr. Terrell: I have admitted all this.

Mr. Sebastian: Did you on the 19th April examine the accessories which were on show?—I did.

Have you a list of those accessories which you saw?—Yes.

Can you point out in the list of accessories any that are applicable to non-motor cycles, and some which are applicable to motor cycles as dis-

tinguished from motor-cars?—Those which are applicable to non-motor cycles on the North British Rubber Company's stand are twelve cycle tyres, B 1½ in., with jointless rims.

Mr. Justice Byrne: You say these are appropriate only to cycles as distinguished from motor vehicles?—Yes.

Mr. Sebastian: Non-motor cycles.

The Witness: Also on the Eadie Manufacturing Company's stand there was a bicycle front fork with ball head; also a bicycle bottom bracket fitted with chain wheel and cranks. Also No. 89, the Radax Tire Company, three sample cycle tires with rims. Others applicable to cycles with motors attached are No. 4, a tricycle frame. Also a set of tricycle fittings. On stand No. 36 a tricycle frame, no wheels. Stand No. 39 two tricycle front forks. I think that is about all.

Mr. Sebastian: That is a complete list?—Yes.

I think Mr. Philpot went with you and checked your figures?—He did.

I may take it, just putting it all in one, on each occasion you were there the number of cycles—what you call cycles in your view—was considerably in excess of twenty-five?—Yes, it was.

Cross-examined by Mr. TERRELL.

Did not you give Mr. Firth, the solicitor of the defendant, notice to go with you and count these motor-cycles, or did somebody on your behalf?—Not that I am aware of.

You do not know that he went up, in fact, and counted them and found that there were only eighteen, all told?—No, I am not aware of that.

You were there several days?—Yes.

You knew what the contest was?—Certainly.

You knew that the Cycle Show Company were claiming to have the right of exhibiting motor-cycles?—Yes.

And you went there, I suppose, to carefully see whether Mr. Cordingley was committing a breach of his agreement?—Yes.

You examined all the accessories carefully?—Yes.

And these three things are the only things which you could find in the whole show which from your point of view could only be applied to cycles in the sense of cycles and not to motor-cycles?—There were probably others, but they were so difficult to bring in exactly.

"Probably others"—but your business was to find out, and you were there doing so?—Yes.

You were doing your best to find out?—I was.

And doing your best to find all that was there?—Yes.

And that was all you could find?—That was all we claimed.

Did you tell Mr. Cordingley "We object to these 1½ in. jointless rims on the North British Rubber Company's stand"?—I had no communication with Mr. Cordingley.

Did anybody on your behalf tell him?—Not that I am aware of.

You kept that quiet—you did not give him any notice that with regard to these 1½ in. jointless rims you were objecting to them?—As a matter of fact I had nothing to do with Mr. Cordingley.

Whom did you tell that to?—The Agricultural Hall Company, who were our landlords.

Did you complain to them about those particular rims?—Certainly.

What person?—The Secretary of the Hall Company.

What is his name?—Mr. Venner.

When did you tell him first that you complained of the North British Rubber Company exhibiting 1½ in. jointless rims?—I should say Thursday, April 18th.

When was the show finished?—On the 21st.

Did you go and tell him then?—Yes.

Had you complained of those rims?—Yes.

Had you complained of the cycle tires?—Yes.

As being not applicable to motor-cycles?—No.

They were not applicable to motor-cycles?—No, they were not applicable to motor-cycles.

Did you tell the Secretary of the Agricultural Hall that you complained of these articles?—Yes.

That you are sure of?—With the other accessories.

Did you complain of these particular articles?—I did.

Did you do it in writing?—I did not.

Did you think it was very important—these twelve tires?—Everything is important that infringes our agreement.

Did you think this was a very particular and important thing that the North British Rubber Company should exhibit twelve cycle tires?—Yes, I did.

And you only mentioned it by word of mouth to the secretary of the Agricultural Hall Company—you said nothing to Mr. Cordingley, or to anybody on his behalf, so as to give him notice of what you were objecting to. That is how you left it?—I notified to the solicitor of the Hall Company that our agreement was being infringed.

Do the same answers apply to other things you have complained of, the things that were not applicable to motor-cycles. For instance, you complained of the Eadie Manufacturing Company exhibiting bicycle front forks?—Yes.

Did you mention that at the time to the secretary of the Agricultural Hall Company?—Yes. I mentioned that with the other accessories.

Did you mention the three sample cycle tires on rims shown by the Radax Co?—Yes.

None of your complaints were in writing?—I went round the Hall during the show and I went straight up to the secretary's office.

None of your complaints are in writing?—No, not at that time.

And no complaints were made to Mr. Cordingley of these particular articles so far as you know?—Not by me.

These particular articles are every one of them parts of bicycles and tricycles, are not they?—Certainly they are; they are accessories.

There is no pretence that there was any exhibition of bicycles or tricycles, that is excluding motor cycles and tricycles. There are only the three things which are said to be accessories to bicycles and tricycles in that sense. These three items, as I understand them, are all bicycles and tricycles which carried motors, and it is alleged we broke the understanding of having only twenty-five. It is said we had more than that.

Mr. Justice Byrne: Those were motors?

Mr. Terrell: Yes; we say we only had eighteen. That is our case on that part of the case.

Now as to tires. Tires are parts of bicycles and tricycles, are not they?—Yes.

They are not accessories in the sense of being something which is added to it; but they are part of the thing itself?—You cannot ride a bicycle without a tire.

Quite so; you cannot ride a bicycle without a bicycle?—No.

They are parts of the bicycle—part of the instrument itself?—A part, or an accessory.

A lamp is an accessory?—Yes.

It is not part of a bicycle?—A lamp would be an accessory.

And not a part of the bicycle? A spanner is an accessory, and not a part of the bicycle?—Yes.

There are numbers of other things—cases for putting the bicycles in, stands for holding them, tools for cleaning them and for using them, which are all accessories, but not parts of the bicycle—and pumps?—Yes.

And cyclometers?—Yes.

Could not these tires exhibited by the North British Rubber Company have been used for motor-bicycles or tricycles?—They were not of the right size.

Could not they have been used for motor-bicycles or tricycles?—No; not at that time.

Can they now?—I believe you can take an ordinary bicycle off the street and have a motor attached to it.

Would these tires be useful for the purpose of making a motor bicycle or tricycle or a quadricycle?—Certainly not a quadricycle.

Well, a tricycle with a motor to it. Are you prepared to pledge yourself that they are things quite outside the possibility of being used for motor-tricycles?—I should say certainly they were outside.

What diameter were these sample cycle tires?—I cannot give you that.

Cannot you remember enough about it to know the diameter?—It was not marked.

But about—was it 28 inches?—I do not know.

How can you say they were not capable of being used for a motor-bicycle?—As far as my knowledge of a motor-bicycle goes they are not used for motor-bicycles at all.

Is your knowledge of motor-bicycles limited?—I daresay it is. It is. I am not an expert.

With regard to the bicycle front fork which you complain of, could not that have been put on to a motor-bicycle perfectly well. The front fork is nothing to do with the motor?—But it is wider than the ordinary bicycle.

Not always. I thought you said they were applied to motor ordinary bicycles.—I am speaking of that time. They do now do so.

The weight of a motor is on the back wheel principally?—Yes.

And being on the back wheel the fork which will do for an ordinary bicycle would do for a motor-bicycle, would not it?—No, they have larger tires.

You have said "At that time." Now ordinary bicycles can be fitted with motors?—I understand so.

At that time they could not?—Not that I am aware of.

So at the time, of all times material to this action, a thing that was to be used as a motor bicycle had to be specially constructed from beginning to end as a motor-bicycle?—Yes, I should think so practically.

And having been so constructed it would be no good as an ordinary bicycle?—Yes, it would if you had got pedals—if the motor breaks down you must use the pedals.

And if you start you must use the pedals?—Yes.

Would you like to go on a long ride with a motor of that sort, using your pedals?—No, I should not.

Turn to the catalogue of these things, page 55. Do you see the North British Rubber Company. That is the description of their exhibit, "Clincher motor pneumatic tires for tricycles, light and heavy motors"?—Yes.

Is that the exhibit you are complaining of?—No, it is not.

Which is the exhibit you are complaining of?—It may not be in this description.

Is it there—never mind about "may be"?—I should say it is the Clincher wired-on tire.

Then it is there?—Yes, I should say so.

You see that it first of all deals with motor pneumatic tires for tricycles, Clincher solid tires for carriages, Clincher wired-on tires. The object of the exhibit, "Clincher wired-on tires," was to show how the wires were applied, was not it?—In the exhibit do you mean?

Yes. Have you ever heard of the Welch pattern?—Yes.

There was a good contest about the wiring on of tires for some long time?—Yes.

Was not this exhibit for the purpose of showing how they were wired

on?—This exhibit is for the purpose of showing they sold ordinary cycle tires.

Was not it for the purpose of showing how the wiring was done?—That is my construction of the exhibit of the tires there.

You see it is described as "Clincher wired-on tires," merely?—Yes.

A wired-on tire is wanted for a motor as well as for anything that uses pneumatic tires?—But these were not motor tires.

Just look at page 57, "Eadie Manufacturing Company." You are complaining of them now. Which of these on Stand No. 39 are the ones that you complain of?—I do not see it in the description.

You will see everywhere throughout the description so far as the catalogue is concerned, he uses the word "motor"?—Still on the other hand it does not follow that he was not exhibiting the other.

You see that?—Yes.

You say it is over and above what was in the catalogue?—Yes.

It was something that Mr. Cordingley had not had printed in the catalogue?—Yes.

Do not you think, seeing it was not in the catalogue, if you were going to complain of it, it would have been fair to have told Mr. Cordingley—"Look here, there is something being exhibited on this stand which is not in the catalogue, and we object to it"?—No, I was not there to protect Mr. Cordingley's interest.

But you were there to protect your own?—Yes.

You did not want to catch Mr. Cordingley in a trap. You wanted really to see that nothing was done which was unfair to you?—He must have known he was showing accessories.

You suggest that he must have known that these things were there. The only few things that you can find and complain of, and as regards two of them you cannot show them in the catalogue?—Many exhibitors exhibit goods on their stalls without putting them in the catalogue.

And without anybody knowing anything about it sometimes.

Mr. Justice Byrne: I notice the word "etc." in that part of the catalogue.

Mr. Terrell: Yes, but it begins always "Eadie Motor." The point is this, that in the catalogue they put it all as being motor. I am not suggesting that we did not exhibit accessories for motor-cycles. If we are wrong with that, we are wrong altogether. I only say that these two or three instances which they are tacking on to the case had no foundation.

Do your answers with regard to the Eadie Manufacturing Company's exhibits apply also to the Radax—these three simple cycle tires on rims?—You mean the same as the North British Rubber?

Yes?—Yes, just the same.

Re-examined by Mr. LEVETT.

Just tell me exactly, taking No. 35, the North British Rubber Company, Limited, twelve sample cycle tires, why do you say they are not accessories for motor-cars?—A motor-car tire is two or three times the size and weight of an ordinary cycle tire.

Why do you say they are not accessories of motor cycles?—Some-what the same reasons, because motor-cycle tires are larger and of a heavier calibre.

At that time had you ever seen a motor-cycle with a tire as small as these?—I had not.

Passing on to No. 39, the Eadie Manufacturing Company, Limited, bicycle front fork you gave us?—Yes.

Tell my Lord why you say that would not do for a motor-cycle?—It is not large enough or heavy enough.

Passing to the Radax, why would not those tires do for motor-cycles?—For the same reason as the North British Rubber Company's—they are not heavy enough or large enough for the rim.

Mr. Levett: We have another witness, my Lord, but after the admission made by Mr. Terrell we need not call him to prove it again.

(To be continued.)

MOTOR-CARS AT THE MANCHESTER CYCLE SHOW.

AT the fifth annual Manchester Cycle Show, which opened in the St. James Hall on Thursday last week, a good display of motor-cars is to be seen. The exhibition was opened, in the presence of a large number of visitors, by Mr. Alderman Rudman, Mayor of Salford, who, appropriately enough, was driven to the hall on a Marshall motor-car. Messrs. Marshall and Co., Clayton, Manchester, show two of their latest 6 h.p. cars, one with a *tonneau* and the other with a dogcart body; a Renault motor-tricycle is also staged. Mr. William Lea, Birkenhead, has a large collection of cars, including several English-made Benz cars and a Decauville. Mr. Johnson exhibits a Déchamps car. The Imperial Autocar Company, Hulme, Manchester, show two well-finished cars of their own design. Both are driven by water-cooled vertical engines, 6 h.p. and 3 h.p. respectively, and placed in the front. The larger car has three speeds, while the smaller is fitted with two. The Manchester Motor-car Corporation have a big display of cars, including the Allard four-seated dog-cart, with 5 h.p. engine in front, Argyle light car, with 2½ h.p. engine, Benz car, and a very fine-looking Motor Manufacturing Company's 6 h.p. Panhard phaeton. The Locomobile Company of America make a big display of their well-known steam cars. Messrs. Bennett and Carlisle, Limited, Exchange Arcade, Manchester, have a Progress voiturette and a Locomobile steam car on their stand. Messrs. Newton and Company, Blackfriars Street, Manchester, have on view one of the latest pattern De Dion 4½ h.p. voiturettes with the new *tonneau* body. The New Century Company show one of their Century motor-tandems. Other

exhibitors of motor-vehicles include Messrs. R. M. Wright, of Lincoln. Messrs. Jennings and Company, Deansgate, Manchester, show a Singer motor-bicycle, which is attracting considerable attention. An "Excelsior" motor-bicycle is to be seen on the stand of the Bracegirdle Cycle Company, Mercury Cycle Works, Manchester. The Riley Cycle Company, Ltd., Coventry, have on view an example of their motor-tricycles and quads. Brampton's motor chains are shown by Mr. C. E. Skinner, while Mr. Hans Renold also shows samples of his power-transmitters. Motor-car and cycle tires are shown by the North British Rubber Company, Ltd., the Swain Patents Syndicate, Ltd., the Radax Pneumatic Tyre Company, Ltd., and the Challiner and Willoughby Carriage Tyre Company, Ltd.

THE RECENT TRIALS OF ELECTRICAL CARS.

THE report of the judges in the trials of vehicles propelled by electricity, held at Chislehurst from November 6th to November 9th, 1900, has just been issued and deals in a very lucid way with the origin and carrying out of the events. Then follow the following general criticisms of the performances of the following cars:—

1. The "Powerful," Krieger car for two persons, with Leecoll batteries, sixty cells and Postol-Vinay motor.

8. A Joel car to carry two persons, with Rosenthal battery and Joel motor.

11. An Electric Motive Company's car to seat four, with the Company's batteries and 4-pole enclosed series motor.

12. A Still Motor Company's car for four persons, with Ideal battery and Still Motor Company's Motor.

13. A car for three or four persons, with Leitner battery and Lundell motor.

WEIGHT OF CARS AND BATTERIES.—Car No. 1 weighed 48½ cwt., being designed for long distance runs, and carrying 29½ cwt. of cells. Next in weight came Car No. 11, 30½ cwt., with 12½ cwt. of cells, next Car No. 13, weighing 26½ cwt., with* 9½ cwt. of cells, the highest car being No. 12, 18½ cwt., with 6½ cwt. of cells.

DISTANCE TRIALS.—The first and last days' runs were arranged so as to give the heavier cars an opportunity of showing what they could do, the trials on each occasion being for an unlimited distance, the driver to declare to the observer when the run was to be considered as finished. The distances run in these tests are given in the Table, and also the units per mile run. The latter figure, however, has been omitted in the case of the first day's run because it was impossible to ascertain how much the batteries contained on starting out. Efforts were made to obtain a record of the current output during the run, but the results were considered unreliable, and have consequently been disregarded. It is no doubt of value in an electrically driven car that the speed should be capable of reduction on heavy grades, so as to relieve the battery as much as possible from large overloads. Efforts were made during the tests to ascertain the current taken by the different cars on certain grades. Such observations are only of value if the corresponding speeds are taken, and this it was so difficult to do that the current readings have not been published.

TRIALS OVER LIMITED DISTANCES.—The runs on the second and third days were for limited distances on one charge, namely, on the second day 29½ miles, and on the third day 29½ miles. Cars No. 11, 12, and 13 completed 21½ miles on the second day, and the whole distance on the third day. Car No. 1 completed 24½ miles on the second day and could have run the whole distance but for an accident to one of the cells. On the third day it completed the whole distance.

BATTERIES.—The batteries used were of different types. That driving car No. 1 was peculiar in many respects, the time required to charge being remarkably short. This is a feature of importance. On the other hand, the judges have had no opportunity of ascertaining what loss these or any of the cells show during an interval between charging and discharging. Certain battery renewals were rendered necessary by the excessive current taken on the hills, and might no doubt have been avoided by a better system of control. The arrangements for coupling up the cells were extremely bad in some of the cars, and could hardly fail to cause trouble on a long run. Besides the renewals of the cells above referred to, several small failures of parts were noted.

RECUPEATION.—Much had been expected from recuperation, whereby the motors act as generators in descending a hill and return current into the battery. The experience of the observers, however, was unanimously to the effect that this action really amounted to very little in practice. Considerable current was no doubt returned, but for such short intervals of time that the saving of energy was practically nil. An indirect advantage of recuperation may perhaps be found in the case of those batteries which tend to become polarised. In such cases a return current no doubt has a beneficial effect in depolarising the plates.

PASSENGER ACCOMMODATION.—Some of the cars which ran were capable of carrying four passengers, or three with the driver, but car No. 12 was the only one which actually did so. In a few instances one or more of the passengers had to dismount on the hills.

COST OF RUNNING.—The cost of running so far as current is concerned may be arrived at by reference to the Table, where the number of units per mile run is given. The price paid for current at different stations varies from 2d. to 8d. per unit. The judges are of the opinion that the weight of the respective cars should not be credited to them in forming an opinion of their merits and they have therefore not given any figures showing the units of electrical energy used per ton-mile. They consider that the number of units per mile run is a fairer estimate of the capability of the cars, since the heavy cars had ample opportunity

of showing what they could do on the runs of unlimited distance. The judges have, however, refrained from attempting to class the cars in order of merit and have confined their efforts to stating, in a way easily accessible for reference, the actual observations made during the trials, believing that this course would be the most serviceable. They wish, however, to call attention to the excellent record made by car No. 12. This car weighed only 18½ cwt. with 7 cwt. of battery, and while carrying four persons made a high average speed on all the trials and the highest speed in ascending Knockholt hill.

The following table summarises the performances of the cars during the tests:—

No. of Car	1	8	10	11	12	13
No. of passengers carried	2	2	2	2	4	2
Weight of car including passengers	48½ cwt.	19 cwt.	not taken.	30½ cwt.	18½ cwt.	26½ cwt.
Weight of battery in lbs.	3,300	846	1,320	1,416	756	1,042
Ratio weight of battery to total weight	·6	·4	—	·414	·365	·3
Normal voltage	150	33	74	61·5	80	86
<i>Tuesday's run, miles</i>	59	36½	17	33	23	33½

Open circuit volts, end of run	100	—	—	55	given.	54·5
Units per mile, based on previous night's charge	·865	—	—	1·34	·505	·414
Total mileage for four runs	172½	36½†	—	98½	91	120½
Average speed, miles per hour	10·97	7·35	—	8·22	10·75	7·66
Best day's run, miles	60	36½	—	33	29·25	35·75
Miles per cwt. of car	1·242	1·93	—	1·09	1·58	1·36

† Ball-bearing on motor-shaft broke, preventing longer run.

‡ One run only.

NOTE.—No speeds in excess of twelve miles an hour are recognised or entered.

ONE HUNDRED AND NINETEEN electric conveyances now ply for hire in Chicago.

THE *Liverpool Mercury* is one of the latest dailies to start a column of motor notes.

THE next house dinner of the Automobile Club will be held on March 13th. A paper on "Some Automobile Experiences" is to be read the same evening.

THE Motor-Car Journal.

VOL. II.]

LONDON, SATURDAY, MARCH 2, 1901.

[No. 104.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

IT was, of course, not to be expected that the decision of the Roads and Bridges Committee of the East Suffolk County Council with regard to the legal speed permitted to motor-cars would meet with universal approval. During the past week a number of letters have appeared in the Ipswich papers on the subject. Mr. James Keith, of Capel Hall, Trimley, was early in the field with a letter in which he expressed the opinion that "we shall soon have these vehicles running on our roads as fast, or faster, than railway trains. I can plainly see that those of us who pay mostly all the rates will have to give up the roads to others who only find these rapid machines and paint and oil for them." Mr. W.

T. Pretty, the well-known motorist, of Ipswich, lost no time in replying to Mr. Keith, to whom he points out that the views of the members of the East Suffolk County Council were much the same as his (Mr. Keith's) until they had obtained a certain amount of information about motor-cars and experienced the safety of automobile locomotion. Feeling that Mr. Keith's prejudice on this question is mainly through lack of information thereon, he has offered to practically demonstrate to him the possibilities of a motor-car of to-day. We hope Mr. Keith will accept the offer.

Motor-Car Service at Southampton.

AT the last meeting of the Southampton Borough Council the Watch Committee reported that they had received an application from Mr. F. H. Compton for permission to run motor-cars in Southampton and district as public conveyances, and applying for the necessary carriage licences accordingly. The Committee did not recommend the Council to comply with the application. No doubt this was due to the fact that the Corporation is contemplating its own motor-car service, for the Town Clerk of Southampton is at present inviting tenders for the supply of three motor-omnibuses, each with portable top covers, and capable of accommodating twelve persons.

The Nottingham and District Automobile Club.

A GENERAL meeting of the members of this club took place on Friday evening of last week at the head-quarters, the Black Boy Hotel, Nottingham, when Mr. Percy Richardson gave a most interesting and instructive address on "The Daimler System." The chair was taken by Mr. E. W. Wells (vice-president), and there were present, amongst others, Messrs. G. H. Kirk, G. Cowen, S. Harvey, C. Duly (Bulawayo), W. H. Warburton (Leicester), Gilbert (Lincoln), R. Harbidge, M. Ross Browne, R. Cripps, P. Huskinson, G. Rimington, H. Rimington, and A. R. Atkey (hon. secretary). Mr. Wells, in introducing Mr. Richardson, thanked that gentleman on behalf of his fellow members for his kindness and courtesy in coming down from London specially to address the Club. Mr. Richardson, who was

cordially received, then went very fully into the details of the Daimler system, his remarks being rendered very lucid and interesting by means of a full-size working model of a 6 h.p. engine, which he had specially brought from London for the purpose of the lecture. Questions and a full discussion followed, the meeting concluding with a very hearty vote of thanks to Mr. Richardson.

Motor-Cars in France.

MR. E. S. CHEEL, in the course of a letter from Paris, remarks that in driving a 6 h.p. Panhard car last Sunday afternoon from the Arc de Triumphe to Versailles and back *via* the Bois de Boulogne, he counted no less than 230 motor-vehicles, most of them being splendidly equipped cars in every respect. Mr. Cheel adds, "It is a noticeable fact that most of the tricycles and quadricycles are fitted with water-cooled engines and radiators. Not a single specimen of the motor-bicycle was to be seen. When are our people going to show the same enthusiasm? Fancy seeing 200 or more cars in Hyde Park on a fine afternoon, and yet it ought to be, and will surely come before long."

The Projected Irish Automobile Tour.

THOSE members of the Automobile Club who are in favour of the projected automobile tour in Ireland will be glad to learn that at a meeting of the Waterford County Council, Captain Coughlan, J.P., proposed, and Mr. Y. J. Usher, J.P., Co. High Sheriff, seconded, the following resolution: "Resolved, that we fully endorse the views contained in Mr. R. J. McCreedy's letter, and also cordially approve of the observations made by Alderman W. G. D. Goff at the recent meeting of the Automobile Club of Great Britain and Ireland; and we sincerely trust that the Club may visit Waterford and enjoy the delightful scenery of our beautiful County; and we promise that as far as in us lies the well-known good qualities of our County roads will be fully maintained during the approaching touring season." The resolution was adopted unanimously.

The Value of Races.

IT is idle to question the value of races for stimulating improvement in construction, and there are few of us who do not turn with some interest to the columns of racing news at this time of year, whatever pious horror we may express in public at the idea of "scorching" on our own roads. Once again the honours have fallen to the 24 h.p. Panhard, which was unfortunately not faced by any bigger competitor. Curiosity regarding the possible performance of larger speed monsters is, consequently, still unsatisfied, and the problem of how much bigger an engine it is possible to carry on pneumatics at racing speed is no nearer solution. Even if races only encouraged the production of durable tires they would be well worth holding, for, admitting that the racing car is neither comfortable nor useful for any other purpose, the qualities of its tires are the same as those demanded for the touring vehicle. And the admission is

THE GENERAL AUTOMOBILE AGENCY, D. Farman, Man., Garage open day and night, all cars in stock, 100-104, Long Acre, W.C.

one it would be rash to make; for though the error of too light construction may be encouraged to some extent by racing, it is an error that brings its own detection and punishment, which is not the case with the opposite practice, to which many builders have been so liable.

Why not an "Autodrome."

It is to be hoped that the idea of establishing an automobile racecourse, suggested some time ago, will not be dropped. It is too much to expect that road racing will ever be permitted in this country, even if it were desirable; and the difficulties of keeping a clear course for it assert themselves more or less in every French race; and though there might be a diminution of interest for the drivers in being confined to a small circle of route, there would be much more for spectators to see. Many questions would of course arise regarding the possible dimensions and situation of such a racecourse, and some public-spirited land-owner might do much to solve them; but the idea is one worth consideration in the interests of British automobilism.

Motoring in the Snow.

MR. G. D. BARNES, in his account of the recent run to Farnham in our issue of the 16th ult., referred to the many snow drifts encountered on the trip, and to the fact that a number of photos were taken of the cars amid most wintry surroundings on the Hog's Back. By the kindness of Mr Von Laer,

IN THE SNOW ON THE HOG'S BACK.

who also took part in the run on his 6 h.p. Panhard, we are this week able to reproduce one of the many interesting photos taken on the occasion.

The Wolseley Voiturette.

In our issue of September 8th, 1899, we mentioned the fact that the extensive works of the late firm of Starley and Westwood, of Adderley Park, Birmingham, had been acquired for the Liquid Fuel Co. The negotiations then in progress collapsed, and until recently the works have been idle. Now, however, they have been taken possession of by the Wolseley Tool and Motor Car Co., Ltd., of which company Mr. H. Austin is the manager. The extent of the new works may be gauged from the fact that they cover an area of about $3\frac{1}{2}$ acres, the dimensions of the main shop being no less than 300 ft. by 209 ft. The object of the new company is primarily to manufacture the Wolseley voiturette, which vehicle, it will be remembered, was so successful in the 1,000-mile trial of last year. Since then orders for cars have poured in to the old company, which they

were unable to supply in sufficient numbers, but with the facilities at the new company's command, and under the able management of Mr. Austin, this state of affairs will soon be altered. The new company has a well tried and popular machine and should be successful.

The Edinburgh Motor-Car Service.

WITH reference to our Comment of last week regarding the Edinburgh Auto-car Company, Mr. Norman D. Macdonald writes us that there has not been any disagreement amongst the directors; and that Mr. T. Roland Outhwaite is still a director, although for some time past he has ceased to be the manager, Mr. Brakenridge now occupying that position. There was a little friction among the men for a few days through the introduction of some new regulations, but as soon as the men met the directors all was amicably arranged, the cars being once more in operation.

A Protest.

ON Tuesday last, before proceeding to Sheen House, we had the privilege of driving two Chief Constables round the Park and while travelling between the Marble Arch and Hyde Park on fourth speed—this specially at the request of our passengers—we heard the sound of a motor horn, and a four-cylindrical car with an unfinished body on dashed by at a speed of probably twenty-five miles an hour. The car was in charge of a *mécanicien* and the pace it was travelling amounted to furious driving. Bearing in mind the locality, we consider the driver should be spoken to by the manufacturers whose car he was driving.

The Automobile Club for Glasgow.

ABOUT a month ago a number of gentlemen met to consider the formation of an automobile club for Glasgow. They remitted to a committee to determine whether the proposed club should become allied to the existing Scottish Automobile Club, or become a distinct association. The committee called the supporters together again on Friday last week in Glasgow, and unanimously recommended the former course. Mr. J. R. Nisbet again presided, and from his report it appeared that the committee had met Mr. Norman Macdonald and Dr. Dawson Turner, representatives of the S.A.C., and these gentlemen had agreed on behalf of their Club to reconstitute it so as to embrace the Clubs that were being promoted in Aberdeen and Glasgow. Mr. Norman Macdonald and Mr. J. R. Nisbet were therefore asked to wait upon the Automobile Club and make certain overtures respecting representation of the Scottish Automobile Club upon the council of the parent body, with the result that the standing committee of the A.C.G.B.I. have placed upon their agenda for the acceptance of the Club certain new rules, which provide "that the Scottish Automobile Club shall have three sections, viz.: (i.) Eastern section, having its centre at Edinburgh; (ii.) Northern section, having its centre at Aberdeen; (iii.) Western section, having its centre at Glasgow. The local work of the sections to be controlled by local committees; the local committees to be represented on the general committee of the S.A.C., which shall deal with automobile matters affecting Scotland as a whole. The president and a vice-president, or two vice-presidents, of the S.A.C. and two delegates elected by each section of the S.A.C. shall become members of the general council of the A.C.G.B.I." The meeting unanimously agreed to the recommendation, and reappointed the committee to meet the committee of the S.A.C. with a view to reconstruct its constitution accordingly. When this has been done another general meeting will be convened, and on the adoption of the revised constitution the western section of the Scottish Automobile Club will become an accomplished fact.

Trade Matters.

WITH the approach of spring, matters in motor-car circles are beginning to move with rapidity, and it appears that fresh *garages* are about to be opened in several parts of London. One which has just been opened is that of the General Automobile Agency, in Long Acre, W.C. It consists of an immense

ground floor and basement, rivalling in size almost the *garage* of Charron's, in France. This will be open day and night, for the purpose of repairs, storage, etc., and is under the management of Mr. D. Farman. Another show room for the sale of American electric vehicles has been opened off Regent Street, and yet another, we hear, will be shortly opened off Oxford Street. In the meantime, manufacturers and agents report trade as being exceedingly brisk, and all are hopeful that the coming spring will see a material development of the motor-car industry.

The Motor-Vehicle Users' Defence Association.

THE committee of the Motor Vehicle Users' Defence Association has just issued its report for 1900. A schedule of cases selected from a large number is given, from which it is seen that the association has rendered valuable service to members who claimed its assistance. The working organisation of the association runs smoothly, and the committee carefully consider on its merits and properly deal with every case brought before them by members; and, moreover, advice is given on all matters which come within the scope of the objects for which the association was formed. In order to increase the membership of the association, a scheme has been proposed whereby the administration and duties of the association shall be transferred to the Motor Union about to be formed by the Automobile Club of Great Britain and Ireland. Should this scheme be approved, the members of this association will be called together to approve and pass the scheme. During the year the association made awards to members out of the Defence Fund to the extent of £46 10s. towards costs in respect of claims, etc.

"Punch" and Motor-Cars.

SKETCHES in which the motor-car plays a prominent part appear to have become a regular feature of *Punch*. Last week's issue of our contemporary contained a sketch of two prominent members of Parliament seated in an accurately-drawn motor-car, although of a somewhat old fashioned type, threading their way amid a variety of obstacles in the shape of progressive legislation. They doubt whether they can get through at all. In the current issue "The Joys of Motoring" form the topic of the automobile sketch, a motorist being seen lying on his back under the car "tightening up a nut or something."

The Question of Novelty.

"THERE is no new thing under the sun," said the Wise King; but motors and the Maybach patent were not dreamt of in his philosophy. If the account of a scientific contemporary is to be relied on, it would be difficult to deny the merit of novelty to the latest American production in the automobile line. The vehicle in question, which hails from the State of Maine, is described as having a 20 h.p. explosion engine, and weighing 1,200 lb.; but the axles of the wheels are parallel to the length of the car, and the "wheels" themselves consist of two hollow steel bolsters, 10 ft. by 2 ft. Each has a spiral skate-blade enwrapping it in the form of a right and left hand thread, while the front support of the car is a runner like that of an ice-yacht. The engine rotates the spiral bolsters in opposite directions, and is thus supposed to screw itself along. We are informed that the best pitch for the spirals was a problem to the inventor, until he thought of carrying two sets, one for level and one for hill work. The car is intended for running on ice or frozen snow; it can run on land we are told, "but the friction is greater." So we should suppose!

A Demonstration at Chelmsford.

THE committee of the Automobile Club of Great Britain and Ireland arranged a demonstration of motor-cars at Chelmsford on Tuesday last week, to which they invited the Highways Committee and other members of the Essex County Council, but these gentlemen for some reason did not avail them-

selves of the opportunity. Those motorists who were good enough to face the dreadful weather were, however, rewarded by the presence of an interested gathering of inhabitants of Chelmsford, including many prominent persons, who had some enjoyable experiences with the cars. The High Sheriff of Essex and representative of Chelmsford on the Essex County Council, Mr. Henry Collings Wells, J.P., D.L., was induced to take a trip in Mr. Edge's 16 h.p. Napier, and this car was made the leader of a triumphal procession of all the cars to Broomfield Lodge, where Mrs. Wells viewed the carriages, and where the High Sheriff generously dispensed hospitality. So pleased was Mr. Wells with the ease and comfort of the car he rode in, that he volunteered to accompany the party on a call on Mr. Henry Marriage, J.P., C.C., whose name is well known to automobilists throughout the country on account of his speeches concerning them at the Essex County Council; but Mr. Marriage was not at home. The snow on the ground made travelling heavy, but some ten or a dozen cars nevertheless appeared at the trysting place, and their owners and mechanics were generously entertained to luncheon at the New Arc Works by Col. R. E. Crompton, and afterwards shown over the works by him. The cars, in addition to the Napier already mentioned, were a 7 h. p. M.M.C.'s Panhard, driven by Mr. John H. Gretton; a Locomobile driven by Mr. Griffin; a De Dion voiturette, by Mr. G. F. Usborn; a Benz car, by Mr.

[illegible]

J. H. Rosling; another Benz, by Mr. A. Rosling; Mr. W. L. T. Arkwright's De Dion voiturette; Mr. Wellington's 6 h.p. Panhard; etc. Fog in and about London prevented other cars from reaching Chelmsford in time. Other automobilists present were the Hon. C. S. Rolls, Colonel Crompton, Mr. Claude Crompton, Mr. Julius Harvey, Mr. W. T. Pretty, and Mr. Shrapnell Smith. Mr. E. A. Rosenheim acted as hon. secretary locally and made all the arrangements for the demonstration, which has proved to the local inhabitants that the up-to-date motor-car is not so black as it is painted by certain County Councillors.

Motor-cars, Past and Present.

THE same evening Mr. E. Shrapnell Smith gave a lecture at the Chelmsford Corn Exchange on "Motor-cars, past and present," Mr. R. E. Crompton being in the chair. The lecturer dealt with the subject very exhaustively, his remarks being illustrated with lantern slides. At the close of the lecture Major Rasch, M.P., moved a vote of thanks to the chairman and the lecturer. He expressed his personal pleasure that Mr. Crompton was a member of the committee appointed by the War Office to report on the question of motor-traction, and he wished that there were more men of business like him on the civil side of the War Office instead of "the old women who wasted the

money of the ratepayers." He also thought there was a feeling against motor-cars by people who had not been sufficiently instructed about them; but to motorists he said: "Don't come round corners at 40 miles an hour; pull up if a horse is kicking about; and remember that people who don't ride motor-cars are, after all, human creatures." The Hon. C. S. Rolls seconded the proposal, and spoke of the "grandmotherly legislation" in England affecting automobilism. Mr. Crompton, in acknowledging the vote of thanks, alluded to the cruelty inseparable from the use of oxen and horses for military transport purposes. He asked the people to be tolerant with those who were developing the new class of traffic until it was perfected. The noise and smell and the frightening of horses were merely temporary. Halve the omnibuses in London, and the noise, smell, and dirt of the streets would be halved. Mr. Shrapnell Smith, replying, said the real automobilist detested the class of car driver referred to by Major Rasch just as much as the driver of the horse did. Her late Majesty the Queen had set an excellent example by having all her horses trained to motor-cars, and he would suggest that no County Councillors who sought to put a millstone round the neck of the coming industry should be re-elected at the forthcoming elections.

Accumulator Charging.

A SMALL inconvenience that troubles the automobilist in country districts is periodical charging of accumulators for ignition purposes. In the early days—no further back than 1896—Daniell cells were sometimes used instead of accumulators, but their messiness and bulk was an objection, though at that time only two were employed, while with modern coils four would be necessary. The usual charge—pecuniary, that is to say—for the supply of current for this purpose, amounts to from 12 to 18 shillings per horse-power-hour at electric light stations, and even this is not always considered to compensate for the trouble of attending to them. The inevitable waste when a few accumulators are charged from a 100 or more volt circuit through the needful resistance is, of course, partly accountable for this; and it would be worth while for motor agents to consider the advisability of setting up small installations specially adapted for charging a few cells. Country users who doubt their inability to manage such an installation have the alternative of fitting a small dynamo on the car to keep the cells charged, or of charging them by means of a battery; the former, though rather a rough-and-ready method, as the charging current must vary with the engine speed, and must only be switched on when running at a sufficient rate, has been found satisfactory by several automobilists; and the latter, though somewhat messy, has the advantage that there is little risk of injuring the accumulators by inadvertence. Various batteries are sold for this purpose with fancy names and—sometimes—prices; but they usually consist of double-fluid chromic cells, which are on the whole the most satisfactory where a primary battery is required.

The Absent-Minded Automobilist.

NOTWITHSTANDING the value of automobilism in stimulating the observational and ratiocinative faculties of its votaries, they are sometimes liable to lapses of memory. What tricyclist has not at one time or another tried to start without putting in the switch-plug? It is an advantage of lamp ignition that we have never seen brought forward by its defenders, that no one has hitherto tried to start their car without lighting the lamps. An amateur statistician recently informed us that "at a moderate computation" (the usual formula preceding an astonishing statement), £200 worth of nuts, split-pins, etc., were annually deposited on the roads by the motorists of the United Kingdom. He took no account, however, of the spanners, etc., left there after making adjustments, and it is certainly convenient to have the receptacle for such fitted so that each tool has its appointed place. It will be some time before last year's record of an entire Pennington car forgotten at a railway station and sold with other unclaimed property is beaten. The back panel of—apparently—a De Dion voiturette, however, was found near Ripley a few

days ago, left there, presumably, after making some adjustment; and for the benefit of its owner we may add that it awaits him at Mr. Ostler's motor dépôt in Guildford.

An Irish Incident.

A CERTAIN young gentleman, who is the owner of a motor-tricycle and trailing car, and who is notorious for travelling through the streets of Dublin at excessive speeds, was recently motoring down one of the principal thoroughfares of the suburbs of Dublin, namely, Rathmines Road, without a passenger in the trailer. A constable stepped out from the pavement when the said gentleman was within some fifty or sixty yards of him, put up his hand and motioned him to stop. The constable, who, by the way, was a "Fine Broth of a Boy," standing some 6ft. 3½in. in his stocking feet, said, in the richest of brogues, "Now, my foine young jintleman, you can't be racing through the streets at thirty miles an hour, frightening ladies, children, and horses." The motorist stated that he was not going at a pace which exceeded the legal limit (which in Ireland is six miles an hour within the Dublin Metropolitan Police district), but the constable insisted that he must have the motorist's name and address, which, when given, showed that the offender belonged to Her Majesty's forces. The Constable seemed rather taken aback and was all apologies, and, calling the motorist by his rank, stated that he was very sorry to have stopped him, but he would have to be very careful for the future. The motorist in his turn insisted that the constable should report the matter, and that if he did not he would report the constable for having stopped him without any cause. Further, he (the motorist) was of opinion that the constable had no idea as to what speed he was travelling, and the best thing the constable could do was to get into the trailer to see how fast the motor could go. At first the constable refused, but the persuasive powers of the motorist prevailed, and the two went careering along at something like fourteen miles an hour, to the great surprise of the constable and to the delight of the passers-by at seeing a "Limb of the Law" being towed along in a trailer, the experience being funny in the extreme. But where the joke comes in was when they arrived at the Phoenix Park, which was some five miles from the starting point, the motorist politely asking the constable to get out as he had a call to make, and when he went away he unfortunately forgot to come back. What happened to the constable after we cannot say, but we fancy that he returned to his beat a sadder and, perhaps, a wiser man.

Motor-Car Service in Cheshire.

AT the last meeting of the Chester Town Council, a letter was read from Messrs. Watson and Company, cycle and motor-car manufacturers, Falkner Street, Liverpool, announcing their intention, subject to receiving the consent of the Corporation, of running a motor-car service between Chester and Farndon. The applicants stated that the Cheshire County Council offered no objection to the service, and they would be glad to know whether the Cheshire Town Council had any objection to offer. The letter was remitted to the Improvements Committee for consideration. Farndon, which is 8½ miles from Chester, and the adjacent village or township of Holt, are very prettily situated on the banks of the River Dee, and are a great resort for visitors in the summer months. There has, however, always been a difficulty to get there or back, there being no railway station handier than Chester. The only means of conveyance is by bus, which takes nearly two hours to do the 8½ miles journey. There is a fairly large traffic between Farndon and Chester all the year round, but Messrs. Watson anticipate creating a big traffic owing to the quick and pleasant mode of travelling afforded by motor-cars which will easily do the journey under the hour. The projected service will undoubtedly be a great boon to Farndon and district, and should be the means of opening up the place considerably. Messrs. Watson have six Daimler wagonettes for the service, but they do not expect to require more than two or three to start with. They hope to be in a position to inaugurate the service on Saturday next, the 9th inst.

CHIEF CONSTABLES AND MOTOR-CARS.

THE Chief Constables of Counties were some time ago invited by the Automobile Club of Great Britain and Ireland to attend at the club on Tuesday last, the 26th ult., in order that they might have drives in motor-vehicles belonging to members of the Club, and thus obtain personal knowledge of the control which the driver has over his automobile. Among the vehicles which were found outside the Club premises on Tuesday, at eleven o'clock, were the following:—Mr. Frank Butler's 6-horse Panhard; the Daimler Company's 6-horse Parisian car, driven by Mr. Percy Richardson; Mr. John R. Hargreaves' 19-horse Daimler, driven by the owner; Earl Russell's Panhard

MR. J. R. HARGREAVES (19 H.P. DAIMLER) AND MR. FRANK BUTLER (6 H.P. PANHARD) AT SHEEN HOUSE CLUB.

carriage with 8-horse Napier engine, driven by the owner; Mr. Cordingley's M.M.C. phaeton, driven by Mr. Critchley; Mr. Hewetson's Benz, driven by Mr. Coles; Mr. Barnes' Renault, driven by the owner; Mr. Estcourt's 6-horse Daimler, driven by the owner; Mr. W. C. Bersey's 12-horse Delahaye; and Mr. W. J. Peall's 6-horse Daimler. Amongst the late arrivals were the Hon. C. S. Rolls' Locomobile, a Roots and Venables car; two M. M. Company's Iveagh phaetons, one of which was driven by Mr. E. M. C. Instone; and Mr. Roger Wallace's 6-horse M.M.C. phaeton.

The Chief Constables were driven to and around Richmond Park, and were subsequently entertained by the Automobile Club at luncheon at the Sheen House Club, where a room was courteously placed at the disposal of the Automobile Club by the management of the Sheen House Club. After luncheon the Chief Constables were driven back to the Automobile Club, where they held a private conference. At 3.30 p.m. a conference was held between the Chief Constables and the Club Committee, Mr. Roger W. Wallace, K.C., in the chair. Amongst the members of the Club Committee who were present were:—Mr. Frederick R. Simms (Vice-Chairman), Capt. the Hon. Cecil Duncombe, J.P., The Hon. C. S. Rolls, Sir David Salomons, Bart., J.P., Mr. W. Worby Beaumont; Professor Vernon C. Boys, F.R.S.; Colonel R. E. B. Crompton, R.E.; Mr. Charles Cordingley; Mr. Bryan Donkin; Professor H. S. Hele-Shaw, F.R.S., LL.D.; Mr. John Henry Knight; Mr. W. J. Leonard; Mr. Edmund Macrory, K.C.; Mr. C. Harrington Moore (hon. sec.), Mr. Arthur Paget, Mr. E. Shrapnell Smith, and Mr. Stanley Spooner. Among the Chief Constables present were:—Lieut.-Colonel J. F. Josselyn, Bedfordshire; Major Otway Maine, Buckinghamshire; Mr. Charles Stretten, Cambridgeshire; Mr. R. Middleton Hill, Cornwall; Lieut.-Colonel Eden, Durham; Major R. T. Webber, Flintshire; Lieut.-Colonel Henry Daniell, Hertfordshire; Colonel W. B. Ferris, Isle of Ely; Lieut.-Colonel H. M. Moorsom, Lancashire; Mr. Edward Holmes, Leicestershire; Major T. W. Best, Merionethshire; Mr. Paynton Piggott, Norfolk; Mr. J. Dalgleish

Kellie MacCullum, Northamptonshire; Captain G. Williams; Freeman, Shropshire; Captain J. G. Mayne, Suffolk, East; Major A. F. Poulton, Suffolk, West; Captain M. L. Sant, Surrey; Major H. G. Lang, Sussex, East; Captain J. T. Brinkley, Warwickshire; Captain Sterne, R.N., Wiltshire; Major W. H. Dunlop, Yorkshire, East Riding; Major R. L. Bower, Yorkshire, North Riding; and Captain J. Stuart Russell, Yorkshire, West Riding.

The Chairman welcomed the Chief Constables on behalf of the Club, and said that the Club was anxious to hear the views of Chief Constables on the proposed further regulations for motor vehicles. He said that he hoped the experience of motor-vehicles which Chief Constables had had in the morning would tell in favour of automobilism. Without further preface he asked them to favour the Club with their views and advice.

Colonel Eden (Durham) thanked the Club for the invitation and for the practical way in which they had demonstrated to Chief Constables the control of a motor-vehicle. He said he had that morning been driven in an automobile through Regent Street, the Embankment, and many other crowded thoroughfares, and he had been much struck with the way in which motor vehicles could be handled. Indeed in some ways it had been a revelation to him. All the Chief Constables were agreed that, so far as they were concerned, and so far as lay in their power, they were anxious to encourage the movement. Decisions respecting legislation did not, however, rest with Chief Constables, but with County Councillors and the Local Government Board. The great difficulty with which constables had to contend was that of identifying careless or dangerous drivers. If a driver be competent and skilful, and if he drive with judgment, there was no reason why accidents should happen in connection with automobiles; on the other hand, there were drivers who did not stop when called upon to do so, and even when they had been the cause of accidents. He wished it to be distinctly understood that Chief Constables had no authority, but were simply giving their opinions on the questions under discussion.

Lieutenant-Colonel Moorsom said that it was the first time he had been privileged to drive in a motor-car. He had been driven by a perfect charioteer. There would be no need of further regulations if all drivers were so skilful and considerate. He said that he was a horseman, and that his experience had been that when he met motor-vehicles and asked to be allowed to ride by the side of them in order to train his horses he had always met with the utmost courtesy from the drivers of these vehicles. However, Chief Constables were concerned in the safety of the public; they had no authority to speak, but could

MR. P. RICHARDSON (6 H.P. DAIMLER), MR. PEALL'S CAR, AND MR. E. ESTCOURT (6 H.P. DAIMLER).
Photo by] Argent Archer.

only give their individual opinions. His individual opinion was that if means were employed by which motor-vehicles might be identified speed need be no difficulty. He thought that Chief Constables should obtain more experience before they gave any very decided opinion one way or the other.

Major R. L. Bower, C.M.G. (Yorkshire, North Riding), said that he had been the owner of a motor-vehicle for the last few months, and had come to the conclusion there was nothing like

them. All Chief Constables would have to have them. When Chief Constables are provided with motor-vehicles and there is a proper system of telephones and telegraphs there would be no difficulty in stopping scorchers. Any system of identification should, he thought, be tentative. People as they became used to, or users of, motor vehicles, would soon change their opinions. Personally he saw no reason why his motor-vehicle should be numbered any more than his dog cart. His dog-cart was frequently a more dangerous vehicle than his motor car.

Lieut.-Colonel Henry Daniell (Hertfordshire) said that he lived in a County through which every north road out of London passed. Personally he had met with the greatest civility from motorists, although it was impossible for them to know who he was as he was dressed in private clothes. Very often he liked the motor vehicle to pass quickly by his horse so as to get out of the way. Unfortunately there had been several accidents which caused discomfort to the people in the County. The vehicles in question were, he believed, not driven by members of the Club, but belonged to a manufacturing company, and were driven by professional drivers. He thought that Major Bower had struck a somewhat discordant note in stating that he thought numbering was not necessary, as there was a general consensus of opinion among Chief Constables that motor vehicles should be numbered, but if they were numbered the matter of speed was of no importance. He pointed to the fact that steam launches were numbered for the purposes of identification, and he could not see why motor vehicles should not be similarly numbered.

THE COURTYARD AT SHEEN HOUSE CLUB.

Photo by]

[Argent Archer.

Mr. Paynton Piggott (Norfolk) said that last year eighteen vehicles started one morning from the Maid's Head Hotel, Norwich, and one of them ran over a dog belonging to a lady who was highly connected. It was admitted that it was not the fault of the driver. The driver drove on and left the lady with the dead dog in the road. He, as Chief Constable, had sent to the proprietor of the Maid's Head Hotel to find out the name of the driver. Yet although the motorists were all driving there he failed to ascertain the name of the driver. People in the County had been annoyed to this day by the fact that the motorists failed to give the name of the driver.* Another instance was one in which some wagon horses had been frightened by a motor and damage had been caused. The driver of the motor-car did not stop or go back to help. People asked, "Why don't the police find out who the driver was?" He had told the police to spend any money to find the offender. He was eventually traced and when the constable mentioned the matter to him the driver said he did not remember the incident. The driver's wife, however, blurted out, "Oh, yes! don't you remember, you said that you had better not stop." The owner of the wagon said he would "never run down the Norfolk Police again after that," meaning the clever way in which the offender had been traced. He thought that numbering would be an advantage to motorists who

* The Secretary of the Automobile Club states that if the incident occurred during a visit of the Automobile Club to Norwich it is certain that no application was made to him for the name of the driver.

were gentlemen, and drove with consideration, as it would show that they were not driving in such a way as to make them ashamed of identification. The Chief Constable of Norfolk added, "If anyone will give me a motor, they may put numbers all over it." He thought motors ought to be numbered back and front.

Captain J. Stuart Russell (West Riding of Yorkshire) said that if every driver was as good as the driver who had driven him that morning, there could be no need for identification. However, they were not so good or careful. Therefore means of identification were necessary. He pointed out that in Austria bicycles were numbered. He thought bicycles should be numbered here, too. If motors were numbered, in his opinion, speed was no consideration. He thought drivers should be certified also.

Captain Drummond (West Sussex) said he had experience of the Brighton road, and many motors passed through Crawley. He had very few complaints. One Member of Parliament had said that his horse had been frightened by a motor and had turned right about face. The motor driver had driven behind him, and had been rather amused at his predicament. Motorists had taken to wearing black masks.* The general feeling of the public was in favour of numbering. The argument that motors would not be used if they were numbered was sentimental. Constables were numbered, and motorists must not object if constables gently suggest in return that motor drivers should be numbered.

Someone here inquired, "Are Chief Constables numbered?"

Major Lang (East Sussex) said that on the London and Brighton road cyclists and motors scorch at a fearful pace. He had measured tracks on which to catch the scorching cyclist, but had not yet employed this measure with regard to motors. He could not see any objection to numbering.

Captain Stern, R.N. (Wiltshire), said that a motorist near Marlborough drove up behind a doctor's trap without sounding a signal and caused the horse to bolt. The driver was stopped. He said he was a Frenchman, and gave a name and an address which proved to be false. Those were the men who made numbering a necessity—not the respectable men.

Captain G. Williams Freeman (Shropshire) did not set much store on a limit of speed. He thought that if the Automobile Club would agree to numbering, the speed limit might be removed.

Major A. F. Poulton (West Suffolk) reported that a motor owner in his county had been twice summoned for furious driving and his excuse was it was his driver's fault and he could not get another qualified driver. These were the only complaints he had received about motors. Otherwise reports on motors had been favourable.

Captain Drummond said that a motorist has stated as a defence that he could not make his vehicle go below a certain speed. Was this true?

Mr. Roger Wallace (the chairman) said he did not know of any motor vehicle which could not be driven as slowly as the driver liked. It was quite manifest that Chief Constables, whose duty it was to see the law properly carried out, would wish to put their hands on individual offenders with as little trouble as possible. But the difficulty of identifying an offender existed with regard to all classes of offenders—not motor drivers only. Since the warning to motor drivers and the letter to Chief Constables issued by the Club no complaint had been received at the Club. If a complaint had been received the Club would have thoroughly investigated the matter, and would have endeavoured to furnish the name and address of the breaker of the law. He would like to put this on record. The Automobile Club recognised that Chief Constables are brought face to face with a difficulty, because there are black sheep among automobilists as there are in every other portion of the population. Even criminals were not forced to wear identifying numbers when released. It would doubtless be very convenient to Chief Constables if all criminals were forced to wear numbers on their fronts and on their backs. It was easy to say

* Probably a fancy name for dust spectacles.

that there ought to be means of identifying a motor driver, but it would be very hard if the behaviour of a few black sheep were used as a reason for numbering all motor-drivers. A suggestion had been made that the removal of the speed limit might be agreed to if the Automobile Club would agree to numbering. The Club would not lightly disregard this suggestion. What would be the best means of identification must be a matter for careful consideration. The numbering of steam launches had been used as an argument in favour of numbering motors. The numbers on launches were small numbers on the deck or elsewhere by which an offending launch might be identified when the launch was impounded in a lock. People who are rude enough to disregard a signal to stop would be quite capable of covering up an identifying number. Such people, the black sheep, would not scruple to evade identification. If numbering were insisted on the fair-minded automobilist would be subject to all sorts of petty annoyances. People who had a dislike for motors would lodge complaints, and the driver not knowing of it would have no opportunity of collecting evidence. He would have no knowledge at the time that he was to be accused of offending. Every motorist might be required to carry his carriage licence as a man is required to carry his gun licence. This would provide a means of identifying a driver when he is stopped. But it may well be pointed out that the danger is that the driver would not stop. No means, Mr. Wallace thought, would be effective with such a man. A very heavy penalty should be imposed on drivers who fail to stop when justly called on to do so. The Club had given its views on the questions in a circular letter. The Club was now anxious to hear the views of Chief Constables on these questions. The Club was anxious to aid in securing the black sheep.

The Chief Constable for Norfolk said it should be clearly understood that the Chief Constables collectively could give no opinion. They had no right or authority to do so.

Mr. Roger Wallace said that it was thoroughly understood that nothing which had been said was a pledge on the part of County Constables. Chief Constables were not law-makers, but had to see that the law was carried out.

Sir David Salomons, Bart., chairman of the Foreign Relations Committee of the Automobile Club, said that in this country he drove fifty times with a horse to once with a motor. In France he drove automobiles. The provisions of the present Act and regulations affecting motor-vehicles originated with him, as he had been called to assist the Government authorities in the framing of the Act and regulations. He had at the time made two suggestions. One was that motor-vehicles, like farm carts, should have their owner's name and address painted on them, the other that every driver should be registered as a driver. He was told that these suggestions were "un-English." In France every motor driver is required to obtain a driving certificate from a Government engineer. In France every car has its owner's name and address painted on it. Any accident occurring in connection with a motor vehicle was magnified and widely reported in this country, although had it taken place in connection with a horse-drawn vehicle nothing would have been said about it. He remembered seeing a boy run over by a horse-drawn carriage in Grosvenor Square. The lady driving in the carriage drove away before her name could be taken. How many other similar cases were there? In France, at the beginning of the motor movement, the opposition had been as strong as it is here now. But the authorities had the foresight to take the view that the new industry was a great industry, and should not be strangled by repressive legislation. At the recent motor exhibition held in Paris £30,000 were paid for cars intended for this country. There were 20,000 to 30,000 men employed in the motor industry in France. If we are to hold our own these new industries must be encouraged—not killed—here. Greater speed on the road has the effect of facilitating commerce and of annihilating space. In fifteen years time, unless we keep abreast with other countries, we shall find ourselves a third-rate power. Automobilmism was of great importance and would benefit the whole country. He implored all those

who are interested in the welfare of the country to smother feelings of objection, and to encourage high road speeds rather than allow this country to become behind other nations in power and prosperity. Numbering motor vehicles would in no way do away with scorchers, but the number of summonses which the considerate motorist would find on his table would depend on the district through which he had been travelling. The Kent County Council, of which he (Sir David) was a member, had recently passed a resolution to the effect that fourteen miles per hour was not too fast a speed for motors. The opposition to cycles had been lived down. This opposition must be lived down, and he thought the name and address of the owner being painted on the motor vehicle and the registration of drivers would suffice.

Mr. John I. Thornycroft, F.R.S. (member of the Club Committee) said that the numbers on a launch were not large, conspicuous numbers intended for identification by passers-by. Numbers on launches were only sufficiently large for identification when the launch was at rest. For a run-away launch the numbers would be useless. A placard on a motor vehicle sufficiently large for identification by the passer-by would be very objectionable.

Mr. Charles Stretten (Cambridgeshire) said that it must not be thought that Chief Constables wished to interfere with invention or enterprise. They had been asked to give an opinion and they had done so. As regards speed, the law as to "common danger" would, in his opinion, be sufficient.

Captain the Hon. Cecil Duncombe (member of the Club Committee), speaking for himself and not for the Club, suggested a badge on the car.

Professor Hele-Shaw, F.R.S., LL.D. (a member of the Club Committee), suggested an official badge signifying that the wearer was allowed to drive a motor vehicle.

Colonel Daniell and Captain Russell again spoke in favour of numbering. Mr. Middleton Hill (Cornwall) suggested that members of the Automobile and other duly recognised clubs should only be required to have driving certificates and the crest of the Club on their cars; other drivers to be certified and their cars to be numbered.

Mr. Roger Wallace approved this suggestion. He dwelt on the usefulness of the conference, and said that the Club would shortly be dealing with the difficult question of road congestion. He pointed out that increase of speed means increase of traffic on a road. Twice the speed means making a space do twice the work. The regulation of heavy traffic, hours for delivery of goods, were matters of importance. He explained the absence of the Marquis of Chasseloup Laubat owing to illness.

A vote of thanks was proposed to the Chief Constables by the chairman, seconded by Mr. Shrapnell Smith, and carried by acclamation; and Colonel Eden and Captain Russell proposed and seconded a vote of thanks to the chairman and club for courtesy and kindness extended to Chief Constables.

[The foregoing report, which was prepared for the Automobile Club "Notes and Notices," is supplied in advance by the Committee of the Automobile Club.]

THE *Horseless Age* reports that the United States patents of Messrs. Roots and Venables, London, on a kerosene vehicle motor have been sold to parties who propose to manufacture the motors in America.

THE statistics for December relating to accidents in France have just been published, and are as follow:—Deaths due to horses, 69; injured, 656; railway, 12 deaths, 80 injured; bicycles, 3 deaths, 35 injured; automobiles, 1 death, 11 injured.

THE French automobile caravan which is to make the tour of Tunis arrived at Tunis on Monday. The following is the list of "chauffeurs" forming the caravan:—Mr. Didier (Paris), de Dion car; M. Gosior (Dijon), Cottureau car; Baron Romano Gianotti (Turin), with Signor Poggio as his guest, de Dion car; Mr. Wright and son (Nice), de Dion car; M. Marteau (Paris), de Dion car. A de Dietrich car will follow the caravan with spare fittings and pneumatic tires while a Panhard will convey the *mechanicians* and luggage.

CORRESPONDENCE.

THE NESSELSDORF STEERING GEAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of February 16th there appears a description of the Nesselsdorf petroleum-spirit motor-car, and it is stated that the manufacturers of the car have taken out a patent for a new steering gear. So far from being a new thing and a novelty, this device has been my patent both in this country and Germany for a period of eight years. I am fitting these steering gears to various vessels and vehicles. The gear is a splendid success and ensures perfect safety in the management of a motor-car or heavy wagon.

The accompanying illustrations will enable your readers to see one form of this invention as I apply it to steamships. On

PLAN OF KERMODE'S STEERING GEAR.

account of the extraordinary charges and other difficulties experienced in Germany with this invention I allowed the German patent to expire, but I have all along worked the British patent. You will see, therefore, that our Austrian friends cannot put this particular patent on the British market unless I grant them a licence or they come to some other arrangement. For heavy wagons this gear is invaluable, and for high speed cars it is even more so.

Kindly afford me the space to correct what may otherwise give rise to the idea that this invention is that of our neighbours on the Continent.—Yours truly,
J. J. KERMODE.

THE BOLLÉE VOITURETTE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be glad if any readers of the *Motor-Car Journal* would give me their experiences with this car, stating running cost, and whether the gear is very noisy; also whether back tires give trouble, and whether an air-cooled engine is likely to get unduly hot.—Yours truly,
ZERO.

MOTOR-BICYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to the inquiry of your correspondent, "J.," re Motor Bicycles, especially the Minerva and Excelsior, I would just say that both makes are fitted with exactly the same motor and method of driving. The only difference is that the cycle proper of the Minerva is made in Belgium, and that of the Excelsior in England. The motor and its accessories are the invention of a Swiss, but are made by a Belgian firm.

With regard to the general efficiency of the two machines, I must say that on all points I consider the Minerva the simplest and most easily managed motor-cycle I have yet had the pleasure to ride. The tendency to side slip is very minute, owing doubtless to the centre of gravity being so low.—Yours truly,
ALFRED TAYLOR.

FOOTWARMERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in your last issue a paragraph on Footwarmers, in which acetate of soda is recommended. This would be rather expensive, but I think a strong solution of hyposulphite of soda—the photographer's "fixing-bath"—would answer equally well, and would be cheap. Every photographer knows by experience the length of time a solution of hypo. made with hot water takes to cool. I have never tried this for the purpose in question, but it struck me that it would be very suitable.

Yours truly,
A. J. ALDRED.

WHY DO WE BUY FRENCH CARS?

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to a paragraph in your last issue headed, "Why do we buy French cars?" I think the great point that your contributor makes is that owing to the start the French have had they have been able to a very great extent to set the fashion in automobile construction. That this is not always the case, as an English motor manufacturer, I can testify by referring, if I may, to the "Napier" car. In this we have made a carriage which has particular points in regard to construction; we made it with gearing, bearings, and frame of such proportions that will last for years without renewing. At first, it was feared that the increased weight in some portions would militate against the success of the Napier, and I now find that owing to the opportunity we give to all purchasers to inspect carriages in the course of construction at the works, either themselves or competent engineers on their behalf, the points which we have embodied in the carriages are being appreciated, and that people are willing to pay the extra money that the cost of the manufacture necessitates.

It is very pleasing to us in view of the fact that, when we first started to make the Napier car, we were told by those who should have known, that if we made a more costly carriage than the French cars, we could not sell it; but experience now shows me that, providing one is prepared to give value for money and prove it to the customer, there are customers to be found for carriages with the vital parts made at the necessary cost to insure long life.

Yours truly,
S. F. EDGE.

THE CHISLEHURST TRIALS OF ELECTRICAL CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We have read the long-looked-for report of the judges, as issued by the Automobile Club, with considerable interest, perhaps all the more so as the Still electromobile car, entered by us as British agents on behalf of the Canadian Electric Vehicle Company, clearly showed the merits of the Still system, by the results obtained. The particular car entered in the above trials was not one of the latest type of vehicles as now built in England and equipped with Ideal storage batteries, but was one built for Canadian work, and had already done over 6,000 miles of work both in Canada and England, frequently taking such districts as Petersham Hill, Holly and Highgate Hills with ease, carrying four passengers up at about nine miles an hour. It had also frequently been used, as test run, from the depot in Long Acre, W.C., to Lord Salisbury's residence at Hatfield and back, a distance of 46½ miles, at an average speed of twelve miles an hour for the double journey, on one charge of the battery. Had we entered one of the newest type of cars now being constructed in England under the Still patents, the results, although very good, would have been much better; but, finding it impossible to finish the special car in time for the trials, our friends decided at the last minute, rather than be out of the hunt, to enter No. 12 car, Oxford type. This was the only car which carried four persons daily throughout the trials, and this with a set of batteries already used to propel the car for over 1,000 miles in and around the London district. Since the trials this car has done quite another 1,000 miles, and, like Charley's Aunt, is still

running; from recent inspection Mr. Still thinks the car is good for another 7,000 to 8,000 miles with the small cost of a new set of tires.

The judges selected by the Committee of the Club could not have been better selected, all being gentlemen well-known as having practical knowledge of electrical matters, hence their impartial reports cannot fail to enhance the merits of the "Electro-mobile," which we have always maintained as the ideal car for those who can afford to pay the price and obtain current at a moderate charge to work them.

We quite agree with the judges that units used per ton-mile is not so fair a basis of comparison as units per car-mile, and it occurs to us that this idea might be carried still further and that the proper comparison should be units per load-mile, or, in tests of the above class, per passenger-mile. On this basis it may be observed that the units used by the leading cars would be as follow:—say for Wednesday's tests, Car No. 1, took 1.49; No. 11, .617; No. 12, .133; No. 13, .378; whereas on Tuesday's run, Car No. 1, took 1.02; No. 11, .341 and No. 12 only .077. Thus the mean average of watts consumed for say twelve days work of thirty miles per day, would give valuable data as to the efficiency of any particular system.—Yours truly,

SHIPPEY BROTHERS, LIMITED,
per Arther Shippey.

A SINGLE-SEATED CAR WANTED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be obliged if your readers could give me information of any inexpensive motor-car having a comfortable single arm-chair seat, and yet is not a motor-tricycle or bicycle, but a car, or a voiturette, in fact as much as possible like a motor bath chair, with leather head to put up, and leather apron to cover knees, so that the driver could, if he pleased, be entirely shut in during storms.

Such a car would have an enormous sale. It should have a window at back and sides to permit of seeing passing vehicles; it should also be steered from inside and have a thin gauze blind to pull down in front of occupant. When closed up a rider in such a car could defy the elements, could laugh at the Clerk of the Weather when he was bent upon making himself ridiculous by converting the earth into a quagmire and the air into a shower bath, from which, except in such a vehicle, there would be no escape.—Yours truly,

ATHOL MAUDSLAY.

THE AUTOMOBILE MUTUAL PROTECTION ASSOCIATION.

THE following is a copy of a letter addressed to the British Motor Traction Company, 40, Holborn Viaduct, E.C.:

DEAR SIRS,—At a meeting of the Executive Committee of the Automobile Mutual Protection Association, Ltd., held this evening, I was surprised to hear that a report had been spread in automobile circles that I had agreed with your group to practically give away the Association in consideration of certain advantages to be given me. My only object in agreeing to meet you the other day was to hear what you had to say, and report to this Association, with a view of seeing whether such negotiations might be used to advance the interest for which the Association has been formed. I find, however, that apocryphal accounts of our negotiations have been spread (certainly not by me) which are damaging to me and to the interest of the Association. I beg, therefore, to inform you that I decline to discuss the matter further with you except through the solicitor of the Automobile Mutual Protection Association, Limited—Mr. Firth.

Yours faithfully,

C. FRISWELL.

Le Velo makes a statement that Mr. Harvey Du Cros, has ordered from a Paris firm a powerful racing car, which is to be driven by Mr. C. Jarrott in this year's races on the Continent, notably Paris-Berlin. The horse power is, adds our contemporary, being kept a secret.

COUNTY COUNCILS AND THE SPEED OF MOTOR-CARS.

——
KENT.

AT the meeting of the Kent County Council last week Mr. Burch-Rosher moved the following resolution: "That the Kent County Council does not consider that twelve miles an hour, sanctioned by 59 and 60 Vic., chap. 36 (the Locomotives on Highways Act, 1896), s. 4, an excessive speed at which to drive a motor-carriage along a public highway, provided that all persons at any time recklessly driving any such motor-carriage in such a manner and at such a speed as to cause damage to persons, animals, or other property shall be liable, on summary conviction, to a penalty not exceeding £10 and costs, or in default of payment to imprisonment, with or without hard labour, for not exceeding two months." He explained that he wanted the Council to support the motion because a number of persons had taken up a hostile attitude with regard to motor-carriages and desired to restrict their use very considerably. Mr. East seconded the motion, stating that the people of England ought not to put hindrances in the way of the development of the motor-carriage industry in this country. Alderman Salomons supported the motion, and showed that France now supplied many of the motor-cars and carriages used in this country. He believed that with a broad, liberal freedom in regard to this form of locomotion this industry would soon grow in England. The resolution was ultimately carried by a small majority, and the clerk was directed to forward a copy of it to the Local Government Board.

Mr. Rosher next moved: "That the Kent County Council does not consider it just or reasonable that the owners of private motor-carriages should be compelled to have a number painted on or affixed thereto, unless all owners of private carriages drawn by any horse, mule, or other animal have the same obligation imposed on them; but the Council recommends that every such private carriage should have painted thereon in one or more conspicuous place the armorial bearings, crest, or surname initial letter of the owner plainly and legibly depicted." Mr. East again seconded. Alderman Stanhope, however, considered that motor-cars should possess some means of identification, and therefore opposed the motion. Alderman Salomons, on the other hand, suggested that if a number were placed on motor-carriages the driver would simply be persecuted by the police. If the owners of the motor-cars were registered the whole difficulty would be met. On being put this motion was rejected.

PAT'S FIRST MOTOR-CAR.

PAT MURPHY made a motor-car, one of the petrol type, Four wheels were on the highway and many out of sight; Four seats the car provided, two fore and two were aft, Not sideways, but both frontways, and that's what caused a laugh. Full many a patent to that car the trustful Pat now added, Band brakes, free-wheels, pneumatic tires, and cushion seats well padded; Electric lamps to light the way when he went record breaking, And silent engines, so that all could hear each other speaking. Said Pat, "If engines one do twenty miles an hour, Well, surely two will double that, and two I'll have for power." So two were added to the car, and two ignition tubes Were placed beneath the foremost seat connected by a fuse. Pat, ready for to try the car, sent post-cards to three friends To join the festive party "for a fly down to Land's End." The day arrived, the party too, all in tarpaulins clothed, Four cans of petrol and of gin were in the car soon stow'd, Pat saw his mates were seated before he manned the wheel, And then he turned a tap, and the wheels began to squeal. "Pip-pip" sang out the signal horn, "Phut-phut" the engines cried: A violent jerk! a mighty plunge! and all the riders sighed. The car proceeded not upon the journey mapped, Nor did Pat leave the levers until the brake had snapped. Then once again the levers were pushed and pulled and turned, And Pat gazed at the works to see if the petrol burned, But not an inch that car would move, because of imperfections, For it is true, the engines two, worked in opposite directions.

EUSTACE B. BEESLEY.

SCOTTISH NOTES.

Glasgow Week.

THE liveliest satisfaction is felt among Scotch automobilists, and especially those of the west of Scotland, that the suggestion made at the recent special meeting of the Automobile Club in London to dispense with an organised "trial" this summer, and instead hold an Automobile Week in Glasgow during the course of the International Exhibition, is likely to be carried out. The wisdom of cancelling the proposed 1,200-miles Trial is admitted by everyone who has, even in a cursory way, considered the special difficulties which present themselves to such an undertaking this year. Lord Kingsburgh's query, too, "Why repeat a success?" was particularly *apropos*, and very few manufacturers will be sorry to be spared the large expenditure of time and money such a "trial" involves.

A Scotch Welcome.

THAT Glasgow will not be lacking in the warmth of its welcome, nor be grudging in the hospitality it will extend to the Club on its arrival and during its stay in the "Second City," I am certain. The Glasgow men with whom I discussed the matter the other day recognised the opportuneness of the proposed visit, and were convinced that it would give the movement in Scotland the biggest "lift" it had received since the introduction of the motor-car to Britain; in consequence every effort will be made to make the "Glasgow Automobile Week" a stupendous success.

An Eye Opener.

THERE can be no doubt as to the far-reaching effect it will have in popularising the use of motor-vehicles in Scotland. My belief is that to many a "canny" Scot the demonstration will be a positive revelation. He has probably seen the Edinburgh service cars, and perhaps occasionally some of the privately-owned cars in the west or south of Scotland; he has also heard of motor-cars in Perth, Dundee, and far Aberdeen, and just here his knowledge of the automobile movement in many cases ends, except, of course, that he knows that in London and "sic places" they all "bolt" or "blow up." A procession of noblemen and ladies, with members of Parliament, members of the Cabinet, and other notabilities, driving their own well-appointed motor-carriages, would be a veritable "eye-opener" and leave an impression not easily removed. He may witness this sight in Glasgow this summer; and if it were possible for His Majesty King Edward VII. to bring one of his own motor chariots when he visits Glasgow to open the exhibition, which it is still hoped he will be able to do, much amazement would be experienced, and the motor-car would be henceforth exalted to a higher position in society.

Signs of Improvement.

IN writing this I do not wish to be misunderstood. In motor-car manufacture Scotland was early in the field, and the first use of motor-cars for public service work was north of the Tweed. My complaint is that the great Scottish public have in the matter of adopting the mechanical carriage been more than usually slow in discovering a "good thing," and for some inexplicable reason Glasgow—the great engineering city, forsooth—has evinced the same "dullness." Things are changing for the better, however, and there are indications that the city is waking up, not the least important of which is the formation of an influential club, a thing that was found impossible in the West of Scotland twelve months ago, and I have the feeling that Glasgow will most certainly "catch on" this year and move ahead with a rush.

The Proposed Glasgow Club.

A WELL attended meeting of West of Scotland men interested in the formation of an Automobile Club was held in Glasgow on Friday last week, when the committee made the recommendation that the Glasgow Club should form a section of the Scottish Automobile Club. This recommendation the meeting unanimously approved. The decision is certainly a wise one and will be productive of much good. The Scottish Club, it is admitted, has not been so active as it might have been since it came into being, but the introduction of this fresh blood will undoubtedly imbue it with new life, and as each section will be self-managed a healthy rivalry may spring up between them to excel in "good works."

Scottish Club Run.

THE run to Bathgate fixed for February 2nd, and which, on account of the Queen's death, was postponed, is now to take place to-day (Saturday, the 2nd inst.). Bathgate has been selected as a suitable meeting-place for members coming from either east or west. Automobilists in Scotland desirous of taking part in the run who are, as yet, not members of the Club, can obtain full particulars of the time of starting, etc., from Mr. Newton, the Secretary of the S.A.C., 13, George Street, Edinburgh.

The late Mr. Fred Pullar.

IN the death of Mr. Fred Pullar, of Bridge of Allan, particulars of which appeared in the *Journal* last week, Scotland has lost an enthusiastic automobilist. When I met him a few days previously he was in his usual happy humour, looking forward to the coming season's runs of the S.A.C. Mr. Pullar's manner at once impressed those who met him as a young man of grit and pluck, and his heroic attempt to save life at Aithrey Loch, and in which he himself perished, bears ample testimony to this. His parents, I am sure, have the respectful sympathy of all Scotch automobilists. BROWN HEATHER.

FROM LUTON TO MANCHESTER BY MOTOR-CAR.

MR. J. A. BENNETT, of Messrs. Bennett and Carlisle, Manchester, sends us the following brief account of a run made by him and a client last week on a 5-h.p. double-cylinder Sirene voiturette from Luton, Bedfordshire, to Manchester, a distance of about 150 miles:—The roads were in a shockingly heavy condition after the late frosts, and although we carried 120 lbs. of luggage with spare petrol, we only put the low gear in twice. Stopping at Lichfield on Saturday night, we continued the journey on Sunday morning, and arrived in Manchester in good time in the afternoon. Our client learnt to drive in a few miles, although he had not driven a Sirene or similar geared car before, and the fact that he managed to change the gears without any noise speaks volumes for the simplicity of the car, as well as the smartness of the driver. We did not put a spanner to any nuts, nor had we to touch a sparking plug or wire during the whole journey. Motorists would do well to note that a little way past Coleshill on the way to Lichfield the road is up and a new bridge is being built. In the dark we nearly ran into the railings put across the road, there being no warning light.

MR. J. S. CRITCHLEY, who has been on a visit to the United States, returned to London last week.

THE Corporation of Huddersfield are at present inviting tenders for the supply of motor-carts suitable for conveying about five tons of coal from the local collieries to the electricity works in that town.

THE FRENCH MOTOR-CAR EXHIBITION.

(From Our Own Correspondent.)

(Continued from page 859.)

THE novelty on the stand of La Société Parisienne de Construction Automobile, Avenue de la Grand Armée, was a light tonneau car, with removable back seats, and fitted with a new system of transmission gear. Power is supplied by a 6 h.p. Aster motor, the shaft of which carries the fixed wheels of the change-speed gear, the loose wheels being always in mesh and keyed for the required speed. The second shaft carries at the end a pinion which operates a large toothed wheel on the countershaft.

FIG. 1.—LA SOCIÉTÉ PARISIENNE'S LIGHT DELIVERY CAR.

All this mechanism is located above the front axle, every part being enclosed. At the ends of the countershaft are large pinions of the same diameter as those on the rear hubs, they being connected by a chain. The well-known Victoria Combination has undergone several improvements. It is fitted with a $3\frac{1}{2}$ h.p. water-cooled De Dion or Aster motor, three speeds, and a friction clutch. The engine is geared on to the front axle by spur wheels. They also showed a carrier (Fig. 1) constructed on the same system, capable of carrying a load of 3 cwt. without the driver.

The Gladiator Company, of Pré St. Gervais (Seine), exhibited a couple of their small two-seated cars fitted with $3\frac{1}{2}$ h.p. water-cooled Aster motors, and a four-seated tonneau propelled by one of the new Aster engines developing $6\frac{1}{2}$ h.p. (Fig. 2). The frame of this car is built up of wood and channel steel. The engine is water-cooled, a pump and radiator being provided.

FIG. 2.—THE GLADIATOR $6\frac{1}{2}$ H.P. TONNEAU.

Three speeds forward, up to thirty-two miles, and a reverse motion are provided, the transmission being effected by gears and chains. The petrol tank, which is located under the driver's seat, carries twenty-five litres of spirit, and the consumption of the motor is said to be eight litres per 100 kilometres. The frame is spring suspended on the axles fore and aft, while three brakes

are provided. With tonneau, body the car complete weighs about 7 cwt. The most interesting feature of this stand was, however, the military voiturette used by a staff officer during last year's army manoeuvres, which looked very smart in its grey paint. A box is carried at back for the officer's baggage and a basket gives accommodation for his sword. The rest of the exhibit was made up of bicycles and motor-cycles, the quad fitted with a 3 h.p. water-cooled Aster, and carrying an ingeniously-placed radiator, only being of interest to motor-men.

M. H. Lepape, Puteaux (Seine), exhibited two cars which were novel in so far that the shape of the motor was such that the heat is conducted and radiated by the mass of metal that forms the cylinder. The cylinder is cast with a great thickness of metal, and a 5 h.p. motor weighs about 176 lb. Of course, if this system is as effective as water-cooling, the increased weight would be compensated for by the absence of a water tank, while it would, of course, save the motorist a good deal of anxiety. The motor runs at only 750 revolutions a minute, so that it would not be likely to develop much heat, but, as a precaution, M. Lepape directs a current of cold air on to the motor by means of a fan operated by a wheel on the motor-shaft. Power is transmitted in these vehicles by belts running on large wooden pulleys. M. Lepape also exhibited a carrier tricycle propelled by a $2\frac{1}{2}$ h.p. air-cooled motor with change-speed gear and clutch. It is built with a wide carriage body, one half of which carries the chese for loads of 2 cwt., and there is a seat at the side for the

FIG. 3.—THE LEPAPE COTE-A-COTE

driver. A similar vehicle was shown constructed on the sociable system for two persons (Fig. 3). The motor is started by means of a detachable handle. On the level the vehicle can, it is claimed, attain a speed of 24 miles per hour.

Both electrical and petrol vehicles were displayed by La Société des Automobiles Créanche, Rue Brunel, Paris. Their petrol cars which were described in the *Motor-Car Journal* of September last, are propelled by De Dion water-cooled motors carried on a movable fore train. The engine, with bonnet, can be made to slide backwards and forwards a few inches by operating a lever so as to give the necessary tension to the belt that connects the motorshaft with the countershaft. The company are also now building a light delivery van on the same chassis as the voiturettes.

La Fabrique Nationale d'Armes, of Herstal, near Liège, exhibited three light cars similar to those shown at the Crystal Palace in December last, which they are turning out in large numbers. The vehicles are propelled by a two-cylinder vertical motor situated under a bonnet in the front of the frame. It develops 4 h.p. in the cars with three seats, and 5 h.p. in the vehicles with seating capacity for four persons. The company employ an automatic carburetter, which is regulated by the motor itself. Power is transmitted from the motor-shaft to the counter-shaft by two crossed belts, which give two speeds and reverse motion, intermediate speeds being obtained by varying the ignition.

The belt is a short one and tension is given to it by a jockey pulley.

Among other cars La Société Million, Guiet, et Cie., Avenue de Villiers, Paris, exhibited an electric delivery van on the Krieger system. This vehicle has been ordered by the postal authorities in Paris with a view of carrying out trials in the conveyance of mails between the General Post Office and the railway stations.

MM. M. and A. Dulac, Boulevard Pereire, Paris, exhibited a Vehel tonneau fitted with a two-cylinder vertical motor developing 8 h.p. The engine is fixed in the fore part of the frame, and its running is varied by advance of ignition, as well as by a regulator operating on the exhaust valve. The transmission gear consists of the ordinary fixed and sliding trains of spur wheels, giving three speeds and reverse motion. The countershaft is connected with the driving wheels by the usual chains. The car has accommodation for four persons and weighs about 11 cwt. The firm are also building a 6 h.p. car fitted with a single-cylinder engine.

The cars of Messrs. Bégot and Cail, of Rue du Ponceau, Reims have already been fully described in the *Journal*. At the Salon they exhibited a couple of vehicles—one a tonneau propelled by the firm's two-cylinder motor with the cylinders inclined at an angle of 45 deg., and giving 7 h.p., and another

FIG. 4.—THE BEGOT AND CAIL 5 H.P. TONNEAU.

(Fig. 4) propelled by a De Dion motor of 5 h.p. The car is fitted with pump and radiator, and with a Longuemare carburetter. The variable gear is adapted to give four speeds forward and reverse. I was informed by this firm that they are arranging for the introduction of their cars on the English market.

La Société Industrielle d'Automobiles Pluton, Rue Victor Hugo, Levallois-Perret, exhibited several cars constructed upon the Vigneron system, and propelled by 5 h.p. water-cooled De Dion motors. The power is transmitted by a belt to the countershaft, which carries the change-speed gear and driving chains. Two speeds are provided, and by means of an accelerator the rate of travelling can be increased up to twenty-five miles an hour. The cars shown comprised a tonneau and a spider, with removable back seat, so that luggage can be carried if desired.

La Compagnie des Automobiles Rochet-Petit, Rue de la Folie-Regnault, Paris, had on view two new types of cars. One was a vis-à-vis voiturette, propelled by a 4 h.p. Aster water-cooled motor geared on to the rear axle. Inclined steering wheel is fitted. A side lever controls the change speed gear which gives a variation of from eight to forty kilometres an hour. The weight of this car is about 15 cwt. The company had also on view a new light car fitted with a two-cylinder engine of 6 h.p., and having a body of the popular tonneau type.

The novelty on the stand of La Société l'Energie, Rue Sedaine, Paris, was a small car of the tonneau form, propelled by a two-cylinder Buchet motor developing 8 h.p. The spur wheel change-speed gear is arranged for three speeds forward and reverse motor, the power being transmitted to the rear axle by a universal jointed shaft. There is one lever for changes of speed and reversing, another for band brakes on the rear hubs, and the clutch is operated by a pedal, which also actuates a brake on the differential. The car has a long wheelbase, and all four wheels are of the same diameter. I hope to send you illustrations of the car for a later issue. The company also displayed one of their well-known Renaux tricycles, which has already been illustrated in the *Journal*.

(To be continued.)

HERE AND THERE.

ON Saturday next, the 9th inst., the Automobile Club will have a run to Virginia Water. The start will be made at 2 p.m., and dinner will be taken at the Wheatsheaf Hotel.

AMONG the visitors examining the motor-cars outside the Automobile Club on Tuesday last was to be noticed the Hon. Gerald W. Balfour, the Chief Secretary of Ireland.

THE Wolseley Tool and Motor-car Company, Limited, has been registered with a capital of £40,000 to carry on the business of motor-car, cycle, and vehicle machinists, ironfounders, tool makers, etc.

MR. REGINALD TREVOR, who recently met with a serious accident through colliding with a trap, is now, we are glad to learn, out of danger. He still lies at the White Lion Hotel, Cobham, and his complete recovery is only a question of time and rest.

THE Bedfont Motor and Wagon Company, Limited, has been registered, with a capital of £2,500, to adopt an agreement with G. Sparks, and to carry on the business of coachbuilders, mechanical engineers, motor and motor-car builders, etc.

A NUMBER of the employees of the Motor Manufacturing Company gathered together in Coventry last week to give a hearty "send off" to five of their fellow employees, who are going to South Africa as volunteers in the Imperial Yeomanry.

MR. WM. LEA, of Birkenhead, formally opened his new dépôt in Berry Street, Liverpool, on Tuesday, the 26th ult. Mr. Lea has obtained the exclusive agency in Liverpool for Progress, Benz, Decauville, and Darracq cars, types of which he has on view at his new premises.

"MOTOR PROBLEMS" is the title of a new pamphlet just issued by Mr. C. H. Guest, M.I.M.E., of Draycott, Derbyshire. In addition to forming a catalogue of Mr. Guest's specialities, it contains a good deal of useful information to motorists, who can obtain a copy on application.

ON Saturday last one of our correspondents was cycling through the Phoenix Park, Dublin, when he was passed by an officer of the 21st Lancers in regimentals mounted on an Ariel motor-tricycle. There is a great possibility that this officer was using his motor-tricycle in his duties instead of his "Hay Motor." Anyway, this is evidently what we may expect in the future.

DURING the annual mart, or fair, held at King's Lynn last week, Mr. Frank Morriss had a Daimler car running about. The vehicle was in the form of a delivery van, the exterior of which was covered with Mr. Morriss' own advertising matter. It attracted considerable attention from the hundreds of visitors to Lynn, who came from all parts of the Eastern Counties.

THE Derwent Cycle and Motor Company, Scarborough, are now open to undertake repairs of all kinds to any make of motor-car or cycle, they having a complete plant at disposal and an efficient staff of workmen. They have always a stock of petrol, lubricating oils, replacements for De Dion type of motors, and accessories on hand, and have been appointed official repairers to the Motor Manufacturing Company for their district.

MESSRS. R. W. Wright and Company, of Lincoln, have sent us a copy of the very complete motor catalogue they have just issued. In addition to the firm's own "Stonebow" cars, illustrations and particulars are given of the De Dion Progress, M.M.C., Decauville, Gladiator, and the New Orleans voiturettes, the Napier and M.M.C. Panhard cars, the Coulthard steam-waggons, etc. In addition the list contains some useful information for motorists.

CALLING in at Messrs. Friswell's dépôt on Holborn Viaduct, E.C., on Wednesday afternoon, we were able to inspect one of the latest Peugeot 5 h.p. voiturettes that had just arrived. The two-cylinder engine is fitted with both tube and electrical ignition, the arrangement being very compact. There is only one burner for the two tubes, and this is arranged centrally between the two ignition plugs. The car is fitted with wooden wheels, while a feature of the body, which is adapted to accommodate four persons, is that the back rest of the front seat is hinged, so that by simply turning it over the passengers can either all sit facing forward or vis-à-vis fashion.

THE ROYAL AGRICULTURAL HALL COMPANY,
LIMITED, v. CORDINGLEY.

—8—

(Concluded from page 865.)

MR. MORGAN DONNE, sworn. Examined by Mr. SEBASTIAN.

You are a manufacturer of motor-cycles?—Yes.

I think you have carried on that business for about a couple of years?—That is so.

Before that time were you for about eight years works manager to the North Typewriter Manufacturing Company, who manufactured bicycles and tricycles?—Yes.

And you are acquainted with the manufacturing of such things?—Yes.

Have you seen the accessories which were exhibited at the Motor-Car Exhibition at the Agricultural Hall?—I have.

And which Mr. Lamb has been describing?—I was not present when Mr. Lamb was in the box.

Having seen those did you consider that they could, for practical purposes, be used for motor-cars?—Not all of them.

What were those articles? How should you describe them?—Parts for cycles and parts for motor-cycles.

Do you say that in the trade a line is drawn between motor-cars and motor-cycles?—Yes.

Including in the term, "motor-cycle," bicycles, tricycles, and quadricycles, I suppose?—Yes.

Will you go on and tell us where the line is drawn, as between cycles and cars?—There is a wide distinction between motor-cycles and motor-cars; cars have large carriage bodies, cushioned seats, and such-like.

What do cycles have?—Motor-cycles are the usual bicycles and tricycles, strengthened up to receive the auxiliary power of the motor.

What is the next point, if there is one?—The general construction of motor-cycles is exactly similar to bicycles and tricycles. Motor-cycles have the usual bicycle saddle except in the case of quadricycles, where they usually have a cushioned seat in front for the front rider.

How is a motor-car put in motion—how do you start it?—By a crank handle, or it may be started by the fly-wheel of the engine.

How do you start a motor-cycle?—That is usually done by pedalling—similar pedals to what are used on ordinary bicycles and tricycles.

Supposing the motor apparatus comes to grief, can you manage to work the motor-cycle by the pedals?—Yes, the same as an ordinary bicycle or tricycle.

Is there anything corresponding to that in a motor-car?—Not to my knowledge.

How do you steer a motor-cycle?—They are usually steered by means of the handle-bar, as in an ordinary bicycle or tricycle.

Is that so with a motor-car—is there any handle-bar there?—In some motor-cars they have a handle. Sometimes they are steered by means of a lever or a bar somewhat similar to a tricycle or by a wheel, which is the most popular.

Is that line of distinction which you have described, the one generally adopted in the trade?—Yes.

Have you collected some catalogues of manufacturers which bring that out?

Mr. Terrell: Catalogues which somebody else writes are not evidence against you.

Mr. Justice Byrne: This is put in as generally in the trade.

Mr. Terrell: I shall not object. I do not think it is material, but I should think it is not evidence.

Mr. Sebastian: What are those catalogues?—One is the Dion Bouton Syndicate, the British and Colonial Syndicate—that is the largest manufacturer of cycles and light cars in France. The next is a catalogue by the Motor Manufacturing Company, and the next is a catalogue published by the Automobile Manufacturing Company.

Mr. Justice Byrne: And the last one?—The United Motor Industries.

Mr. Sebastian: What is the usual trade distinction putting them all collectively of motor-cycles, motor-tricycles, or motor-quadricycles?—Motor-cycles.

Cross-examined by Mr. TERRELL.

You have had how many years' experience of the cycling trade?—The motor-cycling trade?

The cycling trade altogether.—Well, I was eight years with North's Manufacturing Company, and I made several hundred cycles there.

I only want to know how far back your knowledge goes.—Eight years there, and I have been two years in business on my own account in the motor business.

You are very well acquainted with the conditions under which the trade is carried on?—Yes.

Before the year 1896 substantially in this country there was no trade in motor-bicycles at all?—That is so.

Either motor-cars or motor-cycles. Whatever they may be, there was no trade?—No.

That was because there was an Act of Parliament which prevented locomotives going on the roads?—That is so.

Do bicycles, tricycles, and quadricycles pay duty as carriages?—Yes, they do.

Bicycles?—Bicycles I am in doubt about.

Have you ever heard of anybody paying a duty on a bicycle—I mean to say outside motors—ordinary bicycles, tricycles, and quadricycles?—No.

When they have motors they do as carriages?—Yes.

In 1896 an Act of Parliament was passed allowing these locomotives to be used on the roads?—Yes.

Then the trade began?—Yes.

Long before the year 1896 the Stanley Show was going on?—Yes.

And also Mr. Cordingley was having an exhibition, was not he?—That I could not say. I do not know that.

What do you consider the definition of a motor-cycle as distinguished from a motor-car? Do you say that it is the steering apparatus?—No.

It is not the way of steering that makes the difference?—No.

Is it the way of starting that makes the difference?—No.

Is it the fact that one has pedals and the other has not that makes the difference?—That is a very strong point no doubt—the principal point.

Is it the form of the seat that makes the difference?—No.

I suppose you would say it is taking everything altogether—looking at it altogether?—I should look at it in that light. It is a very strong point.

There are several considerations in your mind which you would take into consideration in deciding whether the thing was a motor-car or a motor-cycle?—Yes.

Would you mind taking this catalogue which has been put in and look on top of page 43. That is a motor-car, is not it?—Yes.

And the next one is a motor-car? How is that steered?—That is steered with a lever.

Steered with a lever which makes the two front wheels turn one side or the other?—Yes.

And very much as a quadricycle used to be steered in the old days before the motors were invented at all?—Yes.

So far as that steering is concerned that and the old quadricycle is the same?—Yes.

That has got a cushion seat and not a saddle?—Yes.

Now look at page 44. What do you think of that? That is a motor-car, is not it?—Yes, it is similar to the other.

Mr. Leigh Clare: Not the steering.

Mr. Justice Byrne: There is a bent handle Mr. Clare wants to call attention to.

Mr. Terrell: It has a chain gearing which is connected with a wheel underneath.

The Witness: Yes, it is connected by a chain and sprockets. Some of the American cycles are steered in that way.

So far as steering is concerned, the different forms of steering are common to motor-cars, to motor-cycles, and to ordinary cycles?—Yes.

Now we will come to the cushions. Look at page 54. Is that a motor-car or a motor-cycle according to you—the bottom one?—That is a motor-quadricycle.

What is the front seat of it. The front seat looks like a motor-car seat?—It is a seat.

I did not say it was not. It is intended to sit upon. It is a cushion seat, is not it?—Yes.

Is there any difference between that seat and the motor-car seat I have just pointed out on page 44?—Yes, there is a difference. On page 44 it is a proper carriage seat, and this is only a kind of an apology for a seat.

This would do very well for a dog-cart seat would not it? You have seen that on dog-carts, have not you?—I do not think that would satisfy the owners of dog-carts.

You could sit on it?—I could sit on anything, pretty well.

The back seat on that is a saddle?—Yes, a cycle saddle.

The cycle saddle was invented as long ago as the old bone shaker?—Yes.

There is nothing remarkable about that?—No.

Look at page 59; what is that? It takes you a long time to make up your mind, does not it?—There are a great many of these things which are on the border line of motor-cycles and motor-cars.

Who is going to show that, the Stanley Show or Mr. Cordingley?—That I cannot say.

Two people are to sit abreast on that, are they not?—Yes.

That is what they call a sociable?—Yes.

Mr. Justice Byrne: I see the cost is £285 to £315.

Mr. Terrell: All these costs are enormous.

The Witness: I see no pedals on this, and I should say it is started by means of a crank handle. I have not seen the machine.

Mr. Justice Byrne: You would call this a motor-car, would you?—Yes.

Mr. Terrell: You say that the pedal is the most important thing?—Yes.

I suppose you are prepared to admit that motor-tricycles and bicycles are not primarily intended to be ridden with pedals?—They are meant to assist the motor.

They are not intended to be driven with pedals. What does a motor weigh—half a hundredweight?—I should say about a hundred-weight and a half.

People who want to ride bicycles and tricycles do not put a hundredweight and a half on the machine if they can help it?—No.

So the primary object of the thing is to be a carriage to travel by mechanical means?—Not a carriage, a cycle.

I tried to use a word we should not quarrel about; it is a carriage, is not it?—No.

Is not it a carriage by Act of Parliament; have you read the Act?—It is looked upon as a light locomotive.

Do you say that the word "carriage" is not applicable to a thing, which is a cycle?—No.

It is not?—To my mind it is not. I think the usual idea of a carriage is a carriage body on wheels mounted on springs.

Interested as you have been in motor-cars, you have not taken the trouble to read the Act which enables them to be used?—I have read it, but I forget it.

Now let me ask you one question about these accessories; there are things known as accessories in the bicycle trade?—Yes.

And there are things known as components?—Yes.

And components are not accessories?—No.

And accessories are not components?—No.

Are bicycle tires components or accessories?—They are usually called tires.

We will get something which is a little nearer. Look at this thing which is complained of. Is a bottom bracket fitted with a chain wheel and cranks a component?—Yes, that is a component.

There is no doubt about that?—No.

Because it goes to make up the machine?—Yes.

You would say a front fork is a component?—Yes.

You are not quite sure about a tire?—No.

When did your company or the Stanley Show Company first exhibit motor-cycles?—That I could not say.

Two years ago?—I could not say.

Three years ago?—I could not say.

You do not know at all? Not a bit?—No.

You do not know whether they have ever exhibited them or not?—I have seen them at their shows.

When did you first see them?—I saw them in 1896—not at their shows.

But at their shows; that is the question?—I could not say positively when.

Nowhere near?—No.

They were things that you remarked in 1896—you remember that date?—Yes.

Re-examined by Mr. LEVETT.

You told my friend something was somewhere near the border line between cycles and motor-cars. You were referred to page 43. Have you any doubt which side of the line those are?—No. I consider those motor-cars.

Have you any doubt?—No, none whatever.

Would the cycle trade have any doubt about it?—No.

Now page 44. Have you any doubt about that?—No, none whatever. 54, the top one; have you any doubt about that?—No, that is a cycle.

Take the middle one?—A carriage.

Could that be called a cycle?—No.

I see the bottom one is described as a "Brown motor-quadracycle." Is that correctly described as a cycle?—A motor-cycle, yes.

59 is the border line one, is not it? Just let us examine 59. You thought 59 was a motor-car. "I should call it a motor-car," you said?—Yes.

Tell my Lord why you should call that a motor-car and not a cycle?—Principally on account of the means of propelling it, there are no pedals.

Mr. Justice Byrne: What is that at the back. I suppose it is the motor, is not it?—I should think so; I have not read the description of this.

Anything else?—No, my Lord, that is all, as far as I can see.

Mr. Levett: Turning back to page 43, the lower picture, I think you said that was steered by the lever?—Yes.

Which is the lever; is it that little handle we see here—that little thing that sticks up?—Yes.

How does that lever operate the front wheel?—It is connected with the front wheel by means of either a rod or a chain.

Is the handle which steers the bicycle connected with the wheel in the same way?—Not usually; it is generally connected with the front wheel.

Mr. Terrell: With the front fork?—The front fork, yes; but in some American cycles, in tandem cycles, they are steered in that way, where both riders can steer the machine.

CHARLES WILLIAM BROWN, sworn. Examined by Mr. LEVETT.

I think you are a journalist and a cycle-motor expert?—Yes.

Have you considered the question, what is the difference between a cycle and a motor-car?—Yes, I have.

I mean the words as used popularly in the trade—the difference in what the trade means between a motor-car and a cycle. What is the difference between a motor-car and a cycle, to begin with?—One is driven by mechanical power and the other is propelled by manual force, by the force of the rider, however applied; it might be applied by the pedals or in any other way.

What is the difference between a motor-car and a motor-cycle?—The motor-car is propelled entirely by mechanical means. A motor-cycle is a machine on which the rider is capable of applying manual power.

Mr. Terrell: Foot power, not manual power?—Not necessarily pedal power. It is usual to propel them by pedal power because that has been found to be the best means.

You mean physical power. You do not mean manual power—you do not mean the hands?—Yes, physical power.

Mr. Justice Byrne: You mean capable of being propelled without any assistance of any other power beside the rider's own—which can be propelled by the rider without the assistance of any artificial outside means.—Without any mechanical means; but the rider may also render assistance to the motor up a steep hill.

I was asking about a motor-cycle, a bicycle-motor. If it is capable of being used by a man independently of the motor, then it is a motor-cycle as distinguished from a motor-car.—It may also mean that the rider would be able to use it altogether without the motor, as up a hill—to assist the motor up a hill.

Mr. Levett: If it can be moved, or helped to be moved by physical power, you say it is a motor-cycle?—Yes.

Mr. Justice Byrne: That is not quite right. It is moved or helped by the rider. You might get someone to push it behind.

Mr. Levett: I mean the physical power of the rider.

Speaking of a motor-car, how do you define a motor-car as to the way it is moved. How is a motor-car moved?—Simply by the motor.

Now come to the starting. How must a motor-car be started?—It is usually started by the driver first of all starting the motor. He connects the motor up to the car, and that starts the car.

Mr. Justice Byrne: There is another thing which used to be called a coolie cycle, where a man drives behind—propels it by driving it behind.

The Witness: That was not unlike a motor-cycle.

Mr. Justice Byrne: That was an exceptional sort of thing.

Mr. Levett: Will you look at this catalogue, page 43. I will take the same as my friend took before. How do you describe these two things on page 43?—They are both motor-cars.

Have you any doubt about it?—Not the slightest doubt.

Now take the two on page 44?—They are both motor-cars.

Now take page 54, what is the top one?—The top one is a motor-cycle.

What is the middle one?—A motor-car.

What is the bottom one?—A motor-cycle.

Have you any doubt about it?—No doubt at all.

Now take page 59, what is that?—A motor-car.

In going up hill what use can be made of physical power in that motor-car?—None whatever.

And in a motor-cycle?—You can help the motor materially.

Cross-examined by Mr. TERRELL.

You are what, on the C.T.C.?—Cycle expert and show reporter, for many years.

The C.T.C. is a cycling club?—A cycle touring club.

A very large club, perhaps the largest in the world?—Not the largest in the world.

Have they got rules?—I think so, but I am not certain on the point.

Have they rules with regard to the admission of members?—Yes.

What people are qualified to be members?—Anybody who is not a professional cyclist.

And he must be a cyclist?—I do not think it is necessary for him to be a cyclist; it generally is.

Have they been considering that in regard to motor-cars lately?—They have been considering the question of motorists being admitted; motor-car owners or drivers being admitted to membership.

How did that come to be considered?—I am not on the Council of the Club, and I cannot tell you.

It was thought to be outside the scope of the club by some people?—Some people thought so.

They thought cycling was a sport, and a thing propelled by machinery was not within the sport?—Some of them thought that.

Did that objection apply to what you are pleased to call motor-cycles as well as motor-cars?—I do not know; I was not present at the time it was raised.

But you have heard about it?—I should think it would apply to motor-cycles. There are many questions raised like that. I believe the club will admit motorists eventually.

Mr. Justice Byrne: They do not admit any motorists at present?—They proposed to admit them. I dare say they would admit them now.

Mr. Terrell: Do you use the expression "motorists"?—Yes.

Is that a known expression?—It seems to be a common expression enough in the papers.

That is to distinguish people who go by motors from people who go by what you call manual power?—Yes; or physical power on cycles.

With regard to the starting of these things—many motor-cars are started by hand?—The majority of the motors are.

But the car itself is given a shove to give it a start?—Occasionally, when they are out of order.

Sometimes they have a crank handle to start?—To start the motor.

And to start the car?—I have not seen a big car started in that way.

Have you seen small cars started in that way?—No. I do not think I have seen small cars started in that way.

What is the object of the pedals in, say, a motor-quadracycle? I think you said a motor-quadracycle was a cycle?—Yes, I do.

The object of the pedals there is to start?—One of the objects.

Look at that picture you have had attention called to on page 54—that bottom picture. You would not like to drive that along any distance without a motor?—No. I should not like to; but I would also say that machine would not go up some of the hills without those pedals.

That would depend on the power of the motor?—As a matter of fact they hardly ever will go up a steep hill without.

It depends whether it is like a wall?—No.

Or very bad motors?—Yes.

The whole trade is in its infancy?—Yes.

Motor-cars and cycles are quite a new thing?—Yes.

Do you remember the Act enabling them to come into operation?—Yes.

It is only since that Act that there has been any trade at all in these things?—In this country.

Do you attend the Stanley Show amongst your other duties?—Yes. When did you first see motor-cycles exhibited at the Stanley Show in any quantity. I do not mean one little exhibit. When did you first see a substantial show of motor-cycles at the Stanley Show. I take as substantial, say if even three or four makers exhibited them?—I cannot say three or four. I think there would be some in 1895.

The Stanley Show has gone on for a large number of years?—Yes. I would not say there were more than three or four, if three or four.

There were not three or four in 1898, were there?—I think so, in 1898.

Did you attend the show?—Yes, but I was doing cycle reporting only.

Then you would pay particular attention to what was there?—I should pass over motors at that time.

You were doing cycle reporting, and you would pass over motors?—Yes, I was doing the *Gazette* reporting. We did not include motors. The motors were done by Mr. Douglas Leechman.

When are you talking of?—1898.

In 1898 the *C. T. C. Gazette* was the organ of English cyclists—the principal one?—Yes.

As distinguished from the trade?—Yes.

The Stanley Show is a show to the public as distinguished from the Crystal Palace Show?—They are both shows to the public.

But it is the large trade show at the Crystal Palace and the smaller trade which shows at the Stanley Show?—Not necessarily; we have had some of the largest makers at the Stanley Show.

Mr. Justice Byrne: I have had a good deal of evidence lately on the subject. There is a great deal of wholesale at the Stanley Show.

Mr. Terrell: The *C. T. C. Gazette* is the organ of the actual cycling public—the person who wishes to cycle on the road as distinguished from the trade?—The *C. T. C. Gazette* is a private publication sent to members of the club only, and is not a public journal.

How many thousand members has the C.T.C.?—60,000.

That is pretty public. Do you think any other cycling publication has anything like that circulation?—I should not like to say.

The *C. T. C. Gazette* in 1898 limited itself, and you were limited in reporting for it to cycles propelled by the feet or the hands?—It did not limit itself. I was doing my report relating to these cycles. There was a report of motor-cycles. It was done, I believe, by Mr. Douglas Leechman.

They were employing two separate persons who were doing separate reports of two separate sorts of things?—It may be they looked at it in that way or they may not.

You looked at it in that way?—I looked at it that I had to do what the Editor told me to do.

Have you had an engineering education?—No, not entirely.

You require an engineering education to understand a motor?—I do not know. I think I understand it pretty well.

But you require an engineering education to understand it?—Yes, in a certain sense.

To understand its construction and mode of operation?—Yes.

Mr. JOSEPH VAN HOODONK, sworn, examined by Mr. LEVETT.

I think you have made bicycles for eleven years?—That is so.

And motors for two years?—That is so.

I think you are well acquainted with the trade, and you have a knowledge of engineering?—I have been in the trade eleven years now on my own account, and I have been in the engineering business ever since I was nine.

Is there a difference made in the trade between motor-cycles and motor-cars. Tell my Lord the points of difference made by the trade?—The usual difference considered in the trade is that the motor-cycle is a sort of a vehicle pretty well on cycle lines, which can be partly or wholly propelled by manual power. A motor-car is a vehicle of a larger description altogether, it is propelled by a motor of some kind, and is not intended to be assisted partly or wholly by manual power.

Take a copy of the catalogue and take page 43. What are those?—Both cars.

Page 44?—Both cars.

Page 54, the top one?—A motor-tricycle.

What is the middle one?—A car.

And the bottom one?—A quadricycle; we call them "quads" in the trade, but still it would be a cycle.

Page 59, what is that?—We have not got a name for that.

You give that up?—I remember now a thing is being made by a man named Reny, in Bradford, which he calls a motorette. I have seen an illustration of that, and from that I should call this a motorette. I should not call it a motor-car. The wheels are cycle wheels. It is not a cycle and it is not a car.

Mr. Justice Byrne: You call that a nondescript, I suppose?—Yes.

Cross-examined by Mr. TERRELL.

Do you know the Hildebrand and Wolfe-Müller motor-cycle?—No.

Do you know the Century motor-cycle?—Yes.

Is that a motor-cycle?—Yes.

Has it pedals?—No.

Why do you say that the Century is a motor-cycle as distinguished from a motor-car?—Because the general get up of the thing is on cycle lines. It is practically a cycle frame with the pedals left off and an engine added to it.

So your evidence is it does not matter. A thing may be a motor-cycle which has no pedals whatever. Is that what you say?—So far as you were to take an ordinary cycle.

Could not you answer my question, yes or no? Can a thing be a motor-cycle which has no pedals?—Yes.

What you say makes the distinction between a motor-cycle and a motor-car is the general get up. That is your view of it?—That is part of it.

What is the other part of it?—The pedals.

It does not matter whether there are pedals or not; it may be a cycle, and made without pedals.—It does to some extent; one thing without pedals would be more a motor-cycle than another thing with pedals.

Are there things which are more motor-cycles and things which are less motor-cycles?—Most decidedly.

Mr. A. J. WILSON called.

Mr. Levett: This witness is so deaf that he wants an interpreter. He is an author; he has written a book on motor-cycles.

Mr. Justice Byrne: Perhaps he can exhibit his book.

Mr. Levett: His proof is his book.

Mr. Terrell: Only I cannot cross-examine him on it. [Book handed to Mr. Terrell].

When was this printed?—It was printed in the commencement of last year, reprinted from articles which I had published during the previous year, 1899, in the Motor-car newspapers.

What part of 1899?—About October.

Mr. Terrell: I shall obviously have to cross-examine this gentleman on this.

Mr. Justice Byrne: He must be sworn then.

Mr. Terrell: To save time I will admit it if your Lordship will take the date it was written. I will take that date without cross-examination.

Mr. Levett: That book had better be marked A. J. W. That is our case.

Major H. C. L. Holden, Royal Artillery and F.R.S., called for the defence, described a motor-car as a carriage propelled by motive power, and which was too heavy to be propelled by human power. A motor-cycle was a smaller variety of motor-carriage, which could be started by human power, and in some cases be subsequently assisted by human power. He described a cycle as a light machine that was entirely propelled by human power. Bicycles, tricycles, and quadricycles—outside motors—never paid duty as carriages, whereas motors did. The strong point of difference between the two classes of vehicles was, in witness's opinion, that one had pedals and the other had not.

Cross examined by Mr. Levett: What do you say is your definition of a motor cycle?—First and primarily a machine fitted with a motor, such machine being built of similar materials, and sometimes in a similar way, to that of the ordinary bicycle, tricycle, or quadricycle; but there the similarity ends, because the motor machine is so heavy that where it can be propelled at all it entails too great exertion on the part of the rider or driver. Have you ever seen a three-wheel machine described as a motor-car?—Yes, the Bollée.

Mr. W. Worby Beaumont was also called for the defence, as was also Mr. Charles Cordingley, the defendant, who, having the list of accessories mentioned by the plaintiffs put to him, specified a number of them that were applicable to motor-cars and not to cycles alone. He declared that the rims, for instance, had been used on a Locomobile, and that he had seen them fitted on such a machine at the Stanley Show.

After hearing Dr. Boverton Redwood and Mr. T. W. Staplee Firth, this concluded the evidence for the defence, and

Mr. Terrell summed up for Mr. Cordingley, saying that the intention of the parties was clearly that at one exhibition the articles were to be of one kind, and at the other of another and distinct kind. The evidence, he submitted, clearly showed that there was no dividing line between a motor-car and a motor-cycle. Under these circumstances was it likely the parties would make the agreement for showing and selling motor-cars without saying where the Stanley Show rights were to begin, and where the defendant's rights were to end? The parties intended that there were to be two separate shows. The Stanley Show was one thing; the defendant's show was another, and was the outcome of a new industry and a new trade legitimised by Act of Parliament in 1896. The agreement specified "no cycles of any kind whatever." The question was: What did they mean by "cycles"?

Mr. Clare having followed on the same side, judgment was postponed until Thursday, the 21st ult.

In giving judgment Mr. Justice Byrne said:—The question I have to determine in this case is whether a certain agreement between the plaintiff company and the defendant authorised the exhibition of motor-cycles. Having stated shortly the agreement, and having read Clause 5, his Lordship continued:—For the plaintiff it is contended that motor-cycles are included in the prohibition as to cycles of any kind or description, while the defendant contends that motor-cycles are not cycles within the meaning of the clause. Prior to 1896, owing to the state of legislation, motor-cars and vehicles of that kind for passengers were practically not in use in England, but an Act of Parliament passed in that year having rendered their use feasible they began to come into general use. Prior to the introduction of motor-cars and motor-cycles there is no difficulty in assigning a meaning to the word "cycle"; it meant, in the cycle trade and to all interested and to the public, a vehicle, usually with two, three, or four wheels, called respectively bicycles, tricycles, and quadricycles, and propelled by the exertion of the rider or riders with the aid of

OF A AA IF PD

mechanical contrivances. In about 1895 or 1896, with the introduction of vehicles for passengers and riders having independent motive power, a new nomenclature became necessary, and the expressions "motor-car," "motor-cycle," and "motor-tricycle" soon became and are among the most common. Witnesses have been called to show the ordinary meaning attached in the cycle trade and amongst exhibitors, experts, cycling journalists, engineers, and writers as to the terms "motor-car," "motor-cycle," and the rest. Having given some instances of the definitions given by several of the witnesses as illustrating the rest, his Lordship continued: It is difficult to get a very absolute and distinct line of demarcation, but on the whole, I think that given in a book that has been produced and put in evidence, "Motor Cycles and How to Manage Them," by A. J. Wilson, appears to me to substantially sum up the difference between motor cycles and cycles, the result being there stated that a motor cycle was a machine constructed like the everyday bicycle or tricycle, a pedalling cycle in fact, with auxiliary motor power attached, the motor doing all the work except up a steep hill, perhaps, and the pedals being principally used to start the machine or to ride it home again in the unfortunate event of failure of the motor power. His Lordship then came to the conclusion that, upon the whole evidence, and having regard to the words in the agreement, "of any kind or description" of cycles, the exhibition of cycles, even though intended to be used with motors, was forbidden by the agreement. The defendant having failed must pay the costs of the action, no other relief being now asked.

Mr. Terrell said his clients would like to take the opinion of the Court of Appeal, and he asked for a stay. This the judge granted, except so far as taxation was concerned.

FURIOUS DRIVING CASES.

At the Edinburgh Police Court, last week, Robert Gillevie, motor-car driver, was convicted of driving a motor-car recklessly and carelessly in Atholl Place on the 8th ult., in consequence of which the car collided with a dogcart, and two occupants of the latter were thrown out. Bailie Murray remarked that this careless driving of motor-cars was much too frequent, and he had difficulty in refraining from sending the accused to prison without the option of a fine. Gillevie was fined £3, or thirty days' imprisonment.

At the Leicester Borough Police Court last week, Wm. Birch, motor car driver, was summoned for furiously driving a motor-car, in Humberstone Road, on the 26th January.—Mr. Harding appeared for the defendant.—Mary Grimes stated that on the night mentioned she was crossing Humberstone Road, near St. Luke's Church, having just got out of a wagonette, when she was knocked down by a motor car, and had afterwards to be extricated from between the wheels. Her head was cut, and she was bruised about the body, in addition to sustaining a fracture of the upper arm. Mrs. Eastwood, sister-in-law of the complainant, gave corroborative evidence. She did not hear the motor-car coming until someone shouted. She called out to the last witness, but she had no time to get out of the way, and witness herself only just escaped being run over. She did not hear any horn blow.—Cross-examined: She did not tell the driver when he called the next day that she and her sister were as much to blame as he was.—Another witness, named Miller, also gave an account of the accident, and said he considered that the motor-car was being driven too fast.—Mr. Hardy submitted that there was no evidence of furious driving and pointed out that the accident was due to Miss Grimes losing her presence of mind when crossing the road. These motor-cars had been running for about a year now, and carried on the average 10,000 passengers a week. This was the first accident of any account that had occurred, so that he did not think there was much cause for complaint.—The Bench considered there was no evidence of furious driving, and dismissed the summons.

THE CARBURETTOR PATENT QUESTION.

IN the Chancery Division on Tuesday Mr. Justice Joyce had before him the undefended case of the British Motor Traction Co. Limited v. Friedlander. It was an action by the plaintiffs to restrain infringement by the defendant, who carries on business in Lewisham, of a patent, No. 16,072 of 1893, relating to a carburettor. It now came on as a motion for judgment in default of appearance.—Mr. Bucknill (for the company) asked for an injunction, an inquiry as to damages, and order for delivery up of the infringing articles.—Mr. Justice Joyce entered judgment in the terms asked.

WATERING A MOTOR-CAR.

WILLIAM HERRING, driver of a steam motor-van, was summoned last week to answer a charge of stealing water. The prosecution was instituted by Edgar Tilley on behalf of the Metropolitan Drinking Fountain and Cattle Trough Association. Mr. Tilley said that the association, which erected the troughs and fountains about the metropolis, paid for the water, which was on constant supply to those places, by meter. The water was therefore the property of the association, and there were notices about that the water was only for man and beast. Police-constable 332 H gave evidence that on the afternoon of the 5th

February he saw the defendant, who was driving a traction engine in Spitalfields, stop at the cattle trough in front of the church and take water from it for his engine. Asked how much the defendant took, the constable said he could not say, because the engine pumped for itself, the defendant putting a 2in. hose into the trough and sucking up the water. The witness thought the process took about a minute and a half. The defendant said he took about seven buckets, or twenty-eight gallons. He had to do it because the water had run out of his boiler, owing to unexpected delays on his journey. Replying to the magistrate, the prosecution said that the water supply cost 6d. per 1,000 gallons. He put the value of the water stolen at 1d. The magistrate fined defendant 20s.

MESSRS. A. B. WARDMAN AND SON, Regent Parade, Harrogate, ask us to state that they keep a stock of petrol for motors.

AN electric motor postal van was put in operation by the postal authorities in Paris last week as an experiment.

It is reported that Messrs. Stanley Brothers, Newton, Mass., inventors of the Locomobile, intend to put out a still lighter and cheaper car in the spring.

At a meeting lately held in Washington the National Capitol Automobile Club was formed, with General Nelson A. Miles as first president.

SERVICES of motor-vehicles between Dawson and the various Yukon creeks began on 2nd February, and so far are reported to have proved highly successful.

A COMPANY is being organised for the purpose of running a service of motor-cars between Buffalo and the Pan-American Exposition grounds.

THE Kingston Motor Company, High Street, Kingston-on-Thames, have been appointed official repairers to the Motor Manufacturing Company, and De Dion-Bouton, Ltd.

A SALE by auction is to be held on March 8 of the plant and stock (comprising thirteen Stirling-Daimler cars to carry eight persons and driver) of the Falkirk District Motor Company, Ltd., in liquidation.

THE Progress Motor Company, Ltd., of Coventry inform us that the sole and exclusive sale of frames and component parts for their "Progress" cars has been placed in the hands of Mr. H. Waterson, of Aston, Birmingham.

AN invitation motor-cycle race, open only to amateurs, is to be held on Easter Monday at Putney Velodrome. Mr. Mark Mayhew, a vice-president of the Putney Athletic Club, is offering a five-guinea prize for the race.

DRIVERS of motor-vehicles in Chicago are threatened with loss of their licences unless they check the speed of their vehicles at street crossings. The City Electrician has sent out a warning to all drivers who hold licences, and has enlisted the aid of the Chief of Police.

MR. GEORGE W. RITCHIE, superintendent of the works of the Locomobile Company at Westboro, Mass., has been experimenting with locomobile sleighs by attaching runners five feet in length to the front wheels, first removing the tires. The experiment is said to have been successful.

THE Thornycroft Steam Wagon Company of America, of Paterson, N. J., is at present building ten of the Thornycroft steam trucks of 3½ ton load capacity. A large part of the works of the Cooke Locomotive Works, with which this concern is related, is set aside for the work on these trucks, and they are rapidly nearing completion.

THE Steam Vehicle Company of America has offered a silver challenge cup to be awarded to the owner of the car who shall before April 15, 1901, establish the best record time for a steam-car between the cities of New York and Philadelphia. The competition is open to all owners of steam vehicles of any description, the route between the two cities to be selected by the contestant. The purpose of the offer of this cup for public competition is to demonstrate the practicability and usefulness of steam vehicles in operating for any distance under adverse conditions. In order to do this the competition takes place during the winter months, when the roads are in their worst condition. It is expected that the competition thus begun will call forth some surprising records and show to the public the immense superiority of the steam vehicle over other means of transportation.
